This plant flowers when ten or fifteen years old and when 20 or 30 feet high.

FOURCROYA GIGANTEA. VENT.

The Great Aloe, ENG. | Sime katalay, TAM.

This plant, one of the Amaryllaceæ has been introduced into India from South America. It is remarkable for its leaves which are often ten feet long. It yields a fibre five or six feet long, somewhat finer than Agave fibre, but possessing similar properties, it is less abundant than the Agave, but is as easily propagated. In preparing its fibre, called aloe fibre, the leaves, cut close to the stem, are placed on a piece of board, and beaten with a short stout stick. After being thus bruised, the pulpy portions are scraped out with a blunt knife, and the fibres are subsequently washed in clean water and dried in the sun. Its long and strong fibre deserves more attention than is given to it. The Agave and Fourcroya are similarly called Aloes and the fibre, aloe fibre. These are not natives of India, but have mostly been introduced from America. They are capable of enduring a great variety of climates, and are all rapidly extending over India, but they are not yet sufficiently abundant, the Fourcroya gigantea, especially, to yield the fibre in large quantities. *M. E. J. R.*

FOUR-LEAVED CARYOTA. ENG. Caryota urens, *Linn.*

FOWLS. ENG.

Ouph,	HEB.	Koli,	TAM.
Murghi,	HIND.		

Though in numerous breeds, and sub-breeds, all the domestic fowls seem to have diverged from a single type. The game breed is from the Gallus bankiva called also G. ferrugineus. Its feathers are closely depressed to the body, it is indomitably courageous, evinced even in the dispositions of the hens and chickens. It is of various colours.

"*Malay*" fowl, with body of great size, disposition savage.

"*Cochin or Shanghai*" breed of great size, of Chinese origin, and disposition quiet.

"*Bantam*" breed, originally from Japan.

"*Creepers*" or "*Jumpers*" from Burmah, with monstrous short legs.

"*Frizzled*" or "*Cafir*" fowls of India, with feathers reversed.

"*Silk fowls*," with silky feathering and

"*Sooty fowls*" of India, the hens of which have a white color, soot stained, black skin and periosteum.

The Europe breeds "*Dorking*," "*Hamburgh*," "*Andalusian*," "*Spanish*," "*Sultans*," "*Ptarmegan*," "*Ghoaondook*," "*Rumpless*" are unknown in S. E. Asia.

"*Gallus Sonneratii*," does not range into the northern parts of India, part of its hackles consist of highly peculiar horny laminæ and it is not now believed to be the parent bird of the domestic fowl.

"*Gallus Stanleyii*" is peculiar to Ceylon, and greatly resembles the domestic fowl.

"*Gallus varius*," called also "*G. furcatus*" is met with in Java, and the islands of the Archipelago as far east as Flores. It has green plumage, unserrated curb and single median wattle.

"*Gallus Temminckii*" is supposed to be a hybrid.

"*Gallus bankiva*," inhabits N. India as far west as Sind, ascends the Himalaya to a height of 4,000 feet, inhabits Burmah, the Malay peninsula, Indo-Chinese countries and the E. Archipelago, as far as Timor.

Fowls are not mentioned in the Old Testament, and are not figured on Egyptian monuments. They are figured on some of the Babylonish cylenders, B. C. 600 and 700. The Institutes of Menu permit the wild-fowl to be eaten but forbid the domestic fowl. At the present day, most of the Pagan tribes on the east coast of Africa from 4° to 6° south of the equator hold the fowl in aversion. Cæsar informs us that the Celts of Britain, would not eat the *hare, goose*, or *domestic fowl*. The Rajpoot will hunt the

first, but neither eats it nor the goose, sacred to the god of battle (Har). The Rajpoot of Mewar eats the jungle fowl, but rarely the domestic. Many of the races in the S. and E. of Asia sacrifice a cock. The domestic fowl is eaten freely by mahomedans and many hindus, and they are largely reared for the table.

Fowls fatten best when kept in the dark. In India their eyelids are sown together.—

Fowls are sacrificed by the Yezdi of Kurdistan. The Assyrians worshipped the cock. The Jews of the east offer a cock for man and woman as an atonement. Socrates desired a cock to be sacrificed to the god of health. *Darwin, Tod's Rajasthan, vol. I., p.* 76, See Gallus. Cock.

FOX, ENG.

Taaleb,	AR.	Nomri,	HIND.
Shual,	HEB.	Kokri,	MAHR.
Lomri,	HIND.	Robur of	CANDAHAR.

In India three species of foxes are met with, and may here be noticed separately.

Vulpes Bengalensis, SHAW.

Canis Bengalensis,	GRAY.	Vulpes Corsac *v.* Bengalensis, Indicus et kokree,	BLYTH.
„ Kokree,	SYKES.		
„ rufescens,	GRAY.		
Vulpes Indicus,	„		
Lomri, Loomri and Noomri,	DUK.	Bengal fox,	ENG.
Bengal dog,	ENG.	Common fox,	„

lives in the entire of India and the adjacent countries, but varies both in size and colour in different localities; is generally of a grayish brown with a fulvous cast, passing in some cases to Isabella; it is always variegated above with an intermixture of whitish hairs. It is a very pretty animal but much smaller than the European fox, with a short head, very sharp muzzle, oblique eyes, nut-brown irides, very slender legs and very bushy tail, trailing on the ground. Its principal food is rats, land crabs, grass-hoppers, beetles, and fruit: the mango, the custard apple, are largely eaten. It always burrows in open plains, runs with great speed, doubling like a hare; but instead of stretching out at first, like the hare and trusting to its turns as a last resource, the fox turns more at first and if it can fatigue the dogs, it then goes straight away.

Vulpes flavescens, GRAY.

Vulpes montanus, HODGS. | Robur in CANDAHAR.

This species is numerous in the valleys around Candahar, hiding in burrows and in holes in the rocks. It is about two feet long from the nose to the insertion of the tail, and the tail is about seventeen inches, height at shoulder about fifteen inches. Its tail is yellowish: back rather darker, inclining to brown; face and outer side of fore legs and base of the tail fulvous: spot on the side of the face just before the eyes, the chin (breast) the front of the forelegs, a round spot on the upper part of the hind foot and the tips of the hairs of the tail blackish, end of tail white, and ears externally black. The skins are soft and are made into the reemchah and posteen.

Vulpes montanus, PEARSON. The Hill fox.

Canis vulpes montanus, PEARS	Vulpes montanus, GRAY.
„ himalaicus, OGELBY.	„ nipalensis, „

The hill fox of India, dwells in the Himalaya, ranging up to the snow limits and in winter, when the snow is on the ground, they are very numerous about Simla, coming close to the houses in search of offal. Its fur is exceedingly rich, dense and fine, the longer sort measuring fully two inches upon the back, and the inner every where of considerable length and of a woolly character. General colour pale fulvous, head mixed with white: tail bushy and white tipped. *Horsfield's Cat. of Mammalia in E. I., Cos. Museum, quoting Mad. L. Soc. Journ. Ben. As. Soc. Journ.* xi., 589, xiv., 345, *Col. Sykes.*

FRAGARIA. The strawberry genus of plants, of the Order Rosaceæ, some species of which occur in India, wild, and others are cultivated. F. chilensis, *Ehr*, the Chili strawberry was brought from South America. F. collina is also an introduced plant. F. elatior *Ehr.* is the Haut-boy strawberry from America and F. grandiflora and F. majaufea are also known, as also F. Roxburghii W. & A. the F. Indica and Malay of Roxburgh, which has also been classed with Duchesnea and Potentilla, growing in the Neilgherries, Dehra Dhoon and Kamaon.

FRAGARIA VESCA, LINN.

Wild Strawberry,	ENG.	Paljor of	CHENAB.
Wood „	„	Bunun also musrini of	RAVI.
Kanzar of	JHELUM.	Bana-phul of	SUTLEJ.
Ingrach, also yang, also tash of	KANGRA.	Tawai of	TRANS-INDUS.

This grows wild in most parts of the Punjab Himalaya, from 4,000 to 12,000 feet. The fruit is excellent when gathered dry but is largely improved by cultivation. It is cultivated by Europeans and market gardeners and in the Bombay Dekhan, a bed of a few square yards brings in from £15 to £20 the season. In Bangalore it is grown abundantly. The Strawberry plant multiplies itself from runners and suckers; the old plant, after it has ceased bearing, throwing them out. As soon as the rains have set in, these runners may be removed into a nursery bed, for their being more easily looked after, and should

have the space of nine or ten inches allowed between them; they will throw out other runners, the whole of which may be separated and transplanted at the proper season. They thrive best in a light soil with good old stable and vegetable manure at first, and as soon as they show a disposition to flower, may have old goats' or sheep's manure added around each plant, a couple of double handsful being sufficient. In no part of the Deccan, should the plants be put out for fruiting before the close of the rains, the latter part of September being quite early enough. Suckers planted for experiment at the commencement of August, grew to a good size, and did nothing for ten or twelve weeks but throw out suckers, which were continually removed, but, after all, fruited badly: the finest and most prolific crop were got from suckers put out in the beginning of October. Some strawberries were gathered in November from the plants put out in August, but they were so few as in no way to induce a trial of the experiment again. Varieties can only be procured from seed; and to procure the seed, select the finest ripe fruit, rub it on a sheet of paper, and dry it. When the rains commence, soak the seed in water, reject all that float, sow the remainder in baskets in a light loam, when they will be fit to remove in about six weeks, and should be put in other baskets four or five inches apart, and taken care of until ready to be transplanted into the beds where they are to remain. As these plants throw out suckers very fast, they must be constantly looked after, and removed. They will commence bearing in six months from the time of sowing the seed. As soon as the rains have ceased, put the suckers that have rooted into square beds, each not less than one foot apart, five in a row: this will give twenty-five in each bed—as many as can be easily looked after and gathered without trampling on the bed and thereby injuring the plants. When the earth is of a clayey consistence, Dr. Riddell has seen the strawberry cultivated on ridges. Some think this is a good plan, but he prefers the beds. It is sometimes necessary, in consequence of flooding the beds, to put tiles under the fruit to keep it clean, but it also attracts the notice of the birds: if straw or grass be used, then the chances are that white ants destroy the plants. This it is that makes some persons prefer the ridge system of growing, as they say the fruit is cleaner in consequence: fine fruit may be grown either way; and if on ridges, the same distance must be allowed between the plants as in beds—and even in the latter the plants may be put on raised cones of earth. The common vegetable manure is all that is required at first until near flowering, when a handful or two of goats' or sheep's dung should be put round the plant, opening the earth and scraping it together. Water during the evening and very early in the morning.—*Birdwood Veg. Prod.* 151. *Drs. Cleghorn Kullu and Kangra* p. 65, 81, *J. L. Stewart, Riddell.* See Strawberry.

FRAGRANT ACACIA, Eng. Acacia odoratissima, *Roxb. Willd.*

FRAGRANT KÆMPFERIA. Kæmpferia rotunda.

FRAGRANT MORINDA. See Morinda.

FRAGRANT PERGULARIA. Pergularia odoratissima.

FRANCE, in the 18th century, made noble exertions for empire in the east. They occupied Madagascar, also the Isles of Bourbon and France; formed a factory at Surat and one at Masulipatam, were repulsed at Galle, but took and again lost Trincomalee, settled at Pondicherry which they surrendered to the Dutch. They abandoned Surat, and founded Chandernagore: conquered Mahe, obtained Karical, repulsed the British fleet off Negapatam, took Madras. Defeated Mafuz Khan near Madras at Sadras and St. Thomé, but were surprised at Cuddalore, twice repulsed and forced to retire. They were beseiged in Pondicherry but repulsed the besiegers. They gained the battle of Amboor when Anwar ud Din fell—surprised the camp of Morari Rao, defeated Mahomed Ali, son of Anwar ud Din, stormed Gingee, defeated Nazir Jung, defeated the British at Volconda. They were shut up at Trichinopoly, where they were twice defeated by Clive and retreated to Seringam where they subsequently surrendered to the British. They afterwards defeated the British at Viccravaudi but sustained a defeat from them at Bahoor. They repeatedly defeated the Mahrattas, obtained great power, under M. Busy, at Hyderabad, and obtained the cession of four provinces on the eastern coast. They defeated the British at Teruvadi, but were defeated at the Golden-rock, at the Sugar-loaf-rock and took refuge in Seringham, were repulsed at Trichinopoly but surprised the British at Contapara, made peace with the British and refused to aid Suraj ud Dowlah against the British. Subsequently they were beaten off Negapatam, took Cuddalore and Fort St. David and were repulsed from Tanjore. They were beaten off Tranquebar at Condore, and off Fort St. David and at Wandewash, and surrendered Pondicherry. Their efforts ceased from the 16th January 1761. By the

Treaty of Paris in 1763, Mahomed Ally, son of Anwar-ud-Din, was declared an independant sovereign. They had able leaders but the officers under them were greatly inferior to Dupleix and Bussy.

The French possessions in India consist of five towns, Chandernagore, Karical, Pondicherry, Yanaon, and Mahe. The total square miles of these is 191½ with a population of 203,887.

Pondicherry was restored to France by the peace of 1763. Captured again in 1793, again restored by the peace of Amiens in 1801, recaptured in 1803, and finally restored in 1814 and 1815.

During their greatest efforts, Admiral de la Bourdonnaix was employed by sea, and Dupleix and Bussy on land.—*Malleson. Ind. Ann.*

FRANCOA APPENDICULATA. A beautiful flowering plant.

FRANCOLINUS PONTICERIANUS. See Aves : Birds : Perdicidæ

FRANKINCENSE.

Coondoor.	Duk.	Minan,	Malay.
Kaminan,	Malay.	Kamayan,	„
Kamanan ; Manan ;	„	Kandricam,	Tam.

Of this, there are several kinds in commerce. The best are the Arabian or tear olibanum, the African, and the East Indian or stalactitic. Olibanum, a fragrant resin, from species of Boswellia, is obtained, in India from the Boswellia glabra : and the gum resin of the Canarium strictum, *Roxb.* is also fragrant. The oleo-resin of the Abies excelsa, or Norway spruce fir, is known as common frankincense ; and, in India, the oleo-resin of Pinus longifolia, is also so called. Some of the frankincense of European markets is doubtless obtained from the Juniperus lycia, and a tree of America is called the frankincense pine.

The substance called Koondricum by the Tamil people is very common in the Indian bazaars, and is used as an incense in religious ceremonies, equally by the hindus and Portuguese christians, being, though not quite of so grateful an odour, cheaper than benzoin. It is supposed by the mahomedan medical men, to be a species of olibanum and they give the name of Coondoor to both ; but it is very unlike olibanum in its appearance ; being always seen in pretty large, agglutinated masses, composed of light brown and yellowish tears, and having a strange stony kind of hardness when pressed betwixt the teeth ; whereas the olibanum is in separate small roundish balls, or large grains which do not give the same sensation on being chewed, nay even stick to the teeth. The Koondricum is generally brought to Southern India from Madagascar, form the coast of Borneo, and also from Pedir on the Island of Sumatra. *Ain's Mat. Med., p.* 16. *Birdwood Veg. Prod.* See Balsam ; Boswellia : Gums and Resins.

FRANKINCENSE PINE, Pinus tæda, Lamb.

FRANKLYN, WILLIAM, Major of the Indian Army, author of A Tour in Persia : History of Shah Alam ; Memoirs of George Thomas ; Tracts Political, Geographical and Commercial on the Dominions of Ava and N. W. Hindustan, 1811.

FRASER, GENERAL, J. S. An officer of the Madras Army, who entered the service in 1800, and during his long career of about fifty-four years, was employed in offices of trust and importance. He was Commandant of Coorg, Resident at Travancore and Cochin, and his last office was that of Resident at Hyderabad.

FRASH, of Kashmir, Populus alba, white poplar.

FRASH BEAN. Anglo-Hind. Phaseolus nanus.

FRAST, Hind. Populus nigra "jangli" "frast," P. alba, "ban frastu," P. ciliata.

FRAUEN MURZE. Ger. Mint.

FRAXINUS. The Ash tree.

The Ash tree,	Eng.	Oren,	Heb.
Aran,	Arab.	Ornus,	Lat.

Of the genus Fraxinus, two species grow in the western Himalaya ; the F. floribunda, or large ash and F. xanthyloides or crab ash.

They grow in the Mehra forest, near Abhotabad, Hazara, and in the valley of the Sutlej, there is abundance of yew and olive, and a considerable quantity of box and ash, the ash and olive near the river, but the box and yew on the higher slopes, 2,000 feet or more above the Sutlej. The larger ash and yew are much esteemed for jampan poles, hefts and tool handles, &c., and the larger, in colour, grain and toughness, resembles the English ash, and makes good walking sticks. Some species of ash are remarkable, like the sugar maples, to which in some respects they are allied, for the sweetness of their sap, which on concreting by exposure to the sun, is known as manna. To the two species, F. rotundifolia and F. florifera and probably also to other species, we owe the manna of the European druggists.—*Ornus florifera*, the *Flowering ash tree*, grows in the

mountains of the south of France, and F. rotundifolia, (Ornus rotundifolia) the round leaved manna ash tree, is a native of Calabria and Sicily.—The wax insect tree, of China, Mr. Fortune says is a species of ash, it grows abundantly on the banks of ponds and canals in the province of Che-kiang; Mr. McCartee of Ningpo, gave him some beautiful specimens of the fresh insect upon the branches of this tree. This insect has been named Coccus pela by Mr. Westwood. When fully developed on the trees they seem as if covered with flakes of snow. The wax is an article of great value in Chinese commerce, and a small portion is exported.—*Fortune's Residence, p.* 146. *Cal. Cat. Ex.* 1802. *Cleghorn Punjab Report. Royle, Him. Bot. p.* 266. *O'Shaughnessy, p.* 434.

FRAXINUS FLORIBUNDA.

Large ash,	ENG.	Sumb,	HIND.
Sum,	HIND.	Sawnan,	,,

The large ash is found on the Thandiani and Mochpura ranges of the Himalaya, but not in Kaghan. It is a large tree, occasionally 12 or 13 feet in girth but is not abundant. The wood in toughness resembles English ash.—*Cleghorn, Punjab Report, pp.* 80, 177.

FRAXINUS XANTHYLLOIDES.

Sunggel,	HIND.	Anoch,	HIND.

The crab ash grows in the N. W. Himalaya and is found in the Sutlej valley between Rampur and Sungnam at an elevation of 7,000 feet. It makes good walking sticks, hefts, and handles: but is very small, and not large enough for other purposes, though occasionally jampan poles are made of it.—*Cleghorn, Punj. Report, p* 64.

FRAZERA CAROLINENSIS; and F. Walteri. See Cocculus palmatus, also Gentianaceæ.

FREGILUS GRACULUS. The Chough is found on high mountains and sea-cliffs of Europe, Asia, and Africa, is common in high Central Asia, the Himalaya, Afghanistan, &c.; as is also another chough, Pyrrhocorax alpinus of the Swiss Alps and Pyrences.

FRENCH. This language is spoken in India, by the employés in the French possessions of Pondicherry, Karikal and Mahe.

FRENCH BEANS. Contain much nutritive matter, and are most desirable for the supply of troops. In France they are sold at from 2½d. to 5d. per lb. according to colour, the white kinds bringing the highest price. They could be produced on the Neilgherries, if grown in large quantities, at about half the above mentioned price.—*Mr. McIvor.* See Phaseolus.

FRENCH MARYGOLD. Tagetes patula.

FRENCH POLISH. Consists of a resin or a gum-resin dissolved in spirit, and used for polishing flat surfaces. For this purpose it is made more fluid than the hard-wood lacker, used in polishing turned surfaces, in order that it may spread easily and dry less rapidly; because the friction being derived entirely from the motion of the hand, more time is required than in polishing turned works. Dissolve 1½ lb. of shell-lac in 1 gallon of spirits of wine without heat. Copal, sandarac, mastic, and gum arabic are added in various proportions, according to the fancy of the preparer. Some recommend 12 ounces of shell-lac, 6 ounces of gum arabic, and 3 ounces of copal, to 1 gallon of spirits of wine. A dark-coloured polish is prepared with 1 lb. of shell-lac, ½ lb. of benzoin, and 1 gallon of spirits; or 1½ lb. shell-lac, 4 ounces of guaiacum, and 1 gallon of spirits. Dragon's blood may also be used to give the required tint. The hardest and most durable polish is made with shell-lac and spirits without any other ingredients. It is usual to make the varnish thicker than is required for use, and to thin it down with spirit when being used. A tough polish is said to be produced from 1½ lb. of shell-lac, 4 oz. of seed-lac, 4 oz. of sandarac, and 2 oz. of mastic to the gallon of spirit; or 2 lbs. of shell-lac and 4 oz. of thus to the gallon. A light-coloured varnish may be made with bleached or white lac; but this darkens by exposure to light.—*Tomlinson.*

FRENCH SETTLEMENTS IN INDIA, are Pondicherry, Chandernagore, Carical, and Yanaon on the Orissa coast, at the bifurcation of the Godavery and Coringa.

FRERE, Sir Henry Bartle, K. C. B. A Bombay Civil Servant, Commissioner of Sind, Member of the Council of India, afterwards Governor of the Bombay Presidency. He belonged to a race of men well nigh unknown in modern days. To courtly bearing, and all that fascinates an eye, he added a facility of thought, clothed in simplest language that seldom failed to bring conviction: and he was gifted with firmness of decision and tenacity of will.—*Thurlow, p.* 46.

FREYA, the Scandinavian goddess of love, and Freyr the god of beauty. Freya is supposed to be the analogue of Oomiah the creative power of the hindu mythology. The grand festival to Freya was in spring, then boars were offered up to her by the Scandinavians, and boars of paste were made and eaten by the peasantry. At the present day, "Vasanti," or spring personified, is worshipped by the rajputs, who open the season with a grand hunt, led by the prince

and his vassal chiefs when they chase, slay and eat the boar. *Tod.* See Basant. Gouri.

FREYCINETIA BAUERIANA. The Norfolk island "Grass tree," belongs to the tribe of Pandaneæ or Screw pines. Its stem is marked by rings, like the cabbage tree, where the old leaves have fallen off, and it lies on the ground, or climbs like ivy round the trees. The branches are crowned with crests of broad sedge-like leaves, from the centre of which the flowers arise, the petals of which are a bright scarlet, and the sepals green, and, when they fall off, clusters appear of three or four oblong pulpy fruit, four inches in length, and as much in circumference.—*Keppel's Ind. Arch., Vol. II. p.* 284.

FRIDBOL BUTI. Hind. Per. Menispermum hirsutum.

FRIENDSHIP, part of the ceremony of a vow of friendship, amongst hindus, consists in dividing a bel or larger wood-apple, half of which is kept by each party, and, from this compact, is called bel bhandar.—*Elphinston's History of India, p.* 365.

FRIGATE BIRD. The Tachypetes aquila, is also called the Sea Hawk, also Man of War bird and the Boatswain. It has short feet, and cannot swim or dive. It is intermediate between the predaceous sea and land birds. It attacks the smallest birds and makes other fishing birds abandon their prey. It takes great flights and is of great endurance, rising to great heights in the air. It ranges through all tropical seas and hovers over the tropical waters. It has been seen 400 leagues from land, and yet is said to return to land every night. Its expanded pinions measure 14 feet from end to end.—*Bennett.*

FRIGATE ISLE, or ILE AUX FREGATES, the most easterly of the Seychelles, in lat. 4° 32′ S. long. 36° 1′ E.

FRINGED CHAMELEON. Chamæleo tiaris.

FRINGILLA. The sparrow genus of birds of the family Fringillidæ. Fringilla montifringilla, the mountain Finch of Europe, N. Asia, Japan, Asia Minor, Afghanistan, Kashmir, W. Himalaya, is a winter visitant in Britain, and the European Montifringilla nivalis has been obtained at Kandahar.

FRINGILLIDÆ, A family of Birds.

Sub-fam. Ploceinæ, 1 gen. 4 sp. viz., 4 Ploceus.

Sub-fam. Estreldinæ, 5 gen. 16 sp. viz., 11 Munia; 1 Erythrina; 2 Amadina; 2 Estrelda; 1 Scissirostrum.

Sub-fam. Fringillinæ, 14 gen. 20 sp. viz. 1 Montifringilla; 1 Fringilla; 1 Pyrrhospiza; 1 Procarduelis; 3 Carpodacus; 1 Hæmotospiza; 2 Pyrrhula; 1 Propyrrhula; 2 Loxia; 1 Chrysomtris; 1 Carduelis; 1 Ligurinus; 1 Serinus; 3 Coccothraustes.

Sub-fam. Emberizinæ, 2 gen. 10 sp. viz., 2 Emberiza; 8 Euspiza.

Sub-fam. Accentorinæ, 1 gen. 4 sp. viz., 4 Accentor.

Sub-fam. Alaudinæ, 4 gen. 1 sub-gen. 14 sp. viz., 3 Alauda, arvensis, gulgula, Malabarica; 2 Calandrella; 2 Galerida; 6 Mirafra; 1 Pyrrhulauda. See Birds.

FRITILLARIA IMPERIALIS. A bulbous rooted plant with very showy flowers, growing well in any light garden soil, the colours are various. They are increased by off-sets.

FROGS are very common in all the South and East of Asia. They belong to the reptile Sub-Class Batrachia and order Batrachia salienta. The Malabar bull-frog, Hylorana Malabarica, occurs in several parts of the peninsula of India. The Rana cutipora occurs in Ceylon, it was named by Mr. Blyth Rana robusta. The little tree frogs, Polypedates maculatus, *Gray*, shelter themselves beneath leaves, from the heat of the sun, and ten species of Polypedates occur in this region. Several species of toads occur, but in Ceylon, the more common are Bufo melanostictus, kelaartii and asper. As in Europe, so in India, these harmless creatures have ever been counted poisonous. Frogs are eaten in India by the humblest of the races, by many of the Burmese and they are eaten in China, by all classes. They are caught in China, by tying a worm or a young frog, just emerged from tad-pole life by the waist to a fish-line, and lobbing him up and down in the grass and grain rice fields where the old croakers are wont to harbour. As soon as one sees the young frog, he makes a plunge at him and swallows him whole, whereupon he is immediately conveyed to the frog-fisher's basket, losing his life, liberty, and lunch together, for the bait is rescued from his maw, and used again as long as life lasts. Frogs, says Fortune, are in great demand in all the Chinese towns, both in the north and south, wherever he had been, and they were very abundant in Nantsin. They abound in shallow lakes and rice fields, and many of them are very beautifully coloured, and look as if they had been painted by the hand of a first rate artist. The vendors of these animals skin them alive, in the streets in the most unmerciful and apparently cruel way. Frogs seemed much in

demand. They are brought to market in tubs and baskets, and the vendor employs himself in skinning them as he sits making sales. He is extremely expert at this part of his business. He takes up the frog in his left hand, and with a knife which he holds in his right chops off the fore part of its head. The skin is then drawn back over the body and down to the feet, which are chopped off and thrown away. The poor frog, still alive, but headless, skinless, and without feet, is then thrown into another tub, and the operation is repeated on the rest in the same way. Every now and then the artist lays down his knife, and takes up his scales to weigh these animals for his customers and make his sales. Everything in this civilised country whether it be gold or silver, geese or frogs, is sold by weight. Dr. Forsyth mentions having seen boiled frogs in a Burmese bazaar, exposed for sale, among other articles of food. The Pyxicephalus adspersus of Dr. Smith, the Matla-metlo of the Bechuana of South Africa, when cooked, looks like a chicken. The length of the head and body is $5\frac{1}{2}$ inches; and the hind legs are 6 inches long. During the dry months they conceal themselves in holes which they make at the foot of bushes.—*William's Middle Kingdom*, Vol. 2. p. 48. *A Res. among the Chin.* p. 343. *Fortune's Residence in China*, p. 45. *Tennent's Ceylon. Livingstone.* See Batrachia, Reptiles.

FROG-FISH, Cheironectes, species, the frog-fish of the British, in India, belongs to the family of Lophiadæ or anglers, and species are met with in many seas. In this group, the bones of the carpus form arms that support the pectoral fins, and enable these fishes to walk along the moist ground, almost like quadrupeds; Cheironectes immaculatus, *Ruppell*, has feet or claws rather than fins. Hartwig mentions a frog-fish of the Asiatic islands and the southern hemisphere, as remarkable for its hideous appearance and its capability of surviving for several days on land. Its pectoral fins are so placed that it can crawl about on land.—*Tennent's Sketches of the Nat. His. of Ceylon*, p. 330. See Fishes.

In few natural products is India more prolific than in its fruits. The pine-apple, mango, mangosteen, jambo, tamarind, orange, strawberries are amongst the best known, besides an infinite variety of smaller fruits partaken by the natives, either dried or in their curries. To the north, and in the hill-districts, peaches, grapes, figs, &c., are both abundant and of good quality. In the south and central parts of Hindustan the fruits and vegetables in general use amongst the people are the melon, gourd, cucumber, water-melon, plantain, guava, jujube, custard-apple, and fig. In some of the hill-districts the wild raspberry and a species of gooseberry are found in great abundance and of good quality. On the N. West of India, in parts of the Punjab, Himalaya, in Cashmir and in Afghanistan, the fruits liked by Europeans are more plentiful. In Cashmir the fruits which attain maturity are the apple, pear, quince, peach, apricot, plum, almond, pomegranate, mulberry, walnut, hazelnut, pistachio and melon. The cherry "gilas" is indigenous and is cultivated in orchards. The bullace "Prunus insitita" is found nowhere else in a wild state. The vine is extensively cultivated. In Kanawar, apples are abundant and nice looking, though not with much flavour. Peshawar sends dried red raisins which sell at lbs. 18 for a shilling, and dried raisins of a pale green colour which sell at lbs. 4 for a shilling and bloom raisins are also obtainable. Dried apricots are very abundant, also figs, dried, flattened and strung together, also the dried plum (alucha) of Peshawur. The small seedless raisin, the Kismis, is in every bazaar. In the upper Hills of the Punjab, the apricot, (Jaldaru or zardaru) is common, its kernel yielding oil. Apples and pears are also grown. There are two species of cherry, the Jamuna, or Cerasus cornuta, and the Cerasus padam; the former has black sweetish berries, which are eaten. The wild pear, called "mehal" or kainth (P. variolosa), is common also in the hills, it somewhat resembles the medlar, and the fruit is sweet when it is rotten. In Kangra and Kulu, there is a crab, or wild apple, called "ban mehal" (Pyrus baccata) also a quince (Cydonia vulgaris). The fruit of the "trimal," or Ficus macrophylla, is sold in the bazaar at Simla. There are on the upper Sutlej some species of Ribes (R. nubicola and R. glaciala), which are like currants, but have little flavour; also a species of gooseberry. There is a wild strawberry (Fragaria vesca); and a blackberry, called "unsri" (Rubus flavus), the fruit of which is preserved. In Kulu and Kangra the loquat (Eriobotrya Japonica),

and the pomegranate, "darim" (Punica granatum), both occur. The "mitha tendu," or fruit of the Diospyros tomentosa, must not be omitted. In the Sutlej valley, Myrica sapida, yields a fruit useful for making sherbets. Among nuts, we find the findak, or nuts of Corylus lacera, sold at Simla; and the seeds of the edible pine (P. gerardiana) are kept for food in Kanawar, where they sell at 2 annas a seer. Above Chini, this tree is the principal one in the forest. In the lower hills the fruit of the "amla" (Phyllanthus emblica), should perhaps be included: the well known plantain and mango do not occur; the latter is last seen, says Dr. Cleghorn, near Rampur, on the Sutlej, and the former below Kotgurh. Eleagnus conferta "gehai," and Carissa edulis, yield fruits that can be preserved, the latter making the well known karunda jelly. In Burmah the fruits are very numerous, but nearly all of them very indifferent, though, to a Burmese who, while a child, eats a raw sweet potato with as must zest as a European would an apple, they are no doubt considered unsurpassable. The ancient Celts eat acorns, the modern Californians still use acorn bread, and the Burmese and Karens eat fruits which are but little superior to an acorn: in general their fruits are much inferior to those of temperate climates. The better sort are as under:

Orange, citrus aurantium.
Sweet limes, citrus limetta.
Shaddock, citrus decumana.
Custard-apple, anona squamosa.
Sour-sop, anona muricata.
Bullock heart, anona reticulata.
Citron, citrus medica.
Small lime, citrus bergamia; c. acida.
Large lime, citrus bergamia.

Table Fruits.

Mangosteen, garcinia mangostana.
Dorian, Durio zibethinus.
Mango, mangifera indica.
„ „ sylvatica.
Lichi, nephelium lichi.
Pawpaw, carica papaya.
Guava, psidium pyriferum (white).
„ „ pomiferum (red).
Pine-apple, ananas sativus, bromelia ananas.
Plantain, musa paradisiaca.
Cocoanut, cocos nucifera.
Loquat, Eriobotrya japonica.
Pear, pyrus.
Jack, artocarpus integrifolia.
Breadnut, „ incisus.
Breadfruit, „ communis.
Mulberry, morus Indica.
Raspberry, rubus sp.
Whortle berry, thibaudia loranthifolia.
Strawberry, fragaria sp.
Roselle, hibiscus sabdariffa.
Water melon,
Double leaved citron, citrus torosa.
Pomegranate, punica granatum.

Rambutan, nephelium lappaceum.
Otaheite gooseberry, cicca disticha: phyllanthus.
Carambola, averrhoa carambola.
Bilimbi, „ bilimbi.
Brazil gooseberry, physalis peruviana.
Sapodilla plum, achras sapota.
Chocolate nut tree, Theobroma cacao.
Bengal currants, carissa carandas.
Granadilla; passiflora quadrangularis.
India grape, vitis indica.
Grape vine, vitis vinifera.
Cherry, cerasus.
Walnut, juglans regia
„ Pegu, juglans tricocca, ta soung-let-wah.
Water melon, citrullus cucurbita.
Musk melon, cucumis melo.
Rose apple, eugenia jambos, jambosa vulgaris.
Jambo fruit, eugenia.
Pierardia fruit, pierardia sapota.
Uvaria fruit, uvaria grandiflora.
Wood apple, feronia elephantum.
Three leaved triphasia, triphasia trifoliata.
Horse mango, mangifera fœtida.
Opposite leaved mango, cambessedea oppositifolia (mangifera.)
Oleaster plum, eleagnus conferta.
Malay apple, eugenia jambosa; e. mallaccensis.
Chesnut, castanea martabanica.
Fœtid sterculia, sterculia fœtida.
Budhs cocoanut, sterculia alata.
Ground-nut, arachis hypogœa.
Sandoricum, sandoricum indicum.
Willoughbeia martabanica.
Tamarind, Tamarindus indicus.
Figtree, Ficus lanceolata.
„ „ glomerata
„ „ macrophylla.
Hog plum, spondias mangifera.

The only trees to the cultivation of which the Chinese pay any attention, are the fruit bearing kinds; and in some places, in China, there are very fair orchards containing the mango, leechee, longan, wangpee, orange, citron, and pumelo. Two of the fruits cultivated in Chusan are of considerable excellence, the one is called yang-mai: it is a scarlet fruit, not unlike an arbutus or strawberry, but having a stone like a plum in the centre, the other is the Kum-quat, a small species of Citrus, about the size of an oval gooseberry, with a sweet rind and sharp acid pulp. This fruit is well known in a preserved state by those who have any intercourse with Canton, and a small quantity is annually sent to England as presents. Preserved in sugar, according to the Chinese method, it is excellent. Groves of the Kum-quat are common on all the hillsides of Chusan. The bush grows from three to six feet high, and when covered with its orange-coloured fruit, is a very pretty object. The shaddock, plantain, and persimmon, are common, and several varieties are enumerated of each; the plantain is eaten raw and cooked, and forms no inconsiderable item in the substance of the poor. The

pomegranate, carambola or tree gooseberry, mango, custard-apple, pine-apple, rose-apple, breadfruit, fig, guava, and olive, some of them as good as, and others inferior to what are found in other countries, increase the list. The whampe, lichi, lungan, or, "dragon's eyes," and loquat, (Eriobotrya) are four indigenous fruits at Canton. The first resembles a grape in size, and a gooseberry in taste; the lichi looks like a strawberry in size and shape; the tough, rough red skin incloses a sweet watery pulp of a whitish color surrounding a hard seed. Grapes are plentiful and tolerably good but the Chinese do not make wine. *Williams' Middle Kingdom*, Vol. II, p. 45. *Fortune's Wandering's*, p. 22; 63. *Cleghorn's Punjab Report; Dr. Mason's Tenasserim*; *Dr. McLlelland's Report.*

FRUMENTIUS. See Christianity.

FRUMENTUM. Lat. Corn.

FRUTA DE BUNO—? Capers.

FTITA. Ar. An unleavened paste of flour and water, baked in ashes of camel's dung, and mixed up with a little butter. *Robinson's Travels*, Vol. II. p. 171.

FU. Every Chinese province is divided into a certain number of districts, called "Fú," "Ting," "Chow," or "Hëen." A "Fu" is a large portion or department of a province under the general control of a civil officer, immediately subordinate to the head of the provincial government.—*Sirr, Chinese.*

FUCHEU, the capital of Fokien province, one of the most wealthy and populous cities in China.—*Yule, Cathay I. p.* 109.

FUCHSIA. A genus of beautiful plants, which can be cultivated during the rains and cold season, they grow freely from slips, which may be sent to a great distance if packed either in a tin case, or bamboo, surrounded with damp moss, the soil in which they strike best is a light sandy loam, the slips until they have thrown out strong shoots, and leaves must never be exposed to the sun, and even then only early in the morning.—*Riddell, Jaffrey.*

FUCUS. A genus of plants belonging to the order Fucaceæ, the Algaceæ of Lindley.

FUCUS NATANS is the Gulf weed, which travellers to and from India, meet with in the Atlantic. Agar-agar is the Malay name for a species of marine alga, the Fucus tenax of many of the Malayan islands, and forming a considerable article of export to China by junks. It is esculent when boiled to a jelly, and is also used by the Chinese as a vegetable glue. It abounds on the coral shoals in the vicinity of Singapore but the finest known in the Archipelago is found on the coast of Billiton. It is known to the Chinese by the name of Hy-Chy and is converted by them to various purposes, such as glue, paint, &c. The chief consumption of it is in the dressing and glazing of their cotton manufactures and the preparation of sacrifice paper and paintings for their temples. A small portion of the finest part is sometimes made into a firm jelly which on being cut up and preserved in syrup makes a delicious sweetmeat.

The Fucus esculentus, Kaddil-pash —Tam. the Ceylon moss, grows in great abundance at Jafnapatam and when boiled down makes an excellent jelly for invalids and forms an article of trade thence.—*Crawfurd Dic. page* 6. See Agar-Agar, Ceylon moss, Edible seaweed. Eucheuma spinosa, Gracillaria tenax. Sphærococcus.

FUCUS SPINOSUS. Linn. Syn. of Eucheuma spinosa.

FUDSI YAMA. A high volcanic mountain of Japan, at present inactive, but which tradition reports to have risen in one night, and, as it rose, there occurred a depression in the earth near Miako, which now forms the lake of Mit-su-no-umi. In A.D. 864, the mountain burst asunder from its base upwards, and at its last eruption in 1707, it covered Yedo with ashes. It is a sacred mountain. It is crested with snow, and presents the appearance of a truncated cone, and the gathering of a white cloud around its summit, is a sign of bad weather. It is occasionally ascended by Japanese pilgrims for the worship of the god of the winds.—See *Japan*, pp. 409—411.

FUEL. In the drier climates of the tropics, is a very scarce article, and the dried dung of animals is very largely used. In the Punjab, the plants in use for fuel are the Alsine, Artemisia sacrorum, Calligonum polygonoides, Caragana pygmæa, Crozophora tinctoria, Ephedra Gerardiana, Eurotia ceratoides, Hippophae rhamnoides, Juniperus communis, J. excelsa, Periploca aphylla, Rhazya stricta, Rosa Webbiana, Tanacetum tomentosum. Since the establishment of a Conservancy of Forests in India, firewood has greatly increased in price. See Firewood.

FUFIL. Ar. Areca catechu Linn., Roxb.

FUGA. One of the five Islands, near Cagayan. See Babuyan.

FUH. Arab. Madder.

FUHM-CHOBI. Arab? Charcoal.

FULADAT. A town near Bamian, yields gold and lapis lazuli.

FUKIEN. A province of China.

FULGO. A river in the Gyah district of

Bengal runs in the Patna district, near Moranchee.

FULICA ATRA. The common coot of Europe, Asia, N. Africa, where found additional to F. cristata: it is common in India. America and Javanese species distinct. See Rallidæ.

FULIGULINÆ. A sub-family of birds of the family Anatidæ or Gooses. It contains one species of the genus Branta, and four species of Fuligula, viz :—

Fuligula ferina. The Pochard, in the circuit of northern regions, Barbary, common in India.

Fuligula nyroca 'Ferruginous Duck.' Europe, Asia, N. Africa: common in India.

Fuligula marila. ('Scaup Duck.') Circuit of northern regions: Punjab, Sindh, Nepal.

Fuligula cristata. ('Tufted Duck.') Europe, Asia, Barbary: common in India.

Fuligula Rufina, of *Pallas,* is the crested Pochard.

FULLJAMES, Capt. He wrote an account of the island of Perim in the Bom. As. Trans. Vol. I. 18. Visit to the Rajpeepla hills, and account of the Cornelian mines in Bom. Geo. Trans. Vol. I. 8. A report on the floods of the Taptee at Surat in 1837.—Ibid, Vol. VII. 352 An account of borings and strata passing through the Gogo in the Bl. As. Trans. 1837; Bom. As. Trans. 1841, Vol. I. 25. An account of a singular hollow near Ahmedabad, called the Boke, supposed volcanic, in the Bom. Geo. Trans. Vol. VII. 164, and on the present and former state of the Runn of Cutch. Ibid, Vol. VIII.—*Dr. Buist's Catalogue.*

FULSA. HIND. TAM. Grewia Asiatica.

FULWA MAHR. OR PHULWARA. HIND. Bassia butyracea.

FUMARIEÆ. The Fumitory tribe of plants, of which there are about 70 species, 18 in India, 4 in Japan, and 1 in Persia. The Indian species, besides two that are common to other countries, consist of 16 of Carydalis; 1 of Dactylocapnos; and 1 of Macrocapnos. The plants of this order have watery juice, are common in the Himalaya from Nepal to Cashmere, and contain a bitter principle. *Voigt.*

FUMARIA OFFICINALIS.

Baqlat ul malek,	ARAB.	Pit-papra,	HIND.
Fumitory,	ENG.	Shatra,	PERS. DUK.

This is used by Indian physicians who consider it diuretic. Among European practitioners, it was long regarded as a valuable tonic and alterative.—*O'Shaughnessy* p. 184.

FUMARIA PARVIFLORA. *W. et A.*

Fumitory	ENG.		
Pit-papra,	HIND.	Shaturuj,	PERS.
Baklat-ul-malik,	ARAB.	Shatra,	,,

Has ovate sepals as broad as the corolla and about two-thirds shorter. It greatly resembles F. officinalis, but is smaller in all its parts. The flowers are of a pale-red colour. It is found in Kent, and is also very common in the East Indies, where it is used as a medicine. The leaves have a bitter taste, mahommedans employ it as a diuretic, and in maniacal cases. F. parviflora, is considered to be identical with the χαπνος of the Greeks; it is much used in the Upper Provinces of India mixed with black pepper, in the treatment of intermittent fevers.—*Eng. Cyc. O'Shaughnessy.*

FUMITORY.

Shahtra,	DUK. PERS.	Pit-papra,	GUZ. HIND.

See Fumaria.

FUNGUS.

Kana kuchu,	HIND.	Kulat, Chandawan	MALAY.

Under this name botanists comprehend not only the various races of mushrooms, toadstools, and similar productions, but a large number of microscopic plants forming the appearances called mouldiness, mildew, smut, rush brand, dry-rot, &c. They are cellular flowerless plants and are arranged into

1. Mushrooms.	4. Mildews.
2. Puffballs.	5. Truffles, morelles.
3. Smuts.	6. Moulds.

all are numerous in India, growing on or in damp vegetable mould. The common field mushrooms, are eaten. But several poisonous fungi so closely resemble the common mushroom, that the utmost caution is necessary in their use. No test whatever, whether botanical or chemical, can be relied on to distinguish the dangerous from the wholesome kinds. Special cultivation is the only sure mode of procuring the mushroom of invariably good quality. One fungus resembling a mushroom grows at the foot of the bamboo, and is regarded by the Burmese as a valuable specific in worms, Dr. Hooker says of the Fungi of the Himalaya that there is marked difference between those parts of Tibet investigated by Dr. Thomson, and the more southern regions. The fungi found by Dr. Thomson were but few in number, and for the most part of very ordinary forms, differing but little from the produce of a European wood. Some, how-

ever, grow to a very large size, as, for instance, Polyporus fomentarius, on poplars near Iskardo, exceeding in dimensions anything which this species exhibits in Europe. A very fine Æcidium (Æ. Thomsoni) also infests the fir tree Abies Smithiana, Hexenbesen of the German forests, but is a finer species and quite distinct. Polyporus oblectans Geaster limbatus, Geaster mammosus, Erysiphe taurica, a Boletus infested with Sepedonium mycophilum, Scleroderma verrucosum, an Æcidium, and a Uromyces, both on Mulgedium Tataricum, about half-a-dozen Agarics, one at an altitude of 16,000 feet above the Nubra river, a Lycoperdon, and Morchella semilibera, which is eaten in Kashmir, and exported when dry to the plains of India, make up the list of fungi. The region of Sikkim is perhaps the most productive in fleshy fungi of any in the world, both as regards numbers and species and Eastern Nepal and Khasia yield also an abundant harvest. The forms are for the most part European, though the species are scarcely ever quite identical. The dimensions of many are truly gigantic, and many species afford abundant food to the natives. Mixed with European forms a few more decidedly tropical occur, and amongst those of East Nepal is a Lentinus which has the curious property of staining every thing which touches it of a deep rhubarb yellow, and is not exceeded in magnificence by any tropical species. The Polypori are often identical with those of Java, Ceylon, and the Philippine Isles, and the curious Trichocoma paradoxum which was first found by Dr. Junghuhn in Java, and very recently by Dr. Harvey in Ceylon, occurs abundantly on the decayed trunks of laurels, as it does in South Carolina. The curious genus Mitremyces also is scattered here and there, though not under the American form, but that which occurs in Java. Though Hymenomycetes are so abundant, the Discomycetes and Ascomycetes are comparatively rare, and very few species indeed of Sphæria were gathered. One curious matter is, that amongst the very extensive collections which have been made there is scarcely a single new genus. The species moreover in Sikkim are quite different, except in the case of some more or less cosmopolite species from those of Eastern Nepal and Khasia: scarcely a single Lactarius or Cortinarius for instance occurs in Sikkim, though there are several in Khasia. The genus Boletus through the whole district assumes the most magnificent forms, which are generally very different from anything in Europe. A fungus has done enormous damage in the Ceylon coffee plantations: when a coffee tree is attacked by the bug, it is deprived of its sap and its nourishment, whilst the fungus which never fails to attend on the bug prevents restoration by closing the stomates through which the tree breathes and respires. Bug exists on the estates to an incalculable extent,—none are believed by Mr. Nietner to be quite free from it. Whole estates are seen black with bugs, *i e.* with the fungus: and, he asks, "am I wrong in saying that if there was no bug in Ceylon, it would at a rough guess produce 50,000 cwts. of coffee more than it actually does." The value of this quantity on the spot being about £125,000, this sum represents the aggregate of the annual loss by bug sustained by the Ceylon planters. *O'Shaughnessy, page* 673. *Hooker's Himalayan Journal.* Vol. II, *pages* 381-382. *I. Nietner observations on the enemies of the coffee trees of Ceylon* 1861.

FUNDY. Bay of. See Bore.

FUNIAT. Hind. Quercus annulata.

FUNIS FELLEUS. See Cocculus cordifolius.

FUNIS UNCATUS. See Gambier.

FUNNUS. Mar. Artocarpus integrifolia.

FURAS. Hind. Tamarix orientalis.

FURFIUN, also Akal-nafzah, also Gholak kala. Arab. Euphorbium.

FURNITURE. The natives of India have been long celebrated for the great patience and fidelity with which they imitate the most elaborate details either of art or manufacture, but they are generally deficient in design, and much may still be done to infuse artistic taste and boldness of execution when better principles of art are brought to bear upon this branch of industry. The woods used for furniture in Madras are.

Common Furniture.	Carved and Ornamental Furniture.
1 Chitagong wood.	1 Ebony.
2 Teak wood.	2 Blackwood, *or* E. I. Rosewood.
3 Toon.	3 Satin wood.
4 Jack.	4 Kiaboca wood.

1. *The Chittagong wood* (*Chickrassia tabularis*) is more used at Madras in the making of furniture than any other wood. It is light, cheap and durable.

2. *The Teak* (*Tectona grandis*) is probably the most durable of all timbers, it is very hard, and very heavy. It is extensively used for bullock trunks and for house and

camp furniture, for which it is well adapted, as it does not split.

3. *The Toon (Cedrela toona)* resembles its congeners, chittagong wood and mahogany, and is very much used for furniture all over the Peninsula.

4. *The Jackwood (Artocarpus integrifolia)* is an excellent timber, at first yellow, but afterwards brown, when made into tables and well kept it attains a polish, little inferior to mahogany. In England it is used, as well as satin wood, for making backs of hair brushes, &c.

1. *Black Ebony (Diospyros melanoxylon).* This well known and much admired wood, lignum nigrum, non variegatum? is very hard, heavy, and susceptible of a high polish. It is seldom obtained of great size.

2. *East Indian Blackwood or Rosewood,* is an excellent heavy wood, suited for the best furniture. It can be procured in large quantities, and of considerable size, the wood contains much oil. In large panels it is liable to split.

3. *Satin wood (Swietenia chloroxylon)* is hard in its character and when polished it is very beautiful and has a satiny lustre, it is much used for picture frames, rivalling the birds eye maple of America. It is occasionally used by cabinet makers for general furniture, but it is liable to split.

4. *Sandal wood (Santalum album)* is found in abundance in Mysore and Canara; it is chiefly remarkable for its agreeable fragrance, which is a preservative against insects. It is much used in making work boxes, walking sticks, penholders, and other small articles of fine ornament but cannot be procured of a large size.

5. *Kiaboca wood (Pterospermum indicum.)* Is imported from Singapore. It is beautifully mottled, of different tints, evidently produced by excrescences from the tree. The wood is chiefly used for inlaying or for making desks, snuff boxes, puzzles, &c. *Dr. Cleghorn M. D., in M. E. J. R. of* 1855. See Blackwood Furniture.

FURASH. HIND. PERS. A class of menial servants employed for inferior offices, as pitching tents, sweeping out houses, &c., and they are always in attendance to execute their master's pleasure. When a native prince wishes to punish a servant, it is generally performed by a Furash;—properly Farash, from Farash, PERS. a carpet.—*Fraser's Journey into Khorasan*, p. 60.

FURRAH-RUD. A river which, like the Murghab and the Tajend, flows from the western side of the mountainous and hilly country to the north of Herat and Kabul. From the eastern side flow the Helmund, the S. E. feeders of the Oxus and the N. Western feeders of the Kabul river.

FURROHUR DIN JASAN. Furohur amongst the Parsee people, means "soul or spirit," and this day is one set apart by the people of this religion for the performance of the ceremonies of the dead.—*The Parsees.*

FURRUCKABAD. Before the cession of Rohilcund to the British Government, the Furruckabad territory was almost entirely surrounded by the dominions of the vizier of Oudh. A tribute of Rupees 450,000 was paid by the Nawab Raees of Furruckabad to the Vizier. This tribute was ceded to the British Government by the Treaty with the vizier of 10th November 1801. The last Nawab Raees of Furruckabad, Tufuzzool Hossein, rebelled in 1857. He surrendered on 7th January 1859 under the proclamation of amnesty. He was convicted and sentenced to death and all his property was adjudged to be confiscated. But it came out on the trial, that he had surrendered on promise of life, and he was banished British territories for ever. He was carried to Aden and sent across the frontier in the direction of Mecca, and warned that if ever he set foot on British Territory, the sentence of death which had been passed upon him will be carried out.—*Aitcheson's Treatises*, pp. 36 37, Vol. I.

FURRUD. HIND. Erythrina Indica.—*Lam.*

FURS are the skins of different animals with the inner side being converted by a peculiar curing process, into a sort of leather, and the outer fine hair left. Previously to their undergoing this process, Furs are termed *Peltry.* The fur of the flying squirrel (Pteromys petaurista) is of such a very fine description, that it would excite much interest in Europe. The beautiful furs, from Lassa and Digurchee, in Thibet, are mostly obtainable in Khatmandoo. These two large cities are great fur depots; they are only forty marches from Khatmandoo.

A very large portion of the Russian fur trade is derived from this part of Thibet, and certainly by far the most valuable furs are obtained there. Some of the most beautiful dresses made of furs are brought by the native merchants from these cities; and a fur cloak with thick silk lining was purchased from one of them for one hundred and fifty Moree rupees, in English money little more than ten pounds. About the beginning of the 19th century, the fur trade with China amounted to upwards of a million of dollars annually; but later no skins or furs were brought to

Canton; the peltry of the American forests command better prices in the European markets. The amount carried into China over the northern frontier is however still considerable, though no account of the number can be obtained. Lambskins of various sorts are much used in the northern parts of the country. The importation of cow and ox-hides is from the Archipelago, but nothing definite is known as to its amount. Hon'ble Mr. *Morrison's Compendious Summary*, *Sir R. Montgomery's Report on the Trade of the Punjab.*

FURSAKH or PARASANG, Persian, is a measure of $3\frac{1}{2}$ English miles. Pottinger says $3\frac{7}{8}$ of a mile. *Pottingers' Travels, Beluchistan & Sind* p. 419.

FU-SANG, M. de Guignes, in his Recherches sur les navigations des Chinois, du Cote de l' Amerique, states that under this name, America is accurately described in a Chinese work of the 5th century as a land in the far East. According to M. Paravey, however, the Fu sang, described in the Chinese Annals, is Mexico, which, he says, was known as early as the 5th century of our era. Carved figures representing Buddha of Java, seated on a Siva's head, were found at Uxmal in Yucatan.

FUSLIUN. Greek. Plantago ispaghula, Spogel seed.

FUTTEH ALI, a king of Persia. See Fatteh-Ali

FUTTEHPORE SIKRI was the field of battle between Baber and rana Singha, chief of Chittore when Baber was defeated. In 1527, however, rana Singha was overthrown in a second engagement *Tr. Hind*, ii p. 1.

FYZABAD, the capital of Badakhshan, abandoned in Wood's time, but reoccupied by Mir Shah. *Yule's Cathay.* I *page* 235.

FYZABAD a town in Oudh. A copper plate of date S. 1243 A. D. 1187 was found here, in which mention is made of the Vaishnava religion and of Lakshmi and of the Rhator princes of Canouj. See Inscriptions.

G. This letter is used in most of the languages of Southern Asia, but with the hard sound as before a,e,i,o.u, in gardener, get, gild, golph, gun. There is not apparently any Eastern tongue, in which it has the soft sound of the languages of Europe, before e and i, as in general, geometry, gin, giorno, Gerusalemme. In writing Eastern words, therefore, this letter, where it occurs, presents similar difficulties to the letter C, which Europeans make interchangeable with K. as in Cashmir, Kashmir, Cabul, Kabul, "Gehoon" *Hind*, wheat, which has the hard sound, might, by a native of Europe be pronounced, erroneously, Jehun, and "Gentoo" a word derived from the Portuguese, and pronounced Jentoo, might be, erroneously, pronounced hard. The Arabic "Jab'l," a mountain, is pronounced "Gabal" by the Northern Arabs. "Ginti." *Hind*, a muster, "Gird" *Hind Pers*, a round or circle, are alike hard. The English letters "gh" are generally to be pronounced separately in Eastern tongues, as if written "g'h,' but in the Arabic and taken from it into Persian and Hindustani there is a separate letter which has a combined softened guttural sound of "*gh*" as Ghulam, a slave.

GAARLA PHALLA. Malbal. Anamirta cocculus. *W. and A*

GAARTO. A town near the source of the Indus. See Yak.

GAB. Fruits of Diospyros embryopteris, the size of a small orange; deep green, with a rusty dust; strongly astringent and mucilaginous.—*Irvine, Med. Top.*

GAB, also Gad, also Gondori. Hind. Cordia serrata.

GABA. Tel. Desmodium collinum, *Wall.*—*W.Ic.*272.—Desm. latifolium, *W. and A.* 696.—Hedysarum coll. *R.* iii. 349.

GABA-GABA, Malay, the midrib of palm-leaves, of the leaf of the sago palm, much used throughout the Moluccas for buildings and fencing. *Atap* is thatch made of the fringe of palm leaves, doubled down and sewed on sticks or lathes of bamboo.—*Journ. of the Ind. Arch. Vol.* VI. *No.* 6.

GABAR. H. properly "Ghab'r" Pers. A person not a mahomedan, in general, but commonly a Zoroastrian, a Parsi or fire worshipper. See Gab'r.

GABASAN. Beng, a tanner.

GABBU NELLI. Tel. Premna longifolia, *R.* iii. 79 also given to other species of *Premna.*

GABBA. Hind, carpets.

GABBI-LAL. Tel. a Bat.

GABDI. Mar. A fisherman.

GABET. M. M. Huc and Gabet by a route, hitherto, so far as we know, quite unexplored by any European, passed among the mountains north of Bootan and Ava, and so made their way due east to the plains of "the Central Flowery Land." M. Huc wrote an accouut of his travels.—*Prinsep's Tibet, Tartary and Mongolia, pp.* 32, 33.

GAB-NUL. Beng. Bengal reed, Amphidonax Bengalensis.

GABOORA. A river near Dinagepore.

GABRIEL or jibrael, according to mahomedan belief, the angel who has charge of all created things.

GAB'R. Pers. A fire worshipper: any non-believer in mahomedanism. According to the manuscript dictionary, Burhan-i-Kattea, Gab'r is used in the sense of Mâgh, which signifies a "Fire-worshipper." Gab'r mani-i-Mágh báshăd, keh átash púrúst âst. This is sometimes written, and very often pronounced Gavr, by a change of letters frequent in Persian, as in other languages. "Gavr," we learn from the dictionary Jehangiri, means "those fire-worshippers who observe the religion of Zardusht, (or Zoroaster), and they are also called 'Mugh.' But Origen, in the third century, defending Christianity against Celsus, an Epicurean, who had alluded to the mysteries of Mithra, uses Kaber as equivalent to Persians. "Let Celsus know," says he "that our prophets have not borrowed any thing from the Persians or Kabirs." (*Orig. contr. Cels. Lib.* VI. *p.* 291. *Cantab.* 1658.) A Jewish writer, quoted by Hyde, (Hist. Relig. Vet. Pers. Cap XXIX.) declares that the Persians call their priests (in the plural) Chaberin, (or Khaberin) whilst the singular Chaber or Khaber (occurring in the Talmud), is explained by Hebrew commentators, as signifying Parsai, or Persians. On this subject Hadrian Reland has offered some remarks, in Dissert. IX, de Persicis Talmudicis. (See his "Dissert. Miscell. Part II. p. 297. Traj ad Rhen. 1706). Dr. Hyde, however, as above cited, thinks that Chaber or Chaver, denoted both a priest and a layman. Ouseley's Travels, *Vol. I. p.* 150.

GACCHA. Sans. Andropogon iwarancusa.

GACHCHA CHETTU. Tel. Guilandina bonduc, *L.* The hindus, from the hostile and unapproachable character of this plant, compare it to a miser in the following *padyam*;

ఇచ్చువానివద్ద నీనివాడుండిన,
చచ్చుగాని నీవి సాగనీదు,
కల్పతరువువద్ద గచ్చపొదయున్నట్లు,
విశ్వదాభిరామ వినరవేమ॥

If a miser dwell near a liberal man, he will die rather than remain a witness of his generosity like the *Gachchá* under the *Kalpa vriksha* (or celestial tree of desire). Vemana. i. 7. *Fl. Andh.*

GACH. Hind. Mortar, plaster, fine plaster; plaster of Paris.

GACHCHA or GOT. Amongst the Jains of Southern India, there are castes or classes, called by these two terms. See Jain.

GACH MIRICH. Beng. Capsicum annuum. Linn; also C. Nepalensis

GACHNI-MITTI. Hind. A soft, saponine, drab colored, clay, or earth.

GACINCULUS, a genus of birds of the Sub-family Geciniuæ and family Picidæ, in which are six sub-families as under:

Fam. Picidæ.

Sub fam. Campephilenæ, 6 gen. 16 sp. 1 Campephilus, viz., 2 Hemicercus, 4 Hemilophus, 3 Chrysocolaptes, 2 Brachypterus, Tiga.

Sub-fam. Geciniuæ, 4 gen. 19 sp. viz., 12 Gecinus, 1 Gacinculus, 3 Meiglyptes, 3 Micropternus.

Sub-fam. Picinæ, 2 gen. 15 sp. viz., 1 Dryocophus, 14 Picus.

Sub-fam. Picumninæ, 2 gen. 3 sp. viz., 1 Picumnus, 2 Sasia.

Sub-fam. Yuncinæ, 1 gen. 1 sp. viz., 1 Yuux torquilla.

Sub-fam. Indicatorinæ, 1 gen. 1 sp. viz., 1 Indicator xanthonotus. See Birds, page 470.

GAD, the Babylonian god of destiny.

GADA. Hind. A club. See Gadha,

GADAMU. Tel. A Bear.

GADANG. Jav. Musa paradisaica, the Plantain.

GADANG CASTILA. Bali. Carica papaya, *Linn.*

GADA PURNA. Beng. Boerhaavia procumbens.

GADARIA, also Guduria. Beng. A shepherd from Gadar or Gadur a sheep, the Gadaria shepherds of the N. W. Provinces have several divisions who do not eat together nor intermarry. The younger brother marries the widow of the elder brother, elder brothers do not marry the widow of a younger brother.—*Wilson.* See Gaddi.

GADDA. Tel. Any edible root.

GADDA. Tel. An egg; the testis.

GADDA-GHAL is a punishment unknown in any but the hindu code; the hieroglyphic import appears on pillars, and must be seen to be understood.

GADDA GORU. Tel. Scutia indica.

GADDAH. Hin. The terminal head of the date palm, eaten as a vegetable.

GADDA KANDA. Tel. Colocasia esculenta, Schott Calla calyptrata, R. iii 514.

GADDA NELLI. Tel. also Budumaru, Celtis (Sponia) orientalis, L.

GADDA PISINIKE. Tel. or Dhataki kusumamu, Grislea tomentosa, R.

GADDA PUTIKE. Tel. or Bandimurugudu. Getonia floribunda, R.

GADDI. A hill shepherd, about Kangra and elsewhere. See Gadaria.

GADDI JANUMU. Tel. Sorghum cernuum, *Willd* Andropogon cer. R. I. 270. A. laxus R. I. 271. Roxb's two sp. appear to refer to the same plant.

GADDI SIUNGAR. Hind. Chenopodium.

GADERWA. Hind. Erythrina arborescens.

GADES had a temple of Melkarth, where his symbol was an ever-burning fire. See Baal.

GADFLY Eng. Œstrum. Lat.

GADD'HA. Hind. An ass.

GADHA. Hind. A club, a mace, occasionally pourtrayed in the hands of Siva and Vishnu. See Siva, Vishnu.

GADHAPURNA. Beng. Bœrhaavia diandria.

GADHI. A hindu sovereign's throne, a pillow. "The cushion," by which a Rajpoot throne is designated.—*Tod's Rajasthan, Vol. I. p* 391. See Gadi.

GADHINA. Beng. Allium ascalonicum. —*Roxb.*

GADI. Hind. (1) A cushion, a porter's knot, a pad; (2) tobacco twisted up into a rope for sale; (3) a seat of honor; the cushion of the throne. Succession to a kingly dignity [illegible] office of chief mahant of a temple, [illegible] succeeding to the gadi, and the occupant is said to be "gadi nishin." Wilson describes it as the spiritual throne of the founder of a hindu sect: the pillow at the original site of the sect; the pillow or seat of the primitive teacher, the spiritual throne. A gadi, is literally, a cushion, and is placed on a rich carpet on the ground and forms the hindu throne. To be raised to or seated on the Gadi, is equivalent to being raised to the throne. See Gadi.

GADI BUNI. Beng. syn. of Trianthema decandra.—*Linn.*

GADI CHIKKUDU KAYA. Tel. Rhynchosia medicaginea, *D. C.—W. & A.* 733.—Dolichos med. R. iii. 315.

GADIDÆ. See Clupeidæ. Fishes.

GADIDE GADAPARA, Aristolochia bracteata, Retz.—R. iii. 490.

GADIDE-GADDA. Tel. Aristolochia bracteata, Retz. *Roxb.*

GADKUJI. Hind. Pyrus variolosa.

GADIMI DONDA PENDALAM. Tel. also Niluva pendalum, Disocorea alata, L.

GADAPATI. The chief of a body of religious mendicants.

GADI SUGANDHI. Tel. or Sugandhipala, Hemidesmus indicus, R. Br.

GADING. Malay, Elephant's tusk, ivory

GADJANTERGARH. A fortress in the southern Mahratta country in L. 15° 44′ N. L. 75° 56′ E The plain at the foot of the fort is 1,996 feet above the sea. *Schl, Herm.*

GADUS. Lat. Cod. See Fishes.

GAD VASSAL. Hind. Allium rubellum.

GAEKWAR. The Gaekwar family, sprang in 1720, from Dammaji Gaekwar Shamsher Bahadur an officer under Khandi Rao Holkar, and they ruled till the treaty with the British Government in 1802. In 1808, Col. Alexander Walker, then Resident at the Gaekwar's court, was able to arrange for payment to the Gaekwar, from ten Rajpoot chiefs, of a certain fixed sum as suzerainty When the Peishwa was overthrown in 1817, the British succeeded that power in the chief control. An annual tribute in the proportion of $\frac{2}{3}$rds to the British Government and $\frac{1}{3}$rd to the Gaekwar. The tributaries are called Talukdars of whom there are 224 and each of whom possesses exclusive jurisdiction in his own district, and only the Grassia and Mul Grassia are allowed to litigate with their ruling chiefs. These are sprung either from cadets of the ruling tribe or from proprietors of lands which they seized and now defend with all the proverbial tenacity of the Rajput, who freely gives and takes life for acres.

The territories of the Gaekwar have an area of 4,399 square miles, with a population of 1,710,404 and an annual revenue of £600,000. acres. *Thomas Prinsep's Antiquities, p.* 286 *and* 287. See India, Kattyawar. Mahratta Governments in India.

GÆRTNERA GARDNERI. Thw. A tree of the Central Province of Ceylon, growing at an elevation of 5,000 to 7,000 feet.—*Thw. Enum. pl. Zeyl. p.* 202.

GÆRTNERA RACEMOSA. Roxb.

Maltilata,	Hind.	Vedala chettu,	Tel.
Madholata,	Sans.		

This is a fine and fragrant flowered creeper, and very hardy. A fine specimen runs over some trees in the Dowlat bagh at Ajmeer.—*Genl. Med. top. p.* 192. Wight in Icones, gives also G. Konigii.

GAETRI. A brief invocation used by hindus, as a prayer. That usually alluded to, under this term, is the "Gaetri-muntram and is considered to be the most sacred verse in the Vedas. In the nature worship of the Vedas, the sun was worshipped under the designation Savitri. This prayer is supposed to be known to brahmans only. They are taught it when they receive the sacred string; and they are enjoined never to communicate it to any other sect. Its Sanscrit words are O'm! Bhurbhuvă ssuvăhā. O'm! Tatsa Vit'hru varennyăm. B'hargo devăssyă dhimahi dhiyo yonaha pratcho dăyăth. O'm! Earth, air, heaven. O'm! let us meditate on the supreme splendour of the divine sun. May he illuminate, our minds. See Gayatri, Hindu, Surya.

GAFFAT near Debra Tabor in Amhara, where the European workmen of the emperor resided,—*James.* See Semitic races.

GAGAH, Jav. A rice field "gagah," "sawah," "tipar," are rice fields differing in the mode of cultivation adopted in them.

GAYGARKAND. Hind. Astragalus multiceps.

GAGAT, also Gagata.. Ger. also Lustrino, It. also Gagus. Lat. Jet.

GAGGERA CHETTU. Tel. The Sans. syns are Kathinjara, and Kutheraka, which signify Ocimum sanctum.

GAGGAR YURMI. Hind. Rhododendron campanalatum.

GAGH-GHO. A long shirt worn by Baluch women.

GAGLI. Hind. (1) Dolichos uniflorus, (2) Arum colocasia.

GAGRA. Hind. A subdivision of the Bhangi or sweeper caste.—*Wilson.*

GAGRA. Hind. Solanum gracilipes.

GAGY. In about lat. 0°, 25′ S. in the Gillolo passage, is an island of considerable extent and moderately elevated.—*Horsburgh.*

GAHAI. Hind. Berries of Eleagnus conferta; the Kankol of Hazara and elsewhere.

GAHALAYA. An outcast predatory race, near Matelle in Ceylon who acted as executioners in the times of the Kandyan kings.

The people of the low lands on the coast of Ceylon are of a Tamulian or Dravidian stock. Those of Kandy, with their habits of polyandry would seem to be allied to the people of Coorg The Gahalaya, Rhodia and Veddah are wild, out-cast races dwelling in the forests and unfrequented parts.—*Tennent.*

GAHARBA. A resin used in Benares in making lacquer ware.

GAHARU. Malay also Alua-tan, also Alivah, Aloes.

GAHARWAR. One of the 36 royal races of Rajputs settled at Kanoj. *Wilson.*

GAHLOT. A Rajput tribe in the N. W of India. The Sisodya are a branch of the

Gahlot, and the rajah of Udyapur is a Sisodya.—*Wilson.* See Gehlot.

GAHRU, Malay. Aloe Indica. *Royle.*

GAHRU, Malay, Japan, also Kaya gahru Agallocha wood. Eagle wood.

GAI. Hind. A cow. Gai Goru. Hind. Horned cattle.

GAIRUN. Duk. Bezoar; Calculus cysticus.

GAJ. An affluent of the Beas river.

GAJA CHINNO. Tel. Celastrus montana, Roxb.—*W. and A. W. Ic.*

GAHUN. Hind. Wheat, Triticum æstivum.

GAILLARDIA PICTA. Flowering plants chiefly from North America, may be grown in any garden soil and may be increased by dividing the roots, common everywhere; the scent of some of the species is unpleasant.—*Riddell.*

GAINA. A dwarf variety of the Bos Indicus, or Indian bullock.

GAINGOOL. Hind.

Panam calang, Tam. Tati kalangoo, Tel.

Is the young plant or shoot of the brab palm tree Borassus flabelliformis. It is boiled and eaten by common people. To obtain it they dig a hole, about three feet deep, in which they put the stone of the fruit and cover it up with earth: about a year afterwards it is dug out and the plant or shoot then produced is called Gaingool.

GAITRI. See Gaetri, Hindoo, Surya, Zonar.

GAJA, Malay. Sansc. Elephant.

GAJA CHINNI. Tel. Celastrus montana, *R.*

GAITA. A wild tribe in the Rajahmundri district.—*Wilson.*

GAJANGI. Tel. Pandanus odoratissimus, *L. fil.*

GAJA NIMMA. Tel. Citrus bergamia, *var.* The *Taba-nibu* of Bengal.

GAJANUMU. A name of the hindu deity Ganesa, it means elephant face. See Ganesa.

GAJA-PATI. A sovereign race that ruled in Orissa, but little is known of them. The name means "lord of the elephant." In the Northern Circars, Chicacole and Rajahmundry were the capitals of the Andhra sovereigns, a race anterior to the christian era.

A more exact knowledge of these and of the early buddhist princes of Vegi or Vengi Desam, who reigned at Dara Nagara on the Kistna, near Amaravati and at Vengipuram the exact site of which is not yet known, is an important desideratum, only likely to be obtained from an investigation of their monumental and architectural remains.

The Kalinga Chalukya power ruled at Rajahmundry, and throughout the Northern Circars. Extant sasanams and sculptured remains exhibit several alternations of superiority between them and the Gajapati of Orissa.

The Ganapati or Kakateya dynasty ruled at Warangul. Though near the frontier, and now in the Nizam's territory, it was once the capital of great part of the N. Circars.

Of the Reddies of Condavir little is known.

The succession of the buddhist race by the Chalukya of Rajahmundry, the subsequent sway of the Ganapati, Verna Reddi and Rayel of Bijanagar, together with their contests and the various relations between them, are little known and may be amply elucidated by existing remains.

GAJA PIPPALI, Sansc. Scindapsus officinalis,—*Schott.*

GAJA PUSHPAMU. Sansc. Mesua *Sp.*

GAJBEL. Hind. The elephant creeper, Bauhinia racemosa.

GAJAR. Hind. (1) Daucus carota, (2) pahari gajar, Hind. Eryngium planum.

GAJER. See Kelat, page 489.

GALI. Tel. Grislea tomentosa, *R.*

GAJJARA. See Inscriptions, page 388.

GAJJARA GADDALU. Tel. Daucus carota, *L.*—Carrot.

GAJLHALLI, or Gazzelhalli, in L. 11° 33′ N, L. 77° 1′ E, in the Nilgiris, on the left bank of the Moyar, N. E. of Utakamand is 5948 ft. above the sea.—*Scott.*

GAJNA or GAYNI. An ancient name of Cambay.

GAJPIPALI. Hind. Plantago amplexicaulis.

GAJUBA. Leaves and triangular stalks of a small succulent plant, brought from Bombay, heating, and used as a purge.—*Gen. Med. Top. p.* 135.

GAJU-BAM. Hind. Anisomeles Malabarica.

GAJU CHETTU. Tel. Solanum rubrum, *Mill.*

GAJU GUM. Gum of the Cashew tree.

GAJ'M. Tam. A cloth measure. See Gaz; Guz.

GAJUR, Hind. Daucus carota. Carrot.

GAL. Hind. Goitre.

GAL. Hind. Pers. Pennisetum Italicum. Panicum Italicum.

GALAGA. Tel. Tephrosia racemosa.

GALA-GALA. Malay, pitch.

GALAGARA. Tel. Eclipta prostrata.—*Roxb.*

GALAM-BUTTER. A reddish white solid oil obtained from Bassia butyracea.—*Simmond's Dict.*

GALANGA. Dut. Eng. Fr. Lat. Galangal.

GALANGA ALBA. See Galangal.

GALANGA KÆMPFERI. Syn. of Kæmpferia galanga.

Kholangan,	,,	Langkwas	Malay.
Laun-don,	Chin.	Langkwe,	,,
Galanga,	Dut. Eng Fr. Lat.	Kalgan,	Rus.
		Kolanjana,	Sans.
Galgant,	Ger		

A brown tuberose root, with a faint aromatic smell, and pungent taste, like a mixture of pepper and ginger. It is supposed to have been introduced by the Arabs, but it was previously mentioned by Ætius. The plant which yielded this root was long unknown, and it has been supposed to be that of a pepper, of an Iris, of Acorus calamus, or to be the Acorus of the ancients. Kæmpferia galanga was so called from its aromatic roots being supposed to be the true Galangal. The tubers of Cyperus longus were sometimes substituted, and called English Galangal. Two kinds, the large and the small galangal, are described; these are usually considered to be derived from the same plant at different stages of its growth, but Dr. Ainslie, in his 'Materia Indica,' insists upon the greater value of the lesser, as this is warmer and more fragrant, and therefore highly prized in India. The plant producing it is a native of China, and the Reverend Mr. Williams says that the root is sent from China to India; and that there are two sorts the greater and the smaller, obtained from different plants, the best of which is the smaller, procured from the Maranta galanga. This is of a reddish color, about two inches long, of a firm texture though light, and possessing an acrid, peppery taste, and a slight aromatic smell. The larger is from a different plant (Kæmpferia galanga), and inferior in every respect. Both are used as spicery, and to some degree in Europe as well as India. The greater Galangal has long been known to be the produce of a Scitamineous plant, the Galanga major of Rumphius ('Herb. Amb.' 5, t. 63), which is the Alpinia galanga of Willdenow, a native of China and the Malayan Archipelago. Several species of this genus have roots with somewhat similar properties. Thus Alpinia alba and A. Chinensis are much used by the Malays and Chinese; the former has hence been called Galanga alba of Kœnig; and the latter has an aromatic root with an acrid burning flavour. The fragrant root of Alpinia nutans is sometimes brought to England, according to Dr. Roxburgh, for Galanga major. Its leaves, when bruised, have a strong smell of cardamoms, and the cardamomum plant is frequently placed in this genus, but has been rearranged under Elettaria. According to Dr. Honigberger (p. 278) the natives of Lahore are of opinion that the root of Piper betel (pan-ki-jar) is what the Persians call Koolian, which is the Indian Galanga. Galanga root is a good deal used in China, and forms an article of commerce, fetching in the London market from 12s. to 16s. per cwt. in bond. Its taste is peppery and aromatic. Externally the color of the root-stocks is reddish brown, internally pale reddish white 1,286 cwt. of Galangal root, valued at 2,880 dollars, was exported from Canton in 1850.—*Williams' Middle Kingdom*, Vol. II. page 400. *Royle, Roxb., Eng. Cyc.* p. 912. *Simmond's Comml. Products*, p. 412.

GALANGA MAJOR. Rumph. syn. of Alpinia galanga. See Galangal.

GALANGA MALACCENSIS. Rumph. syn. of Alpinia malaccensis.—*Roscoe.*

GALANGAN. Jav. An irrigation trench.

GALAPAGOS ISLANDS, almost every indigenous living thing is peculiar to them. Admiral Fitzroy mentions that while one side of them is covered with verdure, the other aspects are barren and parched.—*Wallace, p.* 10.

GALAR-TORI. Hind. Trichosanthes anguina.

GALATIANS, from the Greek, Gala, Milk. Goala, herdsman in Sanscrit. Γαλατικοι, Galatians, or Gauls, and κελτι Celts allowed to be the same, would be the shepherd races, the pastoral invaders of Europe. See Gaola.

GALBANUM. Eng. Fr Lat.

Barzud,	Ar.	Kinnch.ka-Gond,	Hind.
Mutterharz,	Ger.	Galbano,	It.
χαλβανη	Gr.	Pirzud,	Pers.
Chelbeneh,	Heb.	Birzud,	,,
Birija,	Hind.		

The plant producing this gum resin is still undetermined. It has been supposed to be obtained from the Ferula ferulago, also from the Galbanum officinale *Don*, of the tribe Silerinæ, also from the Opoidia galbanifera of the tribe Smyrneæ. It occurs in commerce in agglutinated plastic masses. It is hot, acrid and bitter and in properties resembles asafetida, but weaker.—*McCulloch. Royle Ill. O'Shaughnessey. McClelland.*

GALBANUM OFFICINALE. Don.

Nafiel,	Arab.	Gir-Khat,	Pers.
Kinneh,	Pers.		

This plant has from the seeds, been surmised by Professor Don, to be of the tribe Sile-

rinæ. Ferula ferulago, F. galbanifera, (Nees and Ebermaier) of the coasts of the Mediterranean, the Caucasus, &c. yields copiously a secretion which dries into a gum resin, supposed by some to be galbanum, but Professor Don states that galbanum is yielded by quite a different genus, called by him Galbanum officinale. Little is positively known about the plant which furnishes the galbanum of the druggists, but in the opinion of the best botanists it is not obtained from the Bubon galbanum or Ferula ferulago of most Pharmacopœiæ. The gum resin is obtained by incisions in the root and stems; the juice is cream-coloured, and soon concretes into a solid mass.—*Eng. Cyc. Hogg. p.* 388. *O'Shaughnessy, p.* 367.

GALBOJA. Hind. Pinus Gerardiana.

GALEECHA. Hind. A woollen or cotton carpet or rug.

GALEDUPA ARBOREA.

Kurmeja, Hind. | Kenja, Chetta Hind.

A very common tree in Tenasserim and Pegu, more especially in the Prome district. The seed may be collected in any quantity, it is a large seed and an oil. "Karunga katel" is expressed from it, which is used in Bengal for burning, and medicinally as a liniment. Wight in Icones, gives also G. elliptica and piscidia.—*Dr. McClelland.*

GALEDUPA INDICA. Lam.

Pongamia glabra. *Vent.* | Dalechampa arborea.
Kurmeja, Hind. | Kanuga, Tel.
Kenja, ,,

A very large timber tree, from 40 to 50 feet high, common all over the Indian peninsula, in Bengal, &c. It flowers during the hot season, and the seeds ripen towards the close of the year. They yield a useful oil. Its wood is light, white, and firm, and serves for a variety of economic purposes. Branches stuck in the ground grow readily, grass and every thing else grows well under its shade.—*Mr. Rohde's MSS.*

GALEDUPA TETRAPETALA. A common tree of Tenasserim and Burmah, more especially in the Prome district. Its seeds yield an oil for burning and the flowers a fine red dye.—*Dr. McClelland.*

GALEEM. Arab. Carpets.

GALEGA. A genus of plants belonging to the Leguminosæ, tolerably ornamental. As they form a bush of small size they require room when planted out, the colours are mostly blue and white. Wight in Icones gives Galega Heyneana, incana, pentaphylla, and spinosa. And G. cœrulia; colonila; lanceæfolia, and purpurea are syns. of T. purpurea. —*Riddell.*

GALENA.

Lead Glance, Eng. | Sulphuret of Lead, Eng.
Lead ore, ,, | Bleiglanz, Ger.
Plomb sulfure, Fr. Gr.

This is the richest ore of lead, and from which that metal is chiefly obtained. As met with in commerce it is in heavy, shining, black, or bluish lead coloured cubical masses; having a great resemblance to the sulphuret of antimony. At the Madras Exhibition of 1857, a rich ore of argentiferous galena was exhibited from Martaban by Dr. Brandis, granular, or in minute crystals, with silver passing through it in thready veins. This ore, assayed by Dr. Scott, contains about 80 per cent. of silver lead. But the quantity of silver was found to vary in the portion examined from 70 to 300 ounces in the ton of ore. It is impossible therefore to say what its commercial value may be, unless an average sample were obtained, but if the ore exists in any quantity and of the same quality as that examined, it is a most valuable one, and would be well worth working by Pattenson's mode for separating the silver crystallization, by careful slow cooling, and as the process proves remunerative where only 7 ounces of silver can be obtained from a ton of metal. This is probably the ore referred to by the Rev. Francis Mason, A. M. in his publication on the natural productions of Burmah, where he says the limestone of the Provinces probably contains large quantities of lead. In the valley of the Salwen there is a rich vein of argentiferous galena, which is reported to appear on the surface. A specimen that Dr. Morton sent to England for analysis, was said to be a very valuable mineral, and destined to make a fortune for some one. Professor Mitchell in the certificate that he furnished Dr Morton of the analysis, says it contains Lead, Sulphur, Silver, Gold (traces) Lime, Magnesia, Iron, Silica, and Carbonic Acid. It is a sulphuret of lead or galena. The quantity of lead and silver appears to be considerable, but there was not sufficient of the mineral to estimate either." In a small hand specimen from Martaban, the amount of silver was found to vary in different portions of it, the per centage of lead being about 75. In the first trial the silver was found to amount to about 70 ounces to the ton of ore; but in the second to not less than 300 ounces in the ton, or a little less than 1 per cent. Mr. O'Reiley states that the carbonate of lead exists near the head waters of the Hoimgdaram. Another locality from which galena was exhibited was theDhoneTalook, Kurnool, from which galena in very large blocks has been obtained; one piece measured about 18 inches in diameter and

weighed upwards of 3 cwt. This ore, carefully tested by Dr. Scott some years ago, was then found to contain from 53 to 70 per cent. of lead but no silver; it was also tried at the Mint and yielded a large per centage of lead. It has been used for some years at the Madras School of Arts for glazing pottery and answers well for that purpose, though it is found to succeed better when reduced to the form of minium, and then ground with felspar and an alkali. It was brought to notice by Captain J. G Russell and occurs in large quantities and in blocks of great size in the vicinity of Kurnool. Its history is interesting. It was discovered accidentally by the late ex-Nawaub of Kurnool, in digging a well. The re-examination of the first specimen of the Kurnool ore proved it to contain upwards of 1 per cent. of silver, or 374 ounces in the ton, the quantity of lead and silver together being only 45 per cent. which was occasioned by there being a considerable quantity of gangue disseminated through the portion examined. Another specimen, given by Col. Cotton and also said to be from Kurnool, was found to contain 175 oz. 3 dwts. in the ton. A specimen of this unwashed ore was again analysed by Dr. Scott in 1859 and when fused with carbonate of soda and nitrate of potash, produced about 60 per cent. of metallic lead. The resulting lead, on being cupelled, furnished a bead of silver weighing 1·18 grs. which is equivalent to 96·64 oz. in the ton of ore, or 165·76 oz. in the ton of metal. In the recent researches of Malagah and Dorochet they have found that when sulphide of silver is associated with the sulphides of other metals, it is always unequally distributed. Among the metallic ores holding the promise of being marketable, are a rich ore of galena or sulphuret of lead from Jungumrazpillay in the vicinity of Cuddapah. This ore is rich in silver, and is worked by the Natives on this account, but all the lead is wasted and the silver is obtained by a tedious, clumsy, and expensive process. Galena is found at Rupi of Kulu in the Kangra district, associated with quartz, also in the Khagula in the Shaphur district; in the Kashmir country and in Kandahar. *Powell, Hand book Econ. Prod. Punjab*, p. 54. *M. E. J. R. of* 1857.

GALEODES. A genus of spiders, of which species occur in Central Asia, Tartary and in the Himalaya. The Lycosa or Tarantuloides singoriensis (or Aranea tarantula of Pallas); and the "Scorpion-spiders" common on the steppes, are the Galeodes aranoides (Phalangium aranoides of Pallas). The latter—or a congener common in Afghanistan, was there mistaken for the 'Tarantula' by Elphinstone. Both, but more especially the Galeodes (or Solpuga), are celebrated for their bites, reputed to be envenomed; but this is now denied by naturalists.

This very formidable and most voracious 'Tiger of the Spider class,' is a terrible pest in some parts, as especially on the Astrakan steppe, where its bite is much dreaded by the Kalmuks, who call it the 'black widow' (belbussan charra). Messrs. Zwick and Schill two German missionaries employed by the Russian Bible Society, notice these creatures, as a plague of no mean order. They harbour chiefly under the tufts of wormwood, and about the bones which are always to be found near a Kalmuk habitation, and also at the mouth of the deserted nests of the Spermophilus citillus, where they collect a sort of bed of leaves." On one occasion—"a Kalmuk had been bitten on the back in his bed, about half an hour before, by one of these creatures, which he had killed and preserved. The man's back was swollen to a considerable distance round the part, and water trickled from his mouth. Near the same hut they saw a camel with the body exceedingly swollen by the bite of one of these poisonous spiders. Not long after, they saw a number of camels which had been bitten, in the same state, and nobody seemed to apply any remedy. Of the animal creation, the camels seem to suffer most from these spiders, because they are most addicted to lying on the ground.

GALEODES VORAX. Hutton. An extremely voracious spider, of Northern India, which feeds at night, on beetles, flies, and even large lizards sometimes gorging itself to such a degree as to become almost unable to move, and remaining torpid and motionless for about a fortnight. A sparrow, as also the musk-rat (Sorex Indicus) were put along with it and killed by it.

This "tiger of the insect world," was seen to attack a young sparrow half grown, and seize it by the thigh, which it sawed through. The savage then caught the bird by the throat, and put an end to its sufferings by cutting off its head. On another occasion, says the same authority, Dr. Baddeley confined one of these spiders under a glass wall-shade with two young musk-rats (Sorex Indicus), both of which it destroyed." It must be added, however, that neither in the instance of the bird, of the lizard, or the rats, did the galeodes devour its prey after killing it. Capt. T. Hutton, in the eleventh volume of the *Asiatic Society's Journal*; makes

mention of a lizard bitten by one being "allowed to escape, with only a severe wound on the side; but as it lived for some days before being permitted to run off, the bite of the Galeodes would not appear to be poisonous." —*Gosse* page 237-8. *Tenn. Sketch Nat. Hist. Ceylon*, page 470. *Captain Hutton, in Jour. As. Soc. of Ben.*, Vol. XI. Part II. page 860. *Tennent's Sketches of the Nat. Hist. of Ceylon*, page 470.

GALEOPITHECIDÆ. The flying lemurs, a family of mammals of the order Primates, their position in which may be thus indicated,

ORDER PRIMATES.

GALEOPITHECUS, the flying lemurs, a family of mammals of the order Primates, which may be thus indicated.

GALEOPITHECUS VOLANS. *Shaw.*

Syn. G. marmoratus; philippensis ternatensis, rufus, undatus, Temminckii; are considered by Shaw and others to be varieties.
Lemur volans *Linn.*
Vespertilio admirabilis, *Bont.*
Cato-simius volans, Camelli.
Colugo. *Griff.* An, King.
Flying macaco of Pennant. ENG.

Flying lemur,	ENG	Gendoo,	JAV
,, Fox,	,,	Kubung,	MALAY
,, Cat,	,,		TEL.

This is the only species of the genus. It inhabits India, Burmah, Penang, the Malay peninsula, Siam, Sumatra, Java and Borneo. It is nocturnal. They live on young fruits and leaves and do very great injury to gardens and plantations. All day long, they hang with their heads down suspended by the claws of the hind legs, to the branch of a tree, in clusters, and keep up a continuous querulous squeaking, as one encroaches on the position of another. As evening approaches, they quit their shady retreat and are to be seen winding their flight to distant gardens. They resemble in flight a flock of crows retiring to roost. *Horsfield's Mammalia.*

GALERIDA CRISTATA. The Alauda cristata; Crested Lark of Europe, Asia, N. Africa; rare in Britain, but common in India, where it is known as the Chandul. It is the most abundant lark, on the plains of Upper India and table land of the Peninsula, it is a European species, though of rare occurrence inBritain; and its song, also its mode of delivery of it in the air, is not very unlike that of the sky-lark, although it does not soar to so lofty an altitude. We have somewhere read of the delight expressed by one who had been many years in India, at seeing, upon his return to his native land, the Sky-Lark rise from the sod at his feet, and mount higher, and still higher, till reduced to a mere speck in the heavens, or utterly lost to view, all the while making the air ring with its music. Had he ventured forth into the fields of any part of India, he would have seen and heard similarly; although the species (Alauda malabarica) is different, and may be somewhat inferior to the European sky-lark in song, so far at least as regards variety in the notes; but there is really so little difference that the two birds could assuredly not be distinguished by the voice alone, nor by the mode of flight, for the common Indian Lark resembles the European Wood Lark in size and shape, with the plumage of the sky-lark. *Blyth.*

GALERIUS. See Sassanian kings.

GALERUCA. One of the Coleoptera of Hong Kong.

GALES and hurricanes occur in the Indian Ocean south of the equator. Trade wind gales occur at all seasons, but chiefly in June, July and August. In these, the wind veers but little. In the extra tropical gales between L. 30° and 45° S., the wind veers much, and in the tropical hurricanes, the winds veer and shift. The S. W. monsoon prevails northof the equator, and when it prevails, the S. E. trade wind acquires additional strength from the demand made upon it to supply the S. W. monsoon, these two winds being apparently one system under the influence of the earth's rotation and the high temperature which prevails in the northern hemisphere. The hurricanes of the Indian Ocean are usually rotatory, this was shown by Redfield, Thom, Reid and Piddington South of the equator, they occur in the months of November and May and travel to the W. S. W., and afterwards, but not always, to the Southward and S. E.; the wind invariably moving round a central space (which is usually characterised by a calm) from left to right or with the hands of a watch; while the storm which has a diameter of 1 to 1,500 miles moves onwards at the rate of 1 to 20 milesbut more frequently 4 to 7 miles an hour, for a period varying from a few hours to ten days, attended

with torrents of rain and its northern half often with lightning. Dr. Thom showed that South of the equator these rotatory storms are always generated between the N. W. monsoon and S. E. Trade wind. They occur only during the S.W. monsoon months, and their rise and progress are intimately connected with the S. E. Trade wind and N. W monsoon, two opposing winds. With ships the safest course is to lie to and watch the barometer and wind, till the bearing of the centre be known with some certainty. *Mr. Meldrum in Pro. Brit. Assoc.* 1867. See Cyclone, Hurricane, Winds.

GALETENG. A locality in the island of Flores, occupied by a race so called. According to the statements of Bugis traders, who had settled in Flores, that island is inhabited by six different races, speaking as many different languages, the Ende, the Mangarai, the Kio, the Roka, the Konga and the Galeteng, names derived from the principal places of their residenee. *Crawfurd Dict* 1 *p.* 94. See India, p. 357.

GALGOJA. Hind. of Pangi, Pinus gerardiana, Gerard's pine.

GALHAS. Port. Galls.

GALIACEÆ. Lindley. The Madder tribe of plants; of these, there have been 17 species discovered in South Eastern Asia viz., 1 of Asperula arvensis, *Linn* 11 species of Galium, and 5 species of Rubia. Madder is the only useful product of the order. *Voigt.*

GALI CHAKKA. Tel. Smilax China. —*Linn.*

GALLJERU. Tel. Trianthema decandrum.—*Linn. Roxb.* also T. obcordatum and its varieties.

GALIUM VERUM. See Galiaceæ.

GALILEE, Chinnereth, also Gennesareth, also Tiberias, also Bahr-ul-Tibariah, is a sea or lake formed by the river Jordan and has many fish. Its surface is upwards of 300 feet below the Mediterranean, and it is enclosed by steep hills 300 to 1000 feet high, it is 12 miles long and 6 broad.

GALIM. Ar. Carpets.

GAL KADDU. Hind. Benincasa cerifera, *Savi W. and A.*

GALL, Rash. Heb. See Bile.

GALLA. A Semitic race, occupying Shoa in Abyssinia. They are one of the finest races in Africa of a dark brown colour with strong hair, and well limbed. They live in a beautiful country, extending from L. 8° N. to L. 3° S. with a climate not surpassed by that of Italy or Greece, and speaking a language as soft and musical as pure Tuscan. They are from six to eight millions in numbers, amongst them are scattered christian tribes, but the religion of the race in general is Fetish and the seven tribes of the Wollo Galla are mahomedans. The Fetishists worship the serpent as the mother of the human race, and hold their religious services under a tree. They keep every fourth day as a day of rest. They acknowledge a supreme being whom they call heaven (Mulungu) and have a notion of a future state. There seem to be three natures or attributes in their Supreme being, viz., Wak or Waka, Supreme; Ogli, a masculine, and Ateli, a feminine power or embodiment. They have two holy days in the week, viz,, Saturday, which they call Saubatta Kenna or little Sabbath and Sunday, which is their Saubatta gadda or greater Sabbath. See Semitic races, Somal.

GALLA. Hind. Cupressus torulosa, Twisted cypress.

GALLA. The native name of Point de Galle, the Cock's point of the Portuguese, supposed to be the Tarshish of the Old Testament. See Galle.

GALLA DI LEVANTE. It. Cocculus Indicus

GALLÆ. Lat. Galls.

GALLAH, Singh. the Elephant.

GALL-APFEL. Ger. Galls.

GALLE. A town in Ceylon supposed to be the Tarshish to which the Phœnician mariners resorted. Their Ophir is supposed to be the present Malacca, the Aurea Chersonesus of the later Greek geographers. Galle fort was first built by the Portuguese, and afterwards re-built by the Dutch, who had dismantled it when they stormed Galle, and wrested it from their rivals, in 1640. Considerable additions have since been made by the British to whom Galle was given up in 1796. The fort contains upwards of 500 houses and a garrison. *Tennent.* See Galla.

GALLI. Hind. Phœnix dactylifera.

GALLIAN. Hind. Cupressus torulosa, twisted cypress.

GALLICREX A genus of birds, belonging to the Family Rallidæ and Tribe Macrodactylæ, as under:

Tribe. Macrodactylæ.

Fam. Rallidæ, 7 gen. 15 sp. viz., 1 Porphyrio; 1 Gallicrex; 8 Porzana; 1 Ortygometra, 2 Rallus; 1 Gallinula; 1 Fulica.

GALLIKONDAH. A hill district in the territories of the rajah of Vizianagrum. Like other hill stations, this place had been lying waste for countless ages, populated here and there by a few miserable families of savages, who shared with wild beasts the soil from which they wrung a miserable and precarious existence. The climate of Gallikondah is temperate and fine all the year round.

The country extending from there to Jeypore is all very promising, but has yet to be thoroughly explored. The thermometer falls to freezing on the plateau about 20 miles beyond Gallikondah. To open up a road into the Nagpore territory, viâ Jeypore, would divert a large amount of trade down from those parts, to the sea coast here. Until very lately, this country was thought to be so wild, so barbarous, and so poor, that it was hardly worth anybody's while to die of fever in getting there! Coffee plants are thriving. Cinchona and Tea, will be tried.

GALLINÆ. L. A sub-family of birds of the family Phasianidæ and Order Rasores. The Rasores or game birds are the Gallinæ of Linnæus; the Gallinacei of Viellot; the Pulveratrices of some authors and are the Gallinaceous birds or game birds. Their feet are formed for running: their bills convex; the upper mandible arched over the lower; their food, grain. Nest artless and placed on the ground; eggs numerous, polygamous. Analogous to the order *Pecora* in the class *mammalia*. In this sub-family, Jerdon includes the genera Gallus, and Galloperdix. The European quail is the only real migratory bird of the gallinaceæ, but some other quails, bustard, and rock partridges, Pteroclidæ, wander about to different localities, and the Otis aurita, Ardea bubulcus, some rails, terns and gulls also wander. A few of the gallinaceous birds are polygamous, and their males are very pugnacious. The nests of birds greatly vary. Those of the weaver bird, tailor bird, honey-sucker and oriole, are made with much art. The edible nest of the colocalia swallow is formed in caverns of inspissated saliva: swallows, swifts, bee-eaters and weaver birds build in companies: certain ducks breed on cliffs or trees, and they must carry their young to the water, though this has not been observed. The Megapodidæ gallinaceous birds, says Mr. Wallace, found in Australia, its surrounding islands, and as far west, as the Philippines and the N. W. of Borneo, bury their eggs in sand, earth or rubbish and leave them to be hatched by the sun or by fermentation. They have large feet and long curved claws, and most of them rake together rubbish, dead leaves, sticks and stones, earth and rotten wood, until they form a mound often six feet high and twelve feet across, in the middle of which they bury their eggs. The eggs are as large as those of a swan, and of a brick red colour, and are considered a great delicacy. The natives are able to say whether eggs lie in the mound and they rob them eagerly. It is said that a number of these birds unite to make a mound and lay their eggs in it, and 40 or 50 are found in one heap. The mounds are found in dense thickets. The species of the Megapodidæ in Lombok is as large as a hen, and entirely of a dark hue with brown tints. It eats fallen fruits, earth worms, snails, and centipedes, but the flesh is white and when properly cooked well flavoured.—*Wallace* 154, 156. See Gallus.

GALLINAGO. A genus of birds belonging to the family scolopacidæ and tribe grallatores. They are the various snipe of sportsmen.

Gallinago scolopacinus. Scolopax gallinago; 'Common Snipe.' Europe, Asia, N. Africa: very common in India.

Gallingo gallinula. Scolopax gallinula; 'Jack Snipe' of Europe, Asia, Barbary, common in India.

These are migratory, coming over the Himalaya, in October but the *Gallinago stenura* snipe precedes them, though few sportsmen discriminate it from the common British snipe, which makes its appearance somewhat later, G. stenura is nevertheless a different bird, at once distinguished by having a set of curious pin-feathers on each side of its tail, whereas the British snipe, which is equally abundant in India, has a broad fan-shaped tail, as unlike that of the other as can well be. The pin-tailed is the common snipe of the Malay countries; and is unknown in Europe, excepting as an exceedingly rare straggler from its proper habitat the East. The "Double Snipe" is the Gallinago major of Europe, distinct from the two species of large or 'Solitary Snipes' of the Himalaya, G. solitaria and G. nemoricola. See painted snipe.

GALLINSECTA. See Coccidæ, Coccus.

GALLINULA CHLOROPUS. Moorhen, of Europe, extends to Asia, all Africa, common in India.

GALLIVAT. According to Simmonds, a large rowing boat in the East Indies. *Simmonds Dict.*

GALLOOR KA PUTTA. HIND. A plant used in the cure of goitre.

GALLOPERDIX. A genus of birds of the sub-family Polyplectroninæ and family Phasianidæ as under:

Fam. Phasianidæ.

Sub-fam. Pavoninæ, 2 gen 3 sp. viz. Pavo cristatus, muticus, 1 Melcagris gallopavo.

Sub-fam. Polyplectoninæ, 5 gen. 10 sp viz. 3 Ceriornis, 1 Ithaginis, 3 Galloperdix, 2 Polyplectron, 1 Argus.

Sub-fam. Phasianinæ, 3 gen. 2 sub-gen. 16 sp. viz. 3 Gallus, 7 Euplocomus, 1 Puc-

rasia, 3 Phasianus, 1 Thamalea, 1 Lophophorus.

Sub-fam. Tetraoninæ, 2 gen. 2 sp. viz. 1 Tetragallus himalyensis, 1 Lerva nivicola.

Sub-fam. Peteroclinæ, 1 gen. 4 sp. viz. 4 Pteroclis arenarius, fasciatus, alchata, exustus.

Sub-fam. Perdicinæ, 8 gen. 22 sp. viz. 1 Numida, 4 Francolinus, 1 Caccabis, 2 Perdix, 1 Rhizothera, 4 Arboricola, 3 Rollulus, 2 Perdicula, 4 Coturnix.

GALLOPHASIS. A genus of birds generally called pheasants. The "Khalij" Gallophasis albocristatus of the W. Himalaya and G. melanotus of Sikhim, produce an intermediate race in Nepal; and G. Cuvieri of Asam and Sylhet, and G. lineatus of Burma, interbreed in Arakan, &c., so that every possible transition from one to the other can be traced.

GALL-NUT OAK, the Gall-Oak, Quercus infectoria. See Galls; Quercus.

Galls are produced on different species of oak, by the female of the Cynips or Diplolepis piercing the buds of Q. infectoria and there depositing its eggs. Dr. Falconer, when travelling in the Punjab, was informed that galls were produced on the Balloot oak, Quercus ballota. East India galls of commerce are Bussorah galls re-exported from Bombay. Mecca galls, are also Bussorah galls. A kind of gall is also imported from China, called Woo-peitze, which are said to be produced by an Aphis: they are more bulky than common galls of very irregular shape and hollow. The galls produced on Tamarix indica, or "faras tree," are called "ma-in" and are used for dyeing purposes. They are largely gathered in the Jhang, Gugaira and Muzaffargarh districts, as also in the Dera Ghazi Khan districts, where as much as 500 maunds are annually collected. Galls are imported into England from Smyrna, being produced in Asia Minor; also from Aleppo, the produce of the vicinity of Mosul in Kurdistan. They are also imported into England from Bombay (sometimes to the extent of 1,000 cwt.) having been first imported there from the Persian Gulf. Mr. Wilkinson observed that whenever the prices were low at Smyrna, the Galle came from Bombay, and *vice versa*; but the supply was never abundant from both sources in the same year. They are imported into Bombay from Basra (Bussorah), which is not a great deal farther from Mosul than is Aleppo. They are therefore most probably the produce, like Aleppo Galls, of Kurdistan and of other Persian provinces. The quantity annually imported into Britain amounts to 700 tons. They are employed in tanning, to make ink, and medicinally in infusion, ointment and as gallic acid. They sell at £4 to £6 the cwt. and in the London market are classed as blue, green and white.—*Royle*; *Simmonds*; *Tomlinson*; *McCulloch*, *Faulkner*.

GALL STONES. See Bezoar. Gaolochan. Hind.

GALLUS. A genus of birds belonging to the order Rasores, Family Phasianidæ and Sub-family Phasianinæ, and includes the domestic fowl and all its many species and varieties, the Ouph of the Hebrews, the Murghi of the mahomedans of India, and Koli of the Tamuls.

Fowls, though in numerous breeds and sub-breeds, seem all to have diverged from a single type. The game breed is from the Gallus bankiva called also G. ferrugineus. Its feathers are closely depressed to the body, it is indomitably courageous, evinced even in the disposition of the hens and chickens, it is of various colours.

Malay Fowl. With body of great size, disposition savage.

"*Cochin or Shanghai*" breed, of great size, of Chinese origin, and disposition, quiet.

"*Bantam*" breed, originally from Japan.

"*Creepers*" with "*jumpers*" from Burmah, short monstrous thick legs.

"*Frizzled*" or "Cafir" fowls of India with feathers reversed, "*Silk fowls*," with silky feathers. This is called the Phasianus lanatus, Gallus lanatus, Coq-a-duvet, Silk fowl. Kircher describes them, out of Martini, as woolly hens, the wool of which is much like that of sheep.

"*Sooty fowls*" of India, the hens of which have a white colour, soot stained, black skin and periosteum. The Europe breeds "*Dorking*," "*Hamburgh*," "*Andalusian*" "*Spanish*" "*Sultans, Ptarmigans ghoondook, rumpless*" are only known in S. E. Asia as introduced varieties.

GALLUS SONNERATII, Temm.

Phasianus gallus Sonnerat.		Jangli Murgh.	Hind.
,, Indicus Leach, Blyth, Sykes Jerdon.		Katu Koli.	Tam.
		Adavi Kodi.	Tel.

This does not range into the Northern parts of India, part of its hackles consist of highly peculiar horny laminæ and it is not now believed to be the parent bird of the domestic fowl.

"*Gallus varius*," called also "*G. furcatus*" is met with in Java and the islands of the Archipelago as far east as Flores. It has green plumage, unserrated comb and single median wattle.

"*Gallus Temminckii*" is supposed to be a hybrid it occurs in Batavia.

Gallus ferrugineus, GMEL.

G. bankiva.	TEMM	Geragogor, male, of Gonds	
Ban-murgh.	HIND.	Kuru female.	
Jangli „	„	Natsu-pia.	BHOT.
Ban-kokra of Sonthals		Parsok-tshi.	LEP.

It inhabits N. India as far west as Sind ascends the Himalaya to a height of 4000 feet, inhabits Burmah, the Malay peninsula, Indo-Chinese countries and the E. Archipelago, as far as *Timor*. *Darwin*.

Gallus Stanleyi. GRAY.

G. lineatus BYLTH,

G. Lafayetti, LESSON, the Jungle fowl of Ceylon,

Is peculiar to Ceylon, and greatly resembles the domestic fowl.

Gallus æneus TEMM. is considered to be a hybrid between G. varius and G. Sonneratii, *Darwin*, *Tod. Cal. Rev. Jerdon*, *Horsfield Yules Cathay*, p. 100.

GALLWORTS. See Myricaceæ.

GALMENDORA. A rather hard, very fine, but not close grained, heavy, Ceylon wood.

GALOT. HIND. Ceropegia esculenta.

GALTIGUL.— ? Calotropis procera.

GALUCHI. TEL. Tinospora cordifolia. *Miers*.

GALUM TAROO. TEL. *Rope* from Calotropis gigantea.

GALVANISM. A form by which electricity is excited, discovered by Galvani an Italian.

GAM. HIND. A village,

GAM. The title of the chiefs of the Singhpo.

GAMAL. AR. HEB. Camel.

GAMALLAVADU. TEL. A toddy drawer; the caste following that business. *Wilson*.

GAMBAROON. The older name of Bandar Abbas, a sea-port town in the province of Kirman. It is the ancient Harmozia. It is situated in a barren country, in a bay of the Gulf of Ormuz. It is fortified with double walls. It did not long benefit by the fall of Hormuz; but appears to have been nearly ruined during the reign of Nadir Shah whose tyranny extended its baneful influence even to this extremity of the Persian empire; so that in 1750 Mr. Plaisted found there nine houses out of ten deserted. In the year 1639, there seems to have been an English factory at Bussorah, subordinate to that at Gambaroon and protected by firmans. *Ousley's Travels*, Vol. I. p. 165. "*A journal from Calcutta to Aleppo, &c*, p. 11. *Lond.* 1758. *Kinneir's Geographical Memoir*, p. 201. See Kirman.

GAMBE, CEL. Bœhmeria nivea, China grass.

GAMBIA. MALAY. Gambier: Catechu, ENG.

GAMBIER is extracted from the leaves of the Uncaria gambir, in Siak, Malacca, and Bittang. After inspissating by decoction it is strained, suffered to cool and harden, and then cut into cakes of sizes or formed into balls. A gambier plantation has much the appearance of brushwood of three years growth with leaves of a dark green colour. The leaves are collected 3 or 4 times a year and boiled in a cauldron from which a strong decoction is poured into square boxes which, when cool, hardens and is cut into small cubes of about 1½ inches. As brought to the market it resembles in appearance and consistency little square blocks of yellow mud. The plant, which is small and bushy, seldom over 7 or 8 feet high, is much cultivated at Singapore, and is planted 6 feet asunder; the leaves are small smooth and of a dark green colour. The cropping of the leaves may commence when about 18 months old, but the plant is at its full growth when two years old and its leaves and young branches may thus be cropped once in two months. The croppings are thrown into a large cauldron of hot water and boiled for 6 or 7 hours till all the extract be inspissated into a thick, pasty fluid. This is now poured into shallow troughs a little more than an inch deep, and allowed to cool and dry, when it is cut up into little inch blocks and is then ready for the market, of Siam, Cochin-China, China, and the Archipelago, where, along with betelnut in a leaf of the piper betel (Siri), it is largely chewed as a masticatory, The average size of the Singapore plantations were of 30 acres and when in full bearing employed 8 men. A plantation becomes exhausted and worn out in 15 years from its commencement. There were in 1850 about 800 plantations in Singapore, 600 of which were under cultivation. The extension of this cultivation increased rapidly after 1830 but since retrograded. A composition of this extract is valuable as a preservative for timber. Dissolve three parts of gambier in twelve of dammar oil, over a slow fire. Then, stir in one part of lime, sprinkling over the top, to prevent its coagulating and setting in a mass at the bottom. It must be well and quickly stirred. It should then be taken out of the cauldron and ground down like paint on a muller till it is smooth; and afterwards returned to the

pot and heated. A little oil should be added to make it tractable, and the composition can then be laid over the material, with a common brush. As a protection against the teredo, black varnish or tar are substituted for dammar oil, omitting the grinding down which would not answer with tar. It is largely imported into Britain, from 1846 to 1850, the average quantity entered was 1,200 tons, priced at £13 to £14 the ton. It is duty free. It is used in tanning (*Jour. Ind. Arch.*) Gambier is employed medicinally as an astringent, in tanning, and has been recommended as a preservative of timber exposed to water, also for canvass. The gambier may be in solution, in water, but if applied to a ship's bottom, it should be in the form of a composition of chunam, gambier and dammar oil. It is also recommended to be applied in house building to protect the beams from the white ants, and in ship building as a composition on the butts, and on the outside of the timber previously to planking. Gambier may also preserve timber from dry rot.—*Journal of the Indian Archipelago*, March 1850., No. III. p. 136, *also Dr. Cleghorn's Report*, 1859-60, para. 13, page 7. *Statistics of Commerce.*

GAMBOGE.

Gumma-gutta,	„		

Gamboge is obtained from several plants, in southern Asia. From the Hebradendron cambogioides in Ceylon, syn. of Garcinia gambogioides: also from the Garcinia pictoria of Ceylon, a syn. of Hebradendron pictoria: also the Garcinia Cochinchinensis *Rumph* of Siam. It is also obtained from the Garcinia elliptica. *Wall.* of Siam Sylhet and Tavoy, Garcinia pictoria of.—*Roxb.*

Siam Gamboge is usually seen in cylinders, whence its name of pipe gamboge, but it is also seen as *Lump or Cake gamboge* which occurs in round cakes or masses—and as *Coarse gamboge* or fragments and inferior pieces. *Ceylon gamboge* is seen in irregular masses. The first notice of this vegetable gum resin, is by Clusius, in 1605, who described a piece brought from China, by Admiral Van Neck, in 1603. Two trees yielding a gamboge like substance, were first made known by Hermann, in 1670, one "Goraka," Garcinia cambogia, the other "Kana" or edible, Hebradendron cambogioides. At present, gamboge is received principally from Siam and is supposed to be from the last named plant, a small quantity coming from Ceylon.

The composition and properties of the gamboge of Ceylon, are identical, or very nearly so, with those of other gambogioid exudations from Garcinia gambogia, Xanthochymus pictorius and Xanthochymus spicatus. Others, though they have been supposed closely to resemble ordinary gamboge, are really quite different in appearance, nature, and composition, as well as unfit for any of the well-known economic uses of that substance. The Singalese method of collecting the gamboge is by cutting pieces of the bark completely off, about the size of the palm of the hand, early in the morning. The gamboge oozes out from the pores of the wood in a semi-liquid state, but soon thickens, and is scraped off by the collectors the next morning without injury to the tree, the wounds in the bark soon healing, and becoming fit to undergo the operation again. Gamboge is much used as a pigment, and in miniature painting, it is employed to colour varnishes and lackers. Gamboge of Mysore, is the exudation of Garcinia pictoria. See Clusiaceæ. Resins. —*Drs. Ainslie*; *Royle*; *O'Shaughnessy*; *Cleghorn*; *Eng. Cyc.*; *Wight's Illustr.*; *McCulloch.*

GAMBOGE THISTLE. Eng. Argemone Mexicana.—*Linn*

GAMBOGE BUTTER.

Mukki-tilum, Tam. | Arasinagoorghy yennai, Can.

A solid oil, the cocum butter, obtained from the seeds of the "Gamboge tree." *Garcinia elliptica*, which grows abundantly in certain parts of the Mysore and Western coast jungles. The oil, which is procurable in moderate quantities, is prepared by pounding the seed in a stone mortar and boiling the mass, until the butter, or oil rise to the surface. Two and a half measures of seed should yield one seer and a half of butter. In the Nugger Division of Mysore, it is sold at the rate of As. 1-4 per seer of 24 Rs. weight, or at £36-6 per ton, and is chiefly used as a lamp oil by the better classes of natives, and by the poor as a substitute for ghee. The butter thus prepared does not appear to possess any of the purgative qualities of the Gamboge resin, but is considered an antiscorbutic ingredient in food.—*M. E. J. R.*

GAMBROON, a twilled cotton lining made at Khangurh.

GAMBROON. Now called Bandar Abbas q. v. See Gambaroon.

GAMBOGE PLANTS. Garcinia pictoria, Roxb. of India, Syn. of Hebradendron pictoria. Garcina Cochin-Chinensis of Siam. Garcinia elliptica, Wallich of Silhet and Tavoy. Hebradendron Gambogioides, Syn. of Garcinia gambogioides.

GAMCHA. See Cotton manufactures.

GAMELIN—? See Civet.

GAMEN. The largest of several islands on the north side of Dampier Strait.—*Horsburgh.*

GAMING. In passion for play at games of chance, its extent and dire consequences, the rajpoot, from the earliest times, has evinced a predelection, and will stand comparison with the Scythian and his German offspring. The German staked his personal liberty, became a slave, and was sold as the property of the winner. To this vice the Pandus owed the loss of their sovereignty and personal liberty, involving at last the destruction of all the Indu-races; nor has the passion abated.

Most of the advanced nations of the Asiatic islands are gamblers, and the little fighting fish of Siam and cock-fighting are largely betted on. In the Archipelago, in Bali, Lombok, Celebes and the Philippines, cock-fighting is quite a passion. The only material exceptions are the Javanese. The passion for cock-fighting is indeed impressed in the very language of the Malays, which has a specific name for cock-fighting, one for the natural spur of the cock, and another for the artificial spur; two names for the comb; three for the crow of the cock; two for a cock-pit; and one for a professional cock-fighter. The passion is nowhere carried further than in the Spanish dominions of the Philippines. There, it is licensed by the Government, which derives from it a yearly revenue of about 40,000 dollars or about £10,000. Crawfurd Dict., p. 113.

GAM-LANG. Jav. A musical instrument of Java.

GAMMIRIS. Singh. Piper nigrum.

GAMPA. Tel. Baskets.

GAMPA-KAMALOO. Tel. A race of basket makers in Bellary.

GAN. Hind. Carissa diffusa.

GANA. S. In Mysore, a sect of Lingayats.

GANA. A host of celestials in Kailasa, Siva's paradise.

GAN-ABA. Singh. Mustard seed.

GANAPATI, or Katakeia, the title of an ancient dynasty in Warungul, once the capital of a great part of the Northern Circars. The dynasty of Warangal, ruled from that town over a great part of the Circars, but the succession of the buddhist Chalukya race to dominion at Rajamundry, the subsequent sway of the Ganapati, Vema, reddi and Rayel race of Bijanuggur, together with their contests and the altering relations between them, are very little known. Condavir, was once ruled by a race of Reddi Ganapati means chief of a host.

GANAPATI. One of many names given to the hindu deity Ganesa, the god of prudence and policy. In Northern India he is usually styled Ganesh, but Ganapati in the South; under the name of Kartikeya he is the leader of the celestial armies and as Ganesa and Ganapati, is the god of wisdom. He is the reputed eldest son of Siva and Parvati. See Ganesa, Kartikeya.

GANAPATYA. A limited hindu sect, worshippers of Ganesa or Ganapati, or of his forms Baktratunda or Dhundhi raj. They are so styled because they worship Ganesa or Ganapati exclusively. There are five grand divisions of hindus who so worship a single divinity, uniting in its person all the attributes of Brahm and the Ganapatya are one of these.

GANARA WOOD. A timber of the Northern Circars.

GANCHICA. Sans. Vinegar.

GANDA, properly "g'handa," in several of the hindi dialects means perfume, aroma, odour, and several plants derive part of their compound name from this word.

Gand Bel. Hind. Andropogon schœnanthus. Linn.

Mirchia gand. Hind. Cymbopogon iwarancusa.

Ganda bute. Hind. Euphorbia helioscopia.

Garba gonda. Hind. Saccharum sara.

Ganduga mara. Can. Santalum album. Sandal wood.

GANDA. Hind. Sugar-cane.

GANDA, in Indian currency, the hundredth part of an anna, but, in reckoning, means to count by fours: so that Ganda also means four pice, or about one anna.

GANDA-BEROZA. Hind. The crude resin of Pinus longifolia: also a preparation from the resin. It is often confused with barija or barzad, which is the rare drug galbanum.

GANDAK. Hind. Sulphur: hence, Gandak-ka-atr. Hind. also Gandak-ka-tezab. Hind. Sulphuric Acid, Gandaka Rasa, Sing. Sulphuric Acid.

GANDAK RIVER, traverses the province of Bahar.

GANDAL. Hind. Avena fatua, *Kwar-gandal.* Aloe perfoliata, *Soa Gandal,* Asparagus Punjabensis.

GANDALU. Hind. Bergera Konigii.

GANDALUN. Hind. Daphne oleoides.

GANDAM. Hind. Pers. Wheat.

GANDAMAK. A town occupied by the Koghani tribe of Afghans. It is on an elevated site, is cooler than Jellalabad, and its people tend silk worms, it stands in a rich spot, and has a fine view of the Sufaid Koh. It was the scene of a great disaster to the British Indian Army. *Mohan Lal's Travels, p.* 340.

GANDAMGUNDU. Hind. Lycopus Europæus.

GANDANA, Hind. GANDHAN. Hind. Allium ascalonicum: the Shallot. See Gandhina.

GANDAR. Hind. Andropogon muricatus.

GANDARA. Hind. Nerium odorum.

GANDAVA, in Sanscrit, Ghandarva, good spirits. See Ghandarva.

GANDASULI. Marsden gives this as the Hedychium coronarium of Linnæus, and adds that its flowers are worn as ornaments in the hair, and in the enigmatical language of flowers stand for inconstancy. *Jour. Ind Arch., Vol.* V., *No.* 8, *August* 1851.

GANDAVA. The chief town of Cutch-Gandava. See Beluch, Brahui, Kelat.

GAND BEL. Hind. Andropogon nardus, *Rottl.*

GANDEHRA. Hind. of Kulu. Nerium odorum.

GANDELI. Hind. Vitis Indica.

GANDERA. Hind. Rhazya stricta.

GANDERE. Hind. Nerium odorum. Trikh gandere. Hind. Rhododendron arboreum.

GANDHA-BANIK. Beng. A druggist.

GANDHAK. Hind Sulphur.

GANDHAKA. Sans. Sulphur.

GANDHAKA DRAVAKAM. Tel. Sulphuric acid.

GANDHA-MADANA, in hindu cosmogony, is one of the four boundary mountains enclosing the central region of the world, called Ilavritta, in which Meru, the golden mountain of the gods, is situated. The Puranas are rather at variance as to its position. According to the Vayu it lies on the west, connecting Nila and Nishada, the north and south ranges. The Vishnu Purana places it on the south, the western mountain being there called Vipula. It has, however, a Gandha-madana to the west amongst the projecting branches or filaments of Meru. The Bhagavat places it on the east of Meru. The Mahabarat agrees with the Vayu Purana. The Padma Purana is at variance with itself, and places it in one passage on the west, and in another describes it as on the east. According to this Purana, Kuvera resides on it with the Apsarasa, Gandharba, and Rakshasa. The Sita alighting on its top thence descends to the Bhadraswa versha, and flows to the eastern sea. *Hindu Theatre, Vol.* I, *p.* 24 1.

GANDHANA. Allium cepa; the onion, also, Allium sativum, Garlic.

GAND'HA-P'HALI. Tel. Michelia champaca.—*L.* Particularly the flower buds.

GANDAHARA, according to Bunsen, is Candahar. It is named in the inscription of Darius. So far back as the reign of Darius Hystaspes, the early writers placed Indians on both sides of the Indus and made India extend westward to Gandahara.

GANDHARASAMU. Tel. Gendarussa vulgaris. *Nees.*

GANDHARI. Daughter of rajah Gandhara. She married Dhritarashtra, her sons Duhsasana and Duryodhana were named Kaurava, and fell in the eighteen days battle of Kurukshetra. Gandhari after the battle of Kurukshetra retired with Dhritarashtra and his mother Kunti, to the jungle on the Ganges, where the maharajah died.

GANDHARI DUMPA. Tel. Species of Crinum. *Linn.*

GANDHARITIS. See Bactria, p. 284. Greeks of Asia.

GANDHARVA. In hindu mythology, a shade, a spirit, or ghost.

GANDHARVA a celestial musician. These are demigods or angels who inhabit Indra's heaven, and form the orchestra at the banquets of the gods. They are described as witnesses of the actions of men, and are sixty millions in number. *William's Story of Nala, p.* 142. See Hindoo; Mahadeva.

GANDHARVA One of the four Upaveda, the other three are the Ayush, Dhanush, and St'hapatya. See Vidya.

GANDHI, Hind? A tree of Chota Nagpore. Soft white wood. *Cal. Cat. Ex.* 1862.

GANDHILA Hind. A low vagrant caste in the N. W. Province, who make mats, and exhibit feats of activity, they are also thieves. *Wilson.*

GANDHINA. Beng. Allium ascalonicum. *Roxb.* See Gandana.

GANDHUL. Hind. Ixora parviflora.

GANDHULI. Hind. Gynandropsis pentaphylla.

GANDIAL. Hind. Gouffeia holosteoides.

GANDI-BUTI. Hind. Glinus lotoides.

GANDIVA. In hindu mythology, a bow belonging to Varuna given by Agni to Arjuna, one of the Pandava, before burning the forest of Khandaprestha, to enable him to combat Indra. It was used by Arjuna, one of the Pandava, in the Swayamvara or tournament in which he won Draupadi.

GANDLA. Bergera Koenigii.

GANDUM. HIND. Triticum æstivum, Wheat.

GANDU GANNERU. TEL. Alstonia venenata. *R. Brown.*

GANDUR. HIND. Andropogon muricatus.

GANER. HIND. Avena fatua.

GANESA, is the Hindu god of prudence and policy and the patron of letters; he is the reputed eldest son of Siva and Parvati, and is represented as a short, fat, red colored man with a large belly and the head of an elephant, an emblem of sagacity; he is frequently attended by a rat, sometimes riding on one, the conduct of that animal being esteemed by the hindus as peculiarly marked by wisdom and foresight: he has generally four hands, but sometimes six or eight, or only two. He is invoked by hindus, of all sects, in the outset of any business: if they build a house, an image of Ganesa is previously propitiated, and set up on or near the spot: if they write a book, Ganesa is saluted at its commencement, as he is also at the top of a letter: beginning a journey, Ganesa is implored to protect the way-farer, and, for the guardianship of travellers, his image is occasionally seen on the road-side, especially where two roads cross: but sometimes it is little else than a stone, rudely chisselled into someting like an elephant's head, with oil and red ochre daubed over it, decorated, perhaps, with a chaplet of flowers by some pious neighbour or traveller. It is common to see a figure of the god of prudence in or over bankers' and other shops: and, upon the whole, there is perhaps no deity of the hindu pantheon so often seen and addressed. When he has four arms, in one hand he holds the ankas or hook for guiding the elephant, in another a chank or shell, in the third a conical ball, and in the fourth a cup with small cakes, with which he is supposed to feed himself. Ganesa is often represented eating Batasa. He is sitting on the lotus. Images of him are made and set up with those of Durga, in the festivals of that goddess in Calcutta. In an invocation to a superior deity, a salutation is usually made to him; and his image is frequently seen placed as a propitiation, over doors of houses and shops, to ensure success to the temporal concerns of their owners Siddhi and Buddhi (knowledge and understanding) are represented as the two wives of Ganesa. There are not many temples dedicated to Ganesa; but his images are frequently discovered set up with those of the other deities. Ganesa has several names: among which are Lume bodura ? the long-bellied Eku Duntu, one-toothed; Gajanumu, elephant faced; Gunnis; Ganupati; Pollyar, &c. &c. There are five grand divisions of hindus who exclusively worship a single divinity, uniting in its person all the attributes of Brahma himself: one of these divinities is Ganesa, and the sectaries who thus worship him are called Ganapatya. Ganapati, in conversation, but more correctly spelled Ganpati, is the name commonly given to this deity about Poona, Bombay, and places on the western side of India. Ganesa is the chief of the *Dii minores* of the hindu pantheon as the etymology of the word indicates, and like Janus, of the Romans, was intrusted with the gates of heaven; with the right to preside over peace and war. Ganesa is the first invoked and propitiated on every undertaking, whether warlike or pacific. The warrior implores his counsel: the banker indites the words "Sri Ganesh" at the commencement of every letter; the architect places his image in the foundation of every edifice; and the figure of Ganesa is either sculptured or painted at the door of every house as a protection against evil. Though often represented as four-armed, and holding the disk (*chukra*), the war-shell, the club, and the lotus, Ganesa is not, *bifrons*, like the Roman guardian of portals. In every transaction he is "AD," or the first, though the hindu does not, like the Roman, open the year with his name. One of the portes of every hindu city is named the *Ganesa Pol*, as well as some conspicuous entrance to the palace: thus Odipoor has its Ganesa *dwara*, who also gives a name to the hall, the Ganesa *deori;* and his shrine is to be found on the ascent of every sacred mount, as at Aboo, where it is placed close to a fountain on the abrupt face of the hill, about twelve hundred feet from the base. There is likewise a hill sacred to him in Mewar called *Ganesa Gir*, tantamount to the *Mons janiculum* of ancient Rome. The companion of this divinity is a rat, who indirectly receives a portion of homage, and with full as much right as the bird emblematic of Minerva. *Moore*, *Tod's Rajasthan*, Vol. I. p. 590-91. See Durga, Ganapati, Kartikeya, Karli, Vidya, Parvati, Mahadeva, Saraswati, Vahan. Inscriptions p. 373, 388.

GANESH CHATURTHI, OR CHAUTH. A hindu holiday. On this day, which falls about the beginning of September, was formed Ganesh, called also Ganapati, made from the turmeric and oil off the head of Parvati. He is the god of wisdom who removes obstacles and is invoked at the commencement of all undertakings. Ganapati has a man's body with the head of an elephant, his head is said to have been cut off or destroyed by

Siva, when Ganesh tried to prevent Siva intruding on the privacy of Parvati when bathing. Clay images of Ganesh are made and worshipped for from one to nine days and are then thrown into water. The Chinchor or Chinchwad who resides at a village of that name near Poona is believed to be an incarnation of Ganesh, who promised an ascetic, named Moroba, who lived in Sivaja's time, that he would be incarnate for seven generations in his family. The earth image of Ganesh is one of three forms in which the earth deity Mrittika is worshipped by hindus. The first the Nagapanchami, in which feast a snake of clay is worshipped; the second is Gokul Ashtami, when a clay image of the infant Krishna is worshipped, and the third occasion is that on which Ganesh is worshipped, and this last day of the worship of Mrittika is observed with great pomp. The vahan or carriage of Ganesh is a rat. The feast in honor of his birth is held on the 4th of the month Bhadrapad, and falls on the first days of September and seems to have some connection with the seasons of the year. Ganesh is brought to the house with much pomp.

GANGA. Hind. Sans. A name, properly, of the Ganges, but applied by hindus to several other rivers of India, amongst others to the Kistna and Godavery and two of its affluents are called the Waen Ganga and Paen Ganga.

GANGA, in hindu mythology, the personified goddess of the river Ganges, the source of which the saivas place in Siva's hair; whence, in graceful flow, she

* * * * sprung radiant
And, descending, graced the caverns of the west.

The vaishnavas assert that it flowed out of Vaikontha, from the foot of Vishnu: and, descending upon Kailasa, fell on the head of Siva, who shook some drops (Bindu) from his hair, and these formed the great lake called Bindu Sarovara, far to the north of Hindustan. Sometimes, the Ganges is fabled to issue from a cow's mouth, and the cleft in the Himalaya is called Gungotri and Gaomuki. Others make it arise from water poured by Brahma on the foot of Siva; others, from the feet of Brahma and others from the fingers of Parvati. The Ganga is also called Dasahara or ten removing, as bathing in her waters, on the tenth day of the month Jyaisha, effaces ten sins, however heinous soever, committed in ten previous births. One of the holiest spots of the Ganges, is where it joins the Jamna, near Allahabad, though, with hindus, the sangam or confluence of any river, is a spot peculiarly revered. A person dying at the confluence of the Ganges and Jumna is supposed to be certain of immediate "moksh" or beatitude without risk of further transmigration. Professor Wilson in his translation of the Mudra Rakshasa describes Ganga as

"by the autumn, led,
Fondly impatient, to her ocean lord,
Tossing her waves, as with offended pride,
And pining fretful at the lengthened way."

Though, as above related, the honor of having given birth to this goddess, the personification of the sacred stream of the Ganges has been claimed for their deities, both by the saiva and vaishnava sects, all sects, and castes of hindus worship this goddess of their sacred stream. Numerous temples are erected on the banks of the river in honor of her, in which clay images are set up and worshipped. The waters of the river are highly reverenced, and are carried in compressed vessels to the remotest parts of the country; from whence also persons perform journies of several months' duration, to bathe in the river itself. By its waters the hindus swear in our courts of justice. Mr. Ward informs us that there are 3,500,000 places sacred to Ganga; but that a person, either by bathing in or seeing the river, may be at once as much benefitted as if he visited the whole of them. For miles, near every part of the banks of the sacred stream, thousands of hindus of all ages and descriptions, pour down, every night and morning, to bathe in or look at it. Persons in their dying moments are carried to its banks to breathe their last: by which the deaths of many are frequently accelerated; and instances have been known wherein such event has thereby been actually caused. The bodies are then left to be washed away by the tide, or numbers of them are to be seen floating up and down with every flood and ebb, or lying all along the banks with vultures, adjutant birds, carrion crows and kites about them feeding upon the remains. Several festivals are held during the year in honor of Ganga. She is described as a white woman with a crown on her head, holding a water lily in one of her hands, and a water vessel in another, riding upon a sea animal resembling a crocodile, or walking on the surface of the water with a lotus in each hand.—*Cole. Myth. Hind. p.* 119. See Ganges, Inscriptions p. 375, 382, 385, 390, Orissa, Siva, Triveni.

GANGA. Singh. A great river; Oya, a small river; Ella, a rivulet.

GANGA-BUL. Tib. Literally, place of the Ganges. A sacred lake on the mountain of Haramuk in Kashmir. It lies under the wildest and most lofty peaks of the mountain; is 1½ mile long and 200 or 300

yards wide, and is about 12,000 feet above the level of the sea.— *Vigne.*

GANGA JAMNI. Hind. A kind of rice of the Kangra district.

GANGAL. A river near Uskalli and Hoshangabad.

GAN-GAN. Burm. Mesua ferrea. *Linn.* In Amherst, a very strong, tough, hard, crooked grained, fibrous, red wood, which would be suitable for machinery or any purpose requiring the above properties.

GANGAPAT, also the Bam, and Lukta, are rivers of Gwalior.

GANGA PAVILI KURA. Tel. Portulaca oleracea. *L.*

GANGA GAVI. Tel. Thespesia populnea. *Corr.*

GANGA REGU. Tel. Zizyphus jujuba. *Lam.* var *B.* oblong fruited.

GANGA VANSA, or Gugu putee, a dynasty that ruled in Orissa from about the twelfth century. Their sway extended from the Hooghly to Conjeveram but in 1558, Gala Paliar the general of Suliman king of Bengal, attacked and killed Mookund Rao, the Guguputee chief of Orissa. Kala Paliar, was a bramin convert to mahomedanism, he razed the hindu temples, and seized the image from Juggurnath which he burned on the banks of the Ganges.

GANGELA ORIENTALIS. One of the Leguminosæ.

GANGER. Hind. (1) Grewia betulæfolia; (2) Sageretia brandrethiana; (3) Ehretia aspera; (4) Lycium Europæum.

GANGES. A great river which rises in the Himalaya mountains and runs in a valley through British India to the Bay of Bengal. It has been known to Europe from very early times. The fleets of the Egyptian kings sailed round the peninsula of India and Ceylon. Seleucus Nicator is said to have penetrated to the mouth of the Ganges and it had been sailed up by the Romans, as far as Palibrotha, before the time of Strabo. Its valley seems to have been peopled by several races, long before the Aryan hindus arrived there, and all the conquerors who have entered India from the North West have striven to occupy the fertile valley of this great river. Hindu poets have celebrated its praises in a multitude of songs: the river is fabled in their mythology to be the goddess Ganga; they long to see it, to bathe in its waters and be purified from their sins, and at last to die on its banks, or to have their bones conveyed to it from the most southern parts of India. No hindu raises such a question as in 2nd King's v. 12, for the Ganges is recognised as the most efficacious of all the hindu sacred rivers. On its banks have dwelt the chief of the religious reformers, whom India has seen. Its valley was the cradle of Buddhism; which, from its rise in the sixth century before Christ, gradually spread over the whole of India, was extended by Asoka to Kashmir and Kabul, shortly after Alexander's invasion, and now prevails amongst 222 millions of men. Numerous dynasties have ruled there. The Andra race was in power on the Gangetic province of India, about the beginning of the Christian era, but the most enduring was the great Chetrya family that long ruled at Indraprestha, and terminated with Prithi-raj in A. D. 1200.

The whole valley is now part of British India. The river issues from the mountains at Gangotri, at an elevation of 13,800 feet, and is there known as the Bhagaratti. It issues from beneath a great glacier, thickly studded with enormous loose rocks and earth. The glacier is about a mile in width, and extends upwards of many miles, towards an immense mountain covered down to its base, with perpetual snow, its glittering summit piercing the very skies, rising 21,000 feet above the level of the sea. The chasm in the glacier, through which the sacred stream rushes forth into the light of day, is named the Cow's Mouth, and is held in the deepest reverence by all hindus; and the regions of eternal frost in its vicinity are the scenes of many of their most sacred mysteries. The Ganges enters the world no puny stream, but bursts forth from its icy womb, a river thirty or forty yards in breadth, of great depth, and very rapid. From the source at Gangotri it runs N. W. to Johnioi; W. and S. W., 36 m.; S., 15 m.; S. E., 39 m.; S., 8. m.; W., 24 m.; S. W; 15 m.; S., 130 m.; S. E. to Allahabad, E. 270 m.; E. to Sikrigallee; and S. E. the remainder of course into the Bay of Bengal, by numerous mouths. The Ganges gives off some of its waters to form the Hooghly, and also anastomoses with the Megna. Length, 1,514 m. It receives the Jumna, 860; Gogra, 606; Gunduck, 450; Goomtee, 482; Sone, 465; Coosy, 325; Ramgunga, 373; Mahananda, 240; Karumnassa, 140; Koniae or Jummuna 130; Alaknunda, 80; Bhillung, 50 m. 398,000 square miles drained, exclusive of Hooghly. The Ganges is navigable for river craft as far as Hurdwar, 1,100 m.; steamers ply as far as Gurmukteesur, 393 miles above Allahabad, distant from Calcutta via Delhi, 930 m.; at Cawnpore, 140 m. above Allahabad, the navigation is plied with great activity. The breadth of the Ganges at Benares varies from 1,500 to 3,000 feet. Mean discharge of water there, throughout the year, 250,000

cubic feet, per second. It falls rapidly to Hurdwar, which is 1,300 miles from the mouth. At Allahabad 840 miles from the sea it receives the river Jumna, which rises at the south western base of the Jumnotri Peaks. At about 240 miles from the coast it begins to divide into branches. The two on the west, called the Bhageratti and Jalingi unite to form the river Hugli, the other stream passes to the Brahmaputra with which the waters mingle and are known as the Kartinassa river. The Ganges receives as tributaries, the Ramgunga, Gumti, Ghogra, Gundak, Kosi and Mahananda, from the left bank; and, from the right bank the Kali, the Kali Naddi, Jamna and Sone. Another dividing stream of the Ganges is the Matabhanga. In its course sixteen hundred miles through the plains, it receives eleven rivers, some of which are equal to the Rhine, and none smaller than the Thames, besides as many others of lesser note. It is owing to this vast influx of streams, that the Ganges exceeds the Nile so greatly in point of magnitude, while the latter exceeds it in length of course by one-third. It is a much discussed question in India, whether the Gangetic plain was ever covered with forest, the best authorities consider that it never was so; but there are others who hold the contrary opinion, and aver that the destruction of the timber has produced a great change in the climate. The absence of vegetable remains in the alluvium appears unfavourable to the latter opinion. There are frequent notices in the ancient writings of the hindus of great forests but whether these were limited locally or were general is unknown. In the plain of the Ganges are the *provinces* of Bengal, Bahar, the Doab or Mesopotamia of the Jumna and Ganges, Oudh and Rohilcund. It is of exuberant fertility. The population of the, *Gangetic* Doab is 800 to the square mile, of the Central Provinces 365. The chief town on the banks of the Ganges are Hurdwar, Bijnour, Furrakkabad, Cawpore, Merzapore, Benares, Ghazipur, Patnan Monghir, Bhagulpur, Rajmahal, Rampur, Pubna. Calcutta is below the sea level. Benares 265 feet above it, Allahabad 305 feet, and Agra 670 feet. The Gangetic Delta is an extensive tract of cultivated and forest-covered country, composed of alluvial or transported soil brought down the country by the Ganges and Brahmaputra rivers, and their numerous tributaries, the water-sweepings of two basins whose aggregate area is 432,480 square miles. The Ganges, in its course of 1,680 miles through the plains of India, receives the following eleven rivers; from its left bank the Ram Ganga, Gumti, Kosi and Mahananda, Gogra, Gandak, and from its right bank the Kali Naddi, Jamna and Sone, and some of which, as Rennell observes, are "equal to the Rhine, and none smaller than the Thames."

The Ganges receives its first increase by the junction of the Bhagarathi and Alacananda 30 miles from Srinagur and then by the Jamna (at Allahabad) (the Jamna rises near its own source) and by the Chumbul and Betwah rivers, which drain the north of the Vindhya mountains. In its course it receives the Spen (Sone) and then the Gogra, Cosi and Gunduk (the last at Moonghyr) where the river is 3 miles broad and 30 feet deep.

Between Sikrigulli and Benares, alone, the Ganges receives the tribute waters of the Gumti, the Gogra, the Sone the Gunduk, the Baghmati, the Gogari the Kosi, and the Mahanadi, of which the Gogra itself is fully equal to the Ganges at Benares. To these we must add innumerable minor streams called nullahs, but which in England would be represented by the Isis, Cherwell, Itchin, Severn, Orwell, Humber, Dee and Trent. Eighteen of these rivers are several hundreds of miles in length, and none less than fifty, whilst there are hundreds under fifty miles in length, all assisting to fill the mighty river Ganges. The Delta is intersected from North to South by many broad rivers, and by endless creeks running one into the other filled for the most part with salt water when near the sea. This tract of land, occupies approximately 28,080 square miles of superficial area, or double the area of the Delta of the Nile; measuring from West to East, or from the right bank of the Hooghly river opposite to the Saugor tripod on the South-west point of Saugor Island, to Chittagong it is 270 miles in width; presenting to the Bay of Bengal a series of low, flat, mud banks, covered at high water and dry at low water; a few miles from low water mark commence mangrove swamps, a little further inland trees appear, and lastly cultivation; the nearest cultivation in the central portion of the Delta being forty-seven miles from the sea. In the sea front of the Delta there are nine principal openings having a head stream, that is having water flowing direct from the Ganges, or from the Megna or Brahmapootra,—they are 1, the Ganges; 2, the Megna or Brahmapootra; 3, Horinghatta; 4, Pussur; 5, Murjatta or Kagga; 6, Barapunga; 7, Mollinchew; 8, Roymungul or Juboona; 9, Hooghly. Besides these large rivers there are numerous openings having no head stream, being mere salt water tidal estuaries; these openings or headless rivers are the deepest as no silt or

deposit is poured into them from the higher lands. The tides in the Hooghly run with a rapidity in the springs of seven miles an hour, between Saugor and Calcutta. At Calcutta it is high water about 2h. 30m. on full and change of the moon. The Bore is of not unfrequent occurrence in this river.

The waters of the Ganges are generally muddy yellow. Those of the Jumna are green or blue, and the yellow and blue rivers of China are named from the colours of their waters. This river's annual rise begins in the end of April and continues to increase till the middle of August, when it reaches in many places 32 feet and the level districts in its lower course are inundated sometimes to the extent of 100 miles. About 200 miles from the sea, the river breaks into a labyrinth of rivers, forming islets covered with woods and known as Sunder-buns, but the force of their waters is insufficient to clear the bars of their mouths, and the most westerly branch, the Hooghly is alone navigable for large vessels. At Benares, after the Ganges has received the waters of its tributaries, the Kalli Naddi, the Gumti and others, the average discharge, each secoud of the year, has been estimated at 250,000 cubic liquid feet. By the latter end of July, all the lower parts of Bengal, contiguous to its banks are overflowed, forming inundations of a hundred miles in width, where little appears above the surface of the flood, save isolated villages and trees. Barks of every kind then steer a direct course, husbandry and grazing are alike suspended and the peasant sculls his boat across the fields. In some parts of Bengal, whole villages are every now and then swept away by changes in its course through districts, from which a few years before, it was several miles distant.

Along the sandy shores of the Ganges valley the ever-present plants are mostly English, as Dock, a Nasturtium, Ranunculus sceleratus, Fumitory, Juncus bufonius, common vervain, Gnaphalium luteo-album, and very frequently Veronica anagallis. On the alluvium grow the same, mixed with tamarisk, Acacia Arabica, and a few other bushes. *Hooker, Him. Jour.* Vol. I. p. 80. *Markham's. Shooting in the Himalaya, p.* 57-8. *Cal. Rev. Pages* 1 *and* 2. *Horsfield. Royal Sanitary Commission Report.*

GANGES CANAL. The provinces of Upper India are as remarkable for their fertility and high state of cultivation, as for their being subject to periodic visitations of famine. *Tr. Hind.* From the Ganges at Cawnpore to the Jumna at Agra the distance is nearly two hundred miles. All this long tract is unwatered by a single natural stream. To conquer nature, the great Ganges Canal was projected by Sir Proby Cautly K. C. B., during the administration of Lord Dalhousie and it is unquestionably the greatest work of irrigation ever accomplished in any tropical country at any epoch of history. It cost a million and a half sterling, nearly all of which was expended during the seven years of Lord Dalhousie's administration and the main stream was opened on the 8th April 1854. It extends over 525 miles in length; measures 170 feet in its greatest depth. Its length is five fold that of all the main lines of Lombardy united, and more than twice the length of the aggregate lines of Lombardy and Egypt together, the only countries in the world whose works of irrigation rise above insignificance. It nearly equals the aggregate length of the four greatest canals in France: greatly exceeds all the first-class canals of Holland put together and is greater by nearly one-third, than the greatest navigation canal in the United States of America. When completed it will be 900 miles in length, and it is estimated that the area which may be irrigated by its waters, will not be less than 1,470,000 acres. The following are the principal levels along the various lines of the Ganges Canal. The levels refer to the bed-flooring of all works.

(*a*) Main trunk line.

The Ganges Canal bouches in two branches, one to the Jumna, and the other to the Ganges.

GANGHI. A river of the Ghazipur district runs near Syedpoor in Gazeepoor.

GANGI. Hind Grewia bitulæfolia.

GANGHI CHU. Hind. Tib. Euphorbia, sp.

GANGHI SHO. Hind. Tib. Cactus Indicus.

GANGORI. A hindu festival sacred to the goddess Gouri. Col. Tod remarks that by the prefix of *Ganga* (the river) to *Gouri*, the *Gangori* festival is evidently one, essentially sacred to a river goddess, affording proof of the common origin of the rites of the Isis of Egypt and India. For Gouri is the goddess of abundance, and is called Isa, also Isani or Parvati, also Lakshmi and corresponds to the Ceres of Greece. The festival relates to the Bassant or spring, the vernal equinox. An image is made of earth, barley is sown and by watering and artificial heat is made to grow. In Rajputanah beautiful girls carry the idol and bathe it in the water, and return with it to the palace. The festival resembles that of the Egyptian Diana, at Bubastis, and of Isis at Busiris within the Delta of the Nile. During the festival, Iswara yields to his consort Gouri, and occupies an unimportant position near her at the waters edge, meanly clad, smoking intoxicating herbs, and, whether by accident or design, holding the stalk of an onion in full blossom as a mace or club, a plant regarded by some of the Egyptians with veneration, but held by the Hindus generally in detestation: but why the hindus should, on such an occasion, thus degrade Iswara is not apparent. *Tod's Rajasthan*, Vol. I. p. 575. See Gauri, Gouri

GANGOTRI, 31° 0', 78° 56', in Garhwal. A celebrated hindu temple is on the right bank of the Bhagiratti in its upper course, 10,319 feet above the sea. Near the temple the scenery is grand. Four peaks rise there, huge, lofty, covered with snow, and the river runs impetuously in its shingly bed, the stifled sound of the stones which it rolls along, mixes with the roar of its waters. Soorgarounee is the nearest of the peaks and forms the western point of the great snowy hollow. Roodroo Himala is the eastern, and forms the other point; but from that point runs down, a huge snowy shoulder that seems to give off or end in the mountains that surround and form a great unbroken, though unequal, snowy ridge, bounding and confining the glen of the Bhagirattee. The other three peaks form different points in the back of the immense hollow, and altogether compose one of the most magnificent and venerable mountains, perhaps, that the world can produce.—*Fraser's Himala Mountains*, p. 468, 473. *Herbert, Hodgson.*

GANGPUR. A tributary estate S.E. of the Colehan. With the exception of Gangpoor and Bunni, all the districts in the Sumbulpore and Patna groups have been recently put under the administration of the Superintendent of the Cuttack Tributary Mehals See Kol.

GANGRI or Kailas mountain range extends in one unbroken chain from the source of the Indus, to the junction of the Shayok, and forms the natural boundary between Ladak, Balti and Rongdo on the south, and Ruthog, Nubra, Shigar and Hunnager on the north. It has six passes, at heighths from 15,000 to 18,105 feet. Gangri, in Tibetan, means ice-mountain. Kailas means crystalline or icy, and is derived from Kelas, crystal, which is itself a compound of *Ke* water and *las* to shine. Kailas or ice mountain, is the Indian Olympus, the abode of Siva and the celestials. The Tibetans look upon Ti-se or the Kailas Peak as the highest mountain in the world. See Indus. Kuen-lun.

GANGRI. Tib. Ice mountain.

GANGSALAN. Jav. Pomegranate.

GANGTUNG. See Kunawer.

GANGUE is the mineral substance which encloses or accompanies any metallic ore in the vein. Quartz, lamellar carbonate of lime, sulphate of baryta, sulphate and fluate of lime, are common gangues; but many other substances become such when they predominate in a vein. The word is pronounced *gang*: it is from the German *gang*, a vein or channel. *Faulkner.*

GANGUN. A river near Moradabad cantonment, and near Nageena in Bijnour.

GANHAR. Hind. Amarantus anardana; also A. mangostanus.

GANHILA. Hind. Premna mucronata.

GANHIRA. Hind. Nerium odorum,

GANHULA. Hind. Sambucus ebulus.

GANHULI. Hind. Phænopus, sp.

GAN-HWUY is the western division of the ancient province of Keang-nan, being composed of about two-fifths of that province

GANI. Hind. Oxystelma esculenta.

GANIRA. Hind. Nerium odorum.

GANITRUS SPHÆRICUS, Gaertn, syn. of Elæocarpus prinoïdes. The nuts, cleared of the soft pulp or flesh that covers them, are curiously sculptured, and being bony and taking a fine polish they are frequently set in gold and strung into necklaces. Ganitrus sphæricus, is a middle-sized tree, common in various parts of India, as well as the Malay Archipelago, and those of Monocera tuberculata, from the forests of Travancore, are what are principally used for this purpose.

GANJ. Hind. A wholesale grain market. *Wils.*

GANJ-I-BAR. A bald tract in the central dorsal plateau in the Manja or middle part of the Baree doab. The soil of the Ganj-i-Bar is intensely arid, often saline and produces only some salsolaceous plants with a few bushes of jhand.

GANJA. HIND.

Hemp,	ENG.	Ganja maram,	TAM.
Ganjah,	„	Ganja chettu,	TEL
Ganza,	GUZ.		
Gindshi	JAV.		

The leaves and flowerhead of the hemp plant; also the knots or stocks of the plant picked of. The dried hemp plant which has flowered and from which the resin (see churrus), has not been removed, is, in the Punjab, called ganjah. Bundles of ganjah are about two feet long, and three inches in diameter. The colour is dusky green, the odour agreeably aromatic, the whole plant resinous, and adhesive to the touch. Ganjah is used chiefly for smoking. The narcotic effects of the hemp plant are popularly known in the north of Africa, South America, Turkey, Egypt, Asia Minor, India, and the adjacent territories of the Malaya, Burmese, and Siamese. In all these countries, hemp and its products, are used in various forms, by the dissipated and depraved, as the ready agent of a pleasing intoxication. The leaves or young leaf buds of the hemp-plants, are smoked by itself, or rubbed between the hands and added to tobacco, to increase its intoxicating powers. —*Faulkner. Royle. Waring. Birdwood.*

GANJA. HIND. of Kalesar forest, &c., Robinia macrophylla.

GANJA. The boat used for travellers on the Nile is so called.

GANJA-YENNAI. TAM. Hemp seed oil. See Oil.

GANJAL. A river near Hoshangabad.

GANJAM is the most northerly revenue district in the Madras Presidency, with two chief towns, Ganjam and Chicacole. It suffered from famines in 1789, 1800, 1836, 1866 and in the last, nearly the half of the people were lost. The third known period of scarcity in Ganjam, occurred in 1836, after an interval of 36 years. Cholera was very prevalent, and many of the cattle also perished. After the further lapse of a quarter of a century, Ganjam was a fourth time visited by a severe drought, during the latter part of 1865 and the early months of 1866. Contrasted with 1836 & 1866, it is worthy of note that the two earlier famines of 1789 and 1800, began in the north of the Ganjam district, and increased in intensity towards the south, whilst that of 1836, as in 1866, was felt with greatest severity in Orissa and parts of the district adjacent to Bengal. In the 20 years ending 1867, the value of land in Ganjam increased 50 per cent. and carts from 6,000 to 32,000. Ganjam in 1867 had 1,235,790, people in 285,253 houses, in an area of 6,400 square miles. The area of that part which extends from the Chilka Lake on the north, southwards as far as Itchapoor, and then turning again towards the north, forms a sort of basin enclosed by the Khond Hill ranges, and amounts to about 2,500 square miles with a population of 631,929. Of this number 363,288 are cultivators. The district comprises the two divisions of Chicacole (the southern) and Itchapore (the northern), with Preaghee. It contains seven government talooks, viz., Waddah, Itchapore, Paulatalagum, Poobacondah, Goomsoor, Soradah, Moherry. The revenue of the Government lands therein, is about 4¾ lacs. There are nineteen ancient zemindaries, paying an annual peshcush of about 3 lacs; and thirty-seven proprietary estates. The district contains several petty chieftainships, which yield no revenue and it embraces a large portion of the mountainous tracts known as Khondistan, and the valley of Chocapaud from none of which is any revenue derived. The Ooria language prevails in the northern part of the districts, as far south as Itchapore. In the southern division, the Telugu prevails. The Khond race have a language peculiar to themselves, which was reduced to writing by Captain J. P. Frye of the Madras N. I. Of the inhabitants, about 4¼ lacs are Oorias. A great many of the Ooria bramins obtain their livelihood as cultivators. Bramins of this sect also trade, and follow the occupations of brick-makers, brick-layers, &c. Chicacole is the principal civil station in the Ganjam district. It is in Lat. 18° 18′ N. Long. 83° 58′ E. about 567 miles from Madras. It lies four miles direct west of the sea, and is situated on the north bank of the river Naugooloo. It is the station of the judge, and the sub-collector. The town of Ganjam is in lat. 19° 22′ N., long. 85° 10′ E. It was nearly deserted in 1835 in consequence of fever, and Chicacole is now the largest town. Aska is a large sugar manufacturing place, Mansoorcottah and Calingapatam are increasing seaports. Chilka lake, in Ganjam, is 35 miles long and about 8 broad with numerous islets.

GANJAYI. TEL. Cannabis sativa, *L.*

GANJ BAKHSHI. See Hindu; Sikh.

GANJIFEH. HIND. Playing cards.

GANJI GADDA. Tel. Commelina Q. Urgenia sp ?

GANJIKA. Sans. Ganjah.

GANNA. Hind. Saccharum officinarum, Sugar-cane.

GANNA, Sans. Amarantus campestris. *Willde.*

GANNERU. Tel. Nerium odorum. Ait. Oleander.

GANNET. A sea-bird, the Sula alba. It measures about 5 feet across and $2\frac{3}{4}$ feet long.

GANONG, generally called Ayen Panas, hot springs in Nanning. All the hot springs of the Malayan Peninsula, and some of those in Sumatra, occur in swampy flats. That of Ganong occurs at or close to the line up to which plutonic action has converted the rocks of the district into granite.

GANPATTY. The hindu god of wisdom. See Ganapati; Ganesa.

GANTHA. A bell: one used in the holy ceremonies of hindus, and which is rung at certain times to keep away evil spirits. These bells, as well as the lustral spoons, are usually surmounted by the figure of the deity in whose worship they are used.—*Cole. Mythl. Hind.* p. 380.

GANTELU. Tel. Pencillaria spicata. *Swartz.*

GANTH Hind. Also ganthi, a knot, Mahomedans usually keep a string for their children on which they tie a knot, each birth day, hence baras-ganth a birth day knot, a birth day.

GANTHIA. Hind. Allium cepa.

GANTHIAN. Hind. Ipomæa reptans.

GANTU BHARANGI. Tel. A species of Clerodendron, a low herbaceous plant, common about Lamsingi in Vizagapatam, the roots of which are largely exported for medicinal purposes.

GANUKA PINDI KURA. Tel. Melochia corchorifolia.

GANYERI. Hind. Zizyphus vulgaris.

GAO, written also Ganw or Gaon. Hind. a village. Travellers in India reckon the day's distance of journies by the Gao or village. Das Gao would mean ten days' journey.

GAO. Hind. A Cow. In hinduism, the gao, or cow, is symbolic of Prit-hu, the earth. A Gao-kos is the distance that is measured by the audibleness of the bellowing of a cow from one extremity to another. *Tr. of Hind.* Vol. II., page 40.

GAO-CHARHAI. Hind. Grazing.

GAOHATTY. A town in Assam the ancient Kasawati. See Gowhatty.

GAOLA. The milkman race, they have considerable herds of cattle. Greek, Gala, milk. See Gala: Galatian, Goala, India. p. 327.

GAO-LOCHAN. Gall stones, extracted from the gall bladders of dead cows, much used in medicine, also in charms; and in painting.—*Gen. Med. Top.* page 136.

GAON. Hind. A village pronounced gam also gang, supposed to be from the Sanscrit grama, and to be represented in the Chinese heong and Singalese gama.

GAON KORAWA. A section of the Korawa race. See Corawa Korawa.

GAOON. Guz. Wheat.

GAO ZABAN. Pers. Lit. cows tongue, of the bazaars of India, is obtained from Cacalia Kleinia, *W.* Anisomeles Malabarica; Trichodesma indicum: Heliotropium erosum, H. ophioglossa, Trichodesma indicum, Onosma bracteatum, O. macrocephala, and Macrotomia euchroma.

GAPTA. A part of the name of Chandragapta.

GAPURJI. Hind. Bixa orellana.

GAR. Tibetan, a fort. In Sanscrit a district, a region, as Kash-gar, Gujar-gar, Cutchwahagar. See Ghur.

GARA. An agricultural tribe in Seharunpore. They are mahomedans and are supposed to be converted slaves, like the Jhoja.

GARA. A river of Rewah.

GARA CHETTU. Tel. Balanites Ægyptiaca *Delile.* var. Indica.

GARAGA. Tel. Gardenia gummifera. *Linn.*

GARAIN. Hind. The Himalayan nettle, a species of Urtica.

GARAKHPUR. Near Magor, the place where the hindu reformer Kabir died. See Kabir Panthi.

GARANDU. Hind. of Murree, Prinsepia utilis.

GARAN. A mole. See Kuwera.

GARAPAGARI. Mahr. A person who pretends to have the power of diverting hailstones off from fields. See Garpagari.

GARAR. Hind. The Gurgura of the Salt Range, Reptonia buxifolia.

GARBA GANDA. Hind. Saccharum sara.

GARANTOGNES? Ginseng.

GARCE. A grain measure equal to $9256\frac{1}{2}$ lbs.

GARCIAS AB HORTO. Physician to the viceroy at Goa, author of a work entitled De Arom. et Simp. Historia. 1565. King.

GARANIA SPECIOSA? Balawa. Burm. A tree of Moulmein. Used in common purposes of building.—*Cal. Cat. Ex.* 1862.

GARCINIACEÆ. A natural order of plants consisting of trees or shrubs, of which

sixty occur in the East Indies, in Ceylon, the peninsulas of India, the Khassya mountains, Silhet, Java and the Moluccas. Of these are 30 species of Garcinia, 20 of Calophyllum, 6 of Mesua, 1 of the genus Gynotroches, 1 to Kayea, 1 to Calysaccion and 1 to Apoterium. The species of this order all abound in a viscid, yellow, acrid, and purgative gum resinous juice, resembling gamboge. This gum resin is obtained by removing the bark or by breaking the leaves or young shoots. It is met with in commerce as the fine or gum gamboge, cake or lump gamboge, and coarse gamboge, and the finest kinds are obtained from Siam. The genera are as under,

Garcinia	Calysaccion	Micranthera
Mammea	Rheedia	Quapoya
Mesua	Pentadesma	Clusia
Calophyllum	Moronobea	Tavomita
Kayea		

GARCINIA. A genus of plants, trees of considerable size, consisting of about 30 species, growing in Ceylon, Travancore, Malabar, and other parts of the peninsula of India, in Sylhet, Assam, the Malay peninsula, and the southern parts of China. Several of them yield edible fruits, and one of them is the Mangosteen fruit tree, G. Mangostana, L., a tree of the Malay peninsula and islands of the Moluccas: G. Kydia, Roxb., of the Andaman islands, is a tree with a sharp but agreeably acid fruit, similar to the large fruit of G. pedunculata, Rox., which grows on Rungpore: G. paniculata, Roxb., a tree of Sylhet, has a palatable fruit something like the mangosteen: G. Roxburghii, Wight, a tree of Travancore, Malabar and Chittagong, has an edible but very acid fruit: G. purpurea, Roxb., grows on the western coast of peninsular India. Useful timbers are obtained from others, but the species are not defined, viz., the Parawah, Youngzalai and Plloua of Burmah. The other species, are speciosa? celebica, dioeca, lanceæfolia, porrecta, Cochin-chinensis, Javanica, bhoomicowa. The fruits of several species of Garcinia besides the mangosteen, are brought to table in the countries where they grow, but they are regarded as very inferior. The Mammee Apple, or Wild Apricot of South America, is said to be very delicious. Its seeds are anthelmintic; its flowers yield on distillation a spirit known as Eau de Creole, and wine is obtained by fermenting its sap. The large berries of the Pacourynva (Platonia insignis) of Brazil are highly prized on account of their delicious flavour.—*Voigt. Ainslie, Eng, Cyc. O'Shaughnessy.*

GARCINIA CAMBOGIA, *Desrous.*, not *Roxb.*

G. gutta,	L	G. Kydia,	W. & A.?
G. Roxburghii,	Wight.	G. Indica,	Choisy.
Wontay,	Cam.	Gorakah-grass,	Singh.
Valaitie amlie,	Duk.	Karka-pulie maram?	Tam.
Kurka pulie,	Maleal.		
Racta shrava,	Sans.	Woda chinta chettu?	Tel.

A tall tree, growing in Ceylon up to 1,500 feet, grows in Travancore and in the forests of Malabar, is very abundant in Tenasserim, and very common in Siam and Cambodia. It yields a pleasant tasted acid fruit.—*Eng. Cyc. Drs. Ainslie, Mason. Thwaites.* See Gamboge.

GARCINIA CORNEA, *Linn.* A tree of Moulmein, Penang, and Amboyna, with a tall though not very thick trunk. The wood is heavy though not very hard, like horn, and is used for the handles of tools. The young trees are used also for house building purposes, but the timber of old trees is too hard to work. The fruit has a resinous smell. *Dr. O'Shaughnessy, Eng. Cyc. Roxb.* ii, *p.* 229.

GARCINIA COWA?

Toung-tha-lai,	Burm.	Cowa,	Hind.
Toung-da-lai,	,,		

Garcinia cowa was found by Drs. Hamilton and Royle, M. D. at Monghir.

GARCINIA ELLIPTICA. *Wall.*

Gamboge Tree, Eng. | Tha-nat-dau, Burm.

Dr Wight considers this to be the gamboge-tree of Tavoy and Moulmein, and not improbably of Siam, the juice is quite emulsive, it could be used readily as a pigment. All the other juices of the Guttiferæ examined are resinous, and do not mix with water, in short are not emulsive. *Drs. Wight and Christison.*

GARCINIA GLUTINIFERA? *Ainslie.*

Panichekai maram. Tam.

Dr. Wight says this is one of the very few trees admitted into his list of Coimbatore woods that he had not himself seen and verified, and it was introduced in the hope, that some resident on the Malabar coast, would favour him with specimens to determine its name and botanical relations. Dr. Gibson believes that a Diospyros must be here meant, but thinks it may be that the Garcinia sylvestris of the Bombay forests is alluded to. If so, the tree, he says, is common in the southern Konkan, Malabar and Canara: always planted, affording a good wood and palatable fruit, from the kernel whereof is extracted by boiling the vegetable concrete oil "kokum." The dried fruit is a common ingredient in native cookery, having an agreeable acid.—*Drs. Wight and Gibson.*

GARCINIA GUTTA, *R. W.*

Cambogia gutta, *Linn.*
Hebradendron cambojioides, *Graham.*

A tree, native of Ceylon, not uncommon about Colombo, and generally on the south-west coast of the island. Produces a kind of gamboge---*Wight's Illustrs.*, i. 126.

GARCINIA MANGOSTANA. *Linn.*

Mangosteen, ENG.	Manggusta, MALAY.
Mungeestun of BOMBAY.	Manggosta, "
Men-gu, BURM.	Manggis Malay of Baloi Java, SUNDA.
Manggisi, Bugis of CEL.	Mangu, "
Manggos, LAMPONG.	

A tree of the Malay peninsula and the Archipelago, which yields the delicious mangosteen, the most palatable of all known fruits. It is a very handsome tree, the foliage, which is large and opposite, being of the darkest shining green. The fruit, is a drupe as large as a moderate apple, is composed of an outer skin of a soft and fibrous nature, brownish red or dark purple on the outside, but when cut, of a bright crimson, the snow white pulp which envelopes the seeds, lying within this, has an appearance no less beautiful to the eye than the flavour is grateful to the palate. Its characteristic quality is extreme delicacy of flavour without being rich or luscious. When cultivated, as in the peninsula of Malacca, it fruits twice a year, being ripe in July and December. It grows in perfection as far as 14° N. of the equator and 7° South of it. A congenial proportion of heat and moisture throughout the year seems much more requisite than soil or latitude for the successful growth of this fruit. The coat or rind of the mangosteen fruit, and the bark of the Katapping or wild almonds (Terminalia catappa), are used for dyeing black. It has been introduced into Travancore. *Crawfurd's Dict. Low's Sarawak*, p. 72, *Marsden's Hist. of Sumatra*, *p.* 97, *Roxb. ii.* 618. *Voigt.*

GARCINIA PEDUNCULATA. *Roxb.*

Tikal, HIND. Tikur. HIND.

A tree of Rungpore, its fruit weighs about 2 pounds. The fleshy part has a sharp pleasant acid taste, and is used in curries sliced; they keep for years and might be useful in long voyages. *Roxb.*

GARCINIA PICTORIA. *Roxb.*

Hebradendron pictorium. CHRISTISON.

It yields Ossara-rewund, a gamboge at least equal to that of Siam or of Ceylon.

GARCINIA PURPUREA. *Roxb.*

Kokum of Bombay, ENG.	Brindao of Goa
Kokum butter tree, "	G. Cochinensis D. C.

This tree grows on the western coast of peninsular India and in ravines of the Konkan. Its fruit yields a solid vegetable oil which melts at a temperature of 95°. It now forms an article of export. The seeds are first sun dried, and then pounded and boiled in water, the oil collects on the surface, and on cooling concretes into a solid cake. When purified from extraneous matter, the product is of a rather brittle quality, of a pale yellowish hue, inclining to greenish, and mild to the taste. The seeds yield about one-tenth of their weight of oil. It is admirably adapted for compounding healing ointments.

GARCINIA ROXBURGHII, *R. W.*

G. Cambogia, ROXB. DESR. not G. Zeylanica, ROXB.	G. affinis, W. & A. G. cowa, ROXB.
Toung-tha-lay, BURM.	Cowa, HIND.

A tree of Ceylon, Travancore, Malabar, Chittagong, and scattered over the hills of British Burmah but scarce. Wood not used, but is yellow and fit for a fancy wood. A cubic foot weighs lbs. 42. In a full grown tree on good soil the average length of the trunk to the first branch is 20 feet and average girth measured at 6 feet from the ground is 6 feet. Fruit eatable, but very acid.—*Drs. Brandis & McClelland, Cal. Cat. Ex. of* 1862, *Voigt, Wight's Illust.* i *p.* 125.

GARDALA. HIND. of Kangra, Bergera Konigii, *Linn, W. & A., Roxb.*

GARD-DEZ. In Afghanistan, remains of Pyrethræ or fire altars are still to be seen on its hills, as also at Bamian, Seghan and other places, showing that fire worship had existed to a certain extent. See Kaffir.

GARDEN. Balsam is the flowering plants of the genus Impatiens.

GARDEN CRESS. Lepidum sativum.

GARDENIEÆ. CHAM. and SCHLECHT, a section of the Order Cinchonaceæ. In this order of plants there are seven sections, in which 233 genera are included, of these, there are 695 species known in the East Indies, 3 in Zanzibar, 4 in Arabia, 3 in Persia, 18 in China, 3 in Timor, and 3 in Japan.

The *Sec.* B. *Gardenieæ* comprises
20 Mussænda, 2 Gynopachys, 14 Stylocoryne.
22 Gardenia, 17 Randia, 1 Griffithia.
4 Menestoria, 1 Heliospora, 1 Hyptianthera.
3 Bertiera, 4 Petesia, 4 Petunga.
2 Macrocnemum.

GARDENIA. A genus of plants of the Order Cinchonaceæ and section Gardenicæ. Wight in his Icones gives figures of 11 species, but the known species in the S.E. of Asia are 23 in number, amœna, anisophylla, arborea, calyculata, carinata, chinensis, coronaria, densa,

dumetorum, enneandra, florida, gummifera, latifolia, longispina, lucida, macrocarpa, rothemanuia, montana, radicans, thunbergia, turgida, uliginosa, and obtusifolia.

Two of the species G. florida and G. radicans, are known as Cape Jasmine, their flowers are highly scented, readily grown by cuttings, they thrive in any garden soil and only require a moderate share of water to flower abundantly, their colours are pink, white, and pale yellow. G. arborea grows in the South of India. G. campanulata is a shrub of Chittagong. Its berry is about the size of a golden pippin apple and is employed as a cathartic and anthelmintic. One species of Gardenia (Telaga. Tel.) is a tree of the Godavery forests and Dekhan, and furnishes a very hard wood which would be very good for turning. G. cariata *Wall*, grows in the Batticoloa district of Ceylon.—*Riddell, Thw. En. Pl. Zeylan*, ii. 159, *Voigt* 377.

GARDENIA CORONARIA. *Buch.*

G. costata, *Roxb.*

Yin-gat,	Burm.	Yen Khat,	Burm.

A tree of Chittagong and Moulmein indigenous in Tenasserim. It produces a profusion of flowers that are white when they first open out in the morning, but on exposure to the sun, become quite yellow. Wood used for building purposes. This wood has a fragrant smell, and would be useful for boxes, but, unfortunately, when cut into planks there are so many flaws and cracks, that it is difficult to procure a piece of any size; it is a strong tough wood and useful for turning. Fruit edible.—*Mason Voigt, Cal. Cat. Ex.* 1862, *Major Benson.*

GARDENIA DUMETORUM. *Retz.* syn. of Randia dumetorum.

GARDENIA ENNEANDRA, *Kon. W. & A.*

Gardenia latifolia, *Roxb.*; *Cor. pl.*
Bikki, Tel.

A small tree of peninsular India, growing in the Carnatic, the Nalla Mallai, the Circars, Khandesh and Guzerat. It furnishes a light wood of little use. Native combs are made of it.—*Voigt, Mr. Latham.*

GARDENIA FLORIBUNDA—?

Thet-ya,	Burm.	Tung-hsen-pan,	Burm.

A tree of Moulmein. This wood is made use of for ordinary house building purposes —*Cal. Cat. Ex.* 1862.

GARDENIA FLORIDA. Linn.

Wax flower Gardenia,	Eng.	Tugu-hsen-pan,	Burm.
Thet-ya,	Burm.	Gul-chand,	Hind.

Wax-flower gardenia is a small shrub of slow growth, cultivated in Japan, the Moluccas and India. Both double and single varieties are common in gardens at Ajmeer; the foliage is beautiful and the pure white double blossom are elegant and fragrant. Most Tenasserim gardens, are graced with this tasteful shrub. Its pure snowy blossoms, strongly fragrant, smell "like the narcissus;" and they contrast delightfully with the thick deep green foliage in which they are set.—*Genl. Med. Top. p.* 185. *Mason.* See Gardenia.

GARDENIA FORTUNIANA, is a most fragrant Chinese plant and now common in English gardens, to which it was introduced by the Horticultural Society in 1845.—*Fortune's Tea Districts, p.* 17.

GARDENIA GUMMIFERA. *Linn.; Roxb.; W. & A.; W. Ic.*

Gardenia arborea, Roxb.

Gummy Gardenia,	Eng.	Chatta matta,	Tel.
Chiri bikki,	Tel.	Garaga,	„

A large shrub or small tree, with large fragrant flowers, which, in the morning, are white, and become yellow by the evening. The wood is hard. The natives eat the fruit. It grows in Ceylon, in the Gingi hills, on the Godavery and in the Circars, and is very common about Duddi, on the Gutpurba river, grows wild on the hills in the Kotah jungles, the leaves and unopened blossoms being shrouded at the point in pure fragrant gum resin, said to be one of the sources of the Dikamully resin.—*Genl. Med. Top. p.* 185. *Voigt, Captain Beddome. Mr. R. Brown.*

GARDENIA LATIFOLIA *Ait.*

Papura,	Hind.	Karinguva,	Tel.
Kumbay maram,	Tam.	Kokkita,	„
Bikki,	Tel.	Kurukiti,	„
Konda manga,	„	Pedda karinga,	„
Kakkiti chettu,	„		

GARDENIA LATIFOLIA.

Broadleaved Gardenia,	Eng	Papura,	Hind.

Grows wild in the moist Kotah jungles and is also cultivated in gardens. It is a small tree in the south of the peninsula of India and also on the Godavery, wood close grained, and promises well for turning.—*Genl. Med. Top. p.* 185. *Captain Beddome.*

GARDENIA LUCIDA. *Roxb.; W. & A.*

Gardenia resinifera. Roth.

Kun kham,	Ar.	Cumbi,	Tam.
Tsay-thsm-by-ah,	Burm.	China karinguva,	Tel.
Dikamalli,	Duk. Guz. Hind.	Tella manga,	„

Grows in the southern Mahratta country, Circars, on the Godavery, Chittagong and Burmah, and gives a close grained wood, well adapted for the lathe: like that of several other species of Gardenia and Randia, it is used for making combs. A cubic foot

weighs lbs. 49. In a full grown tree on good soil the average length of the trunk to the first branch is 15 feet and average girth, measured at 6 feet from the ground is 3 feet. Its resin, Cumbi-pisin, Tam., is a strong disagreeable smelling gum-resin; procurable in most Indian bazaars. It is much used by native doctors, when dissolved in spirits, as an external application, for cleaning foul ulcers. It is now used by some European practitioners in cases of worms in children.—*Faulkner, Voigt, Dr. Brandis, Captain Beddome.*

GARDENIA MONTANA, is common in the coast and inland jungles of Bombay and may be recognised by its straight stem, long stout thorns and general absence of leaves. The wood is hard, but always small, never squaring to more than 3 inches.—*Dr. Gibson.*

GARDENIA PAVETTA. ROXB. Syn. of Stylocoryne webera.—*A. Ridi.*

GARDENIA RADICANS, Cape jasmine. This favourite shrub should be planted in a well manured flower bed or border which has been drained with sand. they require a soil more approaching to sand than clay and plenty of water; propagated by cuttings in boxes or seed pots during the rains. It is a native of China.—*Riddell.* See Gardenia arborea.

GARDENIA RESINIFERA. ROXB., syn. of Gardenia lucida.—*Roxb.*

GARDENIA SPECIOSA. ROTH., syn. of Guettarda speciosa.—*Linn.*

GARDENIA SPINOSA. LINN. syn. of Randia dumetorum.—*Linn.*

GARDENIA TETRASPERMA.

Kurkuni, tulikukar of HAZARA.
Bandaru, putkanda, daru, bakshi of KANGRA.
Jirndu of RAVI.
Bisindidi, CHENAB.

GARDENIA TURGIDA, *Roxb.*

Nunjoonda maram, TAM.

Dr. Wight says, he only knew this from small specimens, and was unable to say whether it is a tree or shrub, but believed the former; the wood is hard and close grained, and is useful in cases where small timber will serve. Dr. Gibson asks if Wight's Gardenia turgida be not G. montana (?) and adds "I do not recognise this species or variety; neither do I find it noticed in Dr. Wight's Prodromus. If it be our Gardenia montana, the tree is rather common in the coast and inland jungles. It may be recognised by its straight stem, long stout thorns, and general absence of leaves. The wood is hard, but always small, never squaring to more than 3 inches." The Gardenia turgida of Roxburgh is a tree of Bhootan, both it and G. montana are in Wight's Icones, ii. t. 577 and 579.—*Drs. Wight and Gibson.*

GARDENS, are kept up by almost every European in the South and East of Asia. Exotics, principally annuals, are largely cultivated and exotic vegetables are grown for the table. But the British India Government have a large gardenat Saharunpore, gardens at Garden Reach, Calcutta, Ootacamund, and Dapoolee, and they aid the garden of the Agri-Horticultural Society at Madras. The Mysore Government support a good garden at Bangalore. A botanical garden is kept up at Batavia in Java, at a considerable expense, defrayed by the Netherland Government. The Government gardens, as also those of the Agri-Horticultural Societies are for the object of encouraging the cultivation of useful and ornamental plants. A garden is the delight of the mahomedans in India, who give them loving names as Lal Bagh, Farkh Bagh, Roushan Bagh. Alike amongst mahomedans and hindus, the formation of a garden as a place of retreat is a great object. In Wilson's specimens of the hindoo drama, which he translated from the Sanscrit, "The Necklace," and "The Toy cart," contain beautiful allusions to gardens in India;

"The garden is now most lovely. The trees partake of the rapturous season, their new leaves glow like coral, their branches, wave with animation in the wind, and their foliage resounds with the blythe murmurs of the bee. The bakula blossoms lie around its root like ruby wine; the champaka flowers blush with the ruddiness of youthful beauty; the bees give back in harmony the music of the anclets, ringing melodiously as the delicate feet are raised against the stem of the asoka tree."—*The Necklace, Act I, page* 272.

"Look round the garden with these stately trees,
Which, daily by the king's command attended,
Put forth their fruits and flowers
And clasped by twining creepers, they resemble
The manly husband, and the tender wife."

Toy Cart, Act 8, *page* 125.

This play is supposed to have been written by king Sudraka, over what kingdom he reigned, is not ascertained with certainty. Mr. Wilson remarks in his introduction to the 'Toy Cart,' page 9, that it may be safely attributed to the period when the sovereign Sudraka reigned, whether that be reduced to the end of the second century after Christ, or whether we admit the tradition, chronologically, and place him about a century of our era. These

specimens of the hindoo drama show how little is the change in the customs of the hindoos since the plays were written.

The British Indian Government has recently encouraged its European and Native soldiers to form kitchen gardens and the following list will show the time needed for the ordinary plants to come to maturity.

Name.	Period required to grow fit for use	Period lasting afterwards.
	Days.	*Months.*
Mustard...	10 to 12	1

Specimen of the Theatre of the Hindoos, translated by Mr. Wilson.—Chow Chow, page 218.

GARDEN SNAIL. Helix, *species*. See Helicidæ.

GARDHA-BHELA of Kakustha or Sooryavansa. A rajah who ruled in Balabhipoora in S. 523, is surmised to have been a son of Bahram Gour, one of whose sons, it is known obtained dominion at Puttun. All that is known of him, is from a passage in an ancient Jain MS., which indicates that in "S. 523, rajah-Gardha-bhela, of Kakustha, orSooryavansa, ruled in Balabhipoora."

GARDI GAVAPU. Tulu. Aristolochia bracteata.—*Retz.*

GARDNERIA NUTANS. *S. & Z.* A tree of Japan.

GARDUL. Hind. of Bombay. Entada pusætha. D. C.

GAREE a carriage and the man who drives it is called a Gareewan; also pronounced Gadi and Gadeewan.

GARCIA SILVA FIQUERVA in A. D. 1627, visited Persia on a diplomatic mission.

GARELU. Hind. Ficus reticulata.

GARERITA. One of the Coleoptera.

GARG. A celebrated rishî and founder of the Garga family, one of the 66 sub-divisions of the Kanojia brahmans. *Wils.*

GARGA. A ruler of the Shaka. See Inscriptions, p. 374. Karli.

GARGA. A hindu astronomer. See Yudhisht'hira.

GARGA BANSI. Hind. A tribe of rajputs so called, chiefly in Gorakhpur and Azimgarh. *Wils.*

GARGES. Hind. of Salt Range, Grewia rothii.

GARGUSA. Hind. of Salt Range, Acacia leucophlœa.

GARH. Hind.

Garh,	Hind.	Gadi,	Karn.
Garhi,	„	Gadhi,	„
Gad,	Mahr.	Gadh, Hind.	*Wilson.*
Gud,	„		

A fort: a house; a fortified village; the watch tower in the centre of a village.

GARHA MANDAL. See Inscriptions, p. 383.

GARHWAL. A district on the N. W. frontier of British India, having the Simla district on its west, and Kamaon to the east. The sanitorium of Masuri is in Garhwal as also the famous hindu temple Badarinath. There are forest tracts in the valleys of the Giri, Tonse, and Pabar rivers, which flow into the Jumna. These valleys adjoin the district of Garhwal, in which deodar forests are in abundance; in the valleys themselves, there appear to be detached forests of deodar, and some of "kail," Pinus excelsa, while lower down, there are forests of "chill," Pinus longifolia, or "sulli" as it is called in Garwal. These rivers are all rapid in their course, and have rocky beds. The Tonse river is under the Garhwal and Dehra Dun authorities: the Pabar and the Giri run through Bashahir and Sirmur, respectively: there is but little deodar in the upper valleys, the streams are rapid, and the volume of water scanty. Garhwal is to a large extent Bhot, the language spoken is hindi. Mr. Powell.

GARI. Hind. A carriage of any kind, from a coach and four to a wheel barrow.

GARI. Tel. syn. of Balanites Ægyptiaca.

GARI-GOND. A light substance like the decayed cotyledons of a seed, or decay-

ed soft grains of the pith of wood, very bitter to the taste. The native druggists of India call it a foreign white gum: it is a purge, and given when vision is much obstructed from any cause: one massee with other ingredients is a dose.—*Genl. Med. Top. p.* 136.

GARIKE. TEL. Cynodon dactylon PERS. The d'hurba grass of India. It is sacred to Ganesa under the name of Durva or Durbba. *W.* 419.

GARIKUN. TAM. Agaric.

GARINDA. HIND. Carissa diffusa. *Roxb.*

GARITI KAMMA. TEM. Vernonia cinerea.—*Less.*

GARIAN. HIND. Dipterocarpus lævis. Its oil, Garjanka tel.

GAR-KULAI. BENG. Soja hispida.

GARKUN. A Chinese officer, as commissioner of Gartok in Hundes.

GARLANDS are in constant use in India, amongst native christians, hindus and mahomedans. On festive, on religious and on funeral occasions, they are placed around the hindu idols, over the graves of mahomedans, at the doors of churches, and are hung around the necks of visitors. This seems to have obtained from the most ancient time, for garlands made part of the bridal as well as sacrificial ornaments amongst the Greeks. Thus, in Agamemnon, Clytemnestra, in addressing Achilles, says—

Offspring of Thetis pity my distress
Succour a virgin named, tho' falsely named
Your bride: yet I with flowers adorned her brow,
And fancied that I led her to your arms,
But now I to the bloody altar lead.
Iphigenia in Aulis.

Hind. Theat, Vol. ii, *p.* 68.

Shumim; Shum, of Numbers xi, 12.	HEBREW	Vell-Ulli,	TEL.

Garlic is largely used as a condiment by all the hindu and mahomedan races of India, who consider it a valuable stimulant. It is added to their curries. It is common all over India, and grown from the seed or bulbs—the latter method being most in practice. One of the bulbs is broken and the cloves taken out and planted in beds about four inches apart: no particular care is required, save watering and keeping clear of weeds. When the leaves dry and wither, then take up the roots and preserve in a safe place.—*Riddell.*

GARLIC OIL.

Lashan ka tel, HIND.	Vellai pundu yennai, TAM.
Bawung putih minak, MALAY.	Vel ulli nuna, TEL.

This is obtained by expression from the cloves of the garlic bulb. It is prescribed internally by native practitioners to prevent the recurrence of intermittent fevers, and externally in paralytic and rheumatic affections.—*Faulkner*; M. *E. of* 1855.

GARLIC PEAR. ENG. See Cratæva.

GARM. HIND. Warm.

GARM. HIND. Panicum aintidotale.

GARM-AB. A hot spring in Jell, which preserves its temperature throughout the year.

GARM-SAIR. PERS. The term applied to winter pasture grounds of the nomade pastoral races of Asia. They are numerous, —indeed every pastoral mountain tribe, in the Himalaya, in Tibet, in the Afghan and Baluch mountains, in Arabia, Syria, Persia, and in Kurdistan, has its wintering region. The province of Fars has its Garm-sair and its Sarhad or Sard-sair, its warm and cold climates. The Kashgoi, are a nomade Turkish tribe of about 12,000 families, whose chief is the Il-Khani of Fars. They and the Bakhtiari from the warm pastures of Arabistan and the head of the Persian Gulf, arrive in spring on the grazing of Isfahan. At the approach of winter, both the tribes return to their respective Garm-Sair or wintering lands. The entire southern region of Fars, bordering on the Persian Gulf, is called the Garmsaer or "hot region." It extends from the sea to the latitude of Kazeroon, and runs parallel with the Persian Gulf, from the banks of the Tab to the confines of Laristan. From Bushire, eastward, as far as Cangoon, the tract is named the Dushtistan or "land of plains." The Tungistan, commonly pronounced Tungistoon, or "narrow land," is a small tract of land east of Bushire. The greater portion of the people of the whole Garm-sair, consists of an independent lawless set, many of the tribes being robbers by profession.

A huge wall of mountains separates the Garmsair, or low region, from the Sard-sair. Sard-sair, signifies the cold region, but it is also termed the Sarhada, a word literally signifying "boundary or frontier," but generally applied to any high land where the climate is cold or the high table-land of Persia. One of the most conspicuous of these, is an abrupt lofty hill, named Hormooj; where coal occurs. In Fars the Garm-Sair of Sijistan is a narrow tract of country along the lower

course of the Helmund. The Baluch races seem to pronounce it "Gurmsehl" or Garmsail, and one of their wintering places is north-west of Nooshky, and distant about 75 miles.—*Pottinger's Travels Beloochistan and Sind*, p. 103. *Rich.*

GARNET.

Grenat.	Fr.	Granati,	Lat.
Granat-stein,	Ger.	Yakut ?	Malay.
Granaten,	„	Sang-i-mahtab,	Pers.
Tambra,	Hind.	Granatnoi-kamen,	Rus.
Granate,	It.	Granadas,	Sp.

Garnet is a word supposed to be derived from the Grenatici, specified by Marhodus, the red hyacinths of the Romans is one of the inferior gems, of which there are many varieties. Some of them are probably distinct species; but agreeing in form, and some other properties, they are classed together. It occurs crystallised, massive, and granular. The varieties are :—1. Almandine or noble garnet. 2. Grossular garnet. 3. Cinnamon stone, essonite, hessonite or kaneel stone; romanzonite; hyacinth. 4. Common lime garnet. 5. Magnesia garnet. 6. Iron garnets. 7. Common iron garnet; rothoffite; alloclorite. 8. Melanite; pyreneite. 9. Colophonite. 10. Uwarorite. 11. Pyrope, almandine, hexahedral garnet. 12. Helvine or tetrahedral garnet. 13. Idocrase or pyramidal garnet. Garnet occurs abundantly in mica-slate, hornblende slate, and gneiss, and less frequently in granite and granular limestone. It is found sometimes in serpentine and lava. The best precious garnets are from Ceylon and Greenland. Grossularite occurs in the Wilin River, Siberia, and at Tellemarken in Norway; green garnets are found at Swartzenburg Saxony; Melanite in the Vesuvian Lavas; Ouvarovite at Bissersk in Russia; Topazolite at Mussa, Piedmont; Aplome in Siberia on the Lena, and at Swartzenburg. Garnets also occur in several parts of the United States. The Garnet is the Carbunculus of the Romans. The Alabandic Carbuncles of Pliny were so called because they were cut and polished at Alabanda. Hence the name Alamandine. The clear deep red garnets make a rich gem, and are much used for ornament. Those obtained from Pegu are most valued. They are cut quite thin on account of their deep colour. Cinnamon-stone is also used for the same purposes. Garnet when powdered is used for the same purposes as emery.—(*Eng. Cyc.*) Precious garnets, or almandines, in the form of pebbles, are often seen for sale among the Burmese; but it is not certain that any are found in the Tenasserim Provinces. Mineralogists say the most beautiful come from Sirian the capital of Pegu. In a creek on the Siamese side of the Tenasserim valley, Dr. Helfer says "rubies are found. They are however of a very inferior description"—probably garnets. The common garnet is occasionally seen in the sands of the rivers, but it is not abundant.—(*Mason.*) At the Madras Exhibition of 1857, Garnets, Carbuncles and Ruby Garnets of very good quality, were exhibited from Nellore, Masulipatam and Bezwarrah; but they were not nearly so large, as the garnets from Mysore and Cuddoor, shown at the Exhibition of 1855. The red variety of the gem is very generally diffused over India. Its geognostic position, is the hypogenic or metamorphic schists, more particularly near their line of junction with plutonic rocks, or trap dykes; for instance, in the crystalline and metalliferous areas of Salem and Nellore, whence the finest crystals are procured, and sold by the native merchants at an insignificant price. Colophonite is not uncommon in these tracts, as also in Mysore, the Neilgherries, the Carnatic, and other provinces of Southern India. It usually occurs in the granite, associated with the hypogene schists. That beautiful variety of dodecahedral garnet, called cinnamon-stone or essonite, was discovered by Dr. Benza, in the Neilgheries in the hypogene hornblende rock, near the Seven Cairns Hill, where entire portions of the rock are formed almost exclusively of them. The essonite and hornblende are in large separate crystals, imbedded in a paste of compact felspar and hornblende; the former is very liable to disintegrate, leaving in falling out, small cavities in the rock. Green garnet is of rare occurrence: the only locality where Newbold discovered this gem was in the Salem district at Sankerydroog, lat. 11° 29′ N., long 77° 58′ E., associated with other green crystals in quartz veins, penetrating hornblende schist. The latter is associated with gneiss, garnet rock, actinolitic schist, and altered lime-stone, thrown into disorder by the intrusion of a porphyritic granite. The green garnet is not found in any considerable quantities. A mine of precious garnet occurs at Gharilpit. about eight miles south of Palunshah, in the Hyderabad country, in the detritus of a granitic rock, penetrated by trap-dykes, and composed of mica, garnets, kyanite, quartz, and felspar. Dr. Voysey, states that the precious garnets are found at the depth of eight or ten feet in the alluvium at the foot of the rock. The surface of the rock and soil were strewed with garnets in great profusion, but these were generally of a very

coarse kind. The garnets when collected are gently pounded, and the bad ones broken: those which survive the blows are reckoned of good quality. In a river near the Munzerabad ghat in Mysore, the natives search for garnets, which are sold at one rupee each. They occur there as deposits from a hill of Mica schist which occurs higher up the river, which Captain R. Roberts of the Engineers followed up. The garnet is classed amongst gems, but only one variety is of value, and inferior kinds are so plentiful that, in some parts of Germany, they are even employed as a flux in smelting iron. In Southern India they are almost universally employed by the cutler, the stone-mason, and others, as a substitute for emery, under which name the coarser garnets are sold in the bazaars. Unlike corundum, however, the hardness of which is only inferior to the diamond, and ranks ninth in the scale of hardness, the garnet is only 6·5 to 7·5 in degree. Garnets are of various colors, a circumstance due to the varying proportions and combinations of the three or four silicates of alumina, lime, iron and magnesia, of which they are composed The precious garnets are of a clear, deep red, and on account of their depth of color are cut by the jeweller quite thin. It is this thin stone which is now termed the carbuncle and it is supposed to be identical with the hyacinth or essonite or hessonite.—*Madras Museum Report. King, McCulloch's Commercial Dictionary*, p. 595. See Corundum. Alabandic Carbuncles.

GARNA. Hind. Carissa diffusa. Hiungarna, Capparis horrida.

GARNI-KURA. Sans. Hibiscus cannabinus.

GARO. Ta-yan. Burm. A tree that grows in the Moluccas, called garo, which the Burmese call ta-yan. Linnæus has described it as Excœcaria agallocha. It is abundant near the sea, the juice is said to produce the most intense pain, and often blindness if it enter the eye. From this the Karen call it the "blind tree"; and all are so much afraid of it, that Mr. Mason has sometimes found it difficult to induce his boatmen to pull up beneath its shade.—*Mason.* See Aloes-wood: Eagle-wood: Excœcaria agallocha.

GARO, Garoo, Gartop, Sur, Yoogar, or Gurtokh, for it is known by all these names, is a collection of black tents inhabited by pastoral tribes for six months. In winter, the Tartars retire chiefly to Eegoong on the bank of the river, two stages down the stream, and the Chinese governors reside at the fort of Tuzheegung, where they have houses. Garo is the most famous mart for wool in Chinese Tartary, and there is a fair of 10,000 or 22,000 people in July, well attended by merchants from Kumaon, Koonawur, and Ladak, and sometimes from Yarkund. Wool, borax and salt are the principal exports, and these articles are exchanged for the produce of the plains of India. The country about Garo must be very elevated, since the only productions are prickly plants and small tufts of short brown grass. It is the great summer mart of Gnari Khorsum. The pass over the range between Garo and the Sutlej, is 19,200 feet above the sea. It is near the source of the Indus river. The Garo river, is the Singge-chu or Indus, also called there Garjung-chu, and there is no great eastern branch as some suppose. At Garo, according to Moorcroft, it is a very insignificant stream.—*Capt. Gerard's Account of Koonawur, p.* 144. See Indus.

GARO. Malay. Aloes wood.

GARO. A race occupying the mountains to the south of the valley of Assam in Lat. 25° 20′ N and Long. 90° 40′ to 91° 20′ E They are about 40 miles south from Goalpara, and to the north of Mymensing. They are a race of hillmen inhabiting the mountainous country called the Garo or Garrow Hills, which bound the north-eastern parts of Bengal. They differ in many respects from other hill tribes. The Naga, Mikir, Kachari, Garo, and Khassya, are the five races in whose possession chiefly, are the broad lands of the Assam chain extending from the N. E. near Kynduayn and Namrup on one side, along the valley of the Brahmaputra to its southern bend round the western extremity of the chain; and, on the other side, South-westerly along the valley of the Burak and Surmu: these highlands are thus embraced by the valleys of the Brahmaputra and its affluents on all sides but the S. E. where they slope to the Kynduayn. The Garrow are called by the villagers and upper hill people, Coonch Garrow; though they themselves, if asked of what race they are, will answer, "Garrow," and not give themselves other tribal appellation, though there are many tribes of the Garrow. A Garrow is a stout, well-shaped man; hardy, and able to do much work; of a surly look; flat, caffre-like nose; small eyes, generally blue or brown; forehead wrinkled, and over-hanging eye-brow; with large mouth, thick lips, and face round and short: their colour is of a light or deep brown. The women are short and squat, with masculine expression of face; in the features they differ little from the men. The dress of these people corresponds

with their persons. They eat all manner of food, even dogs, frogs, snakes, and the blood of all animals. The last is baked over a slow fire, in hollow green bamboos, till it becomes of a nasty dirty green colour. They are fond of drinking to an excess. Liquor is put into the mouths of infants almost as soon as they are able to swallow. Their religion is a mixed hinduism and shamanism. they worship Mahadeva; and at Bauntjaur, a pass in the hills, they worship the sun and moon. To ascertain which of the two they are to worship upon any particular occasion, their priest takes a cup of water, and some wheat: first calling the name of the sun, he drops a grain into the water; if it sink, they are then to worship the sun; and should it not sink, he then would drop another grain in the name of the moon, and so on till one of the grains sink. All religious ceremonies are preceded by a sacrifice to their god, of a bull, goat, hog, cock, or dog. Except milk they use everything. They live in houses raised from the ground on piles. The youngest daughter inherits. The woman marries the brother of her deceased husband; if he die, the next: if all, the father. The dead are kept four days, then burnt amidst feasting and drinking and the ashes buried on the spot. A small dish of bell metal with embossed figures, called a Deo-Kora is hung up as a household god and worshipped and sacrificed to: and the Garo believe that when the household are asleep, the Deo or figure of the Kora issues in search of food and returns to its Kora to rest. The Garrow are under British control. They are classed as Che-anna (6 Annas) and Das-Anna (10 Annas) but they consider themselves one and the same people. They use sharp bambu panji or stakes, four inches long as a means of opposing invasion. In a treaty in 1848, they consented to abstain from hanging human skulls in their houses. They build their houses on piles. The Marquis of Hastings' description of them, however, somewhat differs from the above. He says they are divided into many independent communities, or rather clans, acting together from a principle of common origin, but without any ostensible head of their league. With them all property and authority descends wholly in the female line. On the death of the mother, the bulk of the family possessions must go to the favourite daughter (if there be more than one), who is designated as such, without regard to primogeniture, during the lifetime of her parent. The widower has a stipend secured to him at the time of marriage. A moderate portion is given to each of the other sisters. A son receives nothing whatever, it being held among the Garrow that a man can always maintain himself by labour. The woman acknowledged as chief in each of the clans is called Muhar. Her husband is termed Muharree. He is her representative in all concerns, but obtains no right in her property. The clan will interfere if they see the possessions of the Muhar in course of dissipation. If a daughter be the issue of the marriage, a son of the issue of the Muhar's father is sought in preference to become her husband; and in default of such a person, the son of the nearest female relation of the Muhar (he being of due age) would stand next for selection. The husbands to the sisters of a Muhar are called Lushkur, and it is a denomination to which a notion of rank is attached.

They have frequently made descents on the plains. A party of them, in May 1860, murdered sixteen natives of the plains in the North of the Mymensingh district, and afterwards mutilated the bodies. They confessed the crime and three were executed in their own villages before their own people. Their accomplices, in number some twenty men, were condemned to transportation for various periods. Their object was not so much plunder, as human heads to offer to their spirit of the mountains. The Rajah of Nustung one of the Khassyah states subsequently undertook to aid in repressing these raids

The Garo, or Garrow hills, are a confused assemblage, from 1,000 to 6,000 feet. Estimated area, 4,347, square miles. Character of country, wild. The rock formation is supposed to be chiefly of gneiss. or stratified granitic rock.—*Cole. Myth. Hind.* p. 320, *Hasting's Private Journal*, vol. II., page 132-316. See Khassya, Mikir, Kuki, Singhpo, India 317, 327, 338, 339.

GARO-DE-MALACCA. Fr. also GAROS. Malay. syn. of Aquilaria malaccensis, Sonnerat.

GAROFANI. It. Cloves.

GAROODOO. Beng. Polygala ciliata minor.

GAROREE. A wandering race in Woon.

GARO-TSJAMPICA. Eagle-wood.

GAROU-BUSH. Daphne gnidium.

GARPAGARRI. A tribe, class, race, or sect in the Oomraoti district, hindu sudras, who profess to have the power to prevent the fall of hail stones on fields. Possibly the term is derived from the Arabic "Ghar," ice. Wilson says the word is mahratta and that they are retained in some vil-

lages as part of the establishment to prevent their injuring the crops.

GARP. Ger. Yarn.

GARRA. A river running near Shahabad in Oudh.

GARRAR. Hind. Andropogon muricatus.

GARRAH, and Ubrassa, districts in the west of Cutch, in which are the towns of Mhar, Narna and Lakpat Bandar.

GARRULINÆ, A sub-family of birds of the tribe Insessores and family Corvidæ. It comprises two sections:

a. Magpies, 4 gen. 9 sp. viz.: 3 Pica, 4 Dendracitta, 1 Crypserina, 1 Temnorus.

b. Jay-Magpies, 6 gen. 10 sp. viz : 2 Cissa, 3 Psilorhinus, 2 Garrulus, Perisoreus, 1 Lophocitta, 1 Turnagra.

GARRAH, often written Gharra, a river of the Punjab, the modern name of the ancient Hyphasis. See Gharra.

GARRI Hind. Arundinaria falcata.

GARRULACINÆ. A sub-family of birds, of the tribe Insessores and family Corvidæ. It comprises 5 gen. 27 sp. viz.: 20 Garrulax, 2 Actinodura, 2 Sibia, 1 Cutia and 2 Pteruthius.

Garrulax cinereifrons of Kelaart, is affined to G. delesserti of the Nilgiris, but differing much in its colouring. General hue a rich brown above, much paler below; forehead and cheeks pure ashy; chin and borders of the outer primaries, albescent. Bill blackish. Legs dusky corneous. Length 8½ in.; of wing 4⅓ in.; and tail 4 in.; its outermost feathers 1⅛ in. less; bill to gape 1¼ in. tarse 1½ in.

GARTOP. See Garo, Indus.

GARU. Malay. Eagle wood. See Garo.

GARU BANS. Hind. Bambusa, the Bamboo. Arundinaria falcata.

GARUDA or GURUDA. This demigod, of the hindus, with the head and wings of a bird and the body, legs, and arms of a man, is of considerable importance in hindu mythology. He is the son of Kasyapa and Vinata, the brother of Aruna and the vahan or vehicle of Vishnu

"When high on eagle-plumes he rides."

As Aruna, the charioteer of Surya (the sun), is the dawn, the harbinger of day, so does Garuda, the younger brother, follow as its perfect light. He is the emblem of strength and swiftness, and besides being the bearer of the omnipotent Vishnu, is greatly distinguished in hindu legends on many very important occasions, Aruna in the Sabean system of the Veda, as the charioteer of the sun, driving his six horsed car—corresponds with the Aurora of the Greeks. The emblem or vahan of Vishnu is Garuda, or the eagle, and the Sun-god both of the Egyptians and hindus is typified with this bird's head. Aruna (the dawn), in hindu mythology, also the son of Kasyapa and Vinata, is the brother of Garuda and is described as a handsome youth without thighs or legs. His two sons, Sumpati and Jutayoo, attempting in imitation of their father to reach the sun, the wings of the former were burnt and he fell to the earth: of this the Greeks may have made their fable of Icarus. Aruna's imperfect form has been supposed to be allusive to his partial appearance, his head and body may be seen, but his legs are yet in invisible night, or lost in the blaze of Surya's brilliancy. The images of Garuda are set up and worshipped with those of Vishnu, in the temples dedicated to that deity. Sculptured images of him are also found in the magnificent cavern temples of Elephanta, Ellora, &c., &c. In the last mentioned excavation he is seen in several places accompanying Parvati, the consort of Siva. Garuda has many names. He is called Superna, from the beauty of his plumage, which in the pictures of him is of rich blue, red, and green, colours embellished with the variety of gems which usually adorn the hindu deities. He is also termed Nagantaka, or the enemy of serpents, Vishnu rat'ha, or the vahan of Vishnu, &c. &c. In many of the vaishnava temples, Garuda is represented as a man with wings, and is so sculptured on the pillars, or large plaster figures are placed at each corner of the temple walls. In the Elephanta cave, Garuda is often seen with an appendage, and on several very old coins, he has snakes or elephants in his tail or beak; for he is sometimes spread double headed, like the Prussian eagle —and one snake round his neck. But he is not so represented either in pictures or casts. Some legends make Garuda the offspring of Kasyapa and Diti. This all-prolific dame laid an egg, which it was predicted would produce her a deliverer from some great affliction: after a lapse of five hundred years, Garuda sprung from the egg, flew to the abode of Indra, extinguished the fire that surrounded it, conquered its guards, the devata, and bore off the amrita (ambrosia), which enabled him to liberate his captive mother. A few drops of this immortal beverage falling on the species of grass called Kusa, (the Poa cynosuroides,) it became eternally consecrated; and the serpents greedily licking it up, so lacerated their tongues with the sharp grass, that they have ever since remained forked; but the

boon of eternity was ensured to them by their thus partaking of the immortal fluid. This cause of snakes having forked tongues is still, in the popular tales of India, attributed to the above greediness; and their supposed immortality may have originated in some such stories as these; a small portion of amrita as in the case of Rahu, would ensure them this boon. In all mythological language, however, the snake is an emblem of immortality; its endless figure, when its tail is inserted in its mouth, and the annual renewal of its skin and vigour, afford symbols of continued youth and eternity, and its supposed medicinal or life-preserving qualities may also have contributed to the fabled honours of the serpent tribe. In hindu mythology serpents are of universal occurrence and importance, and the fabulous histories of Egypt and Greece are also decorated with serpentine machinery. Ingenious and learned authors attribute this universality of serpent forms to the early and all-pervading prevalence of sin, which is as old as the days of our greatest grandmother. If such writers were to trace the allegories of sin and death, and the end of their empire, they might discover farther allusions to the christian dispensation in the traditions of the hindus than have hitherto been published. Krishna crushing, but not destroying, the type of sin, has been largely discussed. Garuda is also the proverbial but not the utter destroyer, for he spared one, they and their archetype being, in reference to created beings, eternal. His continual and destined state of warfare with the serpent, a shape mostly assumed by the enemies of the virtuous incarnations or deified heroes of the hindus, is a continued allegory of the conflicts between Vice and Virtue so infinitely personified. Garuda, appears the coadjutor of all virtuous sin-subduing efforts, as the vehicle of the chastening and triumphant party, and conveys him on the wings of the winds, to the regions of eternal day. Bartolomew says, that the vehicle of Vishnu is called Paranda? in the language of Malabar, where it is held in great veneration, particularly by women; and if one of these animals snatch a fish from their hand, they consider it as a most fortunate omen. The bird here alluded to, is the Pondicherry or Malabar eagle; the Haliætus Pondicherianus, *Linnæus*, commonly termed the Brahmany kite. It is this bird that the friar must have seen pouncing on the fish-baskets borne by the Makati (women of the Makwa, or fishing tribe), on the coast of Malabar. The Brahmany kite is very useful in the populous sea-port towns of India in removing carrion and refuse and is never killed. Its usefulness was, perhaps, originally the cause of its obtaining, like the cow, a protecting legend in the popular superstition of the hindus, as with the ibis, and ichneumon in Egypt, where filth and noxious animals abound. Major Moor mentions as one instance of this birds boldness of which he was a witness, viz. its stooping, and taking a chop off a gridiron standing over the fire that cooked it. The religious hindu feeds these birds on holidays, by flinging up little portions of flesh, to which they are attracted by the call Hari! Hari!—*Moor*, p. 447. *Cole. Myth. Hind*, p. 374. *Tod's Travels. Taylor's Mackenzie MSS.*, p. 57. *Cole. Myth. Hind. Inscriptions* p. 379 to 383. *Krishna*, p. 545. See Garuda. Surya, Vahan, Arian. Nandi, Ravana, Serpent. Siva, Vahan, Veda, Vishnu, Vrishala.

GARUDA-BASIVI. A Murali or deva-dasi woman devoted to Siva.

GARUDA PURANA. See Serpent.

GARUDA MALLE. Tel. A species of Jasminum, probably J. angustifolium. Its bitter root is used medicinally.

GARUDA MUKKU. Tel. Martynia diandra. *Glox.*

GARUDAR. Hind. Elsholtzia polystachya.

GARUGA PINNATA. *Roxb.*

Toom,	Beng.	Carrivembu maram,	Tam.
Khyong-youk,	Burm.	Garuga chettu	Tel.
Kuruk,	Hind. Mahr.	Kalugudu,	„
Kanghur,	„		

In Coimbatore, a considerable sized tree, with a round umbrageous head; leaves pinnate, deciduous; flowers of a yellowish white, in panicles covered with a mealy kind of white substance; fruit size of a small plum, used for pickling. Grows in Coimbatore, is common in the Bombay jungles, where the wood is thought of little value; but might be creosoted. The tree is rather common in the plains and on the hills of British Burmah, but the wood is not much used. A cubic foot weighs lbs. 52. In a full grown tree on good soil the average length of the trunk to the first branch is 40 feet and average girth measured at 6 feet from the ground is 9 feet. It sells, in Pegu, at 8 annas per cubic foot.—*Drs. Riddell, Wight, Gibson and Brandis, Cal. Cat. Ex.* 1862.

GARUKI. A town in the Hormara district, a sterile province, subject to Las. The Gujar tribe occupy Jab-Malan: Garuki is occupied by the Sangur tribe, and at Hormara in Mekran, with 400 houses is a tribe of this name. The Hormara tribe say they came originally from Sind. See Kelat.

GARUNDA. Hind. of Murree Hills, Carissa diffusa.

GARVANZOS. Sp. Cicer arietinum.

GAS. Sp. Achyranthes aspera. *Linn.*

GASAGASALA CHETTU. Tel. Alysicarpus styracifolius. *D. C.*

GASAKA. Sans. poppy-seed.

GAS-MADDOO Singh. A snare: one kind is called gas maddoo, tree-snare, to distinguish it from the smaller, called atmaddoo hand-snares.—*Forbes' Eleven years in Ceylon*, Vol. II, p. 58.

GAS-MIRIS. Sing. Cayenne pepper.

GASPAR BALBI. A traveller in India from 1579 to 1588. See Balbi.

GASPAR ISLAND or PULO GLASSA, in lat. 2° 25′ S. long., 107° 6′ E and 14 miles east from Batavia, has on it a peaked hill, visible for 30 miles, and is a principal mark in sailing to or from the Gaspar Straits.—*Horsburgh.* See St. Barbe.

GASPAR STRAIT, is formed between the island of Banca on the west and Billiton on the east. It was named after a Spanish Captain who passed through it from Manilla in 1724. Many navigators prefer this Strait to that of Banca.—*Horsburgh.*

GASTEROPODA. The third class of mollusks, according to the system of Cuvier, who remarks that it is very numerous, and that an idea may be formed of it from the slugs and shell-snails.

According to other classifications it is the second class. It comprises 4 orders 40 families and many species, viz.:—

Order i. Prosobranchiata.

Sec. A. Siphonostomata, Carnivorous gasteropods.
Families Strombidæ; Muricidæ; Buccinidæ; Conidæ; Volutidæ; Cypræidæ.

Sec. B. Holostomota; Sea-snails
Families Naticidæ; Pyramidellidæ; Cerithiadæ: Melaniadæ; Turritellidæ; Littorinidæ; Paludinidæ; Neritidæ; Turbinidæ; Haliotidæ; Fissurellidæ; Calyptreidæ; Patellidæ; Dentalidæ; Chitonidæ.

Order ii. Pulmonifera.

Sec. A. In-operculata.
Families Helicidæ; Limacidæ; Oncidiadæ; Limnæidæ; Auriculidæ.

Sec. B. Operculata.
Families Cyclostomidæ: Aciculidæ.

Order iii. Opisthobranchiata.

Sec. A. Tecti-branchiata.
Families Tornatellidæ; Bullidæ; Aplysiadæ; Pleurobranchidæ; Phyllidiadæ.

Sec. B. Nudibranchiata.
Families Doridæ; Tritoniadæ; Æolidæ; Phyllirhoidæ; Elysiadæ.

Order iv. Nucleobranchiata.

Families Firolidæ; Atlantidæ.

Eng. Cyc. vol. II, *p.* 924. *Woodward's Manual.*

GASTRODIA SESAMOIDES, *R. Br.* A curious herbaceous species of orchis, native of New Holland, is edible, and preferred by the aborigines to potatoes and other tuberous roots: being a parasitic plant, it could scarcely be systematically cultivated. It flourishes in its wild state on loamy soil in low or sloping grounds, and, in the spring, appears as a whitish bulb above the sward, of a hemispherical shape, and about the size of a small egg. The dusky white covering resembles a fine white net, and within it is a pellucid gelatinous substance. Again within this is a firm kernel, about as large as a Spanish nut, and from this a fine fibrous root descends into the soil. It is known in Van Diemen's Land and Australia, by the common name of native bread, also wild yam. —*Simmonds.*

GASSIM. See Jakun.

GASTOROSTEUS DUCTOR; Pilot fish.

GATA. Hind. (1) a plot, or piece of land; (2) two bullocks in yoke, treading out the grain; (3) a brahmin or banya associating with a strange woman.

GATA. Tel. Diospyrus sylvatica.—*Roxb.*

GATHA. Sans. A song, the songs of Zarathrusta.

GATHI. Hind. Bell. See Gantha.

GATPARBAH. A river of the S. Maharatta country.

GATRINTA. V. Tel. Hugonia mystax, L.—*W. & A.*

GATTARU. An outcast race in Ceylon.

GATTA. Hind. Allium cepa.

GATWA. Hind. A kind of grass in Lahore.

GAU. Hind. Carissa diffusa.—*Roxb.*

GAU. Sans. Earth, land, the German Gau, Armenian Gawar, land, province. It was also a settlement of the Aryans near Sogdiana.

GAUDA. Kar. An agricultural tribe in Mysore, sometimes labourers, small farmers under a lease from the land-holders.—*Wilson.*

GAUDAMA. A Buddha of Burma, prior to Sakya Sinha.

GAUDAMA. An image of Buddha Gaudama. They are largely manufactured in Burmah, in marble, wood, stone and metals.

GAUDA-PALEN. A buddhist temple at Paghan "Gauda Palen," signifies the Throne of Gaudama. Height 180 feet. It is cruciform in plan. It is very conspicuous in approaching Paghan from the southward, with numerous pinacles and tall central spires, it is seen glistening with its white stucco like plaster, far down the Irrawaddy river rising like a dim vision of Milan Cathe-

dral. It is compact in structure and elevated in proportion to its bulk. It has a massive basement with porches and rising above in a pyramidal gradation of terraces crowned by a spire " htee." From the top of the terrace, just below the spire, is a fine prospect of a vast field of ruined temples stretching North east and South-west.

GAUDA. Tel. A bricklayer race of hindus.

GAULA. A milk man, the Gaula race are tall, robust and fair. Those of the Peninsula of India have no resemblance to any other race in the Dekhan. The name is evidently from Gala, milk. They are pastoral and migratory.

GAULIGA of Mysore, rear buffaloes, sell milk and ghee and accompany camps.—*Wilson.*

GAULTHERIA NUMMULARIA and several other plants which extend into the North-west Himalaya are also found in the Javanese mountains nearly 3,000 miles distance. Some of these have already been found in intermediate localities, as the Gaultheria, which occurs along the whole Himalayan range, and in the Khasia, and which will probably be found in the mountains of the Malay peninsula and of Sumatra; many other Java plants are more uniformly spread over the hilly districts of India and Ceylon. G. fragrantissima, and G. trichophylla also occur in the Himalaya, but are represented by a few species in the plains of the Punjab, on the outer slopes of the western Himalaya, and even on the Khasia mountains. Spiræa Kamtchatica, chamœdrifolia, and sorbifolia, and Paris polyphylla, are other Siberian forms which extend into the rainy Himalaya, and Corydalis Sibirica and Nymphæa pumila are remarkable instances of specific identity between Khasia and Siberian plants.

GAUMEDI. Moluccas. Caryophyllus aromaticus. *Linn.*

GAUNDI. Tel. A bricklayer.

GAUNRI. Hind. Trapa bispinosa.

GAUR. A province north of Ghuzni, gave the Gori dynasty to India. It and Balkh are separated from the Seistan by the Paropamisan chain. See Gour.

GAURI. See Gouri.

GAURI COW or GWARIKA of the Indian forests, is the Gowri Gao of Nepaul, one of the Bovine family. See Bos.

GAURIKUND. In L. 30° 36', N. L. 79° 3', in Garhwal, is on the right bank of the Mandagni, below Kidarnath. The heights above the sea are as under :

Hot springs - - -	6,417 ft.
Upper limit of wallnut - -	8,116 ,,
Upper limit of chesnuts -	10,016 ,,
Upper limit of " kanchua" -	10,559 ,,

Robert Schlagent.

GAURI SANKAR, the Nepaulese name of a mountain in the Himalaya of Nepal in Lat. 27° 59' 17" N. and Long. 86° 54' 40" E. attaining a height of 29,000 feet above the sea, it is also called Mount Everest, and in Tibetan, Chin-go-Pa-mari. It is on the Nepal and Tibet frontier, and is the highest mountain of our globe as yet measured. The hindu name is from Gauri-white, or fair, a name of Parvati, the wife of Siva; and Sankar, or Sankara, one of the forms, assumed by Siva. Gaurisankar is the term in use, among the hindu pandits of Nepal; its signification shows a remarkable identity with the meaning of the name Chamalhari, the prominent object of western Bhutan. The name given to Gaurisankar by the Tibetans, and that by which it is generally known in the northern-most parts of Nepal is Chin-go-pa-ma-ri.

GAURI SANKAR. In hinduism, is the term usually given to the idol of Siva or Mahadeva and Parvati, in which she is sculptured sitting on Mahadeva's knees, with the bull Nandi at his feet and the Sinha or lion at hers.

GAUTAM Hind. A branch of the Chandravansi, or lunar family of rajputs, very numerous in the lower Doab, and formerly very powerful. Offshoots from them, termed Gautamian are settled in Azimgarh. *Wilson.*

GAUTAMA. Also written Gaudama, and Gotama, in the mythical legends of hinduism, the father of Kripa.

GAUTAMA. A name of Buddha.

GAUTAMA. One of the seven Rishi. See Brahmadica.

GAUSAM. Hind. Schleichera trijuga.

GAUSHIR, also Jaushir; Opoponax.

GAUZEREH. Pers. Bezoar: Calculus cysticus.

GAVAKSHI VRIKSHAMU. Tel. A species of Cucumis, probably, C. pubescens (Maderaspatanus).—*W.* and *A.*

GAVELKIND. Eng. The equal division of the inheritance amongst the sons. It was brought to England by the Jut brothers who settled in Kent. It was the custom of the Getic hordes, and is still followed by the Jharija rajputs. See Polyandry.

GAVIAL. See Gharial, Crocodile.

GAVITELLI. It. Buoys.

GAVU. Tel. See Hindu.

GAWILGHUR. A fortress and hill about 21 miles N. W. from Ellichpoor. It is in Lat. 21° 22' N. 77° 21', E. in Berar

in the hills of the Vindhya range. It was taken by storm on the 15th December 1803. The Gawilgurh hills separate the Tapti and Purna. They rise in peaks to heights of 3,000 feet. Mean height of the Gawilghur village is 1,043 feet. *G. T. S.*

GAWN. GUZ. Triticum æstivum.

GAW-SHIR. PERS. Opoponax.

GAW-ZERAH also Padzahr-i-kani. PERS. Bezoar.

GAWPURGEE. HIND. Arnotto.

GAYA. A town in Bahar province. It was the birth place of the Gautama, Sakya Sinha.

Gaya is Fa Hian's Kia Ye. It is famous for the hindu Vishnupud, which is a rival counterpart of the impression of Buddha's foot and Gaya and Bood'ha Gaya in each others proximity point out the alternate predominance of the antagonistic hindoo and buddhist sects. The Vishnupud had been set up prior to Fa Hian's visit.

The Gayalese widowers are barred the privilege of wiving after the death of their first wife, as hindoo widows are barred the privilege of taking a husband after the death of their first husband. This savours of the celibacy of the Buddhaic priests. There are two places of the name of Gaya, one of which is called Budd'ha Gaya, Buddhistical Gaya, to distinguish it from the town of Gaya, which is situated six miles to the northward. In the town of Gaya itself there are no ancient buildings now existing; but most of the present temples have been erected on former sites and with old materials. Statues, both buddhistical and brahmanical, are found in all parts of the old city, and more especially about the temples, where they are fixed in the walls, or in small recesses forming separate shrines in the court-yards of the larger temples

Budd'ha Gaya is famous as the locality of the holy pipal tree, under which Sakya Sinha sat for six years in mental abstraction, until he obtained buddhahood. A long and detailed account of this sacred place is given by the Chinese pilgrim Hwen Thsang, between the years A. D. 629 and 642. He describes minutely all the temples and statues which surrounded the celebrated pipal tree, known throughout the buddhist world as the bodhi-drum, or "tree of knowledge." Several of the objects enumerated by the Chinese pilgrim can still be identified from their exact correspondence with his description. *Tr. of Hind.* Vol. I. p. 223. *Arch. Surv. Report* Vol. XXXII. *Beng. As. Soc. Journ.* 1864. See Bakror; Punawa; Kurkihar; Rajgir; Bhitari; Bihar; Burabur; Kesarya; Buddha. Inscriptions, p. 378. Lakshmi.

GAYAC. FR. Guaiacum officinale.

GAYA or Geddy—? Jewellery.

GAYAPU AKU. TEL. Sida humilis. *Willd. W. and A.* also S. radicans.—*Cur. W. and A.* From gayam "a wound" aku "a leaf." The leaves are used as a styptic. *Elliot.*

GAYASHAA. The tea-house girl of Japan. They are virtuous; it is part of their profession to assist at the orgies of the Pans and Nymphs. *Hodgson's Nagasaki*, p. 240.

GAYATRI. From the Sanscrit Goi to sing, the most sacred verse of the Vedas. See Gaetri: Gatha.

GAYER. MALAY. A fruit of Singapore. Its seeds are used as marbles.

GAYA KARMA. See Inscriptions, p. 390.

GAYSA GUSA. CAN. Poppy seed.

GAZ or Gazu, which is much used for making sweetmeats in Persia, is a glutinous substance, like honey, deposited by a small green insect upon the leaves of the oak tree. It is the manna of the chemist. See Diod. Sic., Book XVII, Chap. VIII. *Ferrier Journ.*, p. 500. See Gazanjabin.

GAZA. An ancient town which has still 15,000 inhabitants, is above 15 miles S. of Askelon, upon the edge of the desert, to which it stands in the same relation as a sea port to the sea. *Eothen's Travel from the East*, p. 240.

GAZA half a day's journey from Jaffa, occupies the summit of a mount about 3 miles from the sea, and contains about 3,000 people "The king shall perish from Gaza." "Baldness is come upon Gaza." See Zech. IX, 5, and Ezek. XXV. 16. *Robinson's Travels Palestine and Syria, Vol. I*, p. 23.

GAZANJABIN. PERS. The manna produced on branches of the Tamarix Indica, by the punctures of the Coccus maniparus. This is often called Arabian manna, to distinguish it from Turanjabin, Persian manna, from the Shir-kist or Khorasan manna and from Sicilian manna. See Gaza.

GAZEE PEER See Hot Springs.

GAZELLE. The name given to several species of antelope.

The Indian Gazelle is the Antelope Arabica, *Kemprich.*

The Gazella ruficollis is a beautiful Antelope of Eastern Africa, known there as the Andra. It is gregarious and resides in herds in the desert between Nubia, Dongola and Kordofan. It is 5 feet 4 inches long and 3 feet high at the shoulder. Its horns 12½ inches long.

The Ahu or Jairou, is the Gazella subguttirosa and it inhabits all the central

parts of Asia around the Baikal lake, Daüria, Persia, and from East Bucharia to the Black Sea. It assembles in large herds on open plains. See Antelope. Cervus.

GAZLU. Tel. Bangles.

GAZNAVI, from the town of Ghuznee, a dynasty of kings who ruled there and over part of India from A. D. 1002 when Mahmud ruled, till the date of Khosru Shah's death. in 1157. See Ghazni.

GAZPIPAL. Hind. Plantago major ; also Abies Smithiana.

GAZZA EQUULÆFORMIS. *Ruppell* In the Straits of Malacca this species is very numerous at all seasons, and forms like the rest an article of food.

GBEIG. Beng. Goitre, also called Anbi, and in Bootan, Ba, or Ke Ba. The swelling forms immediately below the chin, extending from ear to ear, and grows sometimes to such an enormous size as to hang from the throat down upon the breast. It prevails among the people inhabiting the Morung, Nepal, and Almora hills. It is particularly met with in the low lands adjacent to these hills, from the frontier of Assam, through Binjee. *Turners Embassy*, p. 87.

GE. Hind. Corylus colurna.

GEASTER LIMBATUS and G. mammosus are Fungi.

GEBANG PALM. The Corypha gebanga, *Blume*, of Java, a useful tree, thousands of boys and girls are employed in fabricating its leaves into baskets and bags: thatch, and broad brimmed hats are made of them; fishing nets and hats are woven from their fibre and ropes are manufactured from their stalks *Seeman*.

GEBANTÆ, also known as the Catabeni, a race who occupied the country immediately within the Straits of Bab-ul-Mandeb. Their sea-port was Okelis, which was long the centre of commerce between Europe and the East. Its ruins are situated about a mile inside the Straits, at a place called by the natives Dakooa. See Okelis.

GEBBE. An island in the Eastern Archipelago, between N. Guinea and Gilolo, not far from Gilolo. The island is occupied by a Negro race, with nose flat; the lips thick and projecting, the complexion a dark olive, the eyes deep seated, and, on an average, the facial angle 77 °, but as high as 81 °. In Gebbe and Waigyu and in some parts of the coast of N. Guinea the complexion is lighter and the peculiar texture of the Negro hair is absent. See India 353. Papuan. See Geby.

GEBRAUNTE MAGNESIA. Ger. Magnesia usta. See Magnesia.

GEBY. See Gebbe.

GEB'L. Any mountain, the Egyptian pronunciation of the Arabic Jabl, such as Geb'l Musa, Geb'l Afrit, Geb'l Dukhun, Geb'l Gu, Geb'l Tur. The porphyry quarries of Gebel Dukhan, the Mons Porphyritis of the Romans, are probably coeval with the celebrated breccia quarries of Wadi Keneh, and worked in the time of the first Osertasen, the supposed Pharoah who ruled over Egypt in the time of Joseph. The beautifully coloured porphyries, green, purple, and red, and much of the basalt used in ancient Egyptian sculpture were derived in great measure from Gabel Dukhan and its vicinity, whence they were probably conveyed to Coptos on the Nile, and thence easily distributed to various parts of Egypt. The Wadi from Gebel Dukhan to Keneh, the ancient Koinipolis, a little N. of Coptos, is to this day called the Stikket-el-Arabiyeh, the High road of the Carts. An inscription on the frieze of the temple near Geb'l Dukhan, bears the name of the emperor Adrian, with the surname of Trajan, whose son, by adoption he was. The temple is dedicated to Serapis the great, (with his titles of Pluto and the Sun, ΑΙΙ ΗΑΙΩΙΜΕΓΑ ΑΩΙΣ ΑΡΑΙΙΙ ΑΙ and to the other gods in the same temple. Small temples, to Sarapis are very common in the vicinity of mines and quarries, as Pluto is supposed to preside over demons and the evil genii, who, the orientals imagine, watch over the treasures of the earth, Gebel Dukhan lies in about latitude N. 27 ° 16′ and longitude E. 33. There is an ancient road leading from it to Myos Hormus, an old port on the Red Sea from which it is distant about 32 miles as the crow flies.

In Wadi Billi, there are ruins of signal-posts, mile-stones, guard-houses, forts, wells and stations. Near Ain Abu Markhah are quarries, and traces of buildings, Sakiya or watering places, gardens, a citadel, magazines, brothels, sacred groves, temples, priest's residence, baths, forum, villages, grottos, pottery, green sarcophagus, troughs, blocks of green, and purple porphyry and of black grey-veined breccia. Many tarantulas, "Abu Shebbath" literally, father of the spiders. Wadi Guttar runs in the direction of the crags of Gebel Dukhan, but after passing the well in the middle of the Wadi, it sweeps southerly towards Gebel Altarash, runs into Wadi Keneh receiving along its course the Wadi Altarash, Gerzoo Kohel and others. The well station in the middle of Wadi Guttar below the Mazra, is 150 feet square; it contains remains of buildings with strong walls and there are the remains of buildings. stables and out-houses outside. At Tellaat el Um, Gesher, is a Roman station

of unburnt brick with an area of a fort with towers at the angles: it bears S. S. W. by S. from Gebel Dukhan. A large gateway in the centre opens upon the valley. The enclosure contains a saki, and a cistern of cement 200 feet by 15. The old Roman station of Gebel Gir stands on a hill. There are still the remains of a reservoir and a lake 300 feet in diameter and 20 feet deep, also of several cisterns and three aqueducts, attached to the station. In the valley are the traces of regularly laid out stables and lodgings built of limestone. *The Eastern Desert of Egypt, from Gebel Afrit, by the ancient Porphyry quarries of Gebel Dukhan, near to the old station of Gebel Gir, with a brief account of the ruins at Gebel Dukhan by Hekekyan Bey.*

GECARCINUS. A genus of land crabs, called by the French Tourlouroux, Crabes Peints, and Crabes Violets. G. carnifex and G. hirtipes occurs in India.

GECHCHANGI. Tel. Celastrus montana, *R.*

GECHHI-SHIM. Beng. Broad bean, Lablab-macrocarpum.

GECININÆ. A sub-family of birds of the family Picidæ, as under—

Fam. Picidæ.

Sub-fam. Campephilenæ, 6 gen. 16 sp. viz., 1 Campephilus; 2 Hemicercus; 4 Hemilophus; 3 Chrysocolaptes; 2 Brachypterus; 4 Tiga.

Sub-fam. Gecininæ, 4 gen. 19 sp. viz., 12 Gecinus; 1 Gacinculus; 3 Meiglyptes; 3 Micropternus.

Sub-fam. Picinæ, 2 gen. 15 sp. viz., 1 Dryocophus; 14 Picus.

Sub-fam Picumninæ, 2 gen. 3 sp. viz, 1 Picumnus; 2 Sasia.

Sub-fam. Yuncinæ, 1 gen. 1 sp. viz., 1 Yunx torquilla.

Sub-fam. Indicatorinæ, 1 gen. 1 sp. viz., 1 Indicator xanthonotus. See Birds, p. 470,

GECKO. A genus of Saurian reptiles, of the natural family Geckotidæ, the species of which are widely distributed throughout the world. In the Malay tongue, they are called Tokke or Tokai. In Burmah, the ordinary call of the house Gecko is "Tooktay." They are harmless, but their sudden clear call, and their hideous forms alarm strangers. A French traveller, M. Touquet, hearing his name pronounced, repeatedly answered to it. "Eh! bien," until made aware that it was the Gecko's call. There are in Ceylon Hemidactylus maculatus, *Dum et Bib.*, H Leschenaultii, *Dum et Bib.*, H. frenatus, *Schlegel.* Of these, the last is very common in the houses of Colombo. Colour grey; sides with small granules; thumb short; chin-shields four; tail rounded with a transverse series of small spines; femoral and frenal pores in a continuous line. *Gray*, Lizards, p. 155. The Geckoes, frequent the sitting rooms, and being furnished with pads to each toe, they are enabled to ascend perpendicular walls and adhere to glass and ceilings.

The Tokai or Takke, Malay, Le Gecko de Siam of Cuvier, are numerous in Siam but also occur in Java and other places of the Archipelago. It is from 6 to 9 in. long and marked with red and green spots and frequent tubercles. *Crawfurd's Embassy. Tennent's Sketches of the Natural History of Ceylon, p.* 281. *Gosse's Natural History, p.* 31.

GECKOTIDÆ. A family of Saurian reptiles.

Gen. Gecko verus *Merr.* Bengal. Assam. Andamans. Tenasserim.
Gen. Reevesii, China.
Gen. Chinensis, ,, and Japan.
Gen. Monarchicus. Amboyna, Borneo.
Gen. Smithii, Pinang.

Gen. Platyurus schneiderianus, Java.
Gen. Boltalia sublvis, India.
Gen. Peropus mutilatus, Manilla.
Gen. Theconyx seychellensis, Seychelles.
Gen. Pentadactylus duvaucelhi, Calcutta, India.
Gen. Tarentola borneensis, Borneo.
Gen. Goniodactylus timorensis, India.
Gen. Cyrtodactylus marmoratus, Java, Philippines.
C pulchellus, Singapore.
Gen. Heteronota Keadallii, Borneo.

GEDANGI MOGALI. Tel. Pandanus odoratissimus.—*Linn.*

GEDAUN, in Beluchistan, the tent of black felt, in which families reside. The Afghans call it Kizhdi, the Turks Kara Ulli: and the Persians Siah Chadr. It is the "Namdah" of India, from which is the Indo-European word nomade. See Afghan. Biluchi.

GEDE. Tel. A Buffalo.

GEDE DULAGONDI. Tel. also Enuga dulagondi or Elephant cowhage, Mucuna atropurpurea. The first words mean "buffalo cowhage."—*D. C.*

GEDEE. A cliff in Karang Bollong.

GEDE MANDA. Riocreuxia bubulina. *Ell.*

GEDE PEYYARA CHETTU. Tel. Combretum ovalifolium, *R.* The words mean "buffalo-calf tree."

GEDIA. The fruit of the jack-tree, Artocarpus integrifolia.—*Linn.*

GEDROSIA of the Greeks, the modern Mekran. See Kej.

GEELKOPER. Dut. Brass.

GEER. A tract in the south of the Guzerat peninsula, stretching 50 miles East and West and 30 miles N. and S. It consists of ridges and hills covered with dense forest trees and jungles, and full of almost inaccessible fastnesses which for ages gave shelter to robbers, outlaws and the Aghori fanatics, said to be canibals. See India, 334. Kattyawar.

GEERI, GOTOOMBA. Sans. Xanthochymus.

GEESB. A small village on the southern bank of the Nile, opposite to Masr-el-atik. Its origin is unknown.—*Niebuhr's Travels, Vol.* i, *p.* 65.

GEESH-PATI. Sans., from gir a word, and pati, a lord.

GEESOO. Tib. Koutouktow, Mongol, amongst the Mongols, the title of the highest class of the priests of buddha. The one resident at Oorga, is called by the Mongols, Gheghen Koutouktow. The Oorga high priest seems also to be called Geeso-tahba and is a regenerated Buddha of great sanctity. There are 30,000 Lamas under several heads at Oorga. See Kouren. Koutouktow.

GEETA. Sans., also Gita from Goi to sing a hymn or song. Bhagavat Gita, a divine song, a Sanscrit poem in the form of a dialogue, between Arjuna and Krishna. Geeta. is a discourse on the Yoga philosophy. See Bhagavat Geeta.

GEH. Hind. Kanawar, Corylus lacera, the hazel.

GEHAI. Hind., or Gawai, or Rul of the Sutlej valley, Eleagnus conferta.

GEHAR A large class of child stealers in the valley of the Nerbuddah.

GEHELA. Mar. Randia dumetorum.

GEHENNA. This valley is celebrated for the inhuman and barbarous, as well as idolatrous, worship paid to Moloch; to which deity parents often sacrificed their offspring, by making them pass through the fire. (2 King's xxiii, 10; 2 Chron. xxvii, 3.) To drown the lamentable shrieks of the children thus immolated, musical instruments (in Hebrew termed Toph) were played; whence the spot, where the victims were burnt, was called Tophet. After the captivity, the Jews regarded this spot with abhorrence, on account of the abominations which had been practised there: and, following the example of Josiah, they threw into it every species of filth, as well as the carcasses of animals, and the dead bodies of malefactors, &c. To prevent the pestilence which such a mass would occasion if left to putrify, constant fires were maintained in the valley, in order to consume the whole: hence the place received the appellation of Gehenna. By an easy metaphor, the Jews, who could imagine no severer torment than that of fire, transferred this name to the infernal fire,—to that part of the invisible world, in which they supposed that the demons and the souls of wicked men were punished in eternal fire.—*Robinson's Travels, Palestine and Syria, Vol.* i., *p.* 107.

GEHLOTE, a rajput race founded by Bappa. They long held power in Saurashtra. Before they became saiva hindoos, they chiefly worshipped the sun. The name is also pronounced Grahlote and they are also called Sesodia. Arore, on the Indus is claimed by the Gehlote to have been their ancient site, and they claim to be the Balicaputra who occupied it. They were driven from Balabhipura when it was taken and sacked by the Huns or Parthians. The Gehlote cula is subdivided into twenty-four sacha, or ramifications, few of which exist:—

1 Aharya . . . at Dongurpoor.
2 Mangulia. . . In the Desert.
3 Seesodia . . . In Mewar.
4 Peeparra. . . In Marwar.

Gehlote and Cotemporary Princes.

From the Gehlote have branched the two illustrious stems of the Seesodya and Aharya. They are spread over different parts of the N. W. Provinces; but, though they sometimes call themselves Seesodya, they are rarely known by any other name than that of Gehlote. The name Seesodya is said to be from Seesoo, a hare. Their neighbours, who for some unexplained reason are fond of imputing cowardice to them, say their name of Gehlote is derived from Gehla, a slave girl; but the real origin which is universally believed in Mewar is the following. When the ancestors of the rana of Mewar were expelled from Guzerat, one of the queens, by name Pooshpavuti, found refuge among the brahmins of the Mallia mountains. She was shortly afterwards delivered of a son, whom she called, from the cave (Goha), in which he was born, by the name of Gehlote, from him are descended the present ranas of Oodypoor. Their claim to be descended from Noshirwan and a Grecian princess which has frequently been discussed, invests this clan with a peculiar interest. *Elliot, Tod's Rajasthan*, Vol. I. p. 84.

GEHUN. Hind. Triticum æstivum, Wheat. The word is variously corrupted in the districts of India into Goon, Gohun, &c., &c.

GEKANTAKA. Sans. Asteracantha longifolia. *Nees.*

GELA. Hind. Mimosa scandens.

GELADA RUPPELLII. See Simiadæ.

GELASIMI, land crabs, most of these have a single large claw. They move about with that half erected and quickly retreat to their holes in the sand. There are several species known, G. annuli annulipes; G. dussumieri; G. tetragonum.—*Collingwood.* See Crabs; Crustaceæ.

GELATINE is very abundantly diffused through the animal kingdom. Though not contained in any of the healthy animal fluids it is obtained in large proportion from skins, from most of the white and soft parts of animals as cartilage, tendon and membrane; also from bone and horn. It is likewise found in large proportion in cartilaginous fishes and forms the natural cement of many shells. From all these gelatine may be extracted by simple boiling in water with different precautions in regard to cleaning. The preparation of gelatine in the form of glue from skins, &c., is well known in India, and described in the Persian works on

Materia Medica under the name of "ghurree-al-jallad," "suresbum-i-jild," and "suriss." From bones it may be obtained by the same process but with the assistance of pressure and still more easily if they have been first acted on by muriatic acid to remove the phosphate of lime. The obtaining of gelatine may thus give rise to a number of employments which may be practised wherever these offals are obtainable and the product in the form of gelatine can be turned to account. The solution of gelatine which on cooling becomes a tremulous mass, may by further evaporation be converted into a hard and brittle substance well known by the name of glue. This is made from the parings of hides or horns of any kind, the pelts obtained from farriers, the hoofs and ears of horses, oxen, calves, sheep, &c. In France it is made from the raspings and trimmings of ivory, the refuse pieces and shavings left by button-mould makers and from other kinds of hard bone. Size, again, is made by boiling down in water the clippings of parchment, glove leather, fishskin and other kinds of skin and membrane. This is used either alone or mixed with flour, paste, gum arabic or tragacanth and employed by bookbinders, paper-hangers and painters in distemper. Gelatine is one of the principal constituents of most of the animal substances employed as food and it is arranged by Dr. Prout among the albuminous group all of which he says "differ from the oleaginous and the saccharine principles in this respect that they contain a fourth elementary principle, namely azote."—*Royle on Isinglass, p. 5.* See Food. Isinglass.

GELBHOLZ, also Fustick. GER. Fustic.

GELIDIUM CORNEUM. One of the Algæ; according to some narrators, it enters into the formation of the edible swallow nests of the Japanese islands. See Nostoe edulis.

GELIT. DUT. Litharge.

GELLATI. A Kurd tribe. See Kurdistan.

GELOCHELIDON. A genus of birds of the Family Laridæ, Sub-family Sterninæ. The Laridæ and its genera may be thus shown :—

Fam. Laridæ.

Sub-fam. Larinæ, 2 gen. 5 sp. viz.: 1 Catarracta; 4 Larus.

Sub-Fam. Sterninæ.

Div. 1 Skimmers, 1 gen. 1 sp. viz.: 1 Rhynchops albicollis.

Div. 2 Marsh Terns, 7. gen. 10 sp. 1 Sylochelidon; 1 Gelochelidon; 2 Hydrochelidon; 1 Thalasseus; 1 Seena; 3 Sterna; 1 Sternula.

Div. 4 Oceanic Terns, 2 gen. 4 sp. 2 Onychoprion; 2 Anous.

GELOCHELIDON ANGELICA. Sterna angelica: the 'Gull-billed Tern.' Warmer regions of the old world, extending also to America; Java: common in India.

GELONIUM LANCEOLATUM. *Willd. Roxb. Fl. Ind.* iii, *p.* 831.

G. bifarium, WILLD. | Hsai-than-bayah, BURM.

This tree is not G. fasciculatum. *Roxb.* and not Erythrocarpus glomerulatus.—*Blume.* It is found in the Rangoon district, it seldom exceeds three feet in girth. Wood white color, fit for house posts and adapted for every purpose of house-building. It is common in rather open forests, up to an elevation of 4,000 feet. It is a very variable plant; and Mr. Thwaites thinks that all the specimens he had seen of the genus, from different and distant parts of India, might with safety be referred to one species.—*Thw. En. Pl. Zeyl. p.* 274.

GELUM. TIBET. A Monk.

GEMITORES. The Pigeons, an order of birds including one family and three subfamilies, as under :—

Fam. Columbidæ.

Sub-fam. Treroninæ; 5 gen. 3 sub-gen. 23 sp. viz.: 3 Toria; 8 Treron; 3 Sphenocercus; 4 Ptilonopus; and Carpophaga.

Sub-fam. Columbinæ, 7 gen. 21 sp. viz.: 2 Alsocomus; 3 Palumbus; 2 Columba; 4 Macropygia; 2 Geophilia; 7 Turtur; 1 Calcophaps.

Sub-fam. Gourinæ, 1 gen. 1 sp. viz.: Calænas nicobarica.

GEMS, called precious stones, also precious gems, are mostly minerals, remarkable for their lustre and beauty. Precious stones are frequently mentioned in the Bible in Ex. xxxv, 27; xxviii, 17 to 20; xxxix, 10 to 13. Ez. xxviii, 13. Is. liv and 12. Ez. xxvii and 16. Job xxviii, 18. Ez. iii, 9. They have always been in high esteem in all countries where political changes have been frequent or violent. From their small bulk and consequent portability, they have always risen in price during wars. In the great French revolution from 1789 to 1796 diamonds are stated by Mr. Emanuel to have doubled their usual price. The prices of those of larger value are also regulated by the demand and by the fancies of purchasers.

Transparency, brilliancy, lustre and freedom from defects, to be of value, should also have associated with them the exact quantity of colouring to furnish the desired tint.

Mr. Emanuel informs us, (p. ix.) that, as with many other things, most of what has been written upon gems is only simple reprint, or, at most, compilation from previous writers.

The precious minerals, though mostly tropical, occur in many countries, and generally in rocks or deposits differing widely from them in appearance but generally in granite or gneiss, or are washed into beds of rivers, they are generally accompanied by the precious metals and often various kinds of gems are found together.

Many of those known to the ancients are not now recognised. Akik, Arab is any gem of red hue, cornelian or ruby. The sapphire of the Greeks and Romans is described as intermixed with gold, but, according to Mr. Emanuel, that of Scripture was a transparent blue stone.

Gems are often imitated and Mr. Emanuel lays much stress on the hardness of a stone as a test for gems. Doublets are partly true gems above, and partly false, being a portion of a true joined artistically to glass or other gem below. Lapidaries are sometimes deceived by false gems and Birmingham sends many blue cutglass false gems to Colombo for sale.

The diamond was considered by the Romans a remedy against incubus and succabos The ruby against poison: the jacinth procured sleep: the sapphire procured favour with princes. It was on tables of the sapphire, so often mentioned in holy writ, that the ten commandments were engraved: it was also supposed to preserve the sight; the chrysolite assuaged wrath Each of the twelve apostles was symbolised with a precious stone. Peter by jasper, John by emerald and so on. A sardius, was placed in the breast plate of the jewish high priest, and any precious stone of a red hue was supposed by the Jews to be a preservative against plague, and, amongst the Arabs, to be useful in stopping hæmorrhage The topaz was so named from the island Topazion in the Red Sea. The carbuncle, in Hebrew, Barĕkăt, signifying flashing stone, or lightning stone, was supposed to fall from the clouds, amid flashes of lightning. The Nophek of the Old Testament, translated emerald, seems to have been a carbuncle. The carbuncles of superior brilliancy are called "males" and those of inferior colour females.

The value of the ruby exceeds that of every other gem. The precious opal is the most beautiful of all gems. Its price depends on the play of colours displayed. The hydrophane or Mexican opal loses its beauty when exposed to water.

Since the middle of the 19th century, fresh sources of precious stones have been discovered near Melbourne in Australia and at the Cape of Good Hope colony and much alteration has occurred in the prices. Gems have been selling in India, at 25 per cent. higher than in London. In Australia, the rare varieties of corundum, the oriental emerald and topaz, have been obtained, and artificial gems have been more largely manufactured. India, however, long famed for its wealth in gems, continues largely to export them, and in the four years 1856-7 to 1860-1; the quantities exported were valued at more than half a million sterling, four-fifths of that amount having been sent to Aden and Suez.

Table showing the value of precious stones exported from India to all parts of the world from 1856-57 *to* 1860-61.

Years.	Whence exported.	Countries whither exported.							Total exported to all parts.
		United Kingdom	France.	Other parts of Europe.	Suez and Aden.	China.	Arabian and Persian Gulf.	Other parts.

The prices of gems seem always to have been higher in Asia than in Europe. Tavernier tells us "there are but two places in all the East where coloured-stones are found, within the kingdom of Pegu and the island of Ceylon. The first is a mountain twelve days journey, or thereabouts, from Siren, towards the North-east, the name whereof is Capelon. In this mine are found great quantities of rubies and espinels or mothers of rubies, yellow topazes, blue and white sapphires, jacinths, amethysts, and other stones of different colours. Among these stones which are hard, they find other stones of various colours that are very soft, which they call Bacan in the language of the country, but are of little or no esteem. Siren is the name of the city where the king of Pegu resides: and Ava is the port of his kingdom. From Ava to Siren you go by water in great flat bottomed barques, which is a voyage of sixty days. There is no going by land, by reason the woods are full of lions, tigers, and elephants. It is one of the poorest countries in the world, where there is no commodity but rubies; the whole revenue whereof amount not to above a hundred-thousand crowns. Among all the stones that are there found, you shall hardly see one of three or four carats that is absolutely clean, by reason that the king strictly enjoins his subjects not to export them out of his dominions; besides that, he keeps to himself all the clean stones that are found. So that I have got very considerably in my travels by carrying rubies out of Europe into Asia. Which makes me very much suspect the relation of Vincent le Blanc, who reports that he saw in the king's palace, rubies as big as eggs.

All rubies are sold by weights which are called Rati; that is, three grains and a half, or seven-8th of a carat: and the payments are made in old pagodas. Rubies of the following weights have been sold as under,

	Pags.
Of 1 rati,	20
Of $2\frac{1}{8}$ rati	85
Of $3\frac{1}{4}$ rati	185
Of $4\frac{5}{8}$ rati	450
Of 5 rati	525
Of $6\frac{1}{2}$ rati	920

If a ruby exceed six rati, and be a perfect stone, there is no value to be set upon it.

The other place where rubies are found, is a river in the island of Ceylon, which descends from certain high mountains in the middle of the island; which swells very high when the rains fall: but when the waters are low, the people make it their business to search among the sands for rubies, sapphires and topazes. All the stones that are found in this river, are generally fairer and clearer from those of Pegu.

I forgot to tell you that there are some rubies, but more balleis-rubies, and an abundance of bastard rubies, sapphire and topazes found in the mountains that run along from Pegu to the kingdom of Camboya.

Coloured stones are also found in some parts of Europe, as in Bohemia and Hungary. In Hungary there is a mine where they find certain flint of different bigness, some as big as eggs, some as big as a man's wrist, which being broken, contain a ruby within as hard and as clean as those of Pegu." (*Chamber's Journal, June* 1868.) (*Tavernier's Travels*, p. 143, 144.)

Arabia has the topaz, the onyx, and the yemani or akik. The agate is found near Mocha, emeralds in the Hejaz, beryls and cornelian, near San'a and Aden, malachite in the cavern of Beni Salem, also jasper, amethyst, and turquoise, in the environs of the village of Safwa, about three days journey from Medina. Diamond, the sardonyx, and the topaz, were obtained from this country in former times. Of metals, silver, iron, lead, and copper, are met with in different parts of Arabia, and the last, recently in Oman. Gold is mentioned by the ancient writers, but at present is not known to exist in Arabia. Bitumen is obtained in Arabia Petræa; and in Arabia Deserta, lignite and coal.

In Ceylon, the ruby, amethyst, topaz, sapphire and cinnamonstone are found in great abundance, but not emeralds. Sapphire, spinell, chrysoberyl and corundum are found in Ceylon. The sapphires which are red, purple, yellow, blue, white and starstone, are met with at Matura and Saffragam, and rubies and sapphires at Badulla and Saffragam. The corundum is very plentiful at Battagamana, on the banks of the river Agiri Kandura. The great bulk of the gems, however, come from Ratnapura, which means the city of gems, the river near which is regularly worked. Ceylon affords all the varieties of quartz; as rock-crystal, amethyst, rose-quartz, cats'-eye, and prase. Rock-crystal occurs in abundance, both massive and crystalized, of various colours, good

quality and in large masses. Amethyst also is pretty abundant, very beautiful specimens of this mineral are found in the alluvion, derived from the decomposition of gneiss and granitic rock, at Saffragam and the Seven Korles. A large crystal of it was found near Buanwelle, containing apparently two distinct drops of water. Rose-quartz, which is pretty common, is often found in the same place as amethyst. Ceylon produces the finest cat's eyes in the world, indeed the only kind that are highly esteemed, and that bring a high price. The best specimens have been found in the granitic alluvion of Saffragam and Matura. Prase is of rare occurrence in the island, only amongst the pebbles on the shore of Trincomalee. Belonging to the schorl-family, are topaz and schorl. The topaz commonly passes under the name of the "white or water sapphire." It is generally white, or bluish or yellowish white, it is commonly much water-worn, and perfect crystals of it are very rare. It occurs in many places in the alluvion of granitic rock.

The Zircon family is richer in Ceylon than in any other part of the world. It is found in the districts of Matura and Saffragam; and, is most abundant in the former, "Matura-diamond" is the name applied to its finest varieties by the dealers in gems. Besides the two well-established species, common zircon and hyacinth, there is a third, massive, opaque and uncrystallized, and of a dark brown colour. Specimens of it from Saffragam weigh two or three ounces. The natives are completely ignorant of the true nature of zircon. The yellow varieties are sold by them as a peculiar kind of topaz, the green as tourmalines, the hyacinth red, as inferor rubies, and the very light gray, as imperfect diamonds. All the varieties are found in the beds of rivers, or in alluvial ground, which, both in Saffragam and Matura is of the same kind.

For the ruby-family, Ceylon has been long celebrated. Four species of it, viz., spinell, sapphire, corundum and chrysoberyl occur. In gneiss or granitic rock, spinell is comparatively rare. Dr. Davy got small and very beautiful crystals of it, which were said to have been brought from the interior, and he found it in specimens of clay iron-ore, from a part of the Kandyan country where gneiss is the prevailing rock. Sapphire is much more common, it occurs in considerable abundance in the granitic alluvion of Matura and Saffragam, and in the neighbourhood of Avisavelli, and on the Neura-Ellia-patam.

The corundum of Battagammana is frequently found in large six-sided prisms, is commonly of a brown colour, whence it is called by the natives "Curundu galle" cinnamon stone; occasionally it is to be met with partially or entirely covered with a black crust which is merely the stone with an unusual proportion of iron.

Adularia is very abundant in some parts of the interior, particularly in the neighbourhood of Kandy, where it is occasionally the predominating ingredient of the rock.

Ava gem-sand, comes from the neighbourhood of Ava, and is sometimes one of the Shan articles of merchandise. It consists of small fragments of nearly all the precious stones found in the country, but garnet, beryl, and spinell are its principal constituents, more especially the last, which seems to constitute nearly three-fourths of the whole mass. A single handful will contain specimens of every shade, black, blue, violet, scarlet, rose, orange, amber yellow, wine yellow, and white. *Mason.*

The *beryl*, of which mineral many of the stones used as emeralds in India consist, occurs in the Siberian Altai range; a number of these gems also come from Khotan, Ilchi, and the Chinese provinces. Natives of India say they are found in gold mines, and take 20 years to come to perfection. They are called "Zamrad," or "Zabrjad," and in Punjabi "Panna," the most esteemed colors are the "Zababi," next the "Saidi" said to come from the city Saidi in Egypt. "Raihani," new emeralds; "fastiki," old emeralds, that is, such as have completed their 20 years; "Salki," "Zangari" color of verdigris, "Kirasi" and "Sabuni."

The finest beryl (aquamarine) says Mr. Tomlinson, come from Siberia, Hindostan, Brazil. In the United States very large beryls have been obtained, but seldom transparent crystals: they occur in granite or gneiss. A reputed beryl of large size mentioned in most books on mineralogy has recently been discovered to be a lump of quartz. *Tomlinson.*

Aquamarine includes clear beryls of a sea green, or pale bluish, or bluish green tint. Hindoos and mahomedans use them pierced as pendants and in armlets. They are the "seign" of the Burmese and the Zamarud of the Persians. At the Madras Exhibition of 1855, a good specimen of aquamarine, or beryl, was contributed by Lieut. Puckle from Mysore: other samples of long reed crystals were forwarded by the Nellore Local Committee; small pieces of amethyst, tourmaline, rock crystal, agate and cor-

nelian were exhibited from Masulipatam. Perhaps the aquamarine of the South of India may become more valued.

Prismatic corundum or chrysoberyl, is found among the Tora Hills near Rajmahal on the Bunas, in irregular rolled pieces, small and of a light green colour. These stones are sold as emeralds by the natives, under the name of "puna," but the native dealers are aware that they are softer than the real emerald of India, which is generally green coloured sapphire. It is this green sapphire, the oriental emerald, which is so often seen in Burmah, but beryl (Seing, Burm) and emeralds are brought from the north of Ava, though the localities in which they are found are not known. Chrysoberyl is of a green colour, sometimes with a yellow or brownish, tinge, and occasionally presenting internally an opalescent bluish white light. When transparent and free from flaws, it is much prized. Mr Faulkner says it is found in Ceylon, Connecticut, and Brazil.

Carbuncle, (ανθραχ GR.) Under this term, the ancients included all gems of a red colour, such as hyacinths, rubies, garnets. At present the carbuncle is a gem manufactured from the garnet.

Cat's Eye.

Chashm-i-maidah,	PERS.	Zmilaces,	LAT.
Bel occhio,	IT.	Zmilampis,	,,
Beli oculus,	LAT.	Mata-kuching,	MALAY.

Cat's eye is chiefly found in Ceylon, but specimens are also obtained from Quilon and Cochin, and in the neighbourhood of Madras, the site of the last, however, has not been traced. Cat's eye is much valued in India. It is a transparent quartz full of minute fibres of asbestos and is cut in a highly convex form. It is of a yellow hue, slightly tinged with green. The cat's eye is often set in rings, and is brought to Tenasserim from Burmah. Comstock says: "it is in great request as a gem, and bears a high price:" but those seen in the Maulmain market are not much valued. A small one may be purchased for two rupees, and one of ordinary size for five; while ten rupees is the highest price given for the best.—(*Mason.*)

Coral, pale delicate pink colour, is now the most valued in England, a large drop or bead selling at £30 to £40, and smaller pieces at £120 to £150 the ounce. Red is esteemed in India.

Corundum, if translucent, when red is a ruby; when blue a sapphire and when yellow a topaz. *Sapphire* (sapphirus) with the ancients, was a generic term for all blue gems. It was on tablets of the sapphire, so often mentioned in holy writ, that the ten commandments were engraved. It was supposed to preserve the sight. It occurs in parts of India.

Diamond frequently becomes phosphorescent on exposure to light. It is found chrystalline and amorphous, and of all colours, white, yellow, orange, red, pink, brown, green, blue, black and opalescent. Stones with naturally acute angles are used for cutting glass and sell at £10 the carat, for most gems will scratch but diamonds alone cut glass. The diamond is found in India, Sumatra, Australia the Ural mountains, Brazil, and North America.

In India, in the Dekkan, in the river Pennar in the Cuddapah district and near Banganapilly, in the lower part of the Kistnah, formerly near Ellore and at Golcondah. The diamond lately sold to the emperor Louis Napoleon, for £5,000, was said to have been obtained in the Pennar or at Banganapilly. In Tavernier's time the mines of Golcondah employed 60,000 persons. At Pannah and the river Sonar in Bundelcund, at Sumbulpur on the Mahanaddy also in Malacca? Borneo and Celebes. The diamonds of Borneo occur in the mountain chain in Jannah Laut. Thara and Tora, are two diamond washing tribes who possess sixteen Jaghire villages at Sumbulpore. They are supposed to be of African origin.

Diamonds are found in quartz conglomerates, containing oxides of iron, also in alluvium, in loose and imbedded crystals, almost always of small size, and most frequent in company with grains of gold and platinum. Ordinary diamonds are mostly taken to Europe from the Brazils, but on an average, of 10,000 stones, there will not be one of 18 carats found.

The Nassik diamond was sold to the marquis of Westminster for £7,200. Even with those who profess to be acquainted with gems, the white sapphire and topaz occasionally pass for the diamond. Diamonds in the rough are unattractive pebbles. Diamonds are cut in the rose or brilliant or brilliolette (Briolette) forms. They were usually cut in the rose pattern, till the middle of the 18th century, but roses are, in general, only now used where the space in the setting prohibits the introduction of the brilliant form, brilliants being at present universally worn. Diamonds are cut into facets by rubbing two stones against each other and polished by being held to a rough revolving metal wheel, carrying diamond powder. The double cut brilliant is at present the common form.

The following diamonds are most known:

Name.	Character.	Weight—Carats.	Estimated value £ St. 9, where found.	Present owner.
Eugenie,	Brilliant,	51	£3,000, Pennar.	
Austrian,	Yellow Brilliant,	...	.....	Emperor of Russia.
The Shah,	Diamond,	86	... ...	
Hope,	Blue diamond,	44½	.....	
Polar Star,	Diamond,	...	.....	Pasha of Egypt.
Saucy,	do.	53½	... ...	King of Hanover.
Pigott,	do.	82¼	.....	Rajah of Muttam.
Cumberland,	do.	...	£20,000	Marquis of Westminster
Mattam,	do.	367	£8,000? Borneo.	Emperor of Austria
Nassak,	do.	78⅝	... ...	
Florentine,	Yellowish Brilliant,	139½	... ...	
Dresden,	Green do.	...	..... Brazil.	Mr. E. Z. Dresden.
Star of the South,	Drop shaped do.	125	Brazil.	Emperor of Russia
Mr. E. Z. Dresden,		76½		Crown of England.
Orloff,		194⅛	.....	
Koh-i-noor,	Brilliant,	102⅔	..... Madras.	Crown of France.
Regent or Pitt,	Diamond,	136¾		

Diamonds are weighed by the carat, 4 grains = 1 carat, 151½ carats or 606 grains 1 oz. troy.

Emerald.

Zamarrud,	Ar. Pers. Hind.	Smeraldo,	It.
Emeraude,	Fr	Smaragdus,	Lat.
Ismaragdon,	Gr.	Pachi Kalu,	Tam.
Prasinus,	,,	Esmeralda,	Sp.

Oriental emerald, the green variety of corundum is the rarest of all gems. Emerald is of a beautiful green colour, unsurpassed by any gem. The finest occur in a limestone rock, at Muzo, in New Granada near Santa Fé de Bogota 5° 28′; at Odontchelong, in Siberia and near Ava. It is associated with spinel.

When of a deep rich grass green colour clear and free from flaws, it sells at from £20 to £40 the carat. Those of lighter shade from 5*s.* to £15 the carat. The emerald pillars in the temple of Hercules at Tyre; the emerald sent from Babylon as a present to a king of Egypt, four cubits in length and three in breadth, and the emerald obelisk described by Herodotus, were all doubtless green jasper. The Ural and Altai mountains have latterly furnished the finest emeralds. (*Emmanuel.*)

Moonstone occurs in Ceylon. It is a variety of felspar, and of little value. (*Emmanuel.*)

Pearls in some instances, though full of lustre without, are dead like a fish eye within, and vice versa. They occur of all colours, those of Asia, from the sea pearl oyster Meleagrina margaritifera, are found on the West Coast of Ceylon, in the gulf of Manaar, in the Persian gulf, in the Sooloo islands, near Papua and in the Red Sea. Off the coast of Ceylon, the fishing season is inaugurated by numerous ceremonies, and the fleet, sometimes of 150 boats, then put to sea. Each boat has a stage at its side and is manned by ten rowers, ten divers, a steersman and a shark charmer (pillal karras). The men go down five at a time, each expediting his descent by means of a stone 20 to 25 lbs. in weight, and holding their nostrils, gather about 100 shells in the one to two minutes which they remain under water. Each man makes 40 to 50 descents daily. The pearl oysters are thrown on the beach and left to putrify. In the Persian gulf, so many as 30,000 persons are said to be employed in the pearl fishery. (Job xxviii. Prov. iii.) According to European taste, a perfect pearl should be round or drop-shaped; of a pure white, slightly transparent; free from specks, spots or blemish, and possess the peculiar lustre characteristic of the gem. In India and China, the bright yellow colour is preferred. Cleopatra is said to have dissolved in vinegar, a pearl of the value of 150,000 aureas or golden crowns in the presence of Anthony and to have drunk it off, but it would have required a larger quantity and stronger acid than any one could have taken with impunity, to have done so. Cæsar is said to have paid a sum equal to £50,000 sterling, for a single pearl. The fellow-drop to the pendant destroyed by Cleopatra, is said to have been sawn in two by command of the emperor Augustus, and used to adorn the statue of Venus. (*Emmanuel.*)

Sapphires, in colour vary from white to the deepest blue and black, but stones are often of varied hues. If held in water, with forceps, these coloured and uncoloured stones will be seen. A very good blue sapphire of one carat weight would bring £20. The white sapphire is sometimes sold as a diamond. *Emmanuel.*

Ruby or red sapphire is the most valuable of all gems, when of large size, good colour, and free from flaws. They are found in Ava, Siam, the Cupelam mountains, ten days

journey from Syrian, a city in Pegu, in Ceylon, India, Borneo, Sumatra, on the Elbe, on the Espailly in Auvergne and Iser in Bohemia. The ruby, in colour varies from the lightest rose tint to the deepest carmine, but the most valuable tint is that of "pigeons' blood" a pure deep rich red.

The *Spinel Ruby* and *Balas Ruby* belong to the spinel class of minerals, as also are several of the gems sold as Ceylon rubies. Tourmaline, when of a red colour is called Brazilian ruby, and this term is also applied to the artificially coloured topaz The ruby brings a higher price than the diamond, ranging as per margin.

Carat	£.	£.
1	14	20
1½	25	35
2	70	80
3	200	250
4	400	450

Star Rubies are asteriated corundums.

Tourmaline is sometimes mistaken for the ruby, and the pink topaz for the Balas ruby.

Spinel and *Balas Rubies* are found in Ceylon, Ava, Mysore, Beluchistan. The spinel ruby is of a deep hue. They are comparatively of little value, but are often sold for the true ruby, and the true ruby is occasionally parted with as a spinel ruby.

Topaz is so called from the island of Topazion in the Red Sea. There is a gold coloured and greenish yellow topaz. The oriental topaz according to its colour, receives the following names :—

Nova mina, colourless.	Brazilian chrysolite greenish yellow.
Brazilian sapphire, light blue.	Brazilian ruby, pink or rose colour, artificially obtained.
Aquamarine, greenish.	

Oriental Topaz is found all over the world, in granite and gneiss rocks, which contain fluor spar. The oriental topaz is of very little value in commerce. The gem is of a yellow tint, seldom deep, of a light straw colour. Oriental Topaz, ruby and sapphire consist of pure alumina, coloured with oxide of iron.

	Ruby.	Sapphire.
Alumina - - -	90·0	98·5
Lime, - - - -	0·0	0·5
Silica, - - -	7·0	0·0
Oxide of Iron, - -	1·2	1·0

Sp. Gr. 3·99. Hardness only inferior to the diamond : highly electric. Natural form six sided prisms, variously terminated, more frequently in rolled masses. (*King.*)

Turquoise is the *Firozah*. Turkis, Hind. hence Firoza-Rang, turquoise blue. It is found at Khojend, in Mawar-al-nahr or Trans Oxiana, at Shebavek, in Kirman, and in a mountain of Azerbijan, where the mine was discovered about fifty years before Ahmed ben Abd ul Aziz, composed his Treatise on Jewels. He describes the mine at Nishapur as most celebrated from early ages for that particular kind of turquoise, entitled Abu Ishaki, which, says he, averts evil from those who wear it, conciliates the favour of princes, augments wealth, preserves the sight, ensures victory over an adversary and banishes all unpleasant dreams. The ancient sages, when first they beheld a new moon, immediately after fixed their eyes, says he, on the Firozah. (*Ouseley's Travels*, Vol. I., p. 211.)

The Turquoise, from whatever source, is apt to change colour, if brought into contact with acids, musk, camphor, or other scents. Small clear Persian stones (for it is chiefly found at Nishapur in Khorasan) sell at 6d. to 20s. each, whilst a fine ring stone will realize from £10 to £40, a perfect stone of the size of a shilling and of good depth was sold for £400. It varies from white to a fine azure blue, but it is only the fine blue stones that are of any value. Turquoise is still, in England, believed to protect the wearer from contagion, a belief, as regards that and other stones, very common amongst the ancients. Some specimens change their colour, possibly from the state of the weather. (*Emmanuel.*)

The precious gems commonly seen are

Emeralds.	Amethysts.	Beryl
Pearls.	Sapphire.	and
Rubies.	Topaz.	Precious Opal.
Diamonds.	Avanturine.	

(*Chambers' Journal, June* 1868.)

The course of trade has been so devious from time to time that obscurity long prevailed as to the native countries of the precious stones. The localities in Coimbatore, which supply the beryl, are also supposed to have yielded the emerald, though Tavernier was not able to ascertain that any part of India, in his day was yielding emeralds. Tavanier says "As for emeralds, it is a vulgar error to say they came originally from the east. And therefore when jewellers and goldsmiths do prefer a deep coloured emerald inclining to black, tell ye, it is an oriental emerald, they speak that which is not true. I confess, I could never discover in what part of our continent those stones are found. But sure I am, that the eastern part of the world never produced any of those stones neither in the continent, nor in the islands. True it is, that since the discovery of America, some of those stones have been often brought

rough from Peru to the Philippine Islands, whence they have been transported into Europe; but this is not enough to make them Oriental. Besides that, at this time they send them into Spain through the North Sea." (*Taxernier's Travels*, p. 144.)

That the lands in the East have generally been supposed to be the chief gem producing countries is also shown by the fact that Europe designates the most valuable of them oriental, oriental amethyst, oriental emerald, oriental topaz, oriental aquamarine.

Artificial Gems are largely made, and many of the precious stones are well imitated. The colour of the emerald is peculiar, and called emerald green. The glass of bottle bottoms is, however, largely sold in Ceylon and other places as emeralds. Emeralds are rarely without defects, called flaws, "Rag," *Hind.* and, with the hope of deceiving, the manufacturers, aware of this, make the false emeralds with flaws. Of all precious stones, the emerald is most liable to defects, and their absence should excite suspicion as they can be very easily imitated.

Strass is a technical term for the base of the artificial gems, of which the following is the composition :—

	Strass.	Sapphire.	Emerald.	Beryl.	Topaz.	Sapphire another.	Sapphire another.
Litharge,	5·0						
White sand,	5·75						
Potass,	0·5						
White strass,		250·					
Oxide of Cobalt,		3·74					
Strass,			250·	0·82		0·11	500
Copper green oxide			2·51	187·5		31·25	
Chrome oxide,			0·11				
Antimony glass,				1·32	50·		
Ceruse of Clichy,							
Quartz pebbles calcined,					50·		5·9
Copper acetate,							0·825
Iron tetroxide,							

Inferior gems. Differing from the precious stones is a large class of quartzose minerals called inferior gems: those in common use are:—

Amethyst, common,	Jasper,	Lapis lazuli,
Carbuncle,	Bloodstone, or	Rock crystal,
Jade,	Heliotrope,	Common opal,
Turquoise	Fossil wood,	Sardonyx,
Cornelian,	Agate,	Chryso prase,
Onyx,	Garnet,	Coral,
Moon-stone,	Mother of pearl,	Jet.
Malachite,		

Ayate, the αχατης GR. is one of these, found in great variety and abundance in many parts of India. Some of the agates and other silicious minerals in the amygdaloid rocks on the banks of the Seena river, between Sholapoor and Ahmednuggur, are of great size and in profusion, but the most beautiful are brought from Cambay.

Amethyst. ENG. GER.

Martis,	AR.	Amethystus,	LAT.
Amethyste,	FR.	Martas,	MALAY.
αμεθυστος,	GR.	Ametisto,	PORT. SP.
Sang-i-Sulimani,	HIND. PERS.	Skuandi,	SINGH.?
Amatista,	IT.	Sugandi kallu,	TAM.

The amethyst is mentioned in Ex. xxviii. 19, and xxix. 12, but under this term two different minerals are known, viz., the occidental or the common amethyst, one of the inferior gems, a quartzose mineral, found in amygdaloid trap rocks in all countries, but in some quantity amongst the volcanic rocks of the Dekkhan. Some beautiful specimens of amethyst crystals occur in dykes of quartz near Bowenpilly at Secunderabad. Its colour is of every shade of purple, violet: some of these are valued, for it is almost the only stone that can be worn with mournings. When the colour of a specimen has to be equalized, it is placed in a mixture of sand and iron filings and exposed to a moderate heat.

The oriental Amethyst is also of a purple colour but is an extremely rare gem and belongs to the corundums. Its colour can be destroyed by heat and its purity then resembles that of the diamond.

The agate, onyx, cornelian, and bloodstone, of the Rajpipla range, the Cambay stones as they are called from the place where they are mostly cut, and from which they are almost wholly brought to Bombay, are very abundant.

The cornelian of the Rajpipla range is found in a bed of blue clay—the detritus, probably, of the adjoining rocks. Shafts are pierced in this to the depth of from thirty to thirty-five feet, and horizontal galleries run in any direction that suits the fancy of the miner: the pebbles are distributed promiscuously, and do not appear to lie in

veins or lodes. The galleries seldom exceed a hundred yards in length,—they often run into those of other mines: they are generally five feet in height, and four across. To each mine there are thirteen men attached, who work by turns. Each man must send up so many basketsful of earth and stones before he is relieved. The stones are collected in baskets and drawn up by a rope run over a roller or pulley. A group of people await them at the mouth of the shaft, and examine them one after another by chipping each on a piece of stone: the compact and fine-grained are the best, and the blacker the hue is at first the redder it becomes after being burnt. There were, in 1832, about one thousand miners employed; and each man carried home with him a basket of stones every evening. They were spread out on the ground, and for a whole year turned over every four or five days to the sun: the longer they are so exposed the richer become their tints. In the month of May they are burnt. The operation is effected by placing the stones in black earthen pots or chatties. The pots are placed mouth under, a hole being pierced in the bottom of each; over this is put a piece of broken pot. The pots are arranged in single rows: sheeps dung is the only fuel found to answer: the fire is always lighted at sunset and allowed to burn till sunrise. If any white spots appear on the surface of the pot, the burning is reckoned incomplete. and the fire, continued some time longer. On being removed, the stones that have flaws are thrown aside as useless: those not sufficiently burnt are kept for next year's burning, and the remainder are sold for exportation. Nearly the whole of the stones are cut at Cambay—the greater part of them are made into beads. In the process: the stones are first broken up into pieces of suitable size for the end they are desired to serve. An iron spike is stuck into the ground, point upwards: the stone is placed on this and chipped with a hammer till nearly rounded: it is then passed on to the polisher, who seizes it in a pair of wooden clams and rubs it against a piece of sandstone placed in an inclined plane before him, turning it round from time to time till it assumes a globular form. It is then passed on to the borer and polisher; a hole is drilled. Cambay enjoys celebrity for its agates, mocha-stones, cornelians, and all the chalcedonic and onyx family, all of them brought from Rajpipla, but worked up at Cambay into every variety of ornament,—cups, boxes, necklaces, handles of daggers, of knives and forks, seals, &c. "Cambay stones," the akeek of the natives of Bombay and by Europeans called agates, include all kinds of quartz stones. They are from the amygdaloid trap rocks drained by the Nerbudda and Taptee. They pass in Europe and America for Scotch, Irish, Chamounix, Niagra, Isle of Wight "pebbles" according to the place in which they are sold. The principal varieties sold in Bombay are "crystal," "milk quartz" "prase" a green variety, of "moss stone" "mocha stone," "fortification agate," "calcedony; cornelian," "chrysophrase?" "heliotrope," "onyx," "obsidian," and very rarely "amethyst." These stones abound in all trap countries, the Brazils importing them as largely as India into Europe where the terms "Brazilian" and "Indian agates" are used indifferently by the trade

The fragments of a Murrhine cup, the little Cambay stone cup still made in Cambay, were exhibited in the theatre of Nero, as if, adds Pliny, they had been the ashes of "no less than Alexander the Great himself!" Seventy thousand sesterces was the price of one of these little Cambay cups in Rome in the days of Pompey. The price in Bombay ranges from Rs. 18 to Rs. 35 and Rs. 75. Nero paid 1,000,000 sesterces for a cup "a fact slily remarks Pliny "well worthy of remembrance" that the father of his country should have drunk from a vessel of such a costly price."

Onyx is stained black by being boiled in honey, oil or sugared water and then in sulphuric acid. For red, protosulphate of iron is added: and for blue, yellow prussiate of potash is added to the protosulphate of iron. (*Emmanuel.*)

Jasper, onyx, common opal, bloodstone or heliotrope are found in abundance in many parts of the Dekkan in the valley of the Godavery, and amongst the Cambay stones.

Fossil wood is in large quantity in Burmah, in Sind, and at Verdachellum and Ootatoor west of Pondicherry.

Rock crystal is abundant in the south of the peninsula of India at Vellum.

Garnet from which the carbuncles are formed is in great abundance in the south of India in the river?

Jade which the Chinese so highly value is brought from Central Asia, one locality being at Gulbagashen in the valley of Karakash.

Turquoise also from Central Asia is rather a favourite stone with the mahomedans of India.

Lapis lazuli, also from Central Asia, is not in much request in India.

The *Moonstone*, chiefly from Ceylon is somewhat more valued.

The *Sardonyx* is rarely seen in use in India,

Jet is imported into India, from Europe and is only worn by Europeans, large quantities of lignite are found in the tertiary strata along the sea coast of India, but none of it takes a good polish.

Malachite also an imported mineral, is rarely worn as a gem and only by Europeans. It occurs abundantly in the copper mines in Australia.

Coral and *mother-of-pearl* are also seen in India; but, amongst the people of India, these and all the inferior gems are held in but little esteem, who value a gem for its intrinsic price, not for the workman's skill expended in shaping it, in which the chief value of all the inferior gems consists.

GEM SAND from the neighbourhood of Ava is sometimes one of the Shan articles of merchandize. It consists of small fragments of nearly all the precious stones found in the country, but garnet, beryl, and spinelle are its principal constituents, more especially the last, which seems to constitute more than three-fourths of the whole mass. A single handful will contain specimens of every shade, black, blue, violet, scarlet, rose, orange, amber, yellow, wine yellow, brown and white. Many retain their original crystalline forms, some have the fundamental form of the species, a perfect octahedron: but many others have some of the secondary forms, among which it is not uncommon to see twin crystals re-entering angles, formed by two segments of the tetrahedron truncated on the angles, and joined together by their bases.—*Mason.*

GEMEIN NIGELLE. Ger. Nigella seed.

GEMMÆ MORBIDÆ. Lat. Galls.

GENDA. Beng. Marygold. Tagetes patula. T. erecta.

GENDAGAM. Tam. Sulphur.

Supposed to be a native of the Malay islands. but grows in the Konkans, in Travancore and Madura and is common in gardens in India, Flowers during the wet season, with dark purple or green smooth shoots. Leaves and stalks when rubbed have a strong, rather aromatic odour. After being roasted they are given in chronic rheumatism by the native practitioners. The plant is also said to be emetic. Wight gives Gendarussa Tranquebarensis.—*O'Shaughnessy,* p. 483. *Mason. W. Ic.*

GEND BEL. Hind. syn., of Andropogon nardus: properly, Gandh-bel.

GENDI. Hind. Chrysanthemum Indicum.

GENETTA MANILLENSIS. One of the Viverridæ. See Civet, Mammalia, Viverra.

GENGARU. Hind. Cratoegus crenulata: thorn.

GENEVER-BESSEN. Dut. Juniper berries.

GENGARENI KARRI. Tel. Hibiscus populneus.

GENGHIS KHAN. A mode of writing the name of Changez Khan. His name was Temugin, he lost his father when he was still very young. The father had reigned over thirteen Tartar hordes. *Gutzlaff's Chinese History,* Vol. I. p. 354. See Changez Khan.

GENGIVRE. Port. Ginger.

GENII, Spirits. The word is derived from the Arabic "Jin," through the Persian. Mahomedans believe that the "Jin" reside in the lower or first firmanent. See Jin, Saraswati.

GENIPA AMERICANA. See dyes.

GENISTA TOMENTOSA. Henna *Lawsonia inermis.* See Lawsonia, Dyes.

GENTIAN. Eng.

Gentiane,	Fr.	Genziana,	It.
Enzian	Germ.	Jenciana,	Sp.

The root of plants of Europe, of the genus Gentiana used in medicine and as a stomachic.

GENTIANACEÆ. A natural order of plants, about 100 species of which grow in most parts of the world. 2 in Japan, 1 in Arabia, and 68 in the East Indies, viz., 10 of the genus Gentiana, 2 Pneumonanthe, 5 Ericala, 3 Eurythalia, 2 Crawfurdia, 9 Swertia, 3 Agathotes, 6 Ophelia, 1 Halenia, 1 Erythrœa, 8 Canscora, 9 Exacum, 1 Slevogtia, 1 Mitreola. 1 Metrasaceme, 4 Villarsia.

The whole order is bitter as a characteristic, both in the stem and roots and they are used medicinally as a tonic.

GENTIANA. A genus of plants of the order Gentianaceæ. Dr. Wight names G. pedicellata and G. verticellata: G. umbellata grows in the Caucasus, G. decumbens, L. is common at considerable elevations in the various parts of the Punjab Himalaya; a tincture of it has been used as a stomachic by the Lahoul Missionaries. In Switzerland a bitter liqueur is prepared from G. lutea by fermenting and distilling the sliced root, the alcohol being generated by the sugar it contains. The distilled water is a strong narcotic, a table-spoonful being sufficient to occasion giddiness. Gentian root is a bitter tonic and is given in the form of infusion, tincture, and extract. Before the discovery of cinchona it held the first place among febrifuge remedies, and it is still deemed a very useful medicine in intermittent diseases. A perfect substitute for the infusion of gentian is made from the kurroo (Gentiana kurroo) common in the Himalaya and is much used in native practice. Several species of Agathotes, Exacum and Ophelia answer equally well. Several species, possessed of the same properties as Gentiana are used in various parts of the world. Lindley supplies us with notices regarding the following :—

G. catesbæi, North America.
G. amarella, Chalky pastures in Europe.
G. campestris, Do. do.
G. purpurea, Norway, Switzerland, &c.
G. pannonica, Alps of the Tyrol.
G. punctata, European Alps. *O'Shaughnessy*, p. 458, *Beng. Phar.* p. 302, *Beng. Disp. Voigt.* See Chiraita.

GENTIANA CHIRAYTA. Flem., syn. of Agathotes chirayta. Justicia paniculata.

GENTIANA TENELLA. Fries. The Tita of Ladak. Found in various parts of the Punjab Himalaya. up to 15,000 feet in Ladak. Aitchison states that in Lahoul a decoction of the leaves and stems of this and other species is given in fevers. In Ladak its root is put into spirits.—*Dr. J. L.. Stewart, M. D.*

GENTIANA HYSSOPIFOLIA. Linn. syn. of Cicendia hyssopifolia.—*Adams.*

GENTIANA KURROO. Wall. Pneumonanthe kurroo. Don, Royle.

Kamal Phul,	,,	Nilkanth,	Hind.
HimalayanGentian,	Eng.	Kurroo,	,,
Nilakil,	Hind.		

Grows at Mysooree, Simla, and other parts of the Himalaya. The roots are used like the gentian.—*O'Shaughnessy*, p. 459. *Cleghorn's P. Report*, p. 658. *Dr. J. L. Stewart.*

GENTIANA LUTEA. Linn.

Jantiana,	Ar.	Gentianc,	Gr.

The Gentian plant of Europe.

GENTIANA VERTICELLATA. Linn. syn. of Cicendia hyssopifolia.—*Adams.*

GENTIL, wrote voyages on the Indian Seas entitled "Voyages dans les Mers des Indes." (1660.)

GENTILE. A term used by the Jews to designate all races not Jews or not circumcised. It answered to the Barbaros of the Greeks and Romans. The term is employed by the Europeans in India, to designate the Tiling people, the races occupying the country from Madras to Ganjam. It is pronounced Gentoo, and the people themselves accept that designation. It is supposed to have been obtained from the Portugese. The Gentile of the Jews was the equivalent of the M'hlecha of the Aryan hindu, the "E" of the Chinese and the Kafir of the mahomedan. With the Arabs, they themselves are the Arab ul Arab, all the rest of the world are "ajami" or foreign. Gentoo is a corruption of the Portuguese "Gentio" a "Gentile." Dr. Fryer (Travels, 1672 to 1681), says "theGentues, the Portugal idiom for Gentiles, are the aborigines." He appears to be the first English writer by whom the term is used, but before his time Pietro del la Valle speaks of the hindoos as gentile, following the example of the Portuguese; notwithstanding those unquestionable authorities, Halhed (Gentoo Code xxi, xxii.) supposes that the Portuguese borrowed the term Gentoo from the Sanscrit word Gunt, a sentient being. *Elliot*, quoting Ency, Metrop. Voc. Gentoo.

GENUGHUL. Duk.? Borassus flabelliformis.

GENUSU GADDA. Tel. also Batatas edulis.—*Choisy.* Sweet Potato.

GEODORUM CANDIDUM and Geodorum pallidum are two terrestrial species, members of the genus Geodorum.—*Mason.* Wight gives also G dilatatum.

GEOFFROYUS. A bird of Timor.

GEOGRAPHY. Neither the Arabic nor the Persian letters are sufficiently numerous to compose the pronunciations of many foreign tongues, and they are ill-suited to record proper names in Geography. Much of the value of Abul Fazil's records is lost from this cause.—*Burton's Pilgrimage to Meccah*, iii.

GEOLOGY. Granite and syenite seem the chief up-lifting rocks of India; they burst through upraised sand-stones, clay-slate, mica-slate, chlorite-slate, and lime-stones. This feature of granite and syenite disturbing stratified rocks can be traced

from near Ceylon northwards at intervals through the table-lands of the interior; through Mysore, the Ceded Districts, Hyderabad, Berar and across the Nerbudda into Central India, where the granite for a time disappears. Volcanic trap is visible, however, in the bed of the Jumna, near Allahabad, in latitude 25° north, and in the ascent to Mussoorie by Kuerkoolee, the granite re-appears and makes a great eruption at the Chur Mountain on the southern slopes of the Himalaya. But near Gungotree, at the source of the Ganges, is described as the grand granitic axis of the Himalaya, one of the greatest and most magnificent outbursts of granite in the world. It traverses these mountains in numerous veins—westwards towards the Borenda pass, and eastwards towards Kamet, Nandadevi and Nandakot, upraising the metamorphic schists which form the highest peaks of the snowy range.

Lower down on the southern slopes of these mountains at an elevation of from 8,000 to 1,500 feet, uplifted stratified rocks, consisting of hornblende rock and slate, limestone, sandstone, great beds of quartz, clay, mica, chlorite, and talc slates, rest on the gneiss and granite; and lower still at altitudes of 3,000 to 2,000 feet above the level of the sea, gravel, boulders, marl with coal, recent clays and sand-stone form the Sewalik, or sub-Himalayan mountain. It is in these hills that extensive fossil remains were discovered, and the low alluvial tract, known as the Terai, is the valley formed by the junction of the Sewalik with the Himalayan inclined rocks.

To the south of this, the highest parts of Central India occur along the Aravalli mountains and the Vindhya range, and are from 2,000 to 3,000 feet in altitude. There are, here, three inclinations, one declivity from the Aravalli mountains towards the valley of the Indus, a second from the Vindhya range northwards to the Ganges, and the third running southwards to the Nerbudda. Granite is here, also, the upraising rock; it bursts out at Oudeypore, Kaunore, Banswarrah, and Rajpore, through the gneiss, and mica, and chlorite slates, limestone and sandstone. It was to the east of this central tract that the first great deposit of coal was found lining both banks of the Damoodah, though it has, since then, been discovered in many other provinces of British India. It is in Central India, also, that the volcanic rocks to any extent are first observed as they spread east and west from Neemuch in the form of basalt, basaltic greenstone, greenstone and greenstone amygdaloid, and southwards by Oujein and Saugor across the Vindhya, assuming a columnar structure in their steep descent to the Nerbudda. The trap crosses this river meeting with sandstone and fossils in the Satpura range, and spreads over all western Berar and the Aurungabad province; it assumes a columnar form at Gawilgurh and Chikaldah, occupies Candeish and the Concan to Bombay, and passes southwards to Malwan in latitude 16° north; its southern limits being observed south of Punderpoor, and the right bank of the Kistna towards Bejapore. In the valleys near Homnabad, south and west of Beder, it is seen between and beneath, but never penetrating the great plateau of laterite hills, and is noticed at Maharajahpettah, 30 miles west of Hyderabad. The eastern edge of this vast tract of volcanic rocks, after crossing the Nerbudda to the south, skirts the town of Nagpore in Berar, passes Nandeir, onwards to the west of Hyderabad and to its southern limit, just mentioned. South of this, as well as to the eastward, the trap only appears as great dykes, from fifty to a hundred yards broad, which run east and west parallel with each other. These dykes can at places be traced for a hundred and fifty miles, bursting through the granite and other rocks, tearing the highest of the hills asunder and filling the chasms and crevices with their dark and compact substance. In these provinces, the elements of the trap-rock assume in the dykes a variety of lithologic appearances, greenstone, and porphyritic greenstone; and, in the great volcanic district, basaltic greenstone, hornblende rock, basalt, and amygdaloid, with cornelian, heliotrope, prase, jasper, agates and onyx. The dykes are particularly numerous near Hyderabad, but they occur in the Balaghaut Ceded Districts, in the Carnatic and Mysore almost to the southern Cape of the Peninsula, and, with very rare exceptions, they run due east and west.

The central outburst of granite rocks in the Peninsula is traced from north of the Godavery, in latitude 90° north, through Hyderabad, the Ceded Districts and Mysore to Ceylon. This rock and the greenstone form the prominent parts of the Dekkan, clay-slate, mica, chlorite and hornblende schists, sandstones and limestones with fossils of a post oolite age being the stratified rocks through which they burst. The greenstone is supposed by some observers to decompose into a deep black earth, light when dry, and cracked and rent by the sun in the hot season, but forming a tough,

deep, tenacious soil in the rains, rendering marching almost, if not wholly impracticable. It is called "regur" in the Dekkan, and is the "cotton soil" of Europeans, by many of whom it is regarded as indicating an unhealthy locality. The granite rocks, on the other hand, decompose into a red sandy soil, which is generally hard, and as it allows a rapid percolation of water and quickly dries, it is less fertile, but is considered more favourable to health It may be doubted, however, if there be any facts to prove that the one soil is more favourable to health than the other.

The investigations of Dr. Hugh Falconer have shown that, at a period geologically recent, the present peninsula of India, was a triangular island, bounded on each side by the Eastern and Western Ghats, converging to Cape Comorin while the base of the triangle was formed by the Vindhya mountain range, from which an irregular spur, forming the Aravalli mountains, extended northwards: while between the northern shore of this island and a hilly country which is now the Himalaya mountains ran a narrow ocean strait. The bed of this strait became covered with debris from the adjacent Himalaya on its northern shore, and with this debris became entombed and preserved many and various animal remains. The present condition of the country in northern India has been produced by a subsequent upheaval of the land so that what was the ocean strait, forms the northern plains of India, the long nearly level valleys in which flow the Ganges and the Indus. Besides this, a great upheavement along the line of the Himalaya, has elevated a narrow belt of the plains into the Sewalik Hills (determined to be of tertiary age) and added many thousand feet to the height of the Himalaya, and facts tend to the conclusion that India had one long term and one protracted fauna which lived through a period corresponding to several terms of the tertiary periods of Europe.

Central India, between Hazareebagh and Palemow on the east and Jubbulpore on the west and thence southwards to Nagpore and Chandah, has in the east five well marked sub-divisions of sedimentary rocks with coal bearing strata, the Talchir, Barakur, Ironstone shales, Ranigunj and the Panchet, but at a short distance to the west, there are only a three-fold series, the Talchir, Barakur, and the Panchet. All these successive beds (possibly with the exception of the Talchir) representing an enormous lapse of time, agree in one respect that they seem to be purely fresh-water (fluviatile or fluvio-lacustrine) deposits. The Damoodah, the Barakur the Adjai and the More rivers seem at an early period to have formed one general estuary, the basins of the Sone and the Nerbudda. But the Mahanuddy and the Godavery, in all of which extensive deposits of coal have been found, as yet seem to have not been connected.

The Talchir field, near Cuttack, the detached areas of Talchir sandstones in the Sumbulpur country, and the Belaspur field, are limited to the Mahanuddy basin; the Palamow, the Singrowli, and South Rewah coals are all strictly confined to the Sone basin;—the Chanda field and the continuation of this field in detached areas down the Godavery valley, considerably below Dumagudiam, all are strictly confined to the basin of the Godavery and its affluents, while similarly the coal-fields of the Nerbudda valley are all limited to the drainage basin of that river. In other words, the great drainage basins of this country were on the large scale marked out, and existed (as drainage-basins) at the enormously distant period which marked the commencement of the deposition of the great plant bearing series.

The Talchir rocks below contain no coal, and the Panchet rocks above are equally without any coals, the whole of the workable beds of coal, of this group, being confined to the Damudah rocks which cover a wide spread of country round the bases of the Pachmari hills and extend thence to Umreth and Barhoi, about 16 miles from Chindwarah.

There is an admixture of extinct and existing forms, well preserved remains of hippopotamus, rhinoceros, mastodon, peculiar forms of elephants and very remakable bovines, dissimilar from those now in India, but seemingly identical with those of Europe. Of animals still existing in India, are found the fossil Emys (Pangshura) tecta the imbedded shells are all of a species still living in the valley, and indicate conclusively that the changes have been gradual from the time that the hippopotami wallowed in the mud, and the rhinoceros roamed in the swampy forests of the country, where mastodons abounded and where the strange forms of the sivatherium, dinotherium, and camelopardis existed.

The Central Provinces have nineteen revenue districts, which contain representatives of almost all the formations known to occur within Indian limits. The districts of Sagor and Dumoh, on the north, are altogether on the Vindhyan plateau and a large part of their surface is formed of the deposits to which the name "Vindhyan" has been given. These however are in

many places concealed by volcanic rocks of the great Dekkan trap area, which have flowed over them and all the drainage of these two districts is into the Ganges valley.

The four districts of Jabalpur, Narsinghpur, Hoshangabad and Nimar, immediately to the south of the Vindhyan escarpment along the marked depression of the Nerbudda valley, are in great part on alluvial and tertiary deposits; south of the Nerbudda valley rise the extensive highlands constituting the Satpura range, or its continuation, which are in great part formed of the Deccan trap resting on crystalline rocks or upon sandstone and other rocks of later date. Of this region, Mandla occupies the extreme eastern end, bounded by the steep escarpment of the trappean plateau, near to the edge of which the Nerbudda river has its source at Amerkantak. Along this same range to the west lie parts of Balaghat, Seoni, Chindwara, and Betul south and east of the Satpura ranges, the districts of Bilaspur, Raipur and Sumbulpur lie in the drainage of the Mahanadi river; Belaspur and Raepur occupy the low plain country of Chateesghur, formed principally on rocks believed to belong to the Vindhyan series, with a part of their area covered by coal bearing rocks. Sumbulpore is in a rugged jungly country composed of crystslline and metamorphic rocks.

The great drainage basin of the Godavery on the other hand includes Nagpur, Bhandara, Wardah, Chanda and Sironcha. These districts have no considerable elevation, Nagpur and Bhandara are principally on gneissose rocks, with much trap in Nagpur. Warda is almost entirely on trap rocks; Chanda and Sironcha have a very varied structure including more or less of all the formations that have been named.

The crystaline and metamorphic rocks consist of gneiss of different varieties, often highly granitoid and form the substratum of the whole area, and are seen all around the border of the trappean rocks. The area covered by Deccan trap, in the peninsula of India cannot be little less than 200,000 square miles.

Further south, the basins of the Kistnah river and its affluents, the Gutpurbah and Malpurbah and Beemah are occupied by quartzites, slates, limestones, &c. which cover the larger portion of the districts of Cuddapah and Kurnool, westwards through the Raichore Doab by Gogi, Gulburgah, to Kulladghee and Belgaum and appear to represent the older portion of the great Vindhyan series. Rocks of the same mineral character appear under the great flows of the Dekhan trap, and resting quite unconformably on the gneiss rocks in parts of the Raichore Doab, and the vicinity of Belgaum, and under parts of the ghats on the western coast. That they belong to the same general series as the rocks in Cuddapah and Kurnool, there is no doubt.

Still further to the south, several series of sedimentary rocks have been discovered, but there has not been traced any connection between the several series.

Immediately west of Madras, at Rajahs' Choultry, are extensive beds of clay-slate in which the brothers Schlagentweit discovered tertiary fossils. Underlying the sands and clays of Madras and all along the sea coast, is a bed of dark blue tenacious clay, containing numerous fossils of existing species, and in the extreme south of the peninsula, in Tinnevelly and Madura, are valuable marbles. But, in the district between the sedimentary rocks of the Kistnah and Tumbudra and these Tinnevelly marbles, at Ootatoor and Verdachellum near Trichinopoly are limestone rocks containing numerous fossils, the limits of which are supposed to be near Trichinopoly on the South, and near Pondicherry on the North. From the examination of a very beautifully preserved, and numerous suite of fossils collected from these sites by Messrs. Kaye and Cunliffe, of the Madras civil service, Professor Forbes arrived at the conclusion, that all the beds from which the fossils had been obtained were parts or members of one and the same series, and that that series was equivalent to the cretaceous series of Europe; the deposits at Trichinopoly and Verdachellum, being probably equivalent to the upper greensand and gault divisions of that series; the deposit near Pondicherry, being equivalent to the Neocomien, or lower greensand.

But of the well marked section of the great genus Ammonites, among the large addition to the known catalogue of species, which Mr. Cunliffe's collection has given, there were none of the Fimbriati, an oolitic and cretaceous section; none of the Flexuosi, also a lower cretaceous section; none of the Dentati, also lower cretaceous; none of the Armati, an upper oolitic section; and none of the Lœvigati; while on the other hand, of the Cristati, a section essentially cretaceous, we find one; of the Clypeiformi also a cretaceous section, one: of the Heterophylli five, and all of the cretaceous subdivision of this section; of the Ligati, a group essentially cretaceous, not less than ten. Of nautilus, a genus having a larger development in the upper than in the lower beds of the cretaceous, we have three allied

to other cretaceous forms; of belemnitella, confined to the upper portion of the cretaceous group, one. These will suffice to show, that vast additions to the cretaceous Fauna of India still remain to be worked out.

Fossils from Utatoor near Trichinopoly, furnished by Mr. Brooke Cunliffe.

Pullustra,
Balanus,

There appear amongst them many specimens of the ordinary Placuna placenta and other recent shells which would indicate their age to be that of Professor Lyell's post-pliocene series in his post tertiary group. P. placenta does not now occur in any part of the eastern coast.

Vindhyan Group. The Nerbudda and its vicinity. The Geology of this district has been worked out by Mr. J. G. Medlicott. Few parts of India have excited more interest and attention than the districts adjoining the Nerbudda river, the great thickness of sandstones and associated beds, which form the mass of the Vindhya range, being the most striking and remarkable feature in that country. There is a great faulting, accompanied by much disturbance mechanically, and by much alteration chemically (more especially to the south of this fault), in the rocks which pass along the main line of the Nerbudda valley, along the continuation eastward of this line down the valley of the Soane, and thence across Behar, where the continuation of the same rocks form the Kurruckpoor hills. It is considered a high probability that this line of dislocation was continued to the east by north, up or towards the valley of Assam; its main direction being E. 15° to 18° N. corresponding with the main direction of the Vindhya range and the Khasia hill range.

South of this dislocation the great group of sandstones, shales, &c. forming the Vindhya hills, is almost entirely absent, unless the highly metamorphosed rocks there seen be the continuation downwards of the same series greatly altered.

This great group is altogether of a different character and of a more ancient epoch than the beds associated with the coals of Bengal and of Central India,—the latter resting quite unconformably on the former.

Mr. Oldham gave the name Vindhyan, to this great group; being best seen in the well exposed scarps of the Vindhyan range; and to the subdivisions in ascending order, the names Kymore, Rewah and Bundair: but he applied these names only provisionally, as he thought it possible, that the Rewah limestone and Bundair sandstone are only repetitions of the Soane valley limestone and sandstone produced by faulting.

Coal groups of Burdwan, Hazarebagh and Cuttack. Resting unconformably upon the Vindhya formation, there is a considerable thickness of sandstones, shales and coals, in Central India much disturbed, and traversed by trap dykes. The total thickness of this group in this district exceeds some thousand feet. In these beds occur numerous fossil plants, which thoroughly identify these rocks with the coal-groups of Burdwan, of Hazarebaugh and of Cuttack. Taking it as proved that the strata at Kotah, from which the fish and Saurian remains had been obtained, are the same with those of Kamptee near Nagpore, the strong Permian analogies of the Saurians (Brachyops) ought not to be overlooked.

Mahadewa Group. Resting again quite unconformably upon these rocks is found another series of sandstones, often ferruginous, generally speaking irregularly though strongly bedded, and of great thickness. These form the lofty and boldly scarped range of the Puchmurry or Mahadewa hills. And to this group Mr. Oldham gave the name of Madadewa. In one or two places they seem to pass upwards conformably into sandstones holding remains of large mammalia, and probably of Sewalik date.

This group is markedly separated from the coal-bearing group below, and as compared with it is also characterized by the comparative absence of trap dykes or other exhibitions of igneous rocks.

Upon these, in parts of the district, rest the great spreading sheets of trap rocks forming the continuation of the immense basaltic field of the Deccan. Four and five distinct flows could readily be traced in paces. And adverting to the occurrence of the beds containing shells (Physa, Paludina, Unio, &c.) which are found between these flows (the intertrapean lacustrine formation, of Carter) the evidence derived from the Nerbudda district proves that this alteration was entirely due to the subsequent overflowing of the heated mass of the trap above, and to the disturbances consequent on the exhibition of such powerful force as must have accompanied the production of these immense flows of lava. These shelly beds seem to have been formed by tranquil deposition during the intervals between the successive flows of igneous rock, and to have been broken up indurated and baked by the succeeding outbreak.

The following gives a summary view of these groups in descending order, omitting for the present all the more recent divisions:—

	Groups.	Mineral character.	Age, &c.
	Mahadewa,	Sandstones, with a few shaly beds, for the most part pebbly, often striped with ferruginous bands.	Geological age unknown, a few vegetable fossil stems, &c.
	Damoodah,	Shales, sandstones, coal, for the most part thinly bedded and regular, often greatly cut up by trap dykes. In Cuttack, however, there are no trap rocks	Age not thoroughly decided, probably Jurassic, fossils chiefly vegetable, name taken from the locality where series is most fully developed.
Vindhya.	Bundair,	Sandstones & shales.	Age unknown, probably very ancient, seen all along Vindhya range, into Behar and to the Ganges at Monghyr. Probably also in the Khasia Hills possibly only two subdivisions
Vindhya.	Rewah,	Limestones, shales and sandstones.	
Vindhya.	Kymore,	Sandstones & limestone.	
	Sub-Kymore,	Crystaline limestone pseudo-gneiss (name proposed by H. B Medlicott, Esq.,) micaceous schists, and quartzites, red and green, and white.	Highly probable, though not yet thoroughly proved, that these are only the continuation downwards of the Vindhya groups subsequently altered.

Granite, gneiss hornblende-rock, greenstone, &c.

Mandoo. The ancient town of Mandoo has been built on coralline limestone. It had been

very ingeniously, and correctly inferred by Dr. Carter, in his carefully compiled "Summary of the Geology of India," that the limestone used at Mandoo had been derived from near Baug or Bagh, and at Surbaperee on the Maan. Captain Keatinge thought he traced the following succession, (ascending) a light green stone metamorphic or volcanic; a soft sandstone, very fine grained and white; compact limestone, bluish white: and then the coral limestone, the latter only containing corals. The compact fine limestone, is found at intervals all over the jungle, and has been very largely used for lime in the Mandoo days; the old kilns are without number. He found fossils, wherever an edge of stone lay over a convenient mud bed to retain them. The Echinida, a Brissus, were in great plenty, the Bheels call them Paunchia from their five marks and Pecten 5-costatus. Plagiostoma spinosum and Terebratula octoplicata were numerous, the latter the most numerous and in best preservation, pieces of a large finely marked Echinus Cidaris. There is also a rude impression on a stone of a very large Inoceramus?

To the west of Mhow and Indore, there exist extensive beds of the cretaceous series.

Dr. Carter in the Journal Bombay Asiatic Society, No. XX. July 1857, page 621, considers that these beds are truly Neocomien. The evidence, however, is that these rocks represent the cretaceous era, but is insufficient to enable one to refer them to any subdivision of that great series.

Fossils collected at Baug by Captain Keatinge:

Cuttack and Talcher group. Messrs. Blanford and Theobald examined the Cuttack or Talcher coal-field, and the results arrived at strongly confirm the results given above. The following section is in descending order:

Alluvium, laterite, &c.

1.—Upper grit series,—unfossiliferous—quartzose grits and coarse sandstones, with occasional red shales; pebbly throughout, and near base conglomeric—above 2,000 feet.

2.—Carbonaceous shale series, fossiliferous, consisting of

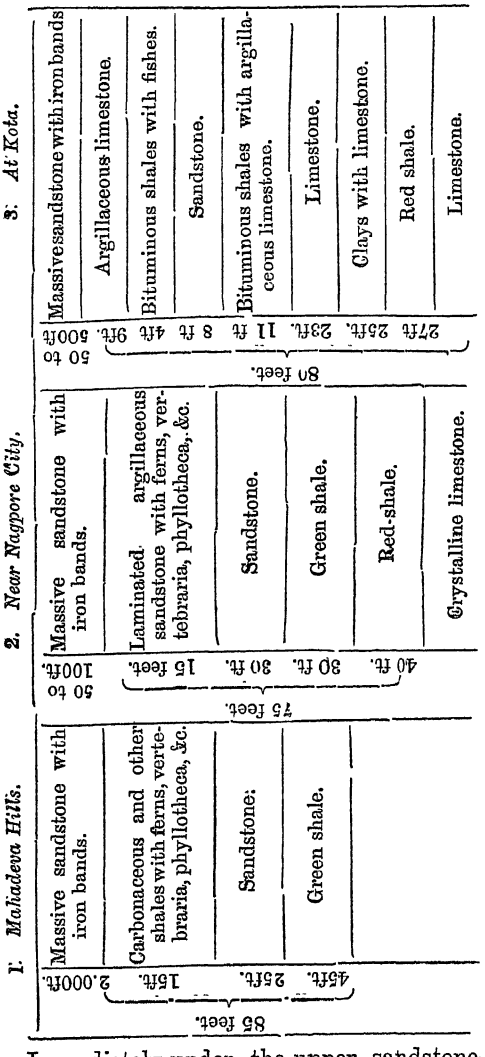
(*a*)—Blue and lilac shales, micaceous; white speckled sandstones, ironstones, about 1,500 feet thick.

(*b*)—Carbonaceous shells containing thin seams of coal (3 inches) irregularly dispersed through them, about 200 feet.

(*c*)—Shales and coarse white sandstones, the latter predominate in lower portion, 100 to 200 feet.

3.—Lower shale and sandstone series, annelide tracks, consisting of

(*a*)—Blue nodular shales, generally arenaceous.



(*b*)—Fine sandstones, much jointed and "tesselated."

(*c*)—"Boulder bed," containing numerous boulders of gneiss and granite frequently 5 to 6 feet across—in a fine argillaceous or arenaceous rock, often rippled, sometimes replaced by a coarse sandstone.

Each of these series rests unconformably on that beneath it.

Western Bengal and Central India. The Rev. Stephen Hislop of Nagpore, writing on the age of the coal strata in Western Bengal and Central India, observes that perhaps the most interesting part, in a section of the rocks of Central India, is the junction of the thick bedded sandstone above, with the laminated strata below. The latter, however various they may be in different localities as regards their lithologic and sometimes even their palæontologic features, may readily enough be distinguished by their relation to the superior beds, whose identity again is sufficiently attested by the iron bands, which run through their mass. This ferruginous sandstone is well developed at the Mahadeva Hills, in the north of the province of Nagpore, in the vicinity of the city itself, and at Kota on the Pranhita, in the dominions of the Nizam. The subjoined sections represent the succession of the strata

at these places respectively, as far as they are known:

Immediately under the upper sandstone, laminated rocks are seen in all. In section 1st, the shales are bituminous and carbonaceous, while in section 2nd, they are of argillaceous sand. But they are of the same age, as many species of fossils being common to both. Section 3rd, instead of having the limestone all collected in the lower part of the section, as is the case at Nagpore and in many parts of the Nizam's country, has it interstratified with the shale; but the bituminous strata occupy the same position as in section 1st. Choosing section 2nd as being better known for comparison with it, instead of section 1st, gives us in descending order sandstone and clay, red shale and limestone. It has been a question whether the fern-bearing coal shales and laminated sandstones of Nagpore the same as the fish-producing bituminous shales of Kota. The Kota fishes that rewarded the researches of Drs. Walker and Bell were pronounced by Sir P. Egerton to be true Oolitic forms, and probably of the age of the Lias; between Nagpore and Chanda, the upper sandstone has the usual iron bands, and the lower laminated beds the common vegetable remains; there is a district with Mangali as the centre (sixty miles S. of Nagpore) where the superior sandstone is less ferruginous, and the inferior or laminated beds are coloured by iron of a deep brick red. In the latter strata the remains of reptiles, fishes and entomostraca predominate, while the few vegetables that are found, are generally very different from those occurring in other parts of the Nagpur territory. The skull of a Labyrinthodont, named Brachyops laticeps by Owen, might suggest for it a Triassic or even Carboniferous age, but the plentifulness of scales of lepidotoid fishes forbids us to assign a more ancient epoch than the Jurassic; and the conclusion is unavoidable, not that our laminated sandstone is older than the age we have attributed to it, but that in India the Labyrinthodont family has come down to a more recent period than in Europe.

The vegetable remains are Tæniopteris, Equisetum laterale, Tæniopteris magnifolia, Phylothecas, Knorria, Lepidodendron, Aphyllum, Aspidiaria, Entomostraca belonging to the genus Estheria.

In the bituminous shales of the Mahadevas we have the following Bengal fossil plants: Tryzygia speciosa, Vertebraria indica, and a species of Phyllotheca, a fragment of which is figured by Dr. McCelland as Poacites minor. (Geol. Surv. Tab. XVI. f. 4.) In the carbonaceous shales of Umret, besides the Phyllotheca now alluded to, another stem, but unfurrowed, which seems to resemble McClelland's Poacites muricata, Tab. XIV. f. 6. In the laminated sandstone of Kamptee, in addition to Vertebraria and the two Poacites as above, Tæniopteris, perhaps of the same species as at Rajmahal, and McClelland's Pecopteris affinis, Tab. XII. f. 11. *b.*, which in Nagpur is a well marked species with a tripinnate frond.

In all these localities the genus Glossopteris abounds. Nagpore seems to have outstripped North Eastern India in Cyclopteris and several other vegetable remains, but is decidedly behind in regard to the Cycadaceæ. The only specimen, procured is a small fragment from the sandstone of Kamptee, the leaflets of which are narrower than a minute blade of grass.

Though amongst the Cutch oolitic strata some are evidently marine, yet from what

Mr. Hyslop had seen of those in the Deccan or those in Bengal, none of them in either of these districts exhibit the least evidence of having been deposited in the sea or ocean: all seem to be of fresh-water origin.

In Chanda and Berar, one of the great sources of doubt as to the extent of the coal deposits rose from the fact, that the beds in the group of rocks in which the coal here occurs (known to Indian Geologists as the Barakur group) had invariably a tendency to exhibit very great variations both in thickness and quality within short distances. They are often of great thickness locally, but thin out and nearly disappear within short distances: this variation also being not only in the thickness, but also in the quality of the beds, so that what shows as a bed of good coal in one place may, within a few yards or a few hundred yards, pass into a shale without coal or even into a sandstone. Coal was found about 15 miles north of Dumagudiam, near the junction of the Tal river near Lingala.

Mr. Medlicott is of opinion that the present limits of the coal measure fields in North India coincide approximately with the original limits of deposition and are not the result of faulting, or even mainly of denudation. All these successive beds (possibly with the exception of the Talchir) representing an enormous lapse of time, agree in one respect, that they seem to be purely fresh-water (fluviatile or fluvio-lacustrine) or estuarine deposits. The Raniganj, the Jherria, the Bokaro, the Ramghur, and the Karunpura fields all belong to the drainage basin of the Damoodah river.

Mr. W. T. Blanford reports that the coal-bearing (Damoodah) beds of Korba extend for about forty miles to the eastward, as far as Rubkub in Udipur (Oodeypore). They also extend far to the south-east towards Gangpur, and to the northwards towards Sirguja, and in all probability are continuous, or nearly so, with the deposits of the same nature known to occur in these Districts. Main Pat and the neighbouring hills, and all the country on the road from Main Pat through Chandargarh and Jashpur to Ranchi, consist of metamorphic rocks with the exception of a cap of trap and laterite on Main Pat.

Indications of the existence of coal seams, were afforded by the occurrence of fragments of coal in the rivers, especially in the Mand, he found a few seams near Chitra, twelve miles west of Rabkub and nearly thirty east of Korba. Two or three are seen in the Mand about three to four miles east-north-east of Chitra, but they are only from a foot to 18 inches in thickness. In a small stream, the Koba Naddi, which runs south of Chitra, one seam about three feet in thickness is seen near the village of Tendumauri, more than a mile south-west of Chitra. It is nearly horizontal, having a very low irregular dip to the west or south-west. Part consists of fair coal, the remainder is shaley.

The only seam examined from which it is possible that a useful supply of fuel might be obtained, is exposed in the same stream rather nearer to Chitra, being about a mile from that village, close to the boundary of the village of Tendumuri, appears to be of considerable thickness, perhaps 20 feet, and the lower portion appeared to be fair in places. The dip is about 15 ° to north-north-west. Lieutenant Sale, of the Chota Nagpur Topographical Survey found a seam of coal about four miles north-west of Rabkub in a small stream running into the Mand, and this may be the source of the blocks in the river bed.

Several coal localities have been lately found by the officers of the Topographical Survey and recorded in their maps. They are all north of Korba and Udipur. The Rajah of Jashpur told that coal occurred in his territory in the Khurea country, twenty-four miles north-west of Jashpur Nagar, about one hundred miles or rather more west by south of Ranchi.

The Talcheer field extends for about 70 miles from east to west with an average breadth of 15 to 20 miles and is bounded both on the north and south by great parallel faults, the former of which has an aggregate throw of upwards of 2,000 feet; these faults are not truly east and west, but to the south of east and north of west. The section in ascending order of the basin shows at the base, sandstone and blue shale, but slightly fossiliferous, in thickness from 500 to 600 feet; over these is a series of shales and sandstones often micaceous, occasional beds of ironstone, and thin layers of coal and coally shale, giving a total thickness about 1,800 feet; and over these again is a distinct series of quartzose grits, conglomerates, and sandstones, in thickness from 1,600 to 2,000 feet. These three groups are unconformable each to the other; the unconformity between the two lower being, however, much less marked than that between the two upper.

To the lower group, as having been first recognized and described in this district, the name of "Talcheer" series has been given.

The second group, which, from its imbedded vegetable remains, was proved to be identical with the rocks of the extensive Damoodah coal-field, when these were first

described, has been denoted the "Damoodah" series.

While the upper group, supposed to represent the great series of rocks, so magnificently seen in the Mahadeva hills of Central India, has been called the "Mahadeva" series. Thus three series can be recognised in each of the extensive fields referred to, although with varying developments and thickness. At the base of the Talcheer series there is a remarkable bed consisting of very large and only slightly rounded masses of granite and gneiss, imbedded in a fine silt, and occurring under such conditions as induce the opinion that the action of ground ice has been the cause of its formation. In the Rajmahal district there is a very limited development of the lower beds, above which unconformably comes the Damoodah series, here exhibiting a greater extension upward than in Cuttack; but unfortunately the sequence of the rocks is interrupted by the intercalation of several successive floes of basaltic trap, the intervals between which have been marked by the continued and tranquil deposition of the mechanical rocks going on. These floes have been repeated six or seven times, and the phenomena of contact are in all cases marked; the upper layers of the mechanical deposits in contact with the trap being in all cases greatly altered while the lower layers are in no cases changed, but rest unaltered on the degraded surface of the underlying trap. But while the actual physical sequence of the deposits cannot be here traced, the fact of their all belonging to the same great series is attested by the occurrence of some identical fossils throughout. A few species pass upwards through the series, but there is a very marked change in the general facies of the flora in the upper as compared with the lower portion of the group; the latter characterized by the abundance of vertebrata, pecopteris, trizygia, &c., the former by the abundance of zamia-like plants. The series, therefore, has been divided into Upper and Lower Damoodah rocks.

Nerbudda. In the Nerbudda district the series is less interrupted, and there also the same general results were obtained. The southern boundary of this great field was for a large part of its course produced by a great fault, having quam proxime, the same general direction as that of the faults bounding the Talcheer field. The age, geologically considered, of the Damoodah rocks is ascertained from their fossil plants, and the fact of the general oolitic facies of this group, especially of those from the upper beds, ascertained. The difficulty of this question was in connection with the discovery, on the one side, of several species identical with those found in these Indian rocks, in the Australian coal-fields, associated with numerous animal remains distinctly referable to the lower carboniferous era, and, on the other hand, to the discovery in Cutch of other species also identical with some of these Indian forms, in beds associated with animal remains, undoubtedly referable to the oolitic epoch. But the latter forms, or those which the evidence of associated animal remains would show to be oolitic, are only found in the upper beds of the Damoodah series, while those which are common to the Australian fields are those chiefly found in the lower beds, with these plants have been found in the districts examined, some annelide tracts useless as distinctive forms.

To Mr. Oldham there seemed, at one time, good reason for separating altogether from the several groups of rocks above referred to, the whole of the great thickness of sandstones which formed the great Vindhyan range, extending almost entirely across India, from the mouths of the Nerbudda to the Ganges at Monghyr. These appeared to be of prior date, and there seemed to him a probability that there was a great line, or a group of lines, of dislocation passing along the general line of the valley of the Nerbudda, and the effects of which might be traced over a very large area, extending towards the north-east, possibly even into the valley of Assam.

Rajmahal. Dr. Oldham shows, that the group of rocks of the Rajmahal hills constitute a formation quite distinct from that of the coal-bearing beds of Burdwan and some other localities; to which latter group he applies the name of the Damuda beds. He shows that the fossil vegetation of the two formations is entirely different, both specifically and in general aspect; that not one species is common to the two; that the Rajmahal beds are characterized by a remarkable abundance and variety of cycadeæ, by a comparative paucity of ferns, and by the absence, in particular, of the genus Glossopteris, as well as of Phyllatheca and Vertebraria; while the Burdwan or Damoodah beds are characterized especially by Glossopteris, Phyllotheca, and Vertebraria, with scarcely a trace of Cycads. It is evident that the Nagpur fossil flora agrees altogether in this respect with that of the Damudah, and not with that of the Rajmahal formation. Dr. Oldham is of opinion that the Rajmahal beds are mesozoic, and probably jurassic, the Damoodah beds palæozoic. But Mr. Bishop

thinks that the facies of this Nagpur and Burdwan flora is rather mesozoic. Botanical evidence is, however, far from unequivocal, and, such as it is, might be out-weighed by the discovery of a single well-marked and thoroughly characteristic fish, shell, or coral.

(*On the age of the Fossilferous thin-bedded sandstone and coal of the Provinces of Nagpur, India. By the Rev. Stephen Hislop.— Quarterly Journal of Geological Society*, Vol. XVII, August 1861, p. 346 to 349.)

According to Dr. Oldham's views the age of the Indian coal-fields, between the parallels of 20° and 25° N., is Upper Carboniferous of a rather later stage than that of the true coal measures of Britain, and more closely allied to the "fern-coal" series of Silesia. Some doubts have been expressed as to the correctness of this view, at least of the age of the Silesian coal-fields, which are known to rest on limestones containing large producti and other fossils of the carboniferous limestone.

Peninsula of India. The following is a brief summary of the formation of the Indian peninsula as described by Dr. Oldham, in ascending order:—

1. Laurentain Granitoid Gneiss—highly metamorphic and traversed by innumerable trap dykes. This is the floor of all the other formations.

2. Quartzose, micaceous, and hornblendic rocks—much contorted.

3. Lower Silurian, or Cambrian—Submetamorphic schists and massive conglomerates of local-rocks. These rocks occur in the Eastern Ghauts.

4. Devonian—The Vindhyan series, principally sandstones, distributed into four groups.

5. Carboniferous — (*a*) Mountain-limestone of the Salt Range, classified as such from the fossils collected by Dr. Fleming.

(*b*). The Talcheer series, sandstones of a peculiar character and colour, resting on a "boulder bed," or ancient shingle beach.

(*c*). The coal bearing rocks of India forming the coalfields of Damoodah, Nerbudda, &c.

6. Permian? or Intermediate.—Beds with reptilian remains, presenting, in Dr. Oldham's opinion the physical break between the Palæozoic and Mesozoic periods of Europe. It is indicated here as doubtfully Permian.

7. Triassic, Upper and Lower. In this latter there are beds of limestone with Ceratites (Muschelkalk ?).

8. Rhaetic Beds—with characteristic fossils.

9. Liassic Group—divided into an Upper and Lower series.

10. Jurassic Group—with Cycadeæ. Divided into Upper, Middle, and Lower Stages.

11. Cretaceous Series—with fine forms of Ammonites and other shells.

12. Eocene.—

(*a*). Nummulitic limestones.

(*b*). Fresh water deposits of lakes; over and through which sheets of lava have been erupted.

13. Miocene.—Laterite, and other strata of several kinds.

14. Pliocene.—Ossiferous gravels, Clays. &c.

15. Recent.—Gravels, clays, and mud of rivers, &c.

It is, he thinks, impossible to look over the above great series of beds so truly representative as they are of the European system, and presenting often in minute detail a marked correspondence with the English subdivisions and formations without being struck with the wonderful uniformity of nature's operations in ancient times over vast portions of the globe. The stratigraphical resemblances are also not less remarkable than the palæontological, for the genera and some species of fossils of the Triassic, Liassic and Cretaceous formations are identical with those of Europe.

Himalaya.—The Geology of the Himalaya and its subsidiary mountain ranges might form the study of a lifetime, without being exhausted. Certain parts of this vast chain of mountains have indeed been studied, especially the lower formation of the Siwalik range, in connection with which the names of Falconer and Cautley are familiar to all. Other portions of the Himalaya, together with the hills beyond Peshawur, to the Safed Koh, Hindu Kush, and Sulaimani ranges, are almost unexplored, and the only published accounts of their structure are to be found in a few scattered and brief notices in the travels of Vigne, Jacquemont and others, and in several papers of the Asiatic Society.

The Salt Range runs transversely between the Jhilam and the Indus, as the Baloti range, and Shaikh Budin hills, considered as a portion or continuation of the range Trans Indus, lie in the vicinity of the Salt range; having those hills on the south, the Peshawur hills on the north, and the end of the Sulaiman range with the Waziri hills on the west. From this place onwards down the western frontier, the branches of the Sulaiman range was represented at the Lahore Exhibition by

several fossils from the Lagari, Mazari and Lower Hills belonging to the Sulaiman system.

The Delhi system of Hills include those of the Delhi, Gurgaon and Hissar districts also the Shekawati hills in Gurgaon which ultimately become fused in the Aravalli range. Some of these hills are fossiliferous, others yield metals; the copper ores of Hissar and of Singhana in Gurgaon district, belonging to this series. In other portions marbles and freestone are found; and the Kalyana hills of Dadri now included in the Jhind territory, furnish elastic sandstone.

Fossils from Spiti and the Peen valley, at elevations of from 15,000 to 17,000 feet.

Belemnites.
Ammonites Gerardi, oolitic?
A. Nepalensis (Gray).
A. triplicatus.
A. Wallichii.
A. biplex (Sowerby).
A. torquatus (Sowerby).
A. acucinctus (Strachey).
Ammonites undescribed.
Spirifer striata, carboniferous.
Productus Sp. carboniferous.
Pholadomya, oolitic.
Nucula cuneiformis.
Rhynconella cynocephala, carboniferous.
Orthoceras? carboniferous.
Astarte major, oolitic.

The Lagari hills, Imam Bakhsh Khan and Dera Ghazi Khan, yield Belemnites, a species of Natica, and several species of Echinus. The curious trilinear markings on the latter, are compared by the people to the impression of a bird's foot: to which, they attribute the origin of these fossils.

"Sangcha," are nummulites from the Mazari hills. Imam Bakhsh Khan, and Sheikh Budin Hills produce the Elephas primogenus, Hippopotamos sivalensis, and Dinotherium.

The Balut range furnishes

Productus costatus.	S. striata?
P. cora.	Streptorhynchus crenistria.
Athyris Roissyi.	S. pectiniformis.
Athyris subtilita, var. grandis.	Lithostroton irregulare.
Orthis resupinata.	Ceripora, sp.
Rhynconella, sp.?	Anomia Lawrenciana.
R. poleurodon.	Lima gigantea.
R. cynocephala.	Pecten.
Spirifera, sp.	Venus suba-glauræ.

Also Natica flemingi from Sakesar in the Salt range.)

Cidaris verneiulii. The natives of India employ fossil encrinites, Sang-i-yahuda, also a minute fossil bivalve shell and Sang-i-Shadnaj as medicinal substances, which are less fit for use than ordinary chalk.

Sikkim Himalaya.—On the north and east, at the base of the Sikkim Himalaya, under the hill station of Darjiling, the great mass of the lofty hills is composed of schistoze rocks of various characters considerably disturbed and contorted. These are decidedly different from, and more recent than, the gneissoze rocks of the greatest portion of India. Near the base of the hills, and faulted against these rocks at high angles, there is a small extent of sandstone and black shales, which contain vertebrata, pecopteris, &c., similar to those occurring in the great coal-fields of Bengal. These fossils are peculiarly interesting, from the fact of their being changed into graphite, and occurring in beds which themselves have a very strongly marked graphitic character. They are of very limited extent; the greater portion of the sandstones, which in this section exhibit a thickness of some thousand feet, belonging to a series of a much more recent date, and which has been subjected to a much smaller amount of disturbance and alteration. This upper group contains many large stems, in all observed cases prostrate, and in most cases giving evidenceof great wear and long exposure previously to being imbedded; and in some of the finer and more earthy deposits an abundance of leaves occur, of the same general character as those occurring in Burmah and Tenasserim. This group has therefore been provisionally referred to the pliocene age. No traces of the great nummulitic series have been observed in this district.

Khassya Hills.—Further south are the Khassya Hills, which form a comparatively isolated range, rising suddenly from the great plains of Bengal in the south, and divided, on the north, by the valley of Assam from the great Himalaya or Bhotan range. On the southern face this range rises almost perpendicularly from the plains which are continuous from the Bay of Bengal, with scarcely a perceptible change of level to the very foot of the hills, and, with the exception of a comparatively small thickness of metamorphic rocks at the base, are composed of nearly horizontal beds of sandstones, a few shaly layers and limestone, long known for the abundance and beauty of the nummulites it contains. These beds dip slightly to the south, and die out towards the north, when the metamorphic rocks come to the surface in the hills. The age of the sandstones and limestones is unquestionably fixed by their organic contents, and therefore, also, the epoch of the coal, which is associated with them, as belonging to the great eocene period of geologists. No newer group of rocks is definitively seen in

these hills. Along the southern face of the range there is evidence of a great dislocation extending for many miles, and possibly along the entire scarp, which has brought down to the level of the plains, the rocks which are seen at the top of the hills. This line of dislocation has in all probability tended to give the nearly rectilinear direction of the escarpment: its date is fixed as at least subsequent to the formation of all the eocene rocks here seen. An older group of sandstone, considerably altered is seen further to the north, within the hills and also a series of highly metamorphosed schists and grits resting upon the gneissoze and granitic rocks.

Burmah and Tenasserim.—Further south, on the east of the Bay of Bengal, the Tenasserim Provinces extend for about six degrees of latitude along the east shores of the Bay of Bengal. In breadth they seldom exceed more than one degree of longitude. From Siam, on the east, these provinces are separated by an interrupted range of mountains, occasionally rising to 7,000 or 8,000 feet high, but the general height of which to the north is about 4,000, diminishing in passing southwards to 3,000 feet or less. The main direction of this range is north and south: this being also the general direction of the coast line, of the minor and outlying ranges of hills, and, therefore, of the rivers The geological structure is tolerably simple although at first sight apparently complicated, from the great disturbances to which the rocks have been subjected. The central range is of granite, occasionally, but not unfrequently of a syenitic character; itself traversed by thick veins of large crystaline felspathic granite, and often along its outer edges, or near its junction with overlying slates, characterized by the presence of tinstone as an ingredient of the mass disseminated among the other mineral constituents. This granite axis is succeeded by highly metamorphic rocks of a gneissose and micaceous character, themselves cut up by numerous veins of granite, which, however, do not extend far from the junction. Upon these is a great accumulation of bluish and bluish-black earthy beds, thinly laminated, of thin-bedded grits, and of pseudo-porphyritic rock, the normal character of which is a hard earthy rock with small irregularly disseminated subcrystaline felspar, passing, on the one hand, into slates, and, on the other, into grits, often coarse and conglomeretic. These harder rocks form all the higher grounds of the outer ranges of hills. This series being best seen in the southern province of Mergui, was provisionally called the "Mergui" series. The total thickness is about 9,000 feet. It is succeeded unconformably by hard sandstones in thick and massive beds, with their earthy partings, generally of reddish tints, occasionally deep red and yellowish. A few beds are slightly calcareous, and in the upper portion a few thin and irregular bands of earthy blue limestone occur. Above these rest about 200 feet of soft sandstone in thin beds, upon which apparently rests the massive limestone of the country so largely seen near to Moulmein. The thickness of the entire group is about 6,000 feet, and as some of its members are best seen in the northern province of Moulmein, it has provisionally been called the "Moulmein" series. To determine the age of the older of these two groups (the Mergui) we have no data. The aspect of much of the rocks is very similar to the trappean ashes and felstones so abundant in the silurian rocks of Great Britain, while others are lithologically like Devonian; but these resemblances are very deceptive. The age of the Moulmein series is, however, tolerably defined by its organic contents. These appear to fix the age of the group as distinctly carboniferous. The whole of these rocks were, subsequently to their induration and disturbance, widely and greatly denuded, and on their upturned edges at intervals is found a series of conglomerates and sandstone and imperfectly coherent shales, with thick beds of coal, generally of lignitic character. None of the conglomerates are coarse; the sandstones are fine, gritty, and pebbly, or clean white quartzose grits; the shales thinly laminated; the coal itself thinly disposed in thin flaky laminæ, with earthy streakings marking its structure. In addition to the total unconformity of these rocks, the imbedded organic remains are quite distinct. They consist of dicotyledonous plants (leaves) belonging to the group of the Lauraceæ, and probably to the genus Laurophyllum of Goppert. In the thin papery shales which overlie the coal are also remains of fish (scales, &c.) of a freshwater character; the whole referring the beds to a very recent epoch, probably corresponding in part to the pliocene of European geologists. It is curious to notice here the absence of any coal in the carboniferous rocks below, and its abundant presence in those newer beds. The total thickness of these beds does not exceed 900 to 1,000 feet. They are never continuously traceable; they occur heaped up against and separated by the projecting ridges of the higher grounds, and must

have been deposited when the physical conformation of the country was very similar to that now existing. They appear to be the result of a series of fresh-water deposits, formed in small lake-like expansions along the lines of the great drainage valleys of the country, and to mark a line of general and greater depression between the main ridge of hills dividing Siam from the British dominions, and the outer ridges which occur between this and the sea. The direction of the main drainage of the country is determined by the direction of these ranges, and is discharged into the sea through narrow rocky gorges, which have a direction nearly east and west, and which are due to lines of breakage and dislocation. To this is due the sudden alteration in the direction of the courses of the larger rivers, as may be seen on maps.

Burmah.—Rocks similar to those situated in the Tenasserim provinces extend northwards up the course of the Salween River, and into the adjoining districts of Burmah, to the north-east of Pegu. And, also, close to the capital of Burmah, and stretching nearly north and south, as far as examined, high ridges of metamorphic rocks are again met with, consisting of gneiss, micaceous schists, and highly crystaline limestone, occasionally of a fine white colour, and largely used by the Burmese for sculpture. But the great valley of the Irawady is, throughout a very large extent of its course, bounded on either side by thick series of rocks, chiefly sandstones but with massive limestones also, which are locally rich in fossils, and which from their evidence, may be clearly referred to the Eocene period. These stretch on both sides of the river as far north as Pugahu, beyond which the higher grounds recede from the river banks; but they are in all probability continued thence into Munipoor, and so united with the nummulitic rocks of the Khasi and Cachar Hills. These rocks have been considerably disturbed and broken, but have a general and prevailing strike nearly north and south, which strike, throughout many miles, has determined the general course of the river Irawady. Their thickness is considerable, certainly exceeding 5,000 feet. Above these Eocene rocks, and resting upon them with slight unconformity, is a series of beds of no very great thickness, characterized by an abundance of gypsum disseminated in thin layers and veins, and in the lower beds of which occur the deposit of clays and of vegetable matter, from which are derived the large supplies of petroleum. These rocks are well seen at Senan kyoung ("stream of fœtid water"), and are traceable northwards to near Amarapura. In the beds which appear to form the uppermost part of this group, but which may possibly belong to another and distinct series, are found some of the fossil bones of the larger animals which occur abundantly in this district. About forty miles north of Amarapura we again meet with sandstones, shales, and coal, resting unconformably on the metamorphic rocks, and characterized by remains of dicotyledonous trees similar to, if not identical with, those found in the coal-yielding group of the Tenasserim provinces, and which are therefore referred to the same age (pliocene). This series, so far as examined, has proved of no great extent or thickness.

Of fossils found in Burmah by Mr. Oldham, during his companionship with Captain Yule's Embassy, he notes the following:—

	Specimens.
Jaws and Teeth.	
Elephant, tusk and lower jaw, . . .	3
Mastodon, lower jaw, and molar tooth,	3
Rhinoceros tooth, ...	1
Tapir? lower jaw, ...	1
Deer, ...	1
Sus? or Merycopotamus, portion of cranium, ...	1
Gavial fragments.	
Pachydermata, *Bones*.	35
Ruminants, „	10
Crocodile, „	24
Tortoise, „	21
„ large, „	17
Undistinguished, „	16

China.—Baron Von Richthoven, who visited China some years ago, made a geological tour through parts of Tai-hu. He found certain outlying reefs of limestone, which hitherto had escaped observation from their similarity to the main limestone beds of the district, answering to the carboniferous limestone of Europe. Certain fossils, especially nummulites, found in these seem to prove these rocks to be of Tertiary age. This in connection with similar deposits in South Europe, in the Himalaya, in Japan and the Philippines and probably also in Formosa, is of considerable interest. It is known that the Tertiary deposits of China cover a considerable area, but hitherto limestone had not been noticed of that age. *Shanghai Consular Gazette. Annals of Indian Administration. Dr. Oldham in Yule's Embassy, p.* 343. *Report of the British Association.*

Powell's Hand Book, Econ. Prod. Punjab, p. 112 *to* 119.

On the age of the Fossilferous thin-bedden sandstone and coal of the Provinces of Nagpur, India. By the Rev. Stephen Hislop.—Quarterly Journal of Geological Society, Vol. XVII, August 1861, p. 346 to 349

See Coal: Colosso Chelus Atlas: Elephant: Felis: Fossils: Lignite: Madras: Simidæ.

GEOMYDA. A genus of reptiles of the Sec. A. Cataphracta or shielded reptiles, the Order Chelonia, and family Geæmydidæ: several species are known, viz.: G. Bealii grandis, mutica, nigricans, reevesii, spinosa, spengleri, and tricarinata. See Chelonia. Reptiles.

GEOPHILUS FULGENS. A luminous centipede.

GEOPHILUS NICOBARICUS the Nicobar pigeon. See Columbidæ.

GEOPHILIA. A genus of birds of the order Gemitores. Family Columbidæ and sub-family Columbinæ. There are several species G. striata, a small ground dove, occurs in Siam and Java. *Wallace.* See Birds. Columba.

GEOPHIS. A genus of reptiles of the order Ophidia and family Calamaridæ:—

Fam. Calamaridæ.
Calamaria catenata, *Blyth*, Assam.
Geophis microcephalus, *Gunth.*, Nilgherry.
„ Perotteti, *D. & B.*, Nilgherry.
Aspidura brayorrhos, *Boie*, Ceylon.
„ Copii, *Gunth.*
„ trachyprocta., *Cope.*
Haplocercus Ceylonensis, *Gunth.*
Falconeria Bengalensis, *Theob.*, Parisnath
Blythia reticulata, *Blyth.*
Grotea bicolor, *Blyth.*
Trachuschium fuscum, *Blyth.*

GEORGIA. The ancient Iberia. Ptolemy describes it as bordered on the north by the Sarmatian mountains, to the south by a part of Armenia, to the east by Albania, and to the west by Colchis, the present Immeretia. The beauty of the Georgian women cannot be disputed; having fine dark large eyes, very regular features, and a pleasing mild expression of countenance. The dress of the higher ranks is splendid, and carefully adjusted; but the humbler women, notwithstanding they share the same taste for the ceremonies of the bath, and regularly go through them all, seldom wash their clothes and they appear often in rags, and always in dirt. The Georgian dance consists of feats of activity, and strange and unelegant contortions of the limbs; sitting down on their heels, and hopping about in that position.—*Porter's Travels*, Vol. I, pp. 123, 137. See Gargestan: Kartelania.

GERAI RANG. Hind. Dark red colour of Geri earth.

GERANIACEÆ The Geranium tribe of plants of which the East Indian species are 12 Geranium and 1 Erodium. The Geraniums are largely cultivated as flowering plants but never very successfully. They are propagated by cuttings which ought to be kept somewhat dry till they root. The root of G. nodosum. L. (G. Napaulense. Sw.) is called rowil and bhand, the chief of the genus are G. rotundifolia, columbinum, dissectum, lucidum and robertianum G. parviflorum has a root eaten in Australia.

GERARD. Two brothers, one a medical, the other a military officer in the Bengal army, who both distinguished themselves by their researches into the physical geography of the Himalaya. Dr. Gerard wrote an account of Kanawar. He accompanied Lieut. (afterwards Sir Alexander) Burnes for a great part of the road, in his travels in Central Asia.

GERARDA BICOLOR. Grey. A genus of harmless snakes of the Order Ophidia, Sub-order Serpentes Colubrinæ non-venenati, and Family Homalopsidæ as under:—

Fam. Acrochordidæ.
Fam Homalopsidæ.
Cerberus rhynchops, *Schn.*, Bengal, Moulmain, Andamans.
Homalopsis buccata, *Linn.*, *Kuhl.*, Martaban.
Herpeton tentaculatum, *Lacep.*
Tytheria Hypsirhinoides, *Theob.*, Andamans.
Hypsirhina enhydris, *Schn.*, Calcutta.
„ plumbea, *Boie.*
„ Chinensis, *Gray.*
Fordonia unicolor, *Gray*, Pinang.
Cantoria elongata, *Girard.*
Ferania Sieboldii, *Schl.*, Pegu
Hipistes hydrinus, *Cantor.*, Rangoon.
Gerarda bicolor, *Gray*, Bassein.
Acrochordus Javanicus, *Hornst*, Pinang.
Chersydrus granulatus, *Schneid.*

GERARDINIA LESCHENAULTIANA. Dcne. A tree in the Central Province of Ceylon. Grows at an elevation of 5,000 to 6,000 feet. *Thw.*

GERARDINIA ZEYLANICA, Dcne.

Urtica heterophylla, Roxb.—Gass-kahambillya, Singh.

Not uncommon in the warmer parts of Ceylon.—*Thw. En., Plant. Zeyl.*, p. 259.

GERFTSIUS or LATTA ISLANDS. A group of small isles in lat. 0° 21' N. long. 127° 9' E.—*Horsburgh.*

GERICHO. Tel. ? Cynodon dactylon.—*Pers.* ?

GERMAN MILLET. Panicum Germanicum. See Graminaceæ.

GERMAN. This race occupy Central and Northern Europe and form, with the Irish, English, Scotch, Russians, Persians, and Arian hindus, Greeks and Romans,

part of the great Iranian family. Philologists admit a Germanic family of languages. Several of the philosophers of Germany have largely investigated the languages of the South and East of Asia. See Hindo, India, Sanscrit, 311, 312, 314.

GERMAN SARSAPARILLA. See Cyperaceæ.

GERSAPPA. A water fall on the river Gangawatty in N. Canara the fall is nearly 1,000 feet.

GERMSAIR, properly garm-sair. Pers. wintering pastures of nomade tribes. The entire southern region of Fars, bordering on the Persian Gulf, is called the Garmsair or "warm region." It extends from the sea to the latitude of Kazeroon, and runs parallel with the Persian Gulf, from the banks of the Tab to the confines of Laristan; from Bushire, eastward, as far as Kangoon, the tract is named the Dushtistan or "land of plains." The Tungistan, commonly pronounced Tungistoon, or "narrow land," is a small tract of land east of Bushire. The greater portion of the people of the whole garmsair, are an independent lawless set, many of the tribes being robbers by profession. A huge wall of mountains separates the garmsair, or low region, from the Sardsair, or high table land of Persia. One of the most conspicuous of these, is an abrupt lofty hill, named Hormooj; where, specimens of coal were found. Sardsair signifies "cold region." It is also termed the sarhada, a word literally signifying "boundary or frontier," but generally applied to any high land where the climate is cold. See Garmsair, Iliyat, Sarhad.

GERSHTASHP. A Persian hero of the time of Feredun, reputed to be ancestor of Neriman, Sam, Zal and Rustum, *Bunsen* (qu. Gashstasp).

GERSTEN-GRAUPEN. Ger. Barley.

GERU. Hind. Red earth. Earths and clays are met with in the Punjab bazaars known by the names of "geru," "geri," "gil-i-irmani," "gil-i-khardya," "gil-i-abrorshi" or "farsi," "gil-i-makhtum" and "harmuchi."

Geru is a hard, red, laminated, earth, sometimes used in dyeing: school teachers grind it up with water and teach to write with it on wooden slates. It is used medicinally in India.

Gil-i-khardya is a variety of Geru.

Gil-i-abrorshi is a pink clay, hard but less brittle, and paler than "gil-i-irmani."

"Gil-i-abrorshi," "gil-i-farsi," is probably the same or very nearly so.

"Gil-i-makhtum." A variegated earth, deep red, and pure white, soft and irregular; it contains clay, carbonate of lime, and sesqui-oxide of iron.

"Gil-i-irmani" differs little from geru and geri. It is a rough, red, brittle earth, occurring in laminated masses, used as a colour, and also medicinally. It is the representative of the "bolus Armeniacus," once so celebrated as a European medicine.

"Harmuzi," or "harmuchi," is much used for house painting, as an artist's colour, and as a medicine; it is a fine deep chocolate red colour like that yielded by artists "brown madder," only opaque.

"Badochi." A red dye, is used to adulterate the "kamela" red dye from the Rottlera tinctoria; it is also used as a glaze for pottery.—*Hand Book of the Punjab.* See Earth Gil.

GERUDA PATSA RAI. Tel. Bezoar.

GESNERACEÆ. An order of plants several genera of which, Achimenes, Gloxinia, Ramondia, Pyrenaica, and Gesneria, are grown as flowering plants in India.

GETÆ, are supposed by Professor Wilson to be the Sacæ. If we examine the political limits of the great Getic nation in the time of Cyrus, six centuries before Christ, we shall find them little circumscribed in power on the rise of Timoor, though twenty centuries had elapsed. At this period (A. D. 1330), under the last prince of Getic race, Toghluc Timoor Khan, the kingdom of Chaghtai was bounded on the west by the Dhasht-i-kipchak, and on the south by the Jaxartes or Jihoon, on which river the Getic khan, like Tomyris, had his capital. Kogend, Tashkand, Ootrar, Cyropolis, and the most northern of the Alexandria cities were within the bounds of Chaghtai. The Geto, Jut, Jit, and Takshac races, which occupy places amongst the thirty-six royal races of India, are all from the region of Sakatai or Chaghtai. Regarding their earliest migrations, the Pooranas furnish certain points of information and of their invasions in more modern times, the histories of Mahmood of Ghizni and of Timoor abundantly acquaint us. From the mountains of Joud to the shores of Mekran, and along the Ganges, the Jit is widely spread; while the Taskshac name is now confined to inscriptions or old writings. Inquiries in their original haunts, and among tribes now under different names, might doubtless bring to light their original designation, now best known within the Indus; while the Takshac or Takiuk may probably be discovered in the Tajik, still in his ancient haunts, the Transoxiana and Chorasmia of classic authors, the Mawar-ool-nahr of the Persians, the Turan, Turkisthan, or

Tocharisthan of native geography, the abode of the Tachari, Tacshac, or Toorshka invaders of India, described in the Pooranas and existing inscriptions. The Gete had long maintained their independence when Tomyris defended their liberty against Cyrus. Driven in successive wars across the Sutlej, they long preserved their ancient habits, as desultory cavaliers, under the Jit leader of Lahore, in pastoral communities, in Bikanir, the Indian desert and elsewhere, though they have lost sight of their early history. The transition from pastoral to agricultural pursuits is but short, and the descendant of the nomadic Gete of Transoxiana is now the best husbandman on the plains of Hindustan. Dr. Jamieson proves satisfactorily that the Getæ and Thracians were the same people, and that it is very probable, if not certain, that the Getæ and Goths were the same people. He also observes that the Getæ and Scythians were the same people. On the northern side of the Danube, opposite to the territory occupied by the Scythians, and in the angle forming a part of Thrace, there was a small nation in the time of Herodotus, who bore the name of Getæ. Ancient writers distinguish the Getæ from the Massagetæ, by placing them in countries remote from each other. Les peuples qui habitent ces vastes contrées de la haut Asie, bornées au midi par l' Inde, la Chine, et la Perse, à l' orient par la mer du Japon, à l' occident par les fleuves qui se jettent dans le mer Caspienne et la Pont Euxin, au nord enfin par la Mer glaciale, sont connus sous le nom vulgaire et collectif de Tartars ..... Quoi qu' il en soit de l' origine de ce nom des Tatars, les Européens, qui l'ont légèrement altéré, s'en servent indifféremment pour designer une foule de nations à demi civilisées, qui different beaucout entre elles, ainsi que la surite de cet ouvrage le fera vois. Dans ce sens, je crois qu'il est bon de conserver à ces nations le nom collectif de Tartares, quoique corrompu préférablement à celui de Tatârs, qui paroît plus correct mais qui appartient à un seul tribu ne doit pas servir à designer les autres tribus en général." The Massagetæ, Getæ or Goths, seem gradually to have advanced from their ancient limits into the more fertile districts of Asia. And all the lower and middle parts of the western boundary of the Indus, went by the name of Indo-Scythia. The Scythians, chiefly the Getæ, had expelled the Greeks, who continued long after the retreat of Alexander, and repeopled it with colonies of their own nation. The Getæ were the bravest and most just of all the Scythians, and continued to preserve this character in their new possessions. They must have pursued the hunter's occupation, living more by the chase, though these occupations are generally conjoined in the early stages of civilization. Asi was the term applied to the Gete, Yeut or Jut, when they invaded Scandinavia and founded Jutland. The Asi seem to have been a northern race with several divisions some of which appear to have been conquered by the Egyptian King Seti III.

Colonel Tod considers that Scandinavia was occupied by a tribe of the Asi. He says that the Sueni or Suiones erected the celebrated temple of Upsala in which they placed the statues of Thor, Woden and Freya, the triple divinities of the Scandinavian Asi. Herodotus says the Getes were theists, held the tenets of the souls immortality as with the budhists. Were we to contrast the literary acquirements of the Chaghtai princes with those of their contemporaries of Europe, the balance of lore would be found on the side of the Asiatics, even though Elizabeth and Henry IV of France were in the scale. Amongst the princes from the Jaxartes are historians, poets, astronomers, founders of systems of government and religion, warriors, and great captains, who claim our respect and admiration.—*Tod's Rajasthan*, Vol. I., pp. 6, 60, 322, 605 *Pennant's Hindostan*, p. 63. *Chatfield's Hindostan*, p. 63. *Recherches sur les Langues Tartares*, pp. 1, 3. *Kennedy on the Origin of Languages*, p. 57. See India. Jat, Scythia. Afghan, India, Yuti.

GETHSEMANE, A Hebrew word, signifying "wine-press."—*Robinson's Travels Palestine and Syria*, Vol. I, p. 121.

GETONIA FLORIBUNDA. *R.* ii, 428.

Bandi murugudu, Tel. | Karra vadala, Tel.

GETSA CHETTU. Tel. Guilandina bonduc.—*Linn.*

GEUHVU, Beng. Excoecaria agallocha.

GEWA. Hind. Excoecaria agallocha.—*Linn.*

GEUM. An ornamental genus of plants, G. coccineum being extremely handsome, mostly the produce of N. America and Russia, they require a light loamy soil, and are increased by dividing the roots or by seed.

GEWLA. Tam. See Gowla.

GEYAR. Hind. Cedrus deodara.

GEYLA. A river in Kattywar, lat. 22°, long. 71° 20' E. flows into gulf of Cambay. Length 60 miles.

GHA, also ghas, HIND. grass, herbage. Malori gha, Hind. Rumex hastatus, Shiligha Hind. Chrysopogon glaucoptis. See Ghans, Ghas.

GHADIR AR. A practice followed by the shiah mahomedans of India. On the 18th of the month Zi-ul-haj, they form three images of dough, to represent the kalifs Abu-bakar Omar and Osman, fill them with honey and, pricking them with pins, they suck the honey as if it were the blood of these kalifs. *Wilson.*

GHADSI, MAHR. Vagrant musicians, said to be descendants of the race who formerly inhabited the great southern forest—the Dandakaranya.

GHAFIZ, HIND. Delphinium saniculæfolium.

GHAFRAN HIND. Saffron.

GHAGRA. HIND. a petticoat. Rajput ladies have only three articles of parure; the ghagra or petticoat the kanchi, or corset; and dopati or scarf; the fashion varies in each province and tribe, though the texture and materials are every where the same: cotton in summer, and quilted chintz or broad cloth in winter.—*Tod's Rajasthan* Vol. I, p. 651.

GHAI KWAN, see Kwang-tung-chi.

GHAIR, AR. Without.

GHAIR MULAZIM, HIND. as opposed to mulazim, persons in the villages of the Panjab who help the farmers, but are not regularly hired cultivators.

GHAIR-MEHDI. A mahomedan sect who believe that the imam Mehdi has come to the world and gone. The words mean, without, or deprived of, Mehdi. See Elias; Mahomedan.

GHALICHA. HIND. PERS. Woollen rugs. Woollen carpets.

GHALLAH. ARAB. grain.

GHALME. HIND. Anabasis multiflora.

GHANDA-BELA. HIND. Andropogon schœnanthus. LINN.

GHANDARVA (Jaksha) the voiceful spirits in the air who sing the praises of Brahma. See Gandarva.

GHANNA. DUKH. Sugar cane.

GHANS. GUZ. HIND. Grass. Hay: Herbage. See Ghansor-Kafur

GHAN SENG. CAN. Bignonia xylocarpa.—*Roxb.*

GHANTA. HIND. A clock: a gong: an hour: ghanta bajana, to strike the hour.

GHANTARAVAMU. SANSC. A species of Crotalaria. This, like the Telugu name Gilaka chettu is a generic term, signifying "rattle" from the sound of the seeds in the dry legume.

GHANTHA WOOD. ANGLO-TEL. Gantha karra. TEL. A wood of the Northern Circars.

GHAO. HIND. A wound, an ulcer wounded. Hence, Ghaeja (?) GUZ. The village barber, and barber surgeon.

GHAR. ARAB. PERS. HIND. White quartz. White cornelian. Ice, hail, also a cave.

GHAR, MONGOL. The hand: it is the same as the Sanscrit word Kar, the Hindi Gar, and in Greek Kheir.

GHAR. A river near Kilcheepoor.

GHAR, HIND. The best kind of ginger.

GHARA. HIND. A globular and short necked earthen vessel. See Gharra.

GHARAM. MAL. Salt.

GHARASKAI. HIND.—? ?

GHAREI KASHMALU. HIND. Lallemantia Royleana.

GHARGHASHTAI. HIND. Amygdalus Persica.

GHARI. A water clock; a clepsydra; a brass gong, a division of time, about 24 minutes, hence, Ghariali, a gong striker.

GHARI. MAR. Ghadi. A Sudra attendant on a temple, corresponding with a Gurare.

GAVIAL, properly Gharial, is the Gavialis Gangeticus, the Narrow-beaked Crocodile of the Ganges, (Edw., Phil. Trans. Natural Syst. Amph.) Gavialis Gangeticus, Gray, (Synops Rept.) the Gavial of the Ganges, Griff., 'Anim. Kingd.' The Gavial of the Ganges is supposed to be the largest of the living Saurians. The measurement of the largest mentioned by Messrs. Dumeril and Bibron is given at 5 metres, 40 centimetres (17 feet 8 inches.)—*Engl. Cyc.*, p. 205. See Gharial; Reptilia.

GHAR-I-JAMSID, See Kandahar.

GHARIKUN. AR. HIND. PERS. Agaric; Boletus igniarinus also Agaricus igneus, also Polyporus, sp. A fungus used in medicine.

GHARILPIT. A mine of precious garnet occurs at Gharilpit, about eight miles south of Palumshah, in the Hyderabad country, in the detritus of a granitic rock, penetrated by trap-dykes, and composed of mica, garnets, kyanite, quartz, and felspar. Dr. Voysey, states that the precious garnets are found at the depth of eight or ten feet in the alluvium at the foot of the rock. The surface of the rock and soil were strewed with garnets in great profusion, but these were generally of a very inferior quality.

GHARIPURA Also called Elephanta, an island in the Bombay harbour, may be called a complete pantheon: for among the hundreds of figures there sculptured, every

principal deity is found. Budha is, evidently, from his size and situation, a principal personage there; yet not he to whom the temple seems peculiarly dedicated, which is apprehended to be the One Supreme Being. But as no representations are ever made of that being, there are shown his three principal powers, or attributes, (viz., according as they be contemplated—mythologically, ethically, metaphysically, or philosophically,) are,

Brahma.	Creation.	Past.
Vishnu.	Preservation.	Present.
Siva.	Destruction.	Future.
Power.	Matter.	Earth.
Wisdom.	Spirit.	Water.
Justice.	Time.	Fire.

Moor's Hindu Pantheon.

GHARKA PULLI—? Garcinia cambogia.

GHAROT. Hind. Oxystelma esculenta.

GHARRA. Hind. An unglazed earthen water pot hence "Ghar-nai" a raft supported on pots. See Ghara.

GHARRA RIVER. The modern Punjabi name of the Hyphasis, the first of the five rivers of the Indus, reached by Alexander. The Gharra runs north of Bahawalpoor, distant two miles. See Punjab. *Ind. in 15th Cent.*

GHAS. Hind. Adiantum venustum. See Gha; Ghans.

GHASAL. Ar. Hind. Pers. The mahomedan legal washings of the body. The mahomedans have two kinds of ablution or lustration, the "Ghasal" or legal washings for all classes, after any kind of bodily uncleanness such as the pollutio nocturna, menses, coitus, or child-birth, for until purified it is unlawful to eat, pray, touch the koran, or go to the mosque. If the legal Ghasal be not needed, nevertheless, before prayer, the wazu or washing in a prescribed manner of the face, hands and feet is indispensable. It occupies two or three minutes. The wazu is only needed, when any minor cause of impurity as in performing the natural functions has occurred. Where water is not to be had, the Teyammum, or rubbing the face, legs and hands with fine dust or dry sand suffices.

GHAS-KUCHOO. Beng. Typhonium flagelliforme.

GHASVEL. Hind. Cuscuta reflexa.

GHAT. Hind. A term employed in India to designate a ferry, or landing place on a river; a range of hills or the scarped wall of a table land; or the defile or pass leading through such. The Western ghats extend from the valley of the Tapti, to the gap of Palghaut, a distance of 800 miles. They are clothed with dense forests, with few inhabitants. The coast line from the sea to their base is generally flat and low with occasional spurs or solitary hills, but the ghats rise abruptly, almost scarped, to an average height of 3,000 feet, Purundar is 4,472, and Mahabaleshwar, 4,700, Matheran is a projecting spur. The eastern Ghats extend from Orissa to Coimbatore, along the eastern side of the peninsula of India, at distances of 50 to 150 miles from the Bay of Bengal. They are steep and well clothed with forests. The country lying between them and the sea is low, scarcely rising above 100 feet above the sea. See Ghatiya.

GHATICA. Sans. An Indian hour, 24 minutes European time. See Danda.

GHATIYA. H. A brahman who attends at ghats where hindu pilgrims bathe, to take care of their clothes, and supply sandal, flowers, &c., he exacts certain fees, as a right, denouncing imprecations on any who resist his exactions, these people sometimes repair to a distance to escort pilgrims to their places of ablution. *Wilson.*

GHAT-MANJHI. H. Beng. A ferryman, applied also to a man who regulates the hire of boats, supplies, &c. &c. *Wilson.*

GHATNA, Hind.? A tree of Chota Nagpore. Hard, yellow timber.—*Cal. Cat. Ex.* 1862.

GHATOT-KACHA, See Inscriptions, p. 373—8.

GHAT PALM. Eng. Caryota urens.

GHATTI GOND. Guz. Hind. Gum-Arabic

GHATYARI. Hind. Andropogon iwarancusa.

GHAZ. Hind. Pers. Tamarix orientalis; tamarisk.

GHAZA, Ar. in mahomedanism, an expedition against infidels: the term Ghazi is applied to those who fight for their religion to the death. *M'cGregor's History of the Sikhs*, Vol. I, p. 193.

GHAZAL. Ar. An ode, it should consist of not less than five, or more than eighteen, couplets; the last line of each couplet terminating in the same letter of the alphabet. The two first lines of the ode rhyme together, after which every alternate line; and the last verse always contains the "takhallus," the assumed literary name of the poet.

GHAZAN son of Kai-Khatu and nephew of Kablai Khan, succeeded to his father's throne in A. D., 1295. He was a brave soldier and statesman.

GHAZGI BRAHUI. See Kelat, p. 492.

GHAZI. Pers. Hind. A mahomedan soldier fighting for his faith. A religious

warrior. One who has slain an infidel.

GHAZI MIYAN. A mahomedan saint in high repute with the agricultural and lower classes of the N. W. provinces, except in Dehli, and included among the Panchpeeree. The Mirat-i-Musaoodee says he had a dream the night before his death, in which his mother came and placed a bridal chaplet on his brow as being indicative of the crown of martyrdom with which he was to be honored on the following day. He is partly on this account called Gajna Doolha and Salar Chhinula. Who this Ghazee Meean was is a question on which even mahomedan authorities are not agreed. Elliot quoting M. Garcin de Tassy, in his memoire of the Moosulman religion in India.

GHAZIPUR L. 25° 33′ 6″. N. L. 83° 31″ 8. E. a town in Hindostan, on the left side of the Ganges, 71 miles N. E. of Benares in the Benares district of the N. W. Provinces. The Dak bungalow is 351 feet above the sea. Lord Cornwallis is buried there. He had been appointed Governor General a second time and was proceeding up the country when he fell sick and died here. *Tr. of Hin.* Vol. I. p. 121.

GHAZLEI. Hind. Tamarix dioica.

GHAZNAVI. Belonging to Ghazni.

GHAZNI. A town in Afghanistan 7,726 feet above the sea. On the north of the town, about half a mile from the gate, rises the first of sultan Mahmud's minars, or towers, the other is about four hundred yards beyond it, in the same direction. They both rise alone, based upon rough stone-work. The most northerly is the handsomest structure; but both are exquisite specimens of brick-work. They are about 140 feet in height, and much damaged. Ghazni commands a most extensive plain, which is but indifferently furnished with villages, and castles, although not absolutely without them, and the river of Nawar runs beneath the town walls on the northern side. The town is seated in the midst of a rich grain country, and in the adjacent plains of Nawar it has immense fields of pasture. Ghazni in its prosperity was frequently taken and sacked, memorably, by the great Hulaku and by Alla-ud-din, the Afghan prince of Ghor. Ghazni has the repute of being a very ancient site. Wilford, following Sanscrit authorities, tells us, that the kings of the Yavana and Deucalion resided at it. He further tells us, that its proper ancient name was Sabal, Zabal, or Saul, as written by Chrysococcas, whence he refers it to be the Ozola of Ptolemy. He also conjectures it to be the Oscanidati of the Pentingerian tables, noted as twenty-two fursangs from Asbana, which he considers Kabal, and thirty-five fersangs from Rupha, which he would identify with Sheher Safar. The annals of the Yadu of Jeysulmir state that long anterior to Vicrama, they held dominion from Ghazni to Samarcand, they established themselves in those regions after the Mahabarat, but, on the rise of mahomedanism or the pressure of other races, they were again impelled towards the Indus river. They assert that Ghizni is properly Gujni founded by the race of Yadu: and in a curious specimen of hindu geography presented by Col. Tod to the Royal Asiatic Society, all the tract about the glaciers of the Ganges is termed Gujlibun, or Gujlibu, the 'Elephant Forest.' elephant wilds. There is a 'Gujingurh' mentioned by Abul Fazil in the region of Bijore, inhabited by the Sooltano, Jadoon, and Eusofyze tribes.

The empire of Ghizni was founded by Abistagi, governor of Korasan A. D. 960, who revolted from the king of Buchara: whose ancestor, in his turn, had risen to power, on the ruins of the kaliphat empire, about 87 years before. Ghizni consisted chiefly of the tract which composed the kingdom of Bactria, after the division of Alexander's empire: that is, the countries lying between Parthia and the Indus; and south of the Oxus. Emperors, who have reigned in Hindoostan since the Ghiznian conquest. *Tod's Rajasthan*, Vol. II, p. 455. *Rennell's Memoirs*, p. xlix.

Acbar was the first who made a great innovation in the standard of the coss. He directed it to be taken at 5,000 guz, equal to 4,757 yards; that is, about a British mile and 5 furlongs.—*Rennell's Memoirs*, p. 4.

It was captured by the British on the 23rd July 1839 re-captured 6th September 1842. *Vigne's personal Narrative*, p. 128-9. *Mason's Journeys*. Vol. II. p. 222. See Kabul p. 433 Kattiyawar. Khyber, Kufa, Mahmud, Somanath.

GHAZN RIVER. Rises in the Huzareh mountains, about Lat. 33° 50', Lon. 68° 20'. Its course generally southerly, as far as lat. 33°; afterwards south-westerly, into lake. Abistada, in lat. 32° 42' lon. 68° 3'

GHEBBANELLI KURA Tel. Greens of Premna integrifolia.—*Roxb.*

GHEBBUNELLI VERU Tel. Root of Premna integrifolia.—*Roxb*

GHEBR properly GABR. Pers. A term of reproach, applied to the Parsees in Persia, it seems to correspond to the Turkish Gaour. See Gabr.

GHECHO. Beng. Spathium chinense.

GHECHU. Hind. Aponogeton monostachyon.

GHEE. Hind. Clarified butter. See Ghi.

GHEENTI-NUTI. Beng. Amarantus tenuifolius.

GHEGURA. Hind. also Gheghura, is the unripe pod of gram. Also the unripe bole of cotton which is known also by the names of Goolur, Ghentee, and Bhitna. When it bursts it assumes another name, when this change in the plant occurs, it is usual eastward of the Jumna, to select the largest plant in the field and having sprinkled it with buttermilk and rice water it is bound all over with pieces of cotton, taken from the other plants of the field. This selected plant is called Sirdar or Bhogul-daee, i. e., Mother-cotton, from bhogla, a name sometimes given to a large cotton-pod and daee (for daiya) a mother; and after salutations are made to it, prayers are offered that the other plants may resemble it in the richness of their produce. To the west of the Jumna there is rarely a Bhogul-daee, but when the pods begin to burst, women go round the field, and as a kind of lustration, throw salt into it, with similar supplications that the produce may be abundant. *Tibullus Lib. II, El. i, says,*

Dii patrii purgamus agros, purgamus agrestes.
Vos mala de nostris pellite limitibus.
Neu seges eludate messem fallacibus herbis.

The practice appears to be observed with a similar object and in somewhat similar fashion to the Ambravalia of the Romans and the Field-Litanies of the English Church Rogation or Gang-days. *Elliot.*

GHEJASUDUMUSTRA. Sans. Pedalium murex. Gokeru.

GHELIJRU. Tel. Trianthema obcordata.—*Roxb.*

GENDAGA TRIVAGUM. Tam. Sulphuric acid.

GHENDAGAM. Tel. Sulphur.

GHENDAMULA. Sans. Hibiscus esculentus.

GHENGIRAVI CHETTU. Tel. Thespesia populnea tree:—*Lam.*

GHENNERU. Tel. Nerium odorum.—*Ait.*

GHENNERA VERU. Tel Root, of Nerium odorum.

GHENTAL. Hind. Tulipa stellata.

GHERIA, a small river that rises in the Balaghat.

GHERIAH, was the chief town and strongest port of Angria: in 1756 it was attacked and taken by a British squadron under Admiral Watson, and on land by an army under Clive A Mahrata army, was present, but held aloof.

GHERIAH. Twenty-one miles from Jungipore is Sooty, where the Bagiritti branches off from the Ganges. The neighbourhood of Sooty is remarkable for the battle of Gheriah, fought between Ali Verdi and Sarferaz Khan in 1740. There was another battle fought in 1763 between Meer Kasim and the British. *Tr. of a Hind.* I. p. 85.

GHERU. Can. Semecarpos anacardium.

GHERUTTI KAMA. Tel. Vernonia cinerea, *Less.*

GHET KUCHU. Beng. Arum orixense. syn. of Typhonium orixense.—*Schott.*

GHEZO HIND. Manna. See Kudrat Halvassi.

GHEZUNJGABEEN MANNA. See Kudrat. Halvassi.

GHI. GUZ. HIND. Clarified Butter.

Ghruttham, grita, SANS. | Neyi, TAM TEL

Ghi is largely manufactured in all the south of Asia and generally sells at 25 per cent. above the cost of butter. Ghi is made in very large quantities in the jungle tracts of the "Bar." The finest ghi used on the Bombay side of India, comes from Karachee near the mouth of the Indus—*Hindu Infanticide*, p. 177.

GHIANDE. IT. Acorns; the seed or fruit of the oak

GHIAOUR, originally Gabar or fire-worshipper, is now synonymous with Kafir, and is applied to the people who preceded the mahomedans, as well as to Europeans. *Rich's residence in Koordistan*, Vol. I. p. 30. See Gaour, Gabr Ghabr.

GHAIAS-UD-DIN - bin - HUMAM- UD-DIN. His takhalus or literary name was Kondemir. His book is entitled Habib-us-sayar-fi afrad-ul-bashar, that is to say, the curious part of the lives of illustrious men. It is a history which he had extracted from that which his father Mircond had composed, and entitled, Rauzat-us-Safa, but to which he made augmentations. He dedicated this book to the secretary of state belonging to the king of Persia, shah Ismael Safavi, who gave him the name of Habib-ullah, and for that reason the book had the name of Habib given it in the year 1508, Heg. 927, in the Reign of Lewis XII. He was also author of another history, which is entitled Khalasat-ul-Akhbar; or The Cream of Histories.—*History of Genghiz Khan*, p. 422.

GHI-TURAI. HIND. Luffa pentandra.

GHILICHI, a branch of the Tochtamish, the first of the tribes of Kapchak *Malcolm's History of Persia*, Vol. II, p. 231.

GHIDAYU. CAN. Tree.

GHI-GOWAR. HIND. Aloe India *Royle*. In Southern India, plants of the "Ghi-gowar" or "Kul-bunda," the Aloe perfoliata, are suspended with their roots upwards, with a longitudinal incision in each leaf, to permit the aroma of the juice to become apparent, and disperse musquitoes from the room.

GHI KA GADDA. DUK. Isoetes Coromandeliana.

GHI-KWAR. HIND. Aloe perfoliata.

GHIKAR, a Scythic race inhabiting the banks of the Indus; at an early period of history they were given to infanticide. It was a custom, says Ferishta, "as soon as a female child was born, to carry her to the market place and there proclaim aloud, holding the child in one hand, and a knife in the other, that any one wanting a wife might have her; otherwise she was immolated." By this means they had more men than women, which occasioned the custom of several husbands to one wife. When any one husband visited her, she set up a mark at the door, which being observed by the others, they withdrew till the signal was removed. The Ghikar are supposed to be the descendants of the mountaineers whose chief Ambisaces sent ambassadors with presents to Alexander. Baber writes the name Guker but it is also written Ghuka and Khaka.—*Tod's Rajasthan*, Vol. I, p. 636. See Afghan, Kabul, Khetri, Jelam.

GHI KOMAR. HIND. Aloe Indica.—*Royle*.

GHILAN. A district known to the ancient Arians as Varena. It was their thirteenth settlement and formed the nucleus of their ancient possessions in India. Haug has shown Varena with the four corners to be a Ghilan. The curse of Ahriman was irregular menstruation. See Arians. Kizzel Ozan.

GHILANI. Abd ul Kader Ghilani, styled Sultan ul Aulia.

GHIL GARANTA. TEL. Crotalaria verrucosa.—*Linn.*

GHILIAK, a nomade race dwelling on the coast of Tartary and Siberia as far as Ayan on the north-western extremity of Seghalin. They are low in stature, stout, and rather broad in proportion to their height. Shape of the head round, cheek bones prominent, eyes oblique, well defined eye brows, more arched than those of the Chinese, hair coarse black and bound into a tail, and occasionally wearing a coarse black beard, hands, small and delicate, with well shaped nails, complexion fair and ruddy. The women are small but prolific.

Dr. Latham's Discriptive Ethnology.

GHILJI, an Afghan tribe which, with the Abdali, form the bulk of the Afghanistan population, but chiefly dwelling in Kandahar and Kabul. The Ghilji tribe occupy the principal portion of the country between Kandahar and Ghazni, and are the most numerous of the Afghan tribes. These people are also found between Farrah and Herat, and again between Kabul and Jelalabad, but in either position, being under due control, they are little heard of. The Ghilji between Kandahar and Ghazni comprise the great families of the Ohtak, the Thoki, the Tereki and the Andari with their sub-divisions. Of these, the three first are independent, and the last, residing at Mokar, are subject to the government of Ghazni. The Ohtak are acknowledged the principal of the Ghilji families, and in the period of their supremacy furnished the chief, or padshah. The Ghilji are both an agricultural and a pastoral people, dwelling in villages and castles as well as in tents. They are a remarkably tall fine race of men, with marked features, the Ohtak and Thoki peasantry being probably unsurpassed, in the mass, by any other Afghan tribe for commanding stature and strength. They are brave and warlike, but the generality of them have a sternness of disposition amounting to ferocity, and their brutal manners are not discountenanced by their chiefs. Some of the inferior Ghilji are so violent in their intercourse with strangers that they can scarcely be considered in the light of human beings, while no language can describe the terrors of a transit through their country, or the indignities which are to be endured.

The Ghilji although considered, and calling themselves, Afghans, and, moreover, employing the Pushtu, or Afghan dialect, seem to be a mixed race. The name is evidently a modification or corruption of Khalji or Khilaji, that of a great Turki tribe, mentioned by Sherif-ud-din in his history of Timur. The testimony of Ferishta, while clearly distinguishing the Ghilji tribes from the Afghans, also establishes the fact of their early conversion to mahomedanism, still there is a tradition that they were, at some time, christians of the Armenian and Georgian churches. This tradition is known to the Armenians of Kabul; and they instance, as corroborating it, the practice observed by the Ghilji of embroidering the front parts of the gowns or robes, of their women and children, with figures of the cross, and the custom of their house-wives, who, previous to forming their dough into cakes, cross their arms over their breasts, and make the sign of the cross on their foreheads after their own manner.

East of Ghazni, in the province of Zurmat, are the Suliman Khel Ghilji, exceedingly numerous, and notorious for their habits of violence and rapine. These have no positive connexion with the Thoki or other tribes, neither have they one acknowledged head, but are governed by their respective malek, who are independent of each other. Dost Mahomed Khan reduced them to the condition of tributaries, after having destroyed a multitude of their castles.

The Ghilji women cannot boast of beauty, which they strive to supply by ornament. The girls, from the age of eight to twenty, are not much veiled, but they twist their hair, and tie it like a cake, which hangs over their forehead and a little below their eyebrows. The centre of the lock (or hairy cake) is adorned by a gold or silver coin, which, in black hair, shines prettily. This is the sign of virginity amongst the Ghilji. The women allow their twisted locks to hang upon their ears, and even as far as their arms.

Moorcroft met with a party of wandering Ghilji: their tents were nothing more than flimsy black blankets, stretched over forked sticks about four feet high; within, they had some more blankets, sacks, and pack-saddles, and without, a few loads of mats, ropes, and netting, for the formation of their packages: both men and women were robust, with strongly marked features.—*Moorcroft's Travels*, Vol. II. p. 360. *Masson's Journeys*, Vol. II. p. 198 to 212. *Pottinger's Travels, Beloochistan and Sind*, p. 200, *Mohun Lal's Travels*, p. 323. See Abdali, Kaffir, Kalmuk, Kandahar.

GHIMISAG. Beng. Hind. Pharnaceum mollugo. Syn. of Mollugo cerveana, *Ser.* Mollugo spergula.

GHIN. Hind. Elæagnus *sp.*

GHINALITA-PAT. Beng. Corchorus capsularis and C. olitorius. *Linn.* Jute.

GHIRIADAKI. Sans. Cajanus Indicus.

GHISSA, an atoll island in the Archipelago. See Keeling Island.

GHISSARI a wandering blacksmith.

GHI TREE. Bassia butyracea.

GHI TURAI. Hind. Also ghia tori, Luffa pentandra.

GHODA-SALA. Sans. Iguana.

GHODASALA. Sans. Mimosa abstergens.

GHOIAN. Beng. Hind. Arum colocasia.

GHOGRA, a confluent of the river Ganges. Fyzabad and Oudh are built on its banks. It rises N. of Kumaon, in lat., 30 28,N.,lon. 80° 40,E., probably at between 17,000 and 18,000 feet. It runs S. E., 33 m., S. W., 70 m.; S. E., 12 m.; S., 30 m.; S., 23 m. further; S. E, to Ganges, near Chupra,—Length, 606 m. It receives the rivers Raptee, 134; Kurnalli, 225; Bhyrvee, 70; Dhauli, 45; Goringunga, 60 m. About 49,000 sq. m. are drained by it. Butler describes it as navigable for the largest class of boats in all seasons.

GHOL. Hind. Coccinea Indica.

GHOLAK. Ar. Euphorbium.

GHOLAM. Ar. Hind.Pers, properly ghulam a youth, a page, a slave. Elliot considerthat in this word we have the origin of the English gallant, gallantry.gala, &c., Ghulam being derived from the Arabic gh'l'm libidinosus, and hence it signifies a comely youth, one chosen as an attendant, or page for his personal endowments. The Spaniards borrowed it from the Arabs, and called a handsome young man "galana" from which, are derived "galante," "galanteur," "galanteria" all subsequently adopted into the European tongues through the influence of the amatory poetry of the troubadours. In Persia Gholam, is now applied to an inferior civil officer or policeman, answering to a "cavass" in Turkey. Several of these are attached to each European embassy in Persia. The Shah has also a number attached to his person who are called Golam-i-Shah: these form a kind of body-guard. The Russians use their gholam only for posting purposes, to accompany members of the embassy, and have a body of Cossacks for escort. The British embassy gholams are used for escort and also for posting purposes, as the regular native Indian cavalry who used to form the escort of the British ambassador was discontinued during the mission of Sir Gore Ouseley, which lasted from 1812 to 1818.

Fraser tells us that in Persia, the Kooleragassee is the superior of the slaves. Each of the princes, as well as the king, has a certain number of confidential troops, who act as guards, or agents, on all important occasions, and who are called "gholam," or slaves. *Elliot. Fraser's Journey into Khorasan*, p. 105. *Ed. Ferrier's Journ.*, p. 21.

GHOL-MUHUNEE. Beng. Deeringia Indica.

GHOND. See Gond, India, Kelat, Kond; Ku p. 488.

GHONDWANA. See Gondwanah, Kol, Koli, p. 536.

GHONGU KURA. Tel. Hibiscus cannabinus.

GHONI, wheat and barley grain, without husk.

GHOONT, or Kund is a hill breed of horses, generally small, strongly made, hard-mouthed, and sometimes almost unmanageable. In ascending hill faces, or passing along the declivities of mountains, it is best to let them have their own way, for in an intricate passage they often show more sagacity than the rider; their common pace is a kind of amble, and they stop every now and then to breathe, when no application of the whip will move them; they are sure footed, and sometimes halt at the edge of a precipice, to the terror of the rider; they are not so quick in ascending hills as the low country horses, but they descend with double the speed, and endure great fatigue. The ghoont, though a useful animal, seldom carries any burden but a man, the total number in Spiti is 295; they are bred chiefly for sale. They have two breeds, one a small ghoont, never above 12 hands high, peculiar to the country; and the other a large breed, from 13 to 13½ hands high, is bought from the Chinese, and usually comes from Choomoortee, for a Chinese ghoont two years old, they give a Spiti ghoont four years old. All are equally hardy and are kept out the whole winter, except the yearlings, which are housed. During winter the ghoont live on the roots of the stunted bushes, and are very expert at scraping the snow from off them with their fore feet. The breed of ghoont might be improved with a little care. Many are killed during winter by wolves and leopards.—*Powell Handbook. Capt. Gerard, Account of Coonawur*, p. 112.

GHOOR, a lizard of Guzerat which the natives believe to be poisonous, there are two kinds of "Ghoor" according to native report, "Putlah Ghoor" and "Chundun Ghoor." So anomalous a creature as a venomous lizard will, however, be believed in by no naturalist, until he has ocular demonstration of the existence of the poison-apparatus. Hardly a snake is caught in India, that is not,according to the snake-catcher,the worst snake in the country.

GHOOROOGOO KURA. Tel. Celosia albida. Linn.

GHOOS, is literally a bribe; and no treaty or transaction was ever carried on in Rajputanah without this stipulation. So sacred was the ghoos held,from tyrant usage, that the Peshwa ministers, when they ruled the destinies of their nation, stipulated that

the ghoos should go to the privy purse.—*Tod's Rajastham*, Vol. II. p. 404.

GHOOSOOL. See Kunawer.

GHOR, also called Ghoristan, the mountainous country between Hirat and Ghazni. According to Istakhri and Ibn Haukal, it is a rugged mountainous country, bounded by the districts of Herat, Farrah, Dawar, Rabat, Kurwan, and Gharjistan, back to Herat, which are all mahomodan countries. Ghor itself was a country of infidels, containing only a few mahomedans and the inhabitants spoke a language different from that of Khorasan.—*Elliot. Elphinstone's Cabul Vol.* I., p. 244.

GHORA. HIND. A horse; hence Ghorawala, a horse-keeper, a groom.

GHORA or Bhutghora, subsequently known as Ahmedabad.

GHORA, is the name of an old and extinct sircar, which according to the register in the "Ayeen-i-Akberee," contained 39 mehals and yielded a revenue amounting to 72,62,780 Dam.

GHORAGHAT Lit. Horse-ferry. A town and zemindari in the Bogra district of Bengal, mentioned in the Ayin Akbari.—*Yule Cathay* II., p. 534.

GHORALANJEA. URIA? Tentara. URIA? A tree of Ganjam and Gumsur, extreme height 30 feet. Circumference 3 feet and height from the ground to the intersection of the first branch, 10 feet. Used for spinning wheels, sugar presses and ploughshares, and burnt for firewood, being tolerably common.—*Captain Macdonald.*

GHORA-MOOG. BENG. Phaseolus sublobatus.

GHORBASTA. The climate of Mekran, generally, but especially at the level tract south of the mountains, is very unhealthy. Ghorbusta or Ghorbund occur in Mehran, great structures, at times almost bearing resemblance to the Cyclopean remains of Europe. They are evidently remains of a people who occupied or passed through the country long prior to the advent of the present occupants, who know nothing of the builders, or of the uses of the buildings, and attribute them to kaffirs or infidels. They are found usually in out of the way places, narrow valleys at present stony and barren. They are placed always on declivities, or across the mouths of ravines. Their solidity and size are proportioned to the steepness of the declivity; but, where there is only a gentle slope the walls are narrow, low and slightly built, but where the descent is great and the flow of water after floods and rains would be violent, they are of great thickness and height, and, as seen in the valley beyond Baghwana, supported and strengthened by buttresses or walls built at right angles. They always present a scarped face to the opposite side, which, when well preserved, is levelled off with the surrounding and superior ground. Those built across the mouths of ravines are very solid, and high, and usually the builders have taken advantage of some mass of rock jutting out as a sort of foundation. Those in slopes are never seen singly, but always in numbers varying with the extent of the ground to be covered, and placed in succession one behind the other. The intervening ground being levelled is thus formed into a succession of terraces. They were connected with the irrigation of the country. Those built across ravines were intended to form tanks for the preservation of the waters that came down at irregular intervals in floods. Those on slopes, to economise the distribution of water; the surplus water of one terrace running over and flooding the lower one, depositing as it went a layer of surface soil. The ground thus levelled, of course, became more valuable, freed from the irregularity and roughness which characterise these narrow stony valleys. They are almost confined to the provinces of Jhalawan, and are largest and most important in the southern and south-eastern portions of the province. The ancient city at Gunjjuk seems of the same date, and constructed by the same people. From the numbers and position of these structures, the people who built them must have been extremely numerous; must have felt that the country as existing by nature was utterly incapable of supporting them; and they must have possessed an energy and ingenuity which the present races are totally without. It appears probable, nay almost certain, that they must have swarmed eastward over the mountains from Mekran, making their appearance on the south-west portion of the table land. Gradually pushing eastward and northward, as their numbers increased, either rapidly by additions from without or more slowly by increase of the population from within, they ascended to the various valleys as high as Kelat, when, discovering the great eastern outlet, the Moolla pass, they found an exit by it into the plains of India. How long they remained on the table land? from whence they originally came? and over what countries they eventually distributed, are alike mysteries.

Lieutenant Aytoun, in his Geological Report on a portion of the Belgaum collectorate given in Mr. Carter's "Geological Pa-

pers on Western India," page 392, mentions that certain gorges in the hills had been artificially bunded and there kadir is a terrace cultivating race on the Pulney hills in the extreme south of the peninsula. There are one or two points of slight resemblance between the "Pelasgi" the builders of the Cyclopean walls of Greece, Italy, &c., and the Ghorbasta builders, suggesting that they might have been a kindred people with kindred habits. The Pelasgi came from Asia, not from Asia Minor, not from Syria, not from Assyria, not from Persia, but probably from that birth place of emigration the tract north and north-east of Persia. The Ghorbusta builders probably came from the same tract and were not Mekranees, nor Persians, nor Assyrians. The Pelasgi, existed only a few generations in Greece (about 250 years) before they were turned out by the Hellenes; they must therefore have brought with them when they entered the country their propensity for building massive walls, and commenced their work almost immediately on arrival. It was probably the same with the wall builders of Beloochistan, they only remained in the country long enough to allow them to extend northward as far as Kelat, when meeting with the Moolla pass, they debouched into the plains. Their art was a fully developed one, before they arrived here to carry it out. The Pelasgi arrived in Greece about 1800 B. C. This date seems to accord roughly with the advent of the unknown people into Jhalawan.

The Ghorbasta buildings differ considerably, however; for when compared with the Cyclopean remains, they are slight, most roughly executed, and insignificant; yet they evince alike instinct and habit in two races which probably came originally from the same region.—*Dr. Cook in No.* VI, *Bombay Medical Transactions.*

GHORBACH. Hind. Acorus calamus.

GHOR-BAND. A valley separated from Koh-i-daman, by a hill range stretching from the Hindoo-Kush, it contains many ancient remains. The Shirwan tribe occupy it. See Ghorbasta, Kelat, p. 489, 490. Khyber, p. 520.

GHORCHURHA, also ghorcharha. A sub-division of the Coormee tribe. The literal meaning of the word, if rightly spelt, is a horse-man, but Elliot is not sure that there may not be some connexion between them and the Koorchurra whom Tod puts down in Chund Bardai's list of the royal races.—*Elliot.*

GHORESUNN, Beng. also Mæstapat. Beng. Corchorus olitorius, Sunn hemp.

GHORI. Hind. White cornelian.

GHORIBUND. See Kohistan.

GHORKA. A people in Nepal said to be of mixed origin, a brave and fierce race, by the Chinese called Ku-ru Ka-li. There can be no doubt of the warlike character of the Ghorka. Not only are they brave and skilful soldiers, but, for a barbarous nation, they are wonderfully advanced in the art of fabricating the implements of war: they cast their own ordnance, manufacture their own muskets, short, powder, and cartridge-boxes; in fact, every instrument or weapon used in civilized warfare is manufactured in Nepaul, often clumsily enough, but the mere fact of their being capable of being used, and used with effect, is highly creditable to the ingenuity of the Ghorka. The Ghorka are the conquerors of Nepaul, and now compose the army; they have grants of land called jaghires, on which they live when not actually on service. They are a handsome and independent race, priding themselves upon not beink able to do anything but fight; and have a free and sometimes noble carriage like the Tyrolese. The Ghurka, and Bhutani, on the East, and the Lahuli and Kanawari on the west, dwelling amongst the valleys of the Aimalaya, are, according to Cunningham, mixed races, between the Bhot family of Tibet and the hindu race of the south. *Cunningham, Oliphant.*

GHORLA. Hind. Gugaira, a wooden implement used in the process of making sajji or barilla.

GHORA-PACHAR. See Sat-dhara.

GHOR-PHAR. Duk. Iguana. See Guana.

GHORPHARA. A powerful Mahratta family, who hold lands at Gunjundurghur, Sondur, Madhol, and Akulkote The derive their name from the Ghorphar, or Iguana, from a tradition that the founder of the family scaled and took a fortress by its means.

GHORAPUCAR. A river of Bhopal.

GHORUMBA. Hind. Cucumis colocynthis.

GHOS. Beng. Luffa pentandra and L. actuangula.

G'HOSEE, also g'hosi, herdsmen. They are said to be descended from the Ahir race. Most of them have now been converted to mahomedanism; indeed, the name is generally considered, according to the dictionaries, to be exclusively applied to mahomedan milkmen. The name is derived from a sanscrit word signifying a cattle-pen. The eastern G'hosi who have been converted are called Bundee G'hosi. In many parts of the country, as in Delhi, the Ghosi are

those who trade in milk, without any reference to their caste or religion.

GHOSHA. Sans, from goosh, to sound.

GHOTA-MAR. Hind. A king-fisher.

GHOUL. Pers. Turk., according to superstitious belief in Persia, a fair woman of about 20 years of age that preys at night on dead bodies. The Ghoul or "Demons of the Desert;" are also described as a hideous race, that sometimes haunt cemeteries, and particularly infest a dreary tract in the North of Persia, not far from Tehran; bearing the portentous name of Malek-al-mout darrah, or "Valley of the Angel of Death."

GHRITA KAUSIKA. See Hindu.

GHRITO-KOMARI. Beng. Aloe Indica.—*Royle.* From which an efficient substitute for our Pharmacopœial aloes may be obtained.

GHUBBER. A large mountain mass between Tank and Bunnoo, protruding into the plains, infested by a predatory tribe, named Mithani, who are perpetually at feud with the Waziri.

GHUGLAT. Hind. Chloroxylon dupada.

GHUJBAI. Hind. Pushtu; also Gira, Alnus nepalensis, Himalayan alder.

GHULABI-JAM. Duk. Eugenia jambos.

GHULAB SING, a maharajah of Kashmir, a Dogra rajput, died on the 2nd Aug. 1857.

GHUMBRA. Hind. Phlomis indica.

GHUNCHI. Hind. Abrus precatorius.

GHUNDA-BELA. Hind. Andropogon citratum.

GHUNDASARU. Duk. Santalum album.

GHUNGOL also Ghangol. The name of the water lily which produces the celebrated Nelofar or lotus flower. It yields a greenish fruit about the size of an orange the seeds of which are eaten by the poorer classes.—*Elliot.*

GHUNGRU. Hind. Bells.

GHUNIA. Tel. Salvadora Persica.—*Linn.*

GHUNNY BAGS are made from the reticulated fibre of the Abelmoschus ficulneus also from the Sunn and Jute.

GHUNTA. Beng. Bignonia suaveolens.

GHUNTEOH PATOOLEE. Uria? A tree of Ganjam and Gumsur, extreme height 22 feet. Circumference 1½ feet, and height from ground to the intersection of the first branch, 10 feet Used occasionally for axletrees and rafters but chiefly for firewood, the tree being rather common.—*Capt. Macdonald.*

GHUNU. Beng Cyperus rotundus.

GHURASKE. Hind. Dodonæa Burmanniana.

GHURB. Hind. Populus ciliata.

GHUREE also Ghari. An hour; or the instrument for measuring time. As a revenue word, it is applied to the subdivision of a village; thus, Khundeegawn in Delhi is divided into 144 Langree, each Langree containing 8 Ghuree.—*Elliot.*

GHUR-GHINA. See Kelat, p. 492

GHURGHUREA—? Corchorus olitorius.

GHURGHUSHTAI. Hind, or Mandala, Pushtu, Amygdalus persica, the peach.

GHURI GHENZA. Tel. Seeds of Abrus precatorius.

GHURJISTAN. The correct orthography of this name according to Yakut and others is Gharjistan or Gharshistan. Yakut says it is bounded on the west by Hirat, east by Ghor, north by Merv, and south by Ghazni. The ruler of the country was called Shar, and from this title the land was so called Gharju-o-Shar. The Merv-rud waters the country, and its chief towns are Bashin and Surmin, but the Shar generally dwells at a town in the hills called Bilkan. *Elliot.*

GHURKANI. See India, p. 336.

GHURKA. See Ghorka, Kazzilbash.

GHURRA, a water pot, for fetching water either of earthen ware, brass or copper.

GHURUGU KURA. Tel. Celosia albida.

GHURUMBA. Hind. Cucumis colocynthis.

GHURUSH. Hind. Phaseolus torosus.

GHURWAL. See Gurhwal; India, p. 322.

GHUSSUN, Arab. Branch of a tree.

GHUZ, Hind. Tamarix orientalis. See Ghaz.

GHUZHBE, Hind. Plantago major; Alnus, sp.

GHWA, Hind. Tamarix orientalis.

GHWANZA, Hind. Crataegus oxyacantha.

GHWARACHERAI Hind. Quercus ilex.

GHWARDZA Hind. Pushtu, Crataegus oxyacantha.

GHWAREJA, Hind. Edwardsia mollis.

GHWARESHTAI, Hind. Amygdalus Persica.

GHWARGA, Hind. Arundo donax.

GHWIYAN Hind. See Guyan.

GHYRUN, also Zahar-mora. Duk. Bezoar.

GIAH-SURKH-GUL. Hind. Anagallis coerulea.

GIAM. Hind. Cedrus deodara.

GIAN. Hind. Premna mucronata.

GIANHAN. Hind. Elæagnus conferta.

GIASHUK. Hind. Juniperus communis.

GIBBEL. Ar. A mountain. See Gab'l; Jib'l.

GIBBON. See Simiadæ.

GIBRALTAR, in lat. 36° 7′ N., long. 5° 21′ W., was captured from the Spaniards in the year 711 and it remained in possession of the Arabs till the early part of the fourteenth century, when the Spaniards retook it, but lost it again in 1333; it was then held by the Arabs until its second recovery by the Spaniards in 1462. On the 24th July 1704, it was suddenly assailed and captured by the British under Sir George Rooke; the garrison being small and unprepared for defence. The Spaniards, occasionally assisted by the French, have since made various attempts to recapture the place, but without success. Burton says Gibraltar is Jebal-ul-Tarikh; and "Mt. Ethne that men clepen Mounte Gybelle" is "Monte Gibello," the mountain, par excellence.—*Burton's Pilgrimage to Meccah*, Vol. I., p. 325.

GIBSON, Alexander, M. D., born at Lawrencebirk, October 1800, was a Medical officer of the H. E. I. Co.'s Mercantile Navy, from 1821 to 1824, during which he visited Bombay, Calcutta, China, and many islands of the Archipelago. In 1825, through the influence of Joseph Hume, he was appointed to the Bombay Medical Establishment, and served throughout the Burmese war as flag Surgeon, to Sir John Hayes. He was from 1837 to 1860, Conservator of Forests. His contributions to science were

On Indigenous Products which may be applied to use in India in supersession of the more costly supplies obtained from Europe. Lithographed 1837.

On the Medical Topography of Guzerat in Vol. 1st of Bombay Medical Transactions.

Description of the Method of Breeding and Rearing Leeches in Western India, do.

Remarks on the Climate, Productions and Diseases of the Deckan, Vol. 2nd of do.

Sundry Papers in the Transactions of the Horticultural Society of Western India for 1838-39 and 40, among which is an account of a simple process for the manufacture of Raw or Muscovado Sugar.

Suggestions for extending the cultivation of useful and ornamental plants in India. Published by order of Earl Aukland, 1841.

Report of Trials on the powers of Bramas press as applied in the extraction of oils. Trans. of Calcutta Hort. Soc. June 1843.

Practical Remarks on the cultivation of Senna, Calcutta Hor. Soc. Trans. Aug. 1843.

Forest and Garden Reports, 1840 to 1850, Transactions of the Agri. and Hor. Society of Western India 1852. This work has numerous misprints.

Hand Book on Indian Forestry comprising descriptions and details of management of teak forests together with an account (drawn up for the guidance of Departments) of the forest trees of western India—their localities, qualities, &c., with remarks on the planting of road trees.

He traced the Kino extract exported from Malabar to be the produce of Pterocarpus marsupium of the Western Ghats.

He began the culture of Hyosciamus now extensively grown for the supply of the medical stores.

The introduction of the officinal senna as a growth in the Bombay Presidency was effected by him.

He established at the district gardens in the Deckan, a manufactory for the supply of numerous oils and extracts for the medical stores, the oils being extracted by means of the hydraulic press, the District Gardens nearly paid their expenses by means of the supplies made.

Memoir on the forest preserves or shikargahs in Sind, printed along with the Parliamentary Papers on Sind, dated 1848.

On the products of the Bassia and some other trees, printed in Sir W. J. Hooker's Journal for February and March 1852.

On the medical properties of the bark of Alstonia scholaris Pharmaceutical Journal of London, March and April 1852.

This officer had been much employed in forests where malaria is of a very deadly character and being asked what precautions he had generally taken, he replied—

To sleep as much as possible with the head entirely covered.

To be in motion either marching or moving about at work at those hours when malaria is deemed to be most active, viz., from 3 to 7 A. M.

When marching in such forests at early morn—to take care always to breathe through repeated folds of cloth extending over the mouth and above the nostrils.

To avoid afternoon marches as the system becomes thereby exhausted and open to the reception of malaria after nightfall.

He is of opinion that with care as to these several particulars, forests may be traversed with comparative safety even at the most deadly seasons.

GHI-CHANGI. Tel. Celastrus montana, *Roxb.* W. A. & W. Ic.

GIDAR. Hind. Jackal.

GIDAR-DAK. Hind. Cissus carnosa, Sageretia oppositifolia; Prunus padus.

GIDAR-KI-TAMAKU, of Shahpur, literally jackal's tobacco, Philiphœa calotropidis, Heliotropium europæum, Verbascum thapsus. See Philipœa.

GIDARMAR, H. A vagrant and thief in upper India, (lit. a jackal killer.)—*Wilson*

GIDI. Hind. Franceœuria crispa.

GIDIA. H. a class of vagrants and thieves in Upper India

GIDDA JONNA. Tel. var. of Sorghum vulgaris. Lit. short or low sorghum.—*Pers.*

GIDDARKUMB, Hind. a fibre.

GIDUGUDU. Tel. Cascaria tomentosa. *Roxb.*

GIGANTIC COCK. See Phasianidæ.

GIGANTIC SWALLOW-WORT. Eng. Calotropis gigantea.—*R. Brown.*

GIGARTINA LICHENOIDES. The whole thallus of the Ceylon moss is sometimes imported from Ceylon, and used in Britain for dressing silk goods.—*O'Shaughnessy*, p. 668. See Ceylon moss. Edible Sea-weed. Gigartina etnax.

GIGARTINA TENAX.

Gracillaria spinosa. | Agar-Agar.

The Chinese people collect this sea-weed on the coast to a great extent using it in the arts and also for food. It affords an excellent material for glues and varnishes. It is simply boiled and the transparent glue obtained is brushed upon a porous kind of paper called "sha-chi" which it renders nearly transparent. It is also used as a size for stiffening silks and gauze, and is extensively employed in the manufacture of lanterns and in the preparation of paper for lattices and windows. This and other kinds of fuci are boiled down to a jelly by the islanders on the south and extensively used for food, it is known in commerce under the name of agar-agar. It is also made into a sweet glutinous jelly, called in Canton, Wong-leung-fan, which is used as a sweetmeat, and sold on stalls in the streets. It is brought from New Holland and New Guinea and other adjacent islands: between 400 and 500 peculs are imported annually by the Chinese at a prime cost of from one to two dollars per pecul. Its cheapness and admirable qualities as a paste render it worthy the attention of other countries; when cooked with sugar, it resembles calf's foot jelly. Of the three kinds of agar-agar sent to the Exhibition of 1862, from Malacca, the first quality was from a sort of Tripe de Roche, an edible sea-weed which grows on the rocks that are covered by the tide. It is much used for making a kind of jelly which is highly esteemed both by Europeans, and Natives for the delicacy of its flavour and is exported to China, at 19s per 133⅓ lbs. The agar-agar of the 2nd quality from Macassar and the Celebes is an edible sea-weed collected on the submerged banks in the neighbourhood of Macassar by the Baju Laut or Sea Gypsies, for exportation to China at 12s.6d. per 133⅓ lbs. The agar-agar of Singapore is collected on the reefs and rocky submerged ledges in the neighbourhood of Singapore, and constitutes the bulk of the cargoes of the Chinese Junks on their return voyages. It is much used as a size for stiffening silks, and for making jellies. The quantity shipped from Singapore is about 10,000 peculs annually.—Though deserving of being better known, it does not appear to be an article of Indian import, or, if so, it is brought in under some other name. —*Hon'ble A. Morrison. Exhib. Jur. Reports and Catalogue. Simmonds. Tomlinson. William's Middle Kingdom* p. 275. See Euchemia spinosa: Gracillaria tenax. Fucus tenax. Plocaria candida. Edible sea-weed.

GIHAIN, or gihen. Hind. Elæagnus conferta.

GIHON, or Oxus. The Arian race, according to Bunsen (IV. 487) emigrated out of the sources of the Oxus (Gihon) or Jaxartes, B. C. 11,000 to 10,000, and (IV. 491.), about B. C. 7,250 to 5,000, the Arians separated into Kelts, Armenians, Irenians, Greeks, Slaves, Germans.

GIHON. A ravine, commencing at the upper part of Gihon, a little to the westward of the city castle, and running at the foot of the western walls, is called the "Valley of Gihon or Rephaim," though the word trench or ditch would convey a more correct idea of its appearance. As it winds round the southern foot of Zion it widens, and is called the valley of Hinnom.—*Robinson's Trav. Palest and Syria*, Vol. I, p. 105.

GILA. Hind. Acacia scandens.

GILA GADDI. Tel. Coix barbata.—*Roxb.*

GILA-GACH. Beng. Entada pusœtha.—*D. C.*

GILA GORANTA. Tel. Crotalaria verrucosa.

GILAKA CHETTU. Tel. Crotalaria.

GILAKARA. Tel. Cumin seed.

GILAM and Siras are on the coast of Laristan. Gilam appears to be the Ila of Arrian. But we can scarcely suppose it the Ghilan, which Hamdallah Cazvini enumerates among the islands of the gulf, sub-

ject to the Persian government.—*Ouseley's Travels*, Vol. I, p. 174. Nearchus, p. 375. Sec. ed. 1807.

GILARPATR. Hind. Laminaria saccharina.

GILAS. Hind. Cerasus communis. C. vulgaris, a kind of cherry.

GILA TIGE. Tel. Entada pusœtha.—*D. C.* Mimosa scandens.—*Roxb.*

GIL-ARMINI. Duk. Hin. Pers. Bole armenian.

GILBOAN or DUIVEN ISLAND, two miles distant from and on the east coast of Java, is in lat. 8° 2′ S and long. 114° 31′ 15″ E. It is small and steep.—*Horsburgh.*

GILEAD BALSAM, Royle, in his Himalayan Botany, mentions that the Balsamodendron (Amyris) Gileadense or Terebinthœ, or Balsam of Gilead-tree, known in the East by the name of Balessan, has long been accounted one of the riches of Arabia, whence or from Abyssinia, its native country, according to Bruce, it was at an early period taken into Syria. It has also been introduced into the Botanic Garden at Calcutta as well as into the Peninsula of India. See Balsam, Balsamodendron.

GILEAD FIR, Abies balsamea See Balsam.

GILERU. Hind. Crysthrina arborescens.

GILGIT. A territory in Central Asia, in lat. 35° N., and long. 74° E., The Indus river runs through it from N. E. to S.W. It is on the southern declivity of the Hindu Kush, between Chitral on the west, and Baltistan (Little Tibet) on the east. In the Bunnu valley there are races intermixed, of whom may be noticed the Durdu of Gilgit and Chulas. According to Burnes, the mir of Badakhshan, the chief of Darwaz in the valley of the Oxus, and the chiefs eastward of Darwaz who occupy the provinces of Kulub, Shughnan and Wakkan, north of the Oxus, also the hill states of Chitral, Giljit and Iskardo are all held by chiefs who claim a Grecian descent. The whole of the princes who claim descent from Alexander are Tajik who inhabited the country before it was overrun by Turki or Tartar tribes. To the west beyond Balti the people of Astor, Gilgit and Hunza-Nager speak different dialects of Dardu, while the Kashmir people have their own peculiar language. The Balti people of Little Tibet, say that Ladak, Iskardo, Khopalu, Purik Nagyr, Gilgit and Astor are distinct Tibets, *Burnes, Bokhara.* See Kabul, Kush, Ladak, Sikh, Tibet.

GILGITI. Hind, A kind of wheat.

GIL 'HRI-MAR. Hind. Aquila pennata, *Gmel.* literally squirrel killer

GIL-I-ABRORSHI. A rough, hard, not brittle, pink earth, only used in native medicine. Properly speaking, a deposit from a mineral spring containing sulphur, the sediment is collected and made into little cakes, but the "Hassan dhup" ordinarily seen in the bazaar is a mere imitation, consisting of some earthy clay mixed with ground sulphur and formed into cakes, called probably Moses' Stone, from its lamellar structure, as if the tables of the laws, given on Sinai, had been on slate tablets.

GILIA ACHILLIÆFOLIA. Beautiful annuals of easy cultivation, may be grown either in the flower garden, or in pots during and after the rains, easily propagated by seed in any light soil.—*Riddell.*

GIL-I-FARSI. Hind. A pink earth.

GIL-I-IRMANI, Armenian bole, not now used in European medicine, but formerly so employed, and still used by natives. *Powell.*

GIL-I-KHARDYA. A red earth.

GIL-I-KIRIA. A soft laminated, nearly white clay, resembling chalk in appearance, hence probably the name.—*Powell.*

GIL-I-MAKHTUM. A soft, rough, irregular, variegated marl, containing clay, deeply colored by peroxide of iron, mixed with nearly white carbonate of lime.—*Powell.*

GIL-I-MULTANI. Fuller's earth. A soft laminated white or pale yellow earth; used by the natives for cleaning their hair, and in medicine.

GIL-I-SAFED. Pers. Chalk, Calcis carbonas.

GIL-I-ZARD. A pale yellow, tough, laminated earth, intermediate in color between geru and gil-i-multani, but resembling both in appearance.—*Powell.*

GILL, Major Robert, an officer of the Madras army, who devoted nearly twenty years of his life to copying and photographing the pictures in the caves of Ellora and Adjunta. His devotion, in dwelling in such lonely spots as in the ravine of Adjunta is unparalleled in modern times.

GILLAR. Hind. Goitre.

GILLAR PATR, Hind. a sea-weed laminaria, used as a drug, for goitre. It is obtained solely via Yarkand, from the shores of the Caspian Sea. Five or six maunds are imported. The word "patr," is a leaf. Dr. Martin Honigberger refers gillur-ka-Puttar to Laminaria saccharina, and alludes to a belief that it is found in a salt lake in Thibet; adding that some English physicians maintain it is brought from the Caspian Sea. He says it is

useful in scrofulous ulcers in horses *Powell Handbook Econ. Prod. Punjab*, p. 8.

GILLESPIE, General, a British officer who by a rapid advance from Arcot relieved Vellore when siezed by rebel Madras troops in 1807. He afterwards commanded the force which captured Java. He was killed on the 30th October 1814 in the Gurkha war at the assault of Nalapani.

GILOLO, one of the Molucca Islands. Its north end is in about Lat. 2° 23′ N. It has high bold land, with three remarkable peaks, and it has a long mountainous coast. The indigenes live in the north of the island. They are radically distinct from all the Malay race. Their stature, their features, as well as their dispositions and habits are almost the same as those of the Papuan. Their hair is semi-Papuan, neither straight, smooth and glossy like all true Malays, nor so frizzly and woolly as the perfect Papuan type, but alway crisp, waved and rough, such as often occurs among the true Papuan but never among the Malay. Their colour alone is often exactly that of the Malay, or even lighter. Of course there has been intermixture, and individuals are occasionally seen whom it is difficult to classify, but in most cases, the large somewhat aquiline nose with elongated apex, the tall stature, the waved hair, bearded face, and hairy body, as well as the less reserved manner and louder voice unmistakingly proclaim the Papuan type. Here is the exact boundary between the Malay and Papuan race. It is only in the northern peninsula that these Papuan indigenes exist, the whole of the rest of the island with Batchian and the other islands westward being exclusively inhabited by Malay tribes like those of Ternate and Tidore. This would seem to indicate that the Alfuro are a comparatively recent immigration and that they have come from the north or east, perhaps from some of the islands of the Pacific, though it is difficult to understand why so many fertile islands should possess no indigenes. The Galela race are natives of a district in the extreme north of Gilolo, but they are great wanderers over the Archipelago. They are a very fine race, remarkably energetic and industrious, of light complexion, tall and with Papuan features, coming near to the drawings and descriptions of the true Polynesians of Tahiti and Owyhee. They build large and roomy prahu with outriggers, and settle on any coast or island they take a fancy for. They catch turtle and tripang, hunt deer and wild pigs, dry the meat, cut down the forest and plant rice or maize. The people of Gilolo are called Alfura, Professor Bikmore however, states they are strictly of the Malay type, and have not the dark skin and frizzly hair of the Alfura of Ceram and Buru, though representatives of that people may exist in Gilolo. The population of Gilolo are supposed to be 75,000, all but 5,000 of them are under the sultan of Ternate. *Bikmore* 313 *Horsburgh*. *Wallace*, ii, 13 405. See Pulo Gasses: Syang; Waygiou, Weeda Islands, Wutsan.

GILO, also Sat gilo, Hind. Tinospora cordifolia.

GILUGUDU. Tel. Casearia tomentosa —*Roxb.*

GILYAK, a race on the lower Amur with Mongol features, but their language is different from the Tungusian dialects along the river According to Rinso, polyandry prevails amongst the Smerenkur Gilyak, and the women are treated with the greatest indulgence. Only those skilled in the art of the needle, however, need expect to get married.—*Ravenstern's Russians*, p 391.

GIMA. Beng. Lady's bed straw, Erythræa centauroides.

GIMEER. See Kush or Cush.

GIN. Hind. Ehretia aspera.

GINDING. The name given to a land wind in East Java, occasioned by the S. E. monsoon blowing right over the land through the gap at Klakka, 1,000 feet above the sea, between the Jyang and Tengger mountains 8,000 and 9,000 feet high.

GINDSHI. Jav. Ganjah.

GINGARU. Hind. Crataegus crenulata.

GINGEE. A town and fort 35 miles N.W. of Pondicherry. In the contests between the rival French and British, and rival Mahratta and Mahomedan princes, Gingee and neighbourhood were frequently scenes of strife, but it long continued a French possession. In the 17th and 18th century it was taken by Sivaji, was attacked by Aurengzeb, stormedby the French, but finally occupied by the British. The French obtained the grant of Pondicherry in 1674, from a rajah of Gingee, who acknowledged the king of Narsinga as his superior; but this latter was, at the same time, dependent on Visiapor. Sevajee took possession of Gingee about the year 1677, and confirmed the above grant in 1680.—*Rennell's Memoir*, p. lxxxi.

GINGELLY OIL.

Jiritch,	Ar.	Kurit; Sohuk,	Pers.

Gingelly oil is expressed from the seed of the Sesamum orientale. It is largely exported from India to Europe where it is sold as olive oil.

GINGELLY SEED. Sesamum Seed.

Sumsum,	Ar.	Taila,	Sans.
Ellu,	Can.	Yellu,	Tam.
Til, Jingelly.	Guz. Hind.	Nuwulu,	Tel.
Kunjed,	Pers.		

The sesamum is extensively cultivated in Southern Asia, for the oil expressed from the seed, which are slightly oval, small, tasteless and inodorous. There are two varieties distinguished, black, and white or yellow, which possess the same properties, and in commerce are met with both in a mixed and separate state. Gingelly seed is largely exported to England and France. This oil is perhaps consumed to a greater extent than any other by the Natives of India, and is second only to cocoanut oil in its importance as an article of commerce. It is extensively cultivated throughout the whole of the Madras Presidency, and the seed and oil have been exported as follows :—

Gingelly Seed.

Year 1847-48.	Year 1848-49.
Qr. 17.518 ...Rs 1,60,134	Qr. 8,594... Rs 1,02,726
Year 1849-50.	Year 1850-51
Cwt. 1,44,125 Rs. 299,412	Cwt. 2,27,779. Rs 4,37,185
Year 1851-52.	Year 1852-53.
Cwt. 1,09,414 Rs. 3,02,559	Cwt. 2,51,613. Rs. 5,31,664

Gingelly Oil.

Year 1847-48.	Year 1848-49.
Gl. 19.520——Rs. 14,766	Gl. 14,686——Rs 11,535
Year 1849-50	Year 1850-51.
Gl. 52,721——Rs. 36,294	Gl. 77,262——Rs. 48,605
Year 1851-52.	Year 1852-53.
Gl. 46,196——Rs 26,722	Gl. 72,607——Rs. 43,608

Of the gingelly seed exported in 1852-53 the United Kingdom received cwt. 12,713—Ceylon, cwt. 590—France, cwt. 2,87,225—Pegue, cwt. 741—Bombay, cwt. 113—Malacca, cwt. 33 and Travancore, cwt. 148. Of the quantity of oil (72,607 gals.) exported in the same year—gals. 42,043 were shipped to the United Kingdom—gals. 2,963 to Ceylon—gals. 4,232 to Mauritius and Bourbon—gals. 19,698 to Pegu—gals. 46 to Bengal—gals. 27 to the French (Indian) ports, and gals. 3,593 to Malacca. The great disparity of color observed in the specimens of this oil is attributed to the mode of preparation. The method sometimes adopted is that of throwing the fresh seeds, without any cleansing process, into the common mill, and expressing in the usual way. The oil thus becomes mixed with a large portion of the coloring matter of the epidermis of the seed, and is neither so pleasant to the eye, nor so agreeable to the taste, as that obtained by first repeatedly washing the seeds in cold water, or by boiling them, for a short time, until the whole of the reddish brown coloring matter is removed, and the seeds have become perfectly white. They are then dried in the sun, and the oil expressed as usual. This process yields 40 to 44 per cent. of a very pale straw-colored sweet-smelling oil, an excellent substitute for olive oil. In India, the oil is chiefly used in cookery, in anointing the person, for making soap, and for burning in lamps. In England, it is chiefly used for the manufacture of soap, and for burning in table-lamps, for which it is better suited than cocoanut oil, owing to the lower temperature at which it congeals. Its value in England (January 1855) £47-10 per ton. In different parts of the Madras Presidency the price of this oil varies from Rs. 1-5-0 to Rs. 6-0-0 per maund of 25 lbs. In S. Arcot it is procurable at Rs. 27-12-5 per candy. The prices per maund of this oil, at the undermentioned stations, for the quarter ending 31st October 1854, were as follows :—

	Rs.	A.	P.		Rs.	A.	P.
Arcot,	3	0	0	Madura,	5	8	3
Bangalore,	3	7	3	Mangalore,	4	1	8
Bellary,	3	2	0	Nagpore,	1	12	0
Berhampore,	2	8	0	Palamcottah,	4	12	0
Cannanore,	6	0	0	Paulghaut,	3	7	0
Cuddapah,	2	13	0	Samulcotta,	2	10	8
Jaulnah,	2	6	0	Secunderabad,	2	3	11
Jubbulpore,	1	5	0	Trichinopoly,	4	1	8
Madras,	3	14	0	Vellore,	3	14	0
Masulipatam,	3	0	0	Vizagapatam,	3	2	0

Second sort Gingelly Oil is erroneously called "Rape," (Kharasanee yelloo), is from the red seeded variety. In Tanjore, it is procurable at Rs. 3-0-0 per maund. In Rajahmundry the two varieties of sesamum are cultivated for the sake of the oil. The best gingelly seed plant, is sown in the month of March, after the rice crop, and is irrigated twice, once at sowing. and once afterwards. The seed which is *black*, and is called 1st sort gingelly, from the fact of its yielding the largest percentage of oil, ripens in May, and sells at the rate of Rs. 60 per candy of 500 lbs. The oil obtained from both varieties, sells at the same price, viz., Rs. 2-14-6 to 3 per maund of 25 lbs. according to quality. The 2nd sort of gingelly is sown in June, and produces a red seed. The plant although a little larger resembles in most respects the former, it has, however, a somewhat longer leaf, and the flower differs a shade or two in color. A candy of 500 lbs. of this seed sells at Rs. 57-8-0. The price of the oil is the same as that of gingelly. This seed has of late been exported to France, in consequence of which the present price is double what it was three years ago. It will have been seen that of this small annual plant there are two or three varieties.—*M. E. of* 1855.

GILLESPIE, General, a British officer who by a rapid advance from Arcot relieved Vellore when siezed by rebel Madras troops in 1807. He afterwards commanded the force which captured Java. He was killed on the 30th October 1814 in the Gurkha war at the assault of Nalapani.

GILOLO, one of the Molucca Islands. Its north end is in about Lat. 2° 23′ N. It has high bold land, with three remarkable peaks, and it has a long mountainous coast. The indigenes live in the north of the island. They are radically distinct from all the Malay race. Their stature, their features, as well as their dispositions and habits are almost the same as those of the Papuan. Their hair is semi-Papuan, neither straight, smooth and glossy like all true Malays, nor so frizzly and woolly as the perfect Papuan type, but alway crisp, waved and rough, such as often occurs among the true Papuan but never among the Malay. Their colour alone is often exactly that of the Malay, or even lighter. Of course there has been intermixture, and individuals are occasionally seen whom it is difficult to classify, but in most cases, the large somewhat aquiline nose with elongated apex, the tall stature, the waved hair, bearded face, and hairy body, as well as the less reserved manner and louder voice unmistakingly proclaim the Papuan type. Here is the exact boundary between the Malay and Papuan race. It is only in the northern peninsula that these Papuan indigenes exist, the whole of the rest of the island with Batchian and the other islands westward being exclusively inhabited by Malay tribes like those of Ternate and Tidore. This would seem to indicate that the Alfuro are a comparatively recent immigration and that they have come from the north or east, perhaps from some of the islands of the Pacific, though it is difficult to understand why so many fertile islands should possess no indigenes. The Galela race are natives of a district in the extreme north of Gilolo, but they are great wanderers over the Archipelago. They are a very fine race, remarkably energetic and industrious, of light complexion, tall and with Papuan features, coming near to the drawings and descriptions of the true Polynesians of Tahiti and Owyhee. They build large and roomy prahu with outriggers, and settle on any coast or island they take a fancy for. They catch turtle and tripang, hunt deer and wild pigs, dry the meat, cut down the forest and plant rice or maize. The people of Gilolo are called Alfura, Professor Bikmore however, states they are strictly of the Malay type, and have not the dark skin and frizzly hair of the Alfura of Ceram and Buru, though representatives of that people may exist in Gilolo. The population of Gilolo are supposed to be 75,000, all but 5,000 of them are under the sultan of Ternate. *Bikmore* 313. *Horsburgh*. *Wallace*, ii, 13 405. The ginger-plant, Zinziber officinale, belongs to the natural order, Zinziberaceæ, and is cultivated in the tropical regions of Asia, America, and Africa. It grows in all parts of India, and is generally cultivated in gardens, being sown about the commencement of the rains, and taken up in eight or nine months, though sometimes left in the ground for the following year. Ginger is sown at the commencement of the rains, in beds of about six feet square, and in a rich cultivated soil. The planting consists in dividing part of the green root, which the natives first soak in a mixture of cow-dung and water; it is then planted about two inches deep and about one foot apart; it requires a great deal of water and to be kept clear of weeds. When the stalks dry, the ginger may be taken up, although it is sometimes left in the ground for a couple of years. It is better for remaining twelve months, and must be watered during the dry season. The stem reaches generally three or four feet in height, and is renewed yearly, while the root, which is the part known as ginger, botanically termed a rhizome, is biennial. In Jamaica, the roots are dug up in January or February when about a year old and after the stems are withered. They are well washed, freed from dirt, and, in some cases, especially with the better kinds, the epidermis or outer coat is stripped off,—and hence the division of ginger into white, scraped or uncoated, and into black, unscraped or coated. In estimating the quality of ginger, a variety of particulars have to be taken into consideration, as whether the rhizomes are coated or uncoated, their form, colour, and consistence.

Ginger roots of good quality have no epidermis, are plump, of a whitish or faint straw-colour, soft and mealy in texture, with a short fracture, exhibiting a reddish, resinous zone round the circumference; the taste should be hot, biting, but aromatic.

Ginger roots of inferior quality are frequently coated with the epidermis, are less full and plump, often contracted and shrivelled, of darker colour, being of a brownish-yellow, of harder texture, termed flinty, and more fibrous, while the taste is inferior, and less aromatic.

According to Dr Pereira, the principal uncoated sorts are:—

Jamaica ginger, imported in barrels holding one cwt. each. It is an uncoated, pale sort; and when of fine quality, occurs in large, bold, fleshy races, which cut soft, bright, and pale-coloured. Inferior samples are small in the race, darker-coloured, more or less flinty and shrivelled.

The cultivation of West India ginger in Ceylon has been successful.

Uncoated Malabar ginger, new sort of Malabar ginger, Tellicherry ginger, Calicut ginger, Cochin ginger, "a pale uncoated sort imported in chests, casks, or bags, sometimes from Tellicherry, but usually from Calicut or Cochin." It resembles Jamaica ginger, both in external appearance and flavour; but has, externally, more of a brownish or reddish tint, it first appeared in English commerce about the year 1841.

This seems to be the large sized ginger, raised in the first place from Jamaica cuttings, grown in Chernaad, some five and twenty miles inland, and is in considerable demand at most times. When brought down in a rough state, and cured, prepared, and packed by Europeans, this ginger realizes a high price in Britain, but on the long voyage, worms frequently spoil the most carefully prepared consignment. This, independent of all market fluctuations, prevents merchants operating largely in this most useful article. Were the worm difficulty overcome, Malabar would probably soon supply enough ginger for the whole of Europe, as its cultivation is easy and far less expensive there than in Jamaica.

Uncoated Bengal ginger, scraped Bengal ginger, new sort of Bengal ginger, Calicut sort of Bengal ginger, "imported in chests of about one and a half cwt. It is an uncoated sort, darker than Jamaica ginger; it is not so large as the uncoated Malalabar sort, and is harder and darker."

The chief coated gingers are:—

Barbadoes ginger, "imported in bags of about sixty or seventy pounds. It is a coated sort, in short, flat races, which are darker coloured than Jamaica ginger, and are covered with a corrugated epidermis."

Malabar ginger, "Unscraped Malabar, Old sort of Malabar ginger, Common Malabar ginger; Bombay ginger imported from

Bombay in bags or packets. It is a coated, dark, and small sort."

Bengal ginger, Common Bengal ginger, Old sort of Bengal ginger "imported in bags. It is a coated or unscraped dark sort, which cuts flinty and brownish, but is plumper and less wormy than common Malabar ginger."

Sierra Leone ginger, Africa ginger, "imported in casks or bags. It is a coated sort, the races being generally larger, less flat and less plump, than those of the Barbadoes sort, which in other respects they resemble. The uncoated gingers, viz., the Jamaica, uncoated Malabar, and uncoated Bengal—are assorted for commercial purposes according to their qualities, thus :—

1. Bold, soft, and bright ginger.
2. Smaller, but soft and bright.
3. Flinty and dark.
4. Shrivelled, and only fit for grinding.

The Barbadoes, African, and coated Malabar and Bengal gingers are usually sold unassorted.

Besides the two kinds of ginger above noticed, other descriptions occur. Thus what is called green ginger, is sometimes imported from Jamaica, it consists of soft and juicy rhizomes with buds, and appears to have undergone but little preparation beyond picking and washing.

Ginger is cultvated to a small extent, in Tenasserim, and some of the Chinese make a ginger preserve of the green roots, in imitation of that which comes from China.

Ginger is extensively diffused throughout the Archipelago, it being of pretty general use among the natives, who neglect the finer spices. The great and smaller varieties are cultivated, and the sub-varieties are distinguished by their brown or white colors. There is no production which has a greater diversity of names. This diversity proves, as usual, the wide diffusion of the plant in its wild state. The ginger of the Indian Archipelago is however inferior in quality to that of Malabar or Bengal.

The young shoots put forth every spring by the perennial rhizome are used in the manufacture of preserved ginger (Conditum zingiberis). These shoots are carefully picked, washed, scalded, scraped, peeled, and then preserved in jars with syrup. (*Dr. P Browne*). "The finest preserved ginger is imported from Jamaica, usually in jars. Barbadoes preserved ginger is seldom brought over. The China preserved ginger is stringy. It is sometimes imported in the dried state. Dried ginger of good quality, soft and mealy, may, by the following process, be converted into excellent preserved ginger. The rhizomes, selected with care are to be immersed for three or four weeks in very weak syrup, scarcely stronger than sugar-and-water, to which a small portion of the carbonate of potash has been added; this addition being made to give them a fresher and greener tint, and also to assist in softening them. As soon as the ginger has become sufficiently soft, it is put up in very strong syrup of white sugar. From the analysis, by Dr. Hassell, of the gingers sold in London, it appears that out of twenty-one samples, fifteen were found to be adulterated with sago-meal, potato-flour, wheat-flour, ground rice, cayenne pepper, mustard-husks, and turmeric powder in various quantities, but in the majority of cases constituting the principal part of the article. (*Hassell. Mason. Food and its Adulteration*, p. 390.)

A great part of that found in the shops has been washed in whiting and water, under the pretence of preserving it from insects The dark colored kinds are frequently bleached with chloride of lime. Barbadoes ginger is in shorter, flatter, pieces called races, of a darker color, and covered with a corrugated epidermis. African ginger is in smallish races, which have been partially scraped, and are pale colored. East India ginger is unscraped; its races are dark ash colored externally, and are larger than those of the African ginger.

Cultivation in Malabar. Tellicherry ginger is in large plump races, with a remarkable reddish hue externally. The Malabar ginger exported from Calicut is the produce of the district of Shernaad, situated in the south of Calicut; a place chiefly inhabited by Moplas, who look upon the ginger cultivation as a most valuable and profitable trade, The soil of Shernaad is so very luxuriant, and so well suited for the cultivation of ginger, that it is reckoned the best, and in fact the only place in Malabar where ginger grows and thrives to perfection. Gravelly grounds are considered unfit; the same may be said of swampy ones, for, whilst the former check the growth of the ginger, the latter tend in a great measure to rot the root; thus the only suitable kind of soil is that which, being red earth, is yet free from gravel, and the soil good and heavy. The cultivation generally commences about the middle of May, after the ground has undergone a thorough process of ploughing, harrowing, &c. At the commencement of the monsoon, beds of ten or twelve feet long, by three or four feet wide are formed, and in these beds small holes are dug at three-fourths to one foot apart, which are filled with manure.

The roots, hitherto carefully buried under sheds, are dug out, the good ones picked from those which are affected by the moisture, or any other concomitant of a half-year's exclusion from the atmosphere, and the process of clipping them into suitable sizes for planting, performed by cutting the ginger into pieces of an inch and a half to two inches long. These are then buried in the holes, which have been previously manured, and the whole of the beds are then covered with a good thick layer of green leaves, which, whilst they serve as manure, also contribute to keep the beds from unnecessary dampness, which might otherwise be occasioned by the heavy falls of rain during the months of June and July. Rain is essentially requisite for the growth of the ginger; it is also however necessary, that the beds be constantly kept from inundation which, if not carefully attended to, entirely ruin the crop; great precaution is therefore taken in forming drains between the beds, and letting water out, thus preventing a superfluity. On account of the great tendency some kinds of leaves have to breed worms and insects, strict care is observed in the selection, and none but the particular kinds used in manuring ginger are taken in, lest the wrong ones might fetch in worms, which, if once in the beds, no remedy can be resorted to successfully to destroy them and thus in a very short time they ruin the crop. Worms bred from the leaves laid on the soil, though highly destructive, are not so pernicious to ginger cultivation as those which proceed from the effect of the soil. The former kind, whilst they destroy the beds in which they once appear, do not spread themselves to the other beds, be they ever so close, but the latter kind must of course be found in almost all the beds, as they do not proceed from accidental causes, but from the nature of the soil. In cases like these, the whole crop is oftentimes ruined, and the cultivators are thereby subjected to heavy losses. The present mode of preparing the land for this crop in the West Indies, is by first carefully hoeing off all bushes and weeds from the piece intended to plant; the workmen are then placed in a line and dig forward the land to the full depth of the hoe, cutting the furrow not more than from five to six inches thick. The land is then allowed to pulverise for a short time; it is then prepared for receiving the plants by opening drills with the hoe, from ten to twelve inches apart, and the same in depth, chopping or breaking up any clods that may be in the land. Two or three women follow and drop the plants in the drills, say from nine to ten inches apart. The plants or sets are the small knots or fingers broken off the original root, as not worth the scraping. The plants are then covered in with a portion of the earth-bank formed in drilling. Great care and attention is required to keep them clean from weeds until they attain sufficient age. They throw out a pedicle or foot stalk in the course of the second or third week, the leaves of which are of similar shape to that of the Guinea grass.

Ginger is a delicate plant, and very liable to rot, particularly if planted in too rich a soil, or where it may be subject to heavy rains. The general average of yield is from 1,500 to 2,000 lbs. per acre in plants, although as much as 3,000 lbs. of ginger have been cured from one acre. The ordinary selling prices of ginger range from 35*s* to 100 shillings the cwt: the duty in Britain is 10*s*. for foreign and 5*s*. for British possessions, the imports range from 12,000 to 35,000 cwt.—*Poole's Statistics of Commerce. Dr. Mason's Tennasserim. Dr. Hassell's Food and its Adulterations* p. 390. *Riddell's Gardening. McCulloch's Commercial Dictionary Faulkner's Dictionary of Commerce. Simmonds.*

GINGERBREAD TREE or Doom palm of Egypt is the Hyphæne Thebaica, and receives its name from its fruit having the look and taste of gingerbread. It is stated by Dr. Lindley to produce the Bdellium. Its wood is used for various domestic purposes, and its kernels turned into rosaries.—*Seeman.*

GINGER PRESERVE. Is imported into India solely from China, in cases containing half a dozen of jars each; the capacity of each jar being about five lbs.—*Faulkner.*

Ginseng is the dried root of the Panax quinquefolia, a herbaceous perennial. It is obtained in Tartary, and also in America, from which latter country some is exported to China. It is produced largely in the northern, middle, and western states, of the American union, particularly Virginia, Louisiana, and Pennsylvania, and it is also found growing in Canada. Mr. Williams tells us that Ginseng is found wild in the forests of Liantung and Manchuria, where it is collected by detachments of soldiers and camp followers, specially detailed for this pur-

pose: the regions where it grows are regarded as imperial preserves, and the medicine itself is held as a governmental monopoly. It is considered by the Chinese as a panacea, and no medicine or dose is regarded as complete without this forms an ingredient. All the ginseng growing in Tartary is the property of the emperor, and he sells a quantity yearly to his subjects, who have the privilege to purchase it at its weight in gold. The co-hong were formerly compelled to purchase upwards of $140,000 worth annually, for which sum a few catties were given them. The roots are about the size and length of a man's little finger, and when chewed have a mucilaginous sweetness; and if good, will snap when broken. They should be sound, firm, and free from worm holes. The Chinese consider that which comes from Tartary to be the best, even when they can see no difference. When first brought from America, the profits were 500 or 640 per cent.; but afterwards the price declined so much as at times to be hardly worth bringing. When the new tariff was first settled, the Chinese objected to a reduction of the imperial duties, but on a representation being made to H. E Keying, the imperial commissioner, it was finally agreed by him, that without changing the tariff, the duty on every separate lot should be levied as if it was one fifth first quality, and four fifths second quality. This arrangement reduces the actual duty paid to 10t. 2m. or $14·17 per pecul. Ginseng is clarified by being boiled and skinned, which operation renders the root somewhat transparent. Clarified ginseng varies in price from $60 to $100 a pecul; the crude, from $35 to $70 a pecul; five per cent., is allowed for loss in weight on this article, which is taken from the price agreed upon per pecul. In 1837, there were 212,898 lbs. imported, at the value of $108,548. In some years there is much more than this amount; the average importation in 1842 and 1843 was 3,000 peculs, at the average price of $48 per pecul. The trade is fluctuating and uncertain, and entirely in the hands of the Americans upon the confines of Tartary and China, near the great wall. It is found wild, flourishing in moist situations, and attaining the height of from two to three feet. A variety of the plant was discovered, a few years ago, in the Himalaya mountains, and small quantities have been sent thence to Canton. The root is about three or four inches in length, and one inch in thickness. It resembles a small carrot, but not so taper at the end, and is sometimes single, sometimes divided into two branches. The stem is striated, without branches, and of a red color near the root. The officinal root differs in appearance, according to the country from which it is brought. In Korea and China it is white, corrugated when dry, and covered with a powder resembling starch. In Manchuria and Dauria it is yellow, smooth and transparent, and when cut resembles amber. The taste of the root is bitter. The stem of the plant, which is renewed every year, leaves, as it falls off, an impression upon the neck of the root, so that the number of these rings or marks indicates the age of the plant, and the value of the root increases accordingly. The importation of the American root at Canton does not interfere to a very serious degree with the imperial sales at the north, as the Chinese are fully convinced that their own plant is far superior, and its high price prevents much of it coming south.—In Tenasserim the Chinese shops have the famous ginseng always on hand, but the plant is not cultivated.—*William's Middle Kingdom p.* 284 *Simmond's Commercial products p.* 436-7. *Honorable Mr. Morrison's Compendious Description.*

GIPSHAN. Hind. Eurotia ceratoides.

GIPSIES. In a recent German work, by Dr. Pott, concerning the gipsies in Europe and Asia, the author seeks for an identity between that tribe and the Luri or Lur of Persia. His supposition rests on the authority of Pottinger, who establishes a similarity between the Luri of Beluchistan and the gipsies in Europe. But on this subject, Baron de Bode observes that the Karachi, Kauli, and Susmani, under which appellations the gipsies are known in Persia, are perfectly distinct from the Luri or Lur tribes. The gipsies in the northern parts of Persia lead a wandering life, but always aloof from the other erratic tribes, and they go by the name of Karachi, from the Turkish word kara, meaning black. They exercise the trade of tinkers, and are consulted at times as horse doctors; but they are in general looked down upon by the inhabitants settled in towns and villages, and even by the other nomadic tribes. In Kermanshah and Kurdistan, where their number is very considerable, they also lead a vagabond life, and are known by the denominations of Susmani, and Kauli. In Ardelan, which is the Persian Kurdistan, there is a large village, near Senneh, inhabited solely by the Susmani. Their morals are anything but strict; the women are like the Indian Bayadere and dance at the Persian majalis, or assemblies, to the music which their husbands perform on some stringed instruments. There are several Iliyat tribes in Persia, the

sound of whose names bears some resemblance with zigane, as the gipsies are called in Russia. These are the Zengheneh, once a very considerable, and, until now, reckoned a very noble, Kurdish tribe of Kermanshah. A branch of them was also transplanted by Nadir Shah into Luristan, where another tribe of the same name of Zengheneh, though of Lurish origin, is established.

In a woody part of Luristan Kuchuk, near Khorremabad, De Bode met some miserable Chinganeh tribes settled in villages, and was told they had nothing in common with the other inhabitants of the country of Lur origin. The Chinganeh perhaps may have some affinity with the gipsy race, but he can say nothing positive on this subject, as he saw but little of them. Popowich speaks of the gipsy apple as a small black fruit unfit to be eaten. A fruit was shown to Baron De Bode in the forests of the Zagros mountains, on the road from Kermanshah to Bagdad. The natives call it Angur-i-Kauli, or the grapes of the Kauli. It is a bunch which grows on the mazu or gall-tree, of a yellowish transparent colour; the fruit cannot be eaten, but, on account of its glutinous property, it is sometimes used as glue.

In a recent work on Bokkara, published in the Russian language, Mr. Khanikoff, the author, alludes to three tribes established there, which, he thinks, belong to the gipsy race, as well on account of the similarity in their outward appearance with that people as in respect to their mode of life. They are called Jughi, Mezeng, and Luli, and though outwardly professing mahomedanism, seem to have no religion at all. General Ferrier mentions that the gipsies in Persia are what you see them everywhere else; they lead a wandering life; each band is independent; they preserve their own ideas of caste as a peculiar people, and with them the dirtiest habits, live upon next to nothing, and detest a regular life and a fixed place of abode. There are more than 15,000 families of gipsies dispersed over various provinces of Persia, paying a heavy tax to the government. They are all under the orders and supervision of the Shater-bashee, who exercises the most absolute powers of administration over them. The tax they pay is a kind of kharaj, or price of blood, which is never levied either on Christians or Jews: it is to this fact that they owe the name of Kooli, slave, one of the epithets by which they are designated. They are likewise called Fal-sen, or, as we should render it, fortune-tellers; also by the name of Kal-bir-band, or sieve-makers, because this is their principal occupation; these, their wives, who do not hide their faces, sell from door to door. General Ferrier at Rubat Abdullah Khan came on a camp of Kalbirband gipsies, and the moment they perceived the travellers they called off their dogs, who were replaced by the women and children, vociferous for alms. It was impossible to proceed a step, for they hung on the legs, clothes, and bridles of the travellers and completely hampered them; they were absolutely forced to comply with their clamorous demands. The women had sunburnt complexions, they were tall, with finely developed forms, which they cared aslittle to conceal as they did their faces. The men were seated at a little distance, making sieves, and apparently quite unconcerned about the proceedings of their wives. These gipsies had the same wandering instincts, like all others he met with in Asia. —*Ferrier Journ.* p. 201. *Pottinger's Travels in Beloochistan and Sind*, chapter X, p. 153. *Baron C. A. De Bode's Travels in Luristan and Arabistan*, Vol. II. pp. 98—103.

Kamel paard, Dut. | Cameleopard, Eng.
Giraffe, Eng.

This quadruped, one of the Ruminantiæ, is the largest known animal. It has persistent horns, in both sexes; the horns are covered with a hairy skin with a tuft of hair at the tip. Lip not grooved, entirely covered with hair, much produced before the nostril; tongue very extensive; neck very long; body short; hinder legs short; false hoof none, tail elongate, with a tuft of thick hair at the end.—*Eng. Cyc.* See Mammalia.

GIRANEE. The Valley of Giranee, is situated south of Mungochar and is distant about 8 miles from Kelat. See Baluchistan, p. 312. Kalat, p. 488.

GIRARDINIA LESCHENAULTIANA.

Urtica heterophilla, Roxb. | Decaschistia crotonifolia.

Neilgherry nettle, Eng, | Ana shorigenam, Malleal.

Grows in the Konkans, Coromandel, Nepaul, and is frequent all over the higher

range of the Neilgherries: the bark yields a fine, strong, white flax-like fibre, which the hill people obtain by plunging the plant into hot water; to deprive it of its virulently stinging properties, and then peeling the stalks. The textile material so prepared is of great strength, and the Todawar use it as thread. It is worth £200 a ton in England.—*M. E. J. R.*

GIRASA. Hind. Cerasus communis.

GIRBAR In Oman, the hides of the sheep or goats are made into leather vessels called Girbar. Those of kids or lambs serve for milk, while the larger are used for either wine or water. They are tanned with the bark of the acacia, and the hairy part, which is left without, is generally, though not invariably, cleansed. The apertures through which the legs protruded are closed up, and the fluid within is discharged through the opening of the neck, which is gathered together, and fastened by means of a leathern thong, its extremity being cut in the form of a tongue or spout. They are slung alongside their camels, and a Bedowin when thirsty may frequently be observed drinking from them whilst in that position. They answer better than jars, because if the camel run against trees or its fellow beasts in the caravan, they are not liable to be broken, and from the evaporation constantly going on, the water is also kept perfectly cool, but whilst new, sufficient attention is not paid to cleansing them, and their contents thus acquire a loathsome taste and smell.—*Wellsted's Travels*, Vol. I, p. 89.

GIRCH. Hind. A kind of hill bamboo.

GIR CHHATRA. Hind. Morchella semilibera.

GIRDAWUREE, also written Girdawari. Patroling, inspecting, going the rounds, from the Persian gird, circuit, circumference.—*Elliot.*

GIRDHANA. A sacred hill from which Krishna derives one of his principal epithets, Girdhun or Gordhun-nath, 'God of the Mount of Wealth.' Here he first gave proofs of miraculous power, and a cave in this hill was the first shrine, on his apotheosis, whence his miracles and oracles were made known to the Yadu race. From this cave (gopha) is derived another of his titles —Goph-nath, 'Lord of the cave,' distinct from his epithet Gopi-nath, 'Lord of the Gopi,' or pastoral nymphs. On the annual festival held at Girdhana, the sacred mount is purified with copious oblations of milk, for which all the cows of the district are in requisition. The worship of Krishna in ancient days, like that of Apollo amongst Greeks, was chiefly celebrated in caves, of which there were many scattered over India. The most remarkable were those of Girdhana in Vrij; Gaya in Bahar; Gophnath on the shores of Sourashtra; and Jalindra on the Indus.—*Tod*, I, 545.

GIRDLES are worn by mahomedans and hindus. They are alluded to in the Bible, Psalm cix, 19—'Let it be unto him as a girdle wherewith he is girded continually.' Dan x, 5—'Whose loins were girded with the fine gold of Uphaz.' Many of the hindus both men and women wear a silver or gold chain round their loins, and all mahomedans wear a muslin girdle called a kamr-band or loin-girdle. Psalm xcii, 1—'Strength wherewith he hath girded himself.' When an Asiatic is about to set off on a journey, to lift a burden, or to do something which requires exertion, he binds firmly his loose upper garment round his loins.

GIRDNALLI. Hind. of Dera Ghazi Khan, Cassia fistula.

GIRI, Pabur, and Tonse rivers, are tributaries of the Jumna and up the valley of the Giri to Kotkai, there is a great consumption of wood and charcoal in connection with the iron smelting, for which that locality is famous..—*Clegh. Punj. Rep.*

GIRNA, a tributary to Taptee. It rises on the E. slope of W. Ghauts, lat. 20° 37', long. 73° 25', E. 120 miles; flows N. 50 miles, into the Taptee. Length 160 miles.

GIRK. Hind. Fluggea virosa.

GIRNA. A river in Khandesh, a dam 1,550 feet long has been thrown across it.

GIRLS. Mrs. Sinnett was introduced to the wife of a Baboo, about twenty-five, and somewhat corpulent, also to one of his sisters-in-law only fifteen, and quite slender. The cause of this difference was explained to her. The girls, although married at an early age, are seldom mothers before fourteen or fifteen, and till then they retain the slenderness of their forms. But after the first lying in, they are shut up for seven or eight weeks in their rooms, fed with all the daintiest dishes that can be procured, and not allowed to take the

slightest exercise: the consequence of this feeding up is that they grow very corpulent, but the hindus as well as the mahomedans admire this style of figure. The two ladies had abundant draperies of blue and white muslin embroidered with gold, and trimmed with broad gold lace, which rather veiled than covered their figures—for through the ethereal fineness of its web every outline could be seen; and as it was merely twined about them, every time they moved, an arm or a part of the breast or of the body would become visible. They seemed, however, to be only disturbed when the muslin fell off their heads, which they always hastily replaced. In addition to the muslin, they are covered with gold, pearls, and jewels so richly that they were really almost like animals of burthen; immense pearls and precious stones covered neck and breast, and between them hung heavy gold chains, with gold coins attached to them. Their ears were pierced with so many holes, (twelve were counted upon one), every hole being filled with an ornament, that one could scarcely see a morsel of the ear itself, nothing was visible but gold, pearls, and gems: on each arm were eight or ten costly heavy bracelets amongst which the principal piece was four inches broad of massive gold, and with six rows of brilliants, a heavy gold chain was twined three times round the waist, and ankles and feet were loaded with chains, bands, and rings. *Sinnett, Lady's Voyage*, p. 98.

GIRDELAN. See Chaldea.

GIRNAR. A mountain in Guzerat, at Junaghar, held sacred by the jains. It contains inscriptions, on a rock, by Asoka. It makes mention of the progress of buddhism in the kingdom of Maka (Magas of Cyrene) of Antioko Yona (Antiochus Theos of Syria) of Gongakona, (Antigonus Gonatus of Macedonia) of Turamays (Ptolemy of Egypt) and Alika Sunai) (Alexander the Second of Epirus.) *Cal. Rev.*, 1848. The same inscriptions occur at Dhauli, in Cuttack, on the opposite side of India, with the addition of three local edicts, one of which would seem to have been done by Asoka's father, as it enjoins the young prince at Ougein to issue similar ordinances to his own. The language of the Girnar inscription is Old Pali, or intermediate between Sanscrit and Pali; but supposed to represent the Pali of the West of India of the fourth century B. C. and the inflexions at Dhauli and Girnar are not quite the same; and there is a difference in the grammar of the two series of inscriptions. From Mr. Prinsep having referred a Sanscrit inscription at Girnar, to the third century before Christ, instead of the fourth or seventh A. D. (which he afterwards rectified) he was induced to derive the Pali from the Sanscrit.

The date as by the Buddhist, Chinese, and Burmese chronology; B. C. 330, but Greek notices make it B. C. 280, and the Mahawanso makes the accession of Asoko B. C. 325. The character used in the inscriptions is Old Lat. The religion mentioned is the buddhist, upholds Dhammo, or the law, mentions days and periods for humiliation, prayer, &c., the sending of missionaries; preachings. Expatiates on the sources of true happiness, virtue, benevolence, peace, charity, reverence, &c., rewarded with temporary blessings in this world, and endless moral merit in the next; and the victory of victories is that which overcometh the passions. It speaks of the wicked being punished in the nethermost regions of hell, and the good having final emancipation, and they are to hope ardently for heaven. The promotion of the king's salvation, and the salvation of all unbelievers, and another existence, are expressly spoken of; also the propitiation of heaven, and the king's immortality. Where is atheism here? King Asoka, or Peyadasi is mentioned. The Greek king Antiochus, and one of the Ptolemies of Egypt, and Antigonus. The inscriptions are on a rock at Girnar, a celebrated buddhist locality, and are edicts of Piyadasi, in the tenth and twelfth years of his reign, and are, therefore, older than those of the Delhi Lat, and Allahabad Lat, which are in the twenty-seventh year of his reign. Their chief object is to prohibit the slaughter of animals, both for food and in religious assemblies. The second edict provides medical aid for men and animals. The third orders the quinquennial assemblies (vide Fa-Hian) for prayer and preaching. The sixth appoints custodes morum (vide Arrian and Buddha's Sermon.) In all there are fourteen edicts inculcating buddhism. The remarkable fact of the mention of the name of Antiochus of Syria, in the medial edict, and Antigonus and Ptolemy of Egypt in the thirteenth occurs. In Asoko's zeal for proselytism he sent to those Greek princes. In the first edict Asoko distinctly says, formerly hundreds of thousands of animals were sacrificed for food in the refectory and temple but that not one should be killed for the future. The third edict enjoins kindness to brahmans and sramanas; because for many hundred years past there has been disrespect to brahmans and sramanas, and slaughter of animals. The

Rajah Tarangini mentions king Mahavahana, a buddhist sovereign of Kashmir of the third or fourth century, issuing an edict against the slaughter of animals, similar to these of Asoko, *Journ. Beng. As. Soc.* vol. VII. p. 217 to 262.

At some distance to the north of the Jaina temples of Girnar and above them on the verge of the hill, stands a huge insulated rock, the Bhairavajoop, or Leap of Death, otherwise styled the Raja-mela-vana-pathar—the 'desire realizing rock',—whence hindus have often been tempted to throw themselves in the hope of a happy future. Laying a cocoanut on the dizzy verge of this rock, the victim attempts to poise himself upon it and in another instant he is beyond humanity's reach, and his body a prey to the vultures that soar under the lofty cliff. Such suicide has long been forbidden, but only about A. D. 1850 three Kunbi, keeping secret their intentions, ascended and made the fatal leap; some Rabari had also determined to do the same, but were restrained.

Postans says the Girnar rock bears three inscriptions. The most ancient, which occupies the eastern side, are the edicts of king Asoka. The celebrated edicts are very perfect.—*Postan's Western India*, Vol. II. p 41.—*Col. Rev.* 1848, *J. B. As. Soc.* vol. VII. p. 217-262. See Asoka, Bactra, Inscriptions. Junaghur. Kabul. Lat.

GIWAIN. Hind. Elæagnus conferta.

GJOOT. Diospyrus, sp.

GLACIER. A French word received into the English language, which must not be confounded with Glaciere, which has a different signification. Glaciers, as defined by Saussure, are those masses of eternal ice which are formed and remain in the open air in the valleys and on the slopes of lofty mountains. In every part of the Himalaya, and of Western Tibet, wherever the mountains attain a sufficient elevation to be covered with perpetual snow, glaciers are to be found, and all the phenomena presented in Europe have also been found there. In the lofty chain of the Cis-and Trans-Sutlej, Himalaya, and of the Kuenlun, whose peaks rise to a very great height, and collect in winter enormous depths of snow, they are of great length. In the central parts of Tibet which are often lower, and even in their loftiest parts are less snowy than the bounding chains, the glaciers are of inferior dimensions where the snow-bed is at once cut off abruptly in an ice cliff, which can hardly be said to be in motion or rather whose motion must be almost entirely from above downwards. Moraines, which, on the larger glaciers and among mountains of easily decaying rocks are of astonishing dimensions, form the margins of each glacier, and also occur longitudinally on different parts of their surface

increasing in number as the glacier advances, till at last the different series whose origin can long be traced to the different ramifications of the glacier, become blended into one. En route to Karakoram, after leaving the Nubra valley, when a sufficient elevation above his encampment had been gained, Dr. Thomson obtained a commanding view of the glacier which occupied the continuation of the main valley. It was nearly straight, and he believes, at least five or six miles long; distances, however, are so difficult to estimate on snow, that this must be regarded as a mere guess. The inclination of its surface was considerable; but, while the distance remained doubtful, no just estimate of the height of the ridge from which it descended could be made. On each side, two or three lateral glaciers, descending from the mountains by which it was enclosed, contributed to increase its size all loaded with heaps of stones, which had at the lower end of the central glacier so accumulated as completely to cover its whole surface. One day, there, he proceeded along the edge of the small plain close to which he had been encamped. On the right hand was an ancient moraine, which prevented him from seeing the road in advance. At the upper end of the plain he found a small streamlet running parallel to the moraine; and about a mile from camp reached the end of a small glacier, from which the streamlet had its origin. Crossing the latter, which was still partially frozen, he ascended in a deep hollow between the left side of the glacier and the moraine. The icy mass had not yet begun to thaw, the temperature being still below freezing. After half a mile he ascended on the surface of the ice, and as soon as he did so, was enabled to see that the glacier had its origin in a ravine on the south, and entered the main valley almost opposite to him. The great body of the ice took a westerly direction, forming the glacier along which he had been travelling; but a portion formed a cliff to the eastward, which dipped abruptly into a small, apparently deep lake. At the distance of perhaps five hundred yards there was another glacier, which descended from a valley in the northern range of mountains, and like the one on which he stood, presented a perpendicular wall to the little lake. Right and left of the lake were enormous piles of boulders, occupying the interval between its margin and the mountains, or rather filling up a portion of the space which it would otherwise have occupied. Into this very singular hollow he descended, on a steep icy slope, and passing along the northern margin of the lake, ascended on the glacier beyond, as before, between the ice, and on reaching the surface of the second glacier he found that a similar but smaller depression lay beyond it to the east, in which also there was a small lake, with another mass of ice beyond it. This third glacier also came from the north, and was a much more formidable mass than those which had already been crossed. It was very steep, and was covered with snow, which was beginning to thaw more than was convenient. When at the highest part, he found that though apparently nearly level, it sloped downwards sensibly though very slightly for nearly half a mile, in an easterly direction. It was evident to him that he had now reached the highest part of the ascent, which he assumed to be 17,600 feet, and that the crest of the pass was covered by this glacier.

Glaciers are chiefly met with in the range to the north of Karakorum and another group, apparently the largest accumulation of glaciers in the Kuenlun, was found at the environs of Sassar; but both much smaller than the groups near the Diamer to the North West, investigated by Mr. Adolphe Schlagentweit. (*H. and R. Schlagentweit No.* viii.) Glaciers in the northwest Himalaya descend to 11,000 feet; but Dr. Hooker could not discover any in the more eastern valleys even so low as 14,000 feet, though at the hot season extensive snow-beds remain unmelted at but little above 10,000 feet. The foot of the stupendous glacier filling the broad head of the Thloook is certainly not below 14,000 feet; though being continuous with the perpetual snow (or névé) of the summit of Kinchinjunga, it must have 14,000 feet of ice, in perpendicular height, to urge it forwards. Dr. Hooker made frequent excursions to the great glacier of Kinchinjhow. Its valley is about four miles long, broad and flat: Chango-khang rears its blue and white cliffs 4,500 feet above its west flank, and throws down avalanches of stones and snow into the valley. Hot springs burst from the ground near some granite rocks on its floor, about 16,000 feet above the sea, and only a mile below the glacier, and the water collects in pools: its temperature is 110°, and in places 116°, or 4° hotter than that of the Yeumtong hot-springs, though 4,000 feet higher, and of precisely the same character. A Barbarea and some other plants make the neighbourhood of the hot-springs a little oasis, and the large marmot is common, uttering its sharp, chirping squeak.—*Dr. Thomson's Travels in Western Himalaya and Tibet.—Hooker Him. Jour. Vol.* II. *pages* 57. 133.

There is a glacier in the valley of Brabaldo, in Little Tibet, a short distance from the village of Arindo. Its width is about 450 yards and nearly a hundred feet high, and a large river flows with velocity from below it. In 1839, Major A. Cunningham traversed a magnificent glacier which spanned the valley of the Cheli river, below the Kali Debi pass (16,700 feet). It was fissured in all directions, and looking down the main fissure which was five feet wide, he saw the stream trickling at a depth of more than 300 feet. The surface was covered with hardened snow and imbedded stones; but, the mass, as seen in the fissures, was clear, transparent, ice filled with white specks. This glacier was about a mile long, and a quarter of a mile broad with an average depth of 200 or 300 feet. In the same range, Dr. Thomson saw a similar glacier, to the north of the Saj pass, about 30 miles, to the north-west of Kali Debi. In 1847, Major Cunningham, crossed a second and larger glacier, to the north of the Parang pass at 18,500 feet. It extended down the head of the Para river for $2\frac{3}{4}$ miles. At its termination, it was 50 feet high, but, a quarter of a mile upward, it was fully 150 feet thick. Dr. Thomson observed a larger glacier on the northern side of the Umasi La, on crossing into Zangskar. It extended from the top of the pass, 18,123 feet, down to a level of 14,500 feet, and was not less than three or four miles in length—Above and below Sassar are several gigantic glaciers that span the noble valley of the Khundan river, which at times has become dammed until the accumulated waters have burst their icy chains, and swept away all traces of man and his puny works, from a height of several hundred feet above the river. In two different parts, then, of the Shayok, above and below Sassar, seen by Dr. Thomson in 1848, the bed of the stream is completely spanned by enormous glaciers. The great glacier is about 30 miles below Sassar, and 20 miles above the junction of the Changchen-mo. Mr. Vigne, Dr. Thomson, Lieut. Colonel Abbot, and Lieut. Colonel Alexander Cunningham have each noticed the great glaciers in the western Himalayas, in Ladak. The last named author (*Ladak, p.* 94) describing the Shayok or Khundan river, a tributary of the Indus, which rises in the Karakorum mountains, to the northward of Le, in lat. 35° N. and long. 78° E., tells us that in these cold and lofty regions, almost every ravine is filled with a glacier, that since 1826, the channel of this river has never been clear and the accumulated waters have formed a lake of considerable size called Nubra-tsho. This barrier has burst on three recent occasions, in 1826, 1833, and 1841. In that of 1841, when the rushing waters reached Torbela, on the Indus, the river came down furiously in an absolute wall of mud, a horrible mess of foul water, carcases of soldiers, peasants, war-steeds, camels, prostitutes, tents, mules, asses, trees, and household furniture, in one flood of ruin, for Raja Gulab Singh's army was encamped in the bed of the Indus at Kulaithree Coss above Torbela, in check of Painda Khan, and, but that part of the troops were then in hot pursuit, the destruction would have been greater. Only those escaped who took at once to the mountain side. Throughout the mountain course of the Indus, fields, houses, and trees were swept away, but man and the animals which he had domesticated, generally managed to escape. The waters of the Indus below the junctions of the Shayock, rose to a height of 60 feet, and to 30 feet at Skardo. It was the third cataclysm which occurred in 1841, when the gallant Syam Singh Atariwala, who fell at Sobraon was encamped in the bed of the river. Suddenly, down rushed the wave of the inundation thirty feet in height and the whole camp took to flight, most of the men were saved; but the baggage, camp equipage, and guns were swept away. (*Cunningham, Thomson.*)

Chorkonda, a glacier in Balti, in Tibet, is in L. 35° 36' N. and L. 75° 58' E., and 16,900 feet above the sea.

Ibi-Gamin, a glacier in Eastern Thibet, in height 22,260 feet English=20,886 French feet.

Captain Godwin-Austen, 24th Regiment, writing in 1863 on the glacier phenomena of the valley of the upper Indus notices the glaciers in that part of the great Himalayan chain which separates Thibet from Yarkund, in E. long 76°, and N. lat. 35-36°, and extending over an area about 100 miles from east to west, from Karakorum Peak, No. 2 (28,265 ft.) to the Mountain of Haramosh. Glaciers supply the Hushe River, which joins the Indus opposite Kapeloo. Those of the upper portion of the valley take their rise on the southern side of the Peak of Masherbrum, and are about 10 miles inlength.

The Great Baltoro glacier takes its rise on the west of Gusherbrum Peak, on the North it is joined by a great ice-feeder which comes down from Peak No. 2; opposite to it, from the south, is another; both of these extend 9 or 10 miles on either side of the main glacier. This from its rise to its further end, measures 30 miles, its course is from E. to W.; the breadth of the valley

along which it flows is 12 miles. It receives numerous tributaries along its course, some of which are 10 miles and more in length; two of them, on the N; lead up to the Mustakh Pass into Yarkund (18,000, ft.) whence a glacier descends to the N. E. about 20 miles in length. The Nobundi Sobundi glacier takes its rise from a broad ice-field which lies to the N. of lat- 36°, and has a S. E. course for 14 miles, with numerous laterals, it then turns S.; when it bears the name of the Punmah glacier, about 5 miles from the termination it is joined by a glacier from the N. W., 15 miles in length.

The Biafo glacier is perhaps the most remarkable of any of this part of the Himalayan range, it has a linear course of upwards of 40 miles; the opposite sides of the valley are very parallel along its whole length, and the breadth of ice seldom exceeds a mile, except where the great feeders join it from the N. E.

From the summit-level of the Biafo Gause, a glacier is continued westward to Hisper in Nagayr, 28 to 30 miles in length.

The Chogo, which terminates at Arundoo takes its rise between the Mountain of Haramosh and the Nushik Pass, it is about 24 miles in length, with numerous branches from Haramosh, 8 miles in length.

The waters from all the glaciers, from that of Baltoro in the E. to Chogo in the W., are collected into the Shigar River, which joins the Indus at Skardo.

All these glaciers carry great quantities of rock-detritus. The blocks on the Punmah glacier are of great size.

There are groovings and old moraines of a former extension of the glaciers in this region, showing that they have at times reached many miles beyond their present termination, and have risen upwards of 400 ft. above their present levels. There are thick alluvial accumulations of the valley of the Indus, particularly in the neighbourhood of Skardo.

Colonel Markham says, " we started early to reach the source of the mighty Ganges. The opposite bank being the best ground for burrell, we were in great hopes that we might find sufficient snow left to enable us to cross the river, but the snow that at times bridges over the stream was gone. At last, the great glacier of the Ganges was reached, and I beheld it before me in all its savage grandeur, thickly studded with enormous loose rocks and earth. Extensive as my travels since this day have been through these beautiful mountains, and amidst all the splendid scenery I have looked on, I can, he says, recall none so strikingly magnificent as the glacier of the Ganges "

The Glaciers and Peaks of the Sasser pass in Nubra, Tibet, are shown by the brothers Schlagentweit, to be in L. 35-6, N; L. 77° 27' 35" E. and 17,753 feet above the sea. *Gosse's Natural History*, pp. 54-55. *Markham's Shooting in the Himalayas, Hooker's Him Journ Thomson, Cunningham, Captain Godwin Austen in Report on Advancement of Science for the year* 1863.

GLAM.—? A tree of Singapore, furnishes this paper-like bark, used in caulking the seams of vessels. A similar substance occurs in Borneo, supposed to be the produce of a species of Artocarpus, and to furnish this paper like bark much used in caulking the seams of vessels.—*Royle Fib. Pl.* p. 341.

GLANDS. Fr. Acorns, the seed or fruit of the oak.

GLANDES. Lat. Acorns.

GLAPHYRIA, a genus of Indian plants belonging to the natural order Myrtaceæ. The species are small trees. G. nitida is called by the Malays 'the Tree of Long Life,' probably from its maintaining itself at elevations where the other denizens of the forest have ceased to exist. It affords, at Bencoolen, a substitute for tea, and is known by the name of the Tea Plant. Various species of Leptospermum and Melalena bear the same name in the Australian colonies. G. sericea has lanceolate acuminated leaves. It is a native of Penang and the west coast of Sumatra. *Eng. Cyc.*

GLAREOLIDÆ, a family of birds, including the genus Glareola, with its two species G. arientalis and G. atea.

GLASS.

Vitrum,	Lat.		

Glass is formed by mixing together siliceous earth with an alkali, and fusing them by a strong heat. Several kinds of glass are made and are distinguished, the differences in them being produced by the proportion of the constituents, the nature of the alkali, the presence of foreign matter, or the process of manufacture. The discovery of the manufacture of glass is ascribed to the Phœnicians and glass flowers are represented on the tombs at Beni-Hassan. But glass is one of those discoveries which could hardly escape being made by any people who employed furnaces to reduce metallic oxides; for the necessary ingredients must often

have been present; and the heat was sufficient, Beckmann has observed, that the discovery of coloured glass must have followed very soon that of making glass itself. It is probable, however, that coloured glass was made previous to colourless glass. For it is difficult to find materials pure enough to make good glass, and it would be some time before the original makers would find out the causes of discoloration. The natives of India seem to have been long acquainted with making different ornaments of glass: for instance, armlets and anklets, and rings of glass form a part of their warping reels Small glass bottles are also made; but mostly of a more or less greenish colour. The green is called kanch, and the purer glass, sisi. It is probable that the extensive diffusion of oxide of iron in the Indian soil, which may have led to the discovery of iron, has prevented the making both of good glass and of good pottery. That this is not incompatible with a knowledge of the method of making imitation gems, seems proved by the same having been the case in the time of Pliny; who states that great value was set upon glass quite free from colour, which was called crystal. He also mentions artificial hyacinths, sapphires, and all kinds of black glass; and we know that the glass-houses of Alexandria were celebrated among the ancients. One of the simplest processes for making glass is that practised in the district of Behar. The efflorescence of the soil, which is an impure carbonate of soda, is collected and thrown into a cistern lined with clay. This is then filled with water, which is afterwards allowed to evaporate. When dry the bottom of the cistern is found covered with a thick saline crust, the earth which was intermixed having subsided before the salt began to crystalize. This soda makes glass without any addition, as it still contains a sufficient portion of siliceous matter. They make blackish and greenish glass: a bright grass-green is obtained by the addition of oxide of copper; and a blue glass by the addition of rung. In Mysore the process is more elaborate. Powdered white quartz, one part, being mixed with prepared soda, six parts, is filled into a crucible capable of containing $5\frac{1}{2}$ Winchester gallons. About fifty of these crucibles are placed in a furnace, and the fire kept up for five days, when a frit is produced, with which they make a black, green, red, blue, and yellow glass, by means of additions of oxide of copper, of an ore called kemudu, and of a blue substance called runga. What these are, continues unascertained.

Though the making of glass has made but little advance in India, the natives work up broken English glass even into barometer and thermometer tubes, &c. Glass globes, silvered in the inside, are made and though the mode of effecting this silvering is not mentioned, an amalgam of quicksilver is probably employed, as, on the application of moderate heat, the silvering becomes dissipated. An art similar to this has of late years been discovered in Britain.—*Royle Arts, &c., of India*, p. 474. Ainslie tells us that glass of an inferior quality was made in several parts of the Peninsula of India, particularly in the Mysore country, at Chinapatam and Muteodu, also at Vallatooroo in Tondiman's dominions, which are contiguous to the Tanjore territory. The manufacture however seems to be confined entirely to small phials and women's bracelets. Above the Ghauts, Dr. Buchanan tells us the frit employed for making glass is composed of one part of fat quartz, and six parts of a kind of ill prepared soda (suja cara) To give glass a green tinge, to the frit just mentioned are added a further quantity of prepared soda, an iron ore called Carin kulloo, another ore called Kemudu, and a proportion of calcined copper; all which materials being fixed and put into the crucible, and properly disposed in the furnace, the fire is kept up for nine days and nine nights. To give glass a red tinge, to the frit already mentioned are added an additional proportion of prepared soda and a quantity of the ore called kemudu, after which the whole are fused together for fifteen days and fifteen nights. To make blue glass, to the same frit are added a further proportion of soda, calcined copper, a quantity of powdered Carin kulloo and a blue substance called runga, which Dr. Buchanan supposes (but is not sure) may be smalis. To give glass a yellow colour, Dr. Buchanan tells us that it is enamelled with the melted calces of the metals—lead, tin and zinc.

Buchanan in his travels in Mysore gives an account of the manufacture of glass for the bangles or armlets worn by the natives. The glass is very coarse and opaque and much more of it is made than is there wrought into ornaments. Great quantities of it were brought by the bangle makers from the Westward. It was of five colours, black. green, red, blue, and yellow, the first was most in demand. All the materials for making the glass are found in the neighbourhood. In the hot season, the Soulie munnoo or soda in the form of a white earthy powder is found in several places near this on the surface of sandy fields. For the exclusive privilege of collecting it the glass

makers paid 48 Co.'s Pagodas; they make it into cakes, the intention of making it into these cakes is prebably to free it from earthy matter; but, for making glass, this is perhaps no advantage, as the earth with which it is mixed is chiefly a quartzose sand, these cakes contain at least one half of their bulk of cowdung and from that cause are inflammable, they are prepared for making glass by being burned and of course afford an exceedingly impure alkali. The glass maker's furnace there, is rather better than that of Chinnapatan, but still it is exceedingly rude. The manufacturers say that when the army of Lord Cornwallis left Seringapatam they gathered with much pains a great number of broken bottles which they found where he had encamped, but after the expense of bringing the bottles to Mutsoda they found that their furnace was not sufficiently strong to liquify European glass. The bottles were then reduced to powder and mixed with alkali, but these materials produced only a useless white glass. The furnaces are constructed on a high terrace which is built against the inside of the town wall and are in form of a dome or like an oven eight feet in diameter and about ten feet high. The oven is not arched but contracted above into a circular opening about 18 inches in diameter, by making the upper row of stones project beyond those below them. At the bottom of the furnace in the side opposite to the town wall is a small opening through which fuel is supplied, the crucibles are oblong and would contain about $5\frac{1}{2}$ Winchester gallons: having been filled with the materials they are lowered down into the furnace by the aperture in the top by which also the workmen descend. They first place a row of the crucibles all round the furnace with their bottoms to the wall and their mouths sloping inwards, in this position they are secured by a bed of clay which covers the crucibles entirely, having only their open mouths exposed; above this row another is placed in a very similar manner and then a third and a fourth. The furnaces vary in size from such as can contain twice that number. The fuel consists of small sticks which, having been gathered a year, are quite dry, a quantity having been put in the bottom of the furnace the workmen ascend and some burning coals are thrown upon the fuel by the opening below; then fresh fuel is added night and day until the time allowed for vitrifying the materials has expired, the fire is then allowed to burn out and the furnace to cool, afterwards the workmen descend and take out the crucibles, which must be broken to get at their contents.

In Tondiman's country, where glass rings appear to be made of a superior quality to those of Mysore, the frit is prepared by adding to fine river sand (Kolindoo manil) (Tam.), a very strong solution of an alkaline earth called Over munnoo, which contains much soda. This mixture is formed into lumps which are dried and then fused for many hours together to form the frit. In order to make glass, a certain quantity of Poongkarum (an impure carbonate of soda) is added to the powdered frit, and the whole fused together for many hours. To give glass a blue tinge, the glass makers add the runga in the manner mentioned. In speaking of the blue glass made in Mysore, they also sometimes, though rarely, add a calx of copper for the same purpose. To give glass a black tinge, the glass makers add Warroogoo husks, and the iron ore called Carine kulloo which is also called Carpoo kulloo. Glass bottles were formerly manufactured at Madras. under the scientific direction of Mr. Ryder, the Assay Master—(*Ain's Mat. Med.* p. 17?.) India seems to possess no slight advantages for the manufacture of the best qualities of glass. As is well known the basis of all glass is silica and alkali, of which the former in the shape of common sand is to be met with almost everywhere, the latter is to be had cheaply and in abundance in most parts of Southern India. In the neighbourhood of Madras as well as in many other localities, the secondary materials also, indirectly essential to the manufacture of the best quality of glass, namely the fire clays used in the construction of the furnaces, are abundant and of very superior descriptions. Yet with all these advantages the natives do not appear to have advanced in the manufacture beyond the first and very rudest stages, and although it is one which, if successfully prosecuted, would probably meet with very extended encouragement, the manufacture of the commonest bottles is not yet practised. The chief defects of the native manufacture are the use of too large a quantity of alkali. In fact, in some cases, it is so much in excess that it might be tasted by applying the tongue to the article. The fault now remarked upon is probably connected with, and caused by another, that of the material being melted at too low a temperature and in too small bulk, and these again probably arise from the use of an improper furnace and an unsuitable kind of fuel. The native furnace is usually a rude hole dug in the ground coated with ferruginous clay, which tends to discolour the glass, and the heat is raised by the use of bellows blast. Hence the temperature is confined

to one point of the mass and is insufficiently diffused, while the body of metal under fusion being small, and the dome and sides above ground being thin, the heat is dissipated from them, and never attains body and elevation sufficient to admit of the mass setting and purifying itself, or of its being freed from air bubbles by the addition of the proper proportion of silica. What is required, is the preparation of the glass in larger quantities at a time, and with this view larger and more carefully constructed furnaces, on the reverberating principle, to be heated by coal; after this, that the process should be attended to more scrupulously, and the materials mixed by weight, instead of being thrown together by measure, as is too commonly the case at present. Country glass is usually made of Dhoby's earth, a crude carbonate of soda with a mixture of a little potash and lime 60 to 70 parts, and yellowish white sand 30 to 40 parts, composed of small fragments of quartz, felspar, iron and a trace of lime. In one hundred parts, for good bottle glass of Europe, are needed

	per cent.		per cent.
Sand, ...	58	Lime, ...	11½
Sulphate of Soda	29	Charcoal, ...	1½

Sulphate of soda only contains 45 per cent. of alkali, so that 29 parts contain 13, while the carbonate of soda obtained from dhoby's earth, contains between 30 and 40 per cent of alkali, according to which the alkali used by the Natives would be to that employed in Europe in the proportion of 23 to 13.

The substances generally used by the Natives in colouring glass are as follows :—
Iron, which gives green, brown and black shades
Manganese.....pink, purple, and black.
Copper.....blue, green, and deep red.
Arsenic,.....white.
Chromate of Iron..... ..a dull green.
All these materials are used in a very crude state, and the proportions measured in a most imperfect manner.—*Madras Exhibition Jury's Report.*

The Chinese manufactures of porcelain, glass and glazes, their carving and engraving of gems, Chinese agates, rock crystals and ivory, excite the admiration of Europe, as also does their lacquer and varnish work.

The colour of the emerald is peculiar, and called emerald green. The glass of bottle bottoms is largely sold in Ceylon and other places as emeralds. Emeralds are rarely without flaws, "Rag," Hind, and, with the hope of deceiving, the manufacturers, aware of this, make false emeralds with flaws. Of all precious stones, the emerald is most liable to defects, called flaws, and their absence should excite suspicion as it can be very easily imitated.

Dr. Hooker in his travels mentions that he dismounted where some very micaceous stratified rock cropped out, powdered with a saline efflorescence. This was an impure carbonate of soda. This earth is thrown into clay vessels with water which, after dissolving the soda, is allowed to evaporate, when the remainder is collected and found to contain so much silica, as to be capable of being fused into glass. Dr. Royle mentions this curious fact (Essay on the Arts and Manufactures of India, read before the Society of Arts, 18 February 1852), in illustration of the probably early epoch at which the natives of British India were acquainted with the art of making glass. More complicated processes are employed, and have been from a very early period in other parts of the continent.

The art of glass making is yet in its extreme infancy in the Punjab. The glass sand occurs in the form of a whitish sand mixed with an alkali, which effloresces naturally. It is called reh : that only of a good white color makes glass. This substance is identical with the alkaline efflorescence which appears in many parts, and whose presence is destructive to cultivation. Wherever such an efflorescence occurs over clean sandy soil, there is naturally formed a mixture of sand and alkali which fuses into coarse lumps of bottle green glass.—*Powell's Punjab Products. Hooker Him. Journ.* Vol. I, p. 13. *Emmanuel on Precious Stones; Buchanan's Mysore*, p. 371, Vol. III. *Madras Exhib. Jur. Report. Ainslies' Materia Medica, McCulloch Dictionary of Commerce*, p. 602. *Royle on the Arts and Manufactures of India.* 1852, p. 474.

GLOCHIDION. *Thwaites.* A genus of small trees, in Ceylon, of which Thwaites mentions G. coriceum; G. Gardneri; G. jussieuianum; G. montanum; F. nemorale; and G. Zeylanicum.

GMELINA. A genus of plants named after Gmelin, author of 'Flora Sibirica.' All the species of Gmelina form shrubs or trees, of which the latter are valued for their timber. They are found in the islands of the Indian Ocean, extending thence into the Malayan and Indian peninsulas. G. Asia-

tica and G. parvifolia are common in various parts of India, and G. arborea extends from Ceylon,—from Prome and Martaban north to the Deyra Valley, in 30° N. lat.

GMELINA, Species. Gombharee, Uria. A tree of Ganjam and Gumsur, extreme height 50 feet: circumference 4½ feet: height from the ground to the intersection of the first branch, 18 feet. A white, light wood. Boxes, chairs, bed-posts, lamp stands, bullock yokes, bazaar measures, toys and other articles are made of it. It is said to be rather scarce and expensive. The bark is said to be used medicinally.—*Captain Macdonald.*

This large tree grows in Ceylon, where it is common up to an elevation of 5,000 feet. It grows in Coimbatore, is rather frequent on the Malabar Coast, grows in the Godavery forests: is not very common on the Bombay side, where it is found more in the forests below the ghats than inland. It grows in Burmah and is plentiful in the Pegu and Tounghoo forests. In British Burmah it is a large tree with white, light wood, used for house posts, planks and for carving images, and recommended for planking and furniture. A cubic foot weighs 35 lbs. In a full grown tree, there, on good soil, the average length of the trunk to the first branch is 50 feet, and average girth measured at 6 feet from the ground is 12 feet. Dr. McClelland calls "Kyoonboe," BURM, a yellow wood, says it is plentiful in the Pegu and Tounghoo forests, is a large and remarkably strong tough timber, and fit for fancy wood. In Moulmein, it is used in ordinary building material. Fruit used as medicine. On the Bombay side, the wood is in much esteem for carriage panels, and other purposes. According to Dr. Roxburgh, it also stands exposure to weather and water well. From its great size, straightness, and general spaciousness in appearance, being a beautiful flowering tree, this is one of the most desirable for propagation throughout the country. Dr. Cleghorn in the Jury reports says it is a large timber tree, growing in mountainous districts: that the wood is light, of a pale yellow colour, easily worked, and does not shrink or warp; used for picture frames, decking small boats, for making venetian blinds, sounding boards, palankeen panels, gram measures, &c. It is very commonly used in the Vizagapatam district for the foundation of wells and other purposes, which require to be submerged in water, where it is remarkably durable. On the Godavery the large trees of this yield a very hard durable wood and the yokes for bullocks are made from it. In Nagpore, the "Seevum" is of a very light colour, has a sort of netted grain, is free from faults, and altogether may be considered a very excellent timber, although unfortunately not procurable in large quantities Its length, there, is from 13 to 18 feet and from 4½ to 3½ feet in girth. The Commissariat there, supply it to the Ordnance Department for making packing cases, &c., and the natives employ it in the construction of palanquins. It takes varnish well, and works up nicely into furniture, but is attacked readily by white ants. From the small scantling of which it is there obtained, it must be classed merely as a rafter wood.—*Drs. Wight, Gibson, Brandis, Cleghorn, and Stewart, Captains Sankey and Beddome, Cal. Cat. Ex. of* 1862, *Thwaites.*

G. arborea, W. Ic not *G. arborea,* Roxb., var. ?—c, p. 128.

"Atdemmata.' SINGH.

Common in Ceylon up to an elevation of 5,000 feet. A tree 45 to 50 ft. high, spreading. The bark and roots are used medicinally by the Singhalese. *Thw. En. pl. Zeyl,* p. 244.

GNANA. Sans. from gna to know.

GNANA-RUTNAVALI. Sans. From gnana, wisdom, rutna, a precious stone, and avalee, a train.

GNANI. Sans. From gna, wisdom

GNA-PI. Burm. The Gna-pi of Burmah is the Balachang of the Eastern Seas, consisting of small fish with prawns and shrimps, first fermented and then dried. It gives rise to a considerable traffic, as no food is deemed palatable without it, and its use extends to every country from China to Bengal. That prepared at Mergui is excellent, only inferior to anchovy paste, by being over powerful.

GNAPHALIUM EXIMIUM. These flowers possess the quality of retaining their colour long after being gathered, the stalk is covered with a whitish down, they are very hardy both the annual and biennial, the colours are yellow, purple, crimson, yellow and white and grow in North America, Africa and Egypt, from two to three feet in height.—*Riddell.* Wight gives G. hypoleucum, marcescens, Neilgherryanum.

GNARI or Nari, a Chinese Tibetan province connected with British India, by the five Bhot passes in Garhwal and Kamaon. The Chinese viceroys are Tibetans with 200 Mongol or Turk troops or perhaps Mantshu Tartars, as they are said to use horseflesh, which no Tibetan and no Chinese would do.

GNAT, Culex, Lat.

GNA YAN PATOO. Burm. Clerodendron nutans. *Wall.*

GNA YOKE, Burm. Capsicum minimum.

GNEMIUM GNETUM. *Linn.*

Wagu, Jav. | Bagu, Malay.

This tree abounds on the southern coast of the island of Sumatra where its bark is beaten, like hemp, and the twine manufactured from it is employed in the construction of large fishing nets. The coarse cordage from the bark is in extensive use throughout the Archipelago. The seeds are eaten in Amboyna, and are roasted, boiled, or fried. The green leaves are dressed as curries, cooked and eaten like spinach.—*Crawfurd's Dictionary*, p. 26, *Marsden's Hist. of Sumatra*, p. 91.

GNEVA. See Lightning conductors

GNIU. Hind. Chenopodium, sp.

GNETUM. See Himalaya.

GNIANA. See Gnyana, Vaishnava, Vidya.

GNIDIA ERIOCEPHALA, called also Daphne eriocephala, is very common on the ghauts of the West of India, and in the hilly parts of the Southern Mahratta country and of the Dekhan. It probably might be turned to the same use as the Nepal plant. See Daphne cannabina. Thymelæa.

GNOMON, Ch'haya, Hind. Ch'haya is spelt in a variety of ways in European books which treat of hindu astronomy; and though there are a variety of elements these are multiplied by mistakes in consequence of Europeans varying their manner of writing oriental words. The word Ch'haya means a shadow: in hindu astronomy, Vishuva ch'haya, the shadow of a Gnomon, when the sun is in the equinoctial points. Madhyama ch'haya, the midday shadow of the same at any other time of the year. Sama-mandala ch'haya, the midday shadow of the same when the sun is east or west of the Gnomon; Ch'haya suta is one of the names of Saturn, meaning Born from Darkness.

GNOO-SHWOAY-NGU-BIN. Burm. Cathartocarpus fistula. Pers.

GNU THEING. Burm. Cathartocarpus nodosus.—*Voigt.*

GNOSTIC. See Adam.

GNU GYEE, Burm. Cathartocarpus fistula.

GNU-THEI-NI. Burm. Cathartocarpus nodosus.

GNYANA. Sansk, Karma is the name of one of the Kanda or general heading of the Vedas. This chapter relates to "Works," the other two, "Gnyana" and Upashana. relate to "Faith" and Worship. See Gnana Vidya, Vaishnava.

GN YOKE MO H'MYAU. Burm. Capsicum minimum.

GO. Hind. A Cow: hence,

Gaola, Gopa. Gopala, Gorakh, Gopini, Gopi, cowherd, shepherd, shepherdess.

Gobar, Cowdung.

Gopi Chanduna, Cowherd's sandal.

Gopi Matti, Cowherd's earth.

Gao-Mukhi, cow's mouth, the ravine in the Himalayas where the Ganges issues.

Gopura, also Gopurum, a gate, a gateway of a town, the ornamental gateway of a hindu temple.

Galatians, from gala, milk, Goala, Herdsman in Sanscrit. Γαλατικοι, Galatians, or Gauls, and κελτι Celts allowed to be the same, would be the shepherd races, the pastoral invaders of Europe.

GOA, on an island, about 23 miles in circumference was captured by Albuquerque on the 25th Novr. 1510. This admiral succeeded Almeyda, in the command of the Portuguese in India. He was bold and enterprising. He captured Goa, and the Port of Malacca, also the island of Ormuz, in the Persian Gulf, all of which he strongly fortified, and Ormuz speedily filled with 40,000 inhabitants. His command lasted from 1507 to 1516 and he was superseded and died.

Goa, has 1,066 square miles and 363,788 population, nearly all of the Romish religion.

GOA or Gwa Island, a small island on the Ava coast, in Lat. 17° 33' N. and Long. 94° 34' E. Goa town is built on the south bank of the river, 7 miles from its entrance. Alguada point, in Lat. 15° 29' N. and Long. 73° 50' E. Horsburgh, forms the northern extremity of Goa bay.

Goa, in Lat. 33° 12' N. and Long. 71° 48' E. in the Punjab, near the left shore of the Indus. The Tower station is 1,797 feet above the sea.—*Walker.*

GOABARI-KAIA. Tel. Copra. Cocoanut.

GOA CEDAR. Cupressus pendula.

GOALA, or GWALA. Beng. A cowherd, one whose business or caste it is to attend cattle and sell milk. The caste of cowherds in Orissa furnishes also palanquin bearers, and domestic servants to Europeans and natives in Bengal.

GOALPARA. A district and town of the Bengal presidency, the town 425 miles distant from Calcutta west of Assam. It is under a permanent settlement, but the other five districts Kamroop, Durrung, Nowgong, Seebsagur and Luchimpore are under Ryotwary tenure.

GOA POTATO. Eng. Dioscorea aculeata. *Linn.*

GOAT.

Hedjaz,	Arab.	Izza,	Chald.
Iiada,	„	Aza	Phœnic.
Bakra, He-Goat.	Hind.	Bebek,	Malay.
Kapros,	Greek.	Kambing,	„
Caper,	Lat.		

The goat belongs to the order Ungulata; Tribe Ruminantia, Sub-Family Caprinæ, goats and sheep. Their position may be under:

Sub-Fam. Caprinæ, Goats, sheep.
1st Capricorns, or Antelope goats, or mountain Antelopes.
Gen. Nemorhœdus, 3 sp.
2. True Goats.
Gen. Hemitragus, 2 sp.
„ Capra, 3 sp.
„ Ovis, 8 sp.
Sub-Fam. Bovinæ.
Gen. Gavæus, 2 sp.
„ Bubalus, 1 sp.

The Lena shawl wool is the produce of the goats of the Tibetan Himalaya. It used to be a prevalent opinion that these goats were found in Kashmir; but that celebrated valley is far too warm and damp for them. The best shawl wool is produced in the vicinity of Garoo, Mansurowur, and the elevated lands to the eastward. The shawl wool is the fleece of the goat, next the skin only; the outer coat is coarse hair, and the two colours are white and light brown. The dogs of Tartary have also a soft down below the hair, very little inferior to that of the goats. *Capt. Gerard's Account of Koonawur*, p. 115.

GOAT'S HAIR is very commonly produced in almost every district of the Punjab, and called "jat." It is used for making ropes, also for matting, and for the strong bags wherein grain, &c., is carried on the backs of oxen. Grain dealers use rugs made of it in the shops in which the grain is poured out when being winnowed, or weighed out.

GOATS FOOT IPOMÆA CREEPER. Ipomæa pes capræ.—*Sweet.*

GOAT ISLAND, a name of Cabras island.

GOAT PEPPER. Capsicum frutescens.

GOATS, See Goat, Ladak. Wool.

GOAT-SKINS. See Leather.

GOAY-PIN-GYEE, Burm. A tree of Moulmein. Used in common purposes of building: its seed is used for weights in weighing gold.—*Cal. Cat. Ex.* 1862.

GOAY THA, Burm. A tree of Moulmein. Used in common purposes of building.—*Cal. Cat. Ex.* 1862.

GOBA GOBA. The stem of the leaf of the sago palm, much used throughout the Moluccas for building and fencing. Atap is thatch made of the fringe or petioles of palm leaves, doubled down and sewed on sticks or lathes of bambu.—*Journal of the Ind. Arch. June* 1852 p. 306.

GOBAR. Hind. Cowdung.

GOBRAUTA, Hind. a cowdung beetle.

GOBB, in Ceylon, a kind of marine lagoon or back water, caused by the rivers' mouths being blocked up and their waters, seeking an exit, traversing the sands adjoining the sea.

GOBBI. Tel. Asteracantha longifolia. —*Nees.*

GOBI. Hind. Brassica oleracea.

GOBI, a great sandy desert in Central Asia. It is in a rainless tract, which lies between L. 30° and 50° N, and L. 75 and 118° E. and includes Thibet, Gobi or Shama and Mongolia. Showers of sand fall in China which the people believe come from the desert of Gobi. In one which occurred on the 26th March 1850, and lasted several days, ten grains to the square foot collected in one day or about 18 tons per square mile. See Kalkas. Rain Sand.

GOBIIDÆ, a family of fishes of the Subclass Teleostei, Order I. Acanthopterygii. The Gobiidæ are arranged into four groups. Gobiina, Amblyopena, Trypauchenina, and Callionymina, in which are 24 genera. The Gobiidæ, include the Blennies, the Gobies or Sea Gudgeons, and the Dragonet.

GOBIUS, a genus of Acanthopterygious osseus fishes belonging to the family Gobiidæ. All the species have two dorsal fins, scaly bodies, and a disc beneath the throat formed by the united ventral fins. By means of this disc they have the power of attaching themselves to rocks. There are 152 species of Gobius known, many of which occur in India, *Gunther. Eng. Cyc.*

GOBREA. Hind. ? Abies webbiana. *Hook.*

GOBRI. Hind. A tribe in Rohilkund living just under the hills. *Wilson.*

GOBURA. Beng. Hind. Anisomeles obovata.

GOBURA-NUTI. Beng. Amarantus lividus.

GOBUR-CHAMPA. Duk. Plumieria acuminata.

GOCALAST'HA, a sect of Vaishnava hindus who worship Krishna alone. See Avataram, Hindoo; Sects, Rama.

GOHICHAMUL. Hind. Balanophora.

GOD, the Semitic name of the Deity was pronounced as I A O indicative of a god of the sun and of fire Clement of Alexandria calls it IAU the Samaritans pronounced IABE, i. e., IAHVEH. Lydus mentions IAO as a god of the Chaldeans. God is from Goadem corrupted into Goden and Woden. The mahomedans use the word Allah to indicate the Supreme Being. *Bunsen.*

GODAMA, like God, a name of Sakya-Muni, which seems, to have been a name applied to Sakya after his death. See Buddha.

GODANTI, Hind. Sulphate of lime.

GODARA. H. A large sub-division of the Jat tribe, on the borders of Hariana.—*Wilson.*

GODAMAPANDI. Tel. Flour.

GODARI. Tel. Grislea tomentosa. The red flowers and leaves are used for dying purposes. In the Northern Circars, the leaves are employed in dyeing leather; sheep-skins, steeped in an infusion of the dried leaves become a fine red, of which native slippers are made. The dried flowers are employed in Northern India, under the name of Dhauri, in dyeing with Morinda bark; but perhaps more for their astringent than for their tintorial properties. Dr. Gibson states that in Kandesh the flowers form a considerable article of commerce inland as a dye. It grows abundantly in the hilly tracts of the Northern Circars.

GODAVERY. This river rises in the Ahmednugur district within fifty miles of the Arabian Sea in the basaltic region described by Colonel Sykes (Geol. Trans., Vol. IV., part 2, 1836). And, greatly increased in size, it enters the granitic table-land of the Deccan, and flows at the southern foot of the Sichel mountains into a sandstone and argillaceous limestone country. This district is similar to that of Bundlecund and Malwa; it also contains diamonds, and has been much broken up by erupted rocks. From the north, the Godavery derives large supplies of water from the great rivers rising south of the Nerbudda and the Taptee, in basaltic tracts, the soil of which being retentive of moisture, the water is everywhere near the surface. From the south it receives only the Manjerah river, which, flowing through arid granitic plains, furnishes but a scanty addition of water, except during the rainy season. Through a pass in the gneiss mountain of Papcondah it enters the plains of the Eastern Coast. In this district the sandstone reappears, at an elevation little above that of the sea, but basaltic hills, several hundred feet in height, in which marine fossils have recently been discovered, exist almost within the delta formed by its sediment. The Godavery rises on the E. declivity of the W. Ghauts, near Nassik at 3,000 feet above the sea; runs S E 200 miles; E. 100; S. E. 85 miles; E. 170 miles; S. E. 200 miles; and disembogues into the Bay of Bengal, by three mouths, length 898 miles. It receives the Wein-Gunga 439 miles; Manjera 330 miles; Poorna 160 miles; Paira 105 miles; Inderaotee 140 miles—130,000 square miles are drained. It has the town of Ganga-khair on its right bank and the towns of Rajahmundry and Coringa at its embouchure. In 1846, the sanction of the Court of Directors of the British East India Company was given to the construction, at an expense of £47,500, of a dam of sufficient height to command the delta, and to supply the rich alluvial soil of which that tract is composed, with the means of constant irrigation. It has been completed and is seven miles long. The experiment of navigating the Godavery by steam has been entertained by the Madras Government. Three great barriers, have been drawn across the river. The rivers embraced under the Godavery navigation project are the Godavery, Wurdah, Pranhita, Wyne Gunga, Indrawatty, Sebbery, and Pyne Gunga. The three first, however, are the principal streams.

The Wurdah takes its rise in the Baitool District west of Nagpore, and after flowing for some distance in a south-east direction is joined by the Wunna, which, passing under Hingunghat, falls to the south, and forms its junction with the Wurdah, at a place called Sweet, eighteen miles south of

the latter place. At this confluence are the falls of Zoourate, and under them is the village of Chuhmunder, which is supposed to be the limit of the engineering operations at present contemplated. The Wurdah flows on to the south-east until a little before reaching Chandah it is joined by the Pyne Gunga, when, losing the names of Wurdah and Pyne Gunga, the united stream continues under the name of Pranhita to its junction with the Godavery, a few miles below the station of Sironcha. Midway between these confluences is situated the third or Dewalamurry Barrier, extending round in a curve for about fifty miles, and midway down this Barrier the Wyne Gunga discharges itself into the Pranhita.

From the confluence of the Godavery and Pranhita below Sironcha to the sea, the river carries the former name, although joined at intervals by the Indrawatty and other tributaries above specified. Thirty miles below Sironcha lies the second or Enchampally Barrier, and eighty miles below this again is placed the first or Sinteral Barrier, whence to the sea there are no material obstructions to a partial, though not perennial, navigation.

Thus the great line of water communication proposed is obstructed by three Barriers, and runs as follows :—

	Miles.
1. From Chuhmunder to Kirmiree and Saligoun (at the head of the Dewalamurry Barrier) ..	90
2. The length of the Barrier ...	30
3. From Mogelee (at the foot of the third Barrier) to Pilmellah (at the head of second or Enchampally Barrier) ..	85
4. The length of the Enchampally or second Barrier to Daodula ..	18
5. From Daodula (at the foot of second Barrier) to Dumoogoodium (at the head of first or Sinteral Barrier) ..	70
6. Length of Barrier to Badrachellum ...	15
7. From Badrachellum to Dowlaishwarum ...	105
From Dowlaishwaram to the Sea there is at present Canal navigation in length ..	32

GODDA, Can. ? A Mysore wood, one of the Cedrelaceæ, polishes well and is good for turning.—*Captain Puckle in Mad. Cat. Ex.* 1862.

GODGUDALA, Hind. Sterculia villosa.

GODU MAHANEL. Singh. Aucklandia costus. *Falconer.*

GODDESS, of these, there are in the hindu religion, one to each of their chief deities, Brahma, Vishnu and Siva. They are the Sakta or energies to their respective lords, their names are Saraswati, Lakshmi and Parvati.

GODDU PAVILI Tel. also Portulaca quadrifida.—*Linn.*

GODDU TUNGA KODU. Cyperus seminudus, *L.*

GODEPORE. A rather hard, fine, close-grained, heavy Ceylon wood.

GODETIA ŒNOTHERA, the Evening primrose, a very pretty single petalled white flower, blossoming only in the evening; and towards morning turns to a pink, when it closes and withers. A fresh succession of flowers continues many weeks, even during the hot season. Is propagated by seed, either in pots or beds. The seed may be sown in the rains—soil should be rich.—*Riddell.*

GODGADALA, Hind. Sterculia Roxburghii.

GODH-BEGOON, Beng. Love-apple, Tomato; Lycopersicum esculentum.

GODHI. Hind. The edible bulb of the Marsilea quadrifolia of Simla.

GODHUMA PISHTA. Sans. Wheat Flour.

GODHUMULU. Tel Triticum sativum. *Linn.* Triticum æstivum.

GODI, Hind. The process of hand hoeing or weeding crops.

GODIAI, Sco. Kurdistan.

GODRA, in Guzerat, its chief is of the Bagela race. See Komarpal.

GOD STONE, see Sami stone.

GODUGU GADDI. Sans. syn. Ch'hatri ch'hatra, Umbrella grass; fragrant grass growing in marshy ground."

GODU MAHANEL. Singh. Patchuck.

GODUMBE ARISI. Tam. Triticum æstivum.

GODUMBE-MAVU. Tam. Wheat Flour.

GOEWANS'E, or, as named in the low country, Vellale, constitute by far the larger numbers of the Singalese. Agriculture, their original employ, is not now their sole occupation. They are a privileged people, and monopolize all the honours of church and state, and possess all the hereditary rank in the country. *Davy's travels in Ceylon* p. 113.

GÆRTNERA. KŒNIGII, *Wight, Ic.*

G. acuminata, Benth. | Sykesia Kœnigii, Arn.
Var. β. G. thyrsiflora Blume. | G. Oxyphylla, Benth. | Sykesia thyrsiflora, Arn.

Var. α is very abundant in Ceylon up to an elevation of 3000 feet. var. β. grows in the south of the island, at no great elevation. *Thw. Enum. pl. Zeyl. p.* 202.

GÆRTNERA ROSEA, *Thw.* Grows in Ceylon in the Ambagamowa and Saffragam districts, up to an elevation of 2000 feet.—*Thw. En. pl. Zeyl*, p. 202.

GÆRTNERA TERNIFOLIA, *Thw.* Grows in Ceylon in the Ambagamowa district near Adam's Peak, at an elevation of 4000 to 5000 feet.—*Thw. Enum. pl. Zeyl.* p. 202.

GŒRTNERA-WALKERI. Wight, Illust.
Sykesia Walkeri, Aru.

Grows in Ceylon, in the Central Province, at an elevation of 3000 to 6000 feet.—*Thw. Enum. pl. Zeyl.* p. 202.

GOENONG GEDEH, or the Blue Mountains, a high range in Java, about 30 miles inland from Batavia. Pangeango rises 9,954 feet: Salak 7,322 feet, and Karang 6,014 feet above the sea—*Horsburgh.*

GOERA. HIND. of Punjab, manured land near villages, same as "nyain."

GOEZ, Benedict Goez, a Portuguese monk, went from Lahore by Kabool, to Kashghur, and across the sandy desert, into China, where he died in A. D. 1607; but his route also was far north of Tibet. Another Jesuit, Anthony Andrada, passed through Kumaon to the Manasarawara lake, and thence went on Rudak, on the western confines of Tibet. His journey was made in 1624, and is discredited by commentators and geographers because of his mentioning this lake as the source of the Ganges and Indus, instead of the Sutlej. There is no doubt, however, that the voyage is genuine, though we have no details of it. *Prinsep's Tibet, Tartary and Mongolia*, p. 12.

GOGA, a river in the Bhagalpoor district.

GOGA, a district of Thibet. See India.

GOGA, the name of a tree, Encœrnada Philippensis ? found in most of the Philippines, the woody filaments of which yield a soapy matter much used in washing linen, and in the process of gold washing for the purpose of precipitating the metal from the sand. It is a shore or littoral plant, formerly ranked by botanists as an Acacia.—*Crawfurd's Dis. of the In. Islands*, p. 144.

GOGAPUR. A saint held in much veneration by the agricultural population of Delhi and the Upper Doab, who, in the month of Badhar present offerings at his shrine, which is at Dudiera, 200 miles southwest of Hissar.—*Wilson.*

GOGLET. ENG. in Hindi, Koza, a water vessel, with a bowl shaped bottom and a long stalk like neck. They are made of earthen-ware or metals or alloys, and are the usual vessels in which Europeans and Natives hold their drinking water. Their name is from the gurgling sound produced when the water issues.

GOGAR-PASS. See Kohistan.

GOGAM. TEL. Choloroxylon dupada.

GOGI-SAG. HIND. Malva parviflora.

GOGIRD. HIND. PERS. sulphur.

GOGO. A town on the coast of Kattiawar, on the west side of the Gulf of Cambay. *Orlebar in B. As. Trans.* 1842, Vol. I, 194. *Dr. Buist.*

GO-GO of Manilla. Acacia abstergens.

GOGOT. A river of Rungpoor, runs near Momunpoor.

GOGRA. HIND. The cotton pod burst open.

GOGRA. The principal rivers which traverse the territory are the Kalee and Surgoo, which, meeting at a place called Pramadee, form the Gogra and Gunduck. The Gunduck is supposed to rise in the Himalaya, and flows into the Ganges near Patna. The upper part of the river is called Saligramee, from the fossil ammonites called saligrams which are found in it, and which the hindoos hold in veneration. The Gogra runs through the Ghorukpoor district near Dhooree Burhul in Goruckpoor passing Nawabgunge. See Kamaon.

GOH. PERS. also Parwar. PERS. also Marwarid. PERS. Pearl.

GOHAFSIN, or JOHAFSIN. See Joasmi.

GOHATTY, in lat. 26° 5′ 8″; N. long. 91° 43′ 8″. A large station in Assam on the Brahamputra, 69 miles E. of Goalpara. The level of the Brahamputra is 70 feet above the sea. Kamaikia temple is 825 feet and the highest point near Gohatty 1,002 feet.—*Herm. Schl.*

GOHELWAR. One of the five southern districts of Kattywar.

GOHILA or GEHLOT. A race descended from Bappa, who in A.D. 727, seized Chitor from the Mori tribe, and founded the Newar dynasty.

They were driven into Kattywar from Marwar by the Rathor rajputs, in A. D. 1200. See Jhaieja, Saurashtra.

GOHINLA. HIND Hamiltonia suaveolens.

GOHUR. In the Binjara tongue, any man, a Binjara man.

GOIA PUNDU. TEL. Psidium pyriferum.

GOIL. See Rajpoot.

GOITRE. The disease known in Europe by this name occurs also, in Asia, attacking the people in Kamaon, the Abor of the mountains bordering the valley of the Brahmaputra, and other mountain tribes. The natives of India employ for its cure, a leaf-looking substance called Galloor ka Puttar Hind: supposed to be dried sea-weed. Goitre, is rare in the valley of Kashmir. Mr. Vigne purchased at Ladak, a piece of common sea weed, which had been no doubt brought there by the merchants trading between China and Turkistan. He saw few cretins. Goitre occurs East of the Indus at elevations of 4,000 feet, but Mr. Bramley states that it is more common on the crest of a high mountain than in the valley of Nepal.

GOJAR. HIND. Edwardsia mollis.

GOJI. HIND. See Guji.

GOJJANGI. TEL. Pandanus odoratissimus.—*Linn.*

GOKAK. The principal cataracts or waterfalls in India, are near Simorree, in Rohilcund; at Gokak, on the Gutpurba are the Gairsappa, where from top of fall to surface of basin is 888 feet, and the depth of basin is 300 feet—1,188 feet, and from 300 to 600 feet across during the rains. Yena inMahabuleshwar,is 600 feet; Cauvery, 300 feet. Cataracts of Suboonreka, Chota Nagpore, and Hurroree Ghaut—the falls, 15, 20, and 400 respectively; about 500 feet across crest.—*Curiosities of Science, Dr. Buist's Catalogue.*

GOKAL. A small town on the banks of the Jumna, below Mathura, Radha, mistress of Krishna was wife of a cowherd of Gokal. Hence one of Krishna's titles is Gokul Nath, Lord of Gokul. Gokul is almost an island and is one of the prettiest spots in the holy land of the hindoos. The scene there is still as pastoral as it had been three thousand and five hundred years ago Large herds of heavy-uddered kine remind us of the days of Nanda, though their number is far short of nine lacs, possessed by that shepherd-chief of old.—*Tr. of Hind*, Vol. ii. p. 117. See Radha, Krishna.

GOKAL-ASHTAMI or Janma ashtami, a hindoo festival in commemoration of the birth of Krishna, an event which is said to have taken place at Mathura, at mid-night, about the 22nd August on the 8th of Shravan. One vaishnava sect keeps the holiday on the 8th and another on the 9th of Shravan, Krishna is stated to have been born of Devaki, niece of Kans, king of Mathura. Kans having had it predicted that one of his race would destroy him, he endeavoured to compass the death of Devaki's offspring in which he failed, and on the 9th Krishna was removed to the house of a cowherd named Nanda. The worshippers abstain during the day from certain articles of diet, at night they bathe and ornament the image and offer the tulsi, or Ocymum sanctum. On the following day, a brahman serves as pujari, and afterwards he himself is worshipped. The 8th day is held by the Gaoli or cowherd race as a great jubilee day, from the circumstance of Krishna having been reared by one of their people, they join hands and dance, and shout Govinda, Govinda. The shrines of Kanoba are much visited at night, the Bhagat of the shrine by self flagellation, becomes hysterical, which is deemed by the people to be a possession by the deity, on which they prostrate themselves, burn incense and present sick people to the Bhagat. On the following day, the Bhagat's disciples work themselves into hysterics.—*Bombay Gazeteer.*

GOKULAST'HA. Gosain ascetics, teachers of the doctrines of Valabha Acharya. See Rudra Sampradayi.

GOKULNATHA. Son of Vittala and grandson of Valabha Acharya. See Rudra Sampradayi, Vallabhachari.

GOKAN. HIND. Alhagi maurorum.

GOKANTICA. SANS. Syn. of Astracantha longifolia. Barleria longifolia.—*Nees.*

GOKATU. SING. Hebradendron gambogioides.

GOKHRU. DUK. GUZ. HIND. BENG.

Tribulus, lanuginosus.	T. terrestris, LINN.
Khusuke-kabir, AR.	Ghejasudu mustra, SANS.
Gokhoor BENG.	Aeknerenchi, SINGH.
Prickly fruited pedalium ENG.	Ana-nerinji, TAM.
Caltrops, ,,	Yenuga-palleru, TEL.

The seed, which is highly mucilaginous, as is also the whole plant, is cooling and demulcent, taken in water as a diluent. Very abundant and troublesome to the naked foot.—*Gen. Med. Top. p.* 135.

GOKHRU DESI, HIND. Tribulus alatus.

GOKHRU KALAN, HIND. Xanthium strumarium.

GOKHUR, BENG. Tribulus lanuginosus.

GOKIURA. HIND. Astracantha longifolia.—*Nees.*

GOKKATU. SING. Gamboge.

GOKPA, HIND. Allium *sp.*

GOKRU. HIND. Xanthium strumarium.

GOKSHARA. HIND. Asteracantha longifolia, Barleria longifolia.

GOKSHIRA. SANS. Milk.

GOKTHURA. HIND. Asteracantha longifolia.—*Nees.*

GLASPATI. HIND. A kind of European iron imported in flat bars.

GLASS BEADS.

Kanch ke 'manke, HIND. DUK.	Munnie, TAM
Butirsacha, MALAY.	Pussalu, TEL.

Coloured glass beads are largely worn in India by several non Arian races.

GLASS NAUTILUS. See Carinaria.

GLASS EEL. A species of Leptocephalus of Shaw, found on the Australian coast. It is from 4 to 8 in. in length. There are eighteen species of this genus.—*Bennett.*

GLAT-CHANDUL. HIND. Gloriosa superba.—*Linn.*

GLAUCIUM PERSICUM. A very handsome plant and showy, either in borders or patches, they require a moderate good soil, the plants not too near each other, and the seed sown at the end of the rains, they are

natives of the South of Europe and Persia. The colours are red, orange, yellow and purple.—*Riddell*

GLAUCOUS LEAVED PHYSIC NUT- Jatropha glauca.

GLAUCUS. A genus of sea lizard, an oceanic nudibranch, soft and fragile, occurs in the E. Seas near Formosa. *Collingwood.*

GLAUCUS HEXAPTERYGIUS. Cuv. or Sea Lizard. This mollusk occurs in the Indian and S. Pacific oceans. It is a fragile delicately coloured animal and is about an inch long. Its upper surface is a vivid purple, and its lower is pearly white. —*Ben.*, p. 46.

GLAUX FLAMMEA and G. javanica, birds of the sub family Striginæ, the position of which may be thus shown:—

Tribe II.—Nocturnæ. Fam. Strigidæ.

Sub-Fam. Atheninæ, 2 gen. 9 sp. viz, 1 Ninox scutatus: 8 Athene.

Sub-Fam. Syrniinæ, 1 gen. 3 sp. viz., 3 Syrnium Indrani, Sinense and nivicolum.

Sub-Fam. Striginæ, 3 gen. 3 sp. viz., 1 Phodilus badius; 2 Glaux flammea, and G. Javanica.

GLET. Rus. Litharge.

G 'LING-GANG. Malay. Cassia alata. —*Linn.*

GLINIAUÆ NACZYNIA. Pol. Earthenware.

GLINUS LOTOIDES. Linn.

Gandibuti of Beas.

Porprang,	Hind.	Zakhm-i-haiyat,	Pers.
Kotuk of	Sind.		

This plant is given in the Punjab as a purgative in diseases of the abdomen, under the name of Zakhm-i-haiyat, which name, however, is also generally ascribed to Sphæranthus hirtus and to Cissampelos pareira. *Dr. J. L. Stewart*, M. D.

GLINUS TRIANTHEMOIDES.

Sharunnay-keeray, Tam.

A procumbent herb with fleshy leaves, of a brownish colour; used as spinach; a very abundant and troublesome weed.—*Jaffrey.*.

GLOBBA CAREYANA. Carey's Globba. On shady banks in the Tenasserim Provinces where violets are seen in England, the pretty orange-flowered globba is not uncommon. Of this genus, Wight, in Icones, gives Globba bulbifera, careyana, marantinoides, ophioglossa, and orixensis.

GLOBBA EXPANSA. Wall. Pa-deinguo.—*Burm.*

GLOBBA NUTANS.—*Linn.* Syn., of Alpinia nutans.—*Roscoe.*

GLOBBA SYLVESTRIS. *Rumph.* Syn., of Alpinia nutans.—*Roscoe.*

GLOBE. Eng. The globe or earth, which Europeans believe to be round, is supposed by mahomedans to be of a tabular form Hindus believe it to be round and supported on a tortoise

GLOBE AMARANTH. Gomphrena globosa.

GLOBIOCEPHALUS INDICUS. *Blyth*, the Ca'ing whale, is closely affined to the European Gl. deductor, but differs externally in being wholly of a black colour. Its intermaxilliaries are shorter; the teeth fewer and larger, numbering 6 or 7 above, 7 or 8 below on each side; the upper view of the maxillaries differs considerably in contour, being broader and less elongated in the Indian species; and there are other discrepancies which are less marked.—*Beng. As. Socy. Journ.* No. 4, 1852.

GLOBIOCEPHALUS RISSII. The Yellow Sea affords this species of Cowfish or round headed cachalot, which the Japanese capture, and other species of whales resort to the waters east of Manchuria. Seals have been observed on the coasts of Liantung, but nothing is known of their species or habits.—*William's Middle Kingdom*, page 258.

GLOCHIDION, a genus of plants belonging to the natural order euphorbiaceæ. The species consist of shrubs or small trees,

arboreum,	jessieuianum,	nitidum,
coriaceum,	lanccolarium,	pinnatum,
ellipticum,	montanum,	sinicum,
gardneri,	multiloculare,	velutinum,
hirsutum,	nemorale,	zeylanicum.

G. coriaceum, G. gardneri, G. jussieuianum, G. montanum, G. nemorale, and G. zeylanicum, are small trees of Ceylon. G. jussieuanum is Wight's Gynoon triandrum and jussieuanum.—*Voigt W. Ic. Thw.* p. 285.

GLOCHIDON LANCEOLARIUM. *L.* Bradleia lanceolaria, a useful timber tree of Assam.—*Roxb.* III, 697, *Voigt*

GLOCHIDION VELUTINUM. *W. Ic.*

Golkamila sama,	Jhelum.	Phyllanthus velutinus.	Mull.
Bera,	Chenab.	Koamil; kalam of	Beas.
Sama; ambu of	Ravi.	Pundna of	Sutlej.

A small tree not uncommon in the Punjab Siwalic tract up to near the Indus. The wood is only used as fuel, the bark is employed for tanning.—*Wight Ic.* Dr. *J. L. Stewart*, M. D.

GLOCHENGUT. Ger. Bell metal.

GLOMEROUS FIG TREE. Eng. See Ficus glomerata.

GLORIOSA SUPERBA. Lin. *Rox. W. Ic.*

Ulat-chandal,	Beng.	Katijan also Kartichey pu,	Tam.
Superb-lily,	Eng.	Adavi nabhi, Agni sikha,	
Kariari,	Hind.	Potti dumpa,	Tel.
Mendoni,	Maleal.		

This beautiful lily is a creeper, which grows wild in Ajmer, the peninsulas of

India and Malacca and in Ceylon and blossoms at the commencement of the rains. The large, flame-coloured, drooping flowers proceed from the upper part of the stalks. The flowers are of a white, yellow and orange colour, the petals long and fringed. It lasts about eight days, undergoing various changes during that time. The root is a strong poison the "Gloriosa," says Loudon, "on account of the glorious colours of its flowers, and the elegance of their form, is a splendid and curious genus." The flower, large as a lily, hangs down, and the petals, stamens and style all turn and grow up like a flower turned inside out. Then to complete the oddity, the leaves prolong their extremities into tendrils, and the plant walks on its toes.—*Mason. Ainslie's Mat. Med.* p. 164. *Gen. Med. Top.* p. 189. *Riddell.*

GLOSSINA MORSITANS, is the Tse Tse fly; it is harmless to man and wild animals and even to calves while sucking the cow. The Tsalt salya or Zimb of Abyssinia seems identical with the Tse Tse fly. It abounds on the banks of the Zambesi river of Africa. Its bite is fatal to the horse, the bullock and cow.

GLOTTE also GLATTEE. Ger. Litharge.

GLOA. Sans, from gloi, to be sad, or to fade.

GLOVES.

Gants,	Fr.	Guanti.	It.
Handschuh,	Ger.	Rukawizii,	Rus.
Dastane, Daste,	Hind.	Pertschatki-Golizii,	„

McCulloch's Commercial Dictionary, p. 606.

GLOW-WORMS, are common in all parts of India. The glow-worm of Ceylon is the female of the Lampyris and attains a size of nearly three inches. Mr. Morren reports that he has found phosphorous in glow-worms, as well as a system of prisms in transparent lenses, above the luminous matter.

GLOXINIA. The species are handsome plants, bell-shaped, purple, blue and white flowers, they require a good light rich soil, and plenty of water, but good drainage and are propagated by seed, and stripping off the lower branches from the stem. G. maculata and G. caulescens succeed very well, if the roots are started into growth at the commencement of the rains. G. caulescens is propagated by leaves under glass; G. maculata by division of the roots: require treatment similar to dahlias for the preservation of the roots: they should not be grown in too large pots.—*Jaffrey. Riddell.*

GLUE. Fr. Bird lime.

GLUE. Eng.

Colli,	Fr.	Prakat; Rakat; Parakat,	
Leim,	Ger.	Parkat,	Malay.
Sirrisht,	Guz.	Vaj'ram,	Tam
Sarisht,	Hind.	Vaj'ramu,	Tel

Is extracted from refuse animal substances, such as the parings of hides, hoofs, ears of horses, oxen, calves, and sheep, and it is used for cementing wood. When good, it is hard, brittle, of a semi-transparent and deep brown colour, and free from clouds and spots. Glue, of a superior kind has been made from the waste residue of animal tissues, which have served the operation of tanning at the Government Tannery, Hoonsoor, samples have been received from Ootacamund, prepared by Mr. Brophy, from bones and remnants of animals which have served as food. Glue of a tolerably good quality is made by the Chinese from ox-hides, sufficient to supply the Chinese themselves, and furnish an article for export to India. Agar-Agar is the Malay name for the tenacious jelly or glue, made from a marine plant, the Plocaria (Gigartina) tenax. It is imported into China from the Eastern Archipelago, though the Chinese likewise manufacture it for themselves, and apply it as size to many useful purposes and use it as food. The bamboo lattice work of lanterns is covered with paper saturated with this glue or gum, which, when dried, is semi-transparent. It is also used in paper and silk manufacture. It is incomparable as a paste, and is not liable to be eaten by insects. When boiled with sugar, it forms a palatable sweetmeat. *Faulkner, Williams, Morrison M. E. J. R.* See Gelatine. Gigartina Tenax.

GLUGA. *Malay* is the Broussonetia papyrifera of botanists, the paper mulberry tree, the plant from which, in China and Japan, a kind of paper is made and clothing in the islands of the Pacific. The Javanese are the only people of the Archipelago who manufacture a paper from the liber or inner bark of this plant, and this is by a process very similar to that by which the ancients manufactured papyrus, but the ordinary Japanese paper, instead of being costly, like the papyrus, is a very cheap commodity. Its colour is that of parchment; it is very tough, and, except that it is liable to be preyed on by insects, owing to the rice-water used in its preparation, it is very durable, The name of the plant, and that of the paper, "daluwang" and "dalambang," are native Javanese words; and it may be concluded that the art of manufacturing paper from the gluga plant is also a native one, and been long known for the few ancient manuscripts found in Java, and which, belonging as they do, to the times of hinduism, cannot be of later

date than the year 1478, that in which hinduism was finally subverted. The Gluga culture and paper manufacture, are chiefly carried on in the province of Kadiri, once an extensive seat of hinduism, and the parties conducting them are the mahommedan priests: in this matter very likely the successors of the brahmins. It is prepared by a process of maceration and beating.—*Crawfurd Dict.*, p. 143. *Journ. of the Indian Archipelago*, Nos. VI., XII. June—December, 1853, p. 276.

GLYCINE, *Species.* Butwause Hind. A very fine and prolific pulse, much cultivated in the Upper Provinces of India.—*Ainslie.* p. 236.

GLYCINE ABRUS. Linn. Syn. of Abrus precatorius.—*W. and A.*

GLYCINE SINENSIS. Takes its name from glykys, sweet, the roots and leaves of most of the species being so. The flowers, which hang in racemes from the axila of the leaves, are violet, yellow, or purple. Fortune found it wild on the hills, where it climbs among the hedges and on trees, and its flowering branches hang in graceful festoons by the sides of the narrow roads which lead over the mountains. From the 20th of April to the beginning of May, most conspicuous amongst the shrubs and herbaceous plants of China, are the flowering Viburnum macrocephalum and dilatatum, with their large heads of snow-white flowers; Spiræa and the double variety, which is more beautiful than the original species; Weigela rosea, now well known in Europe: Moutans of various hues of colour; azaleas, particularly the lovely little "Amæna," Kerria japonica; the lilac and white glycine: roses; Dulytra spectabilis and Primula cortusoides, and with such a host of Flora's beauties the Chinese gardens are gay indeed. But perhaps the most beautiful sight of all is the Glycine sinensis; climbing upon and hanging down from other trees, the effect produced by this climber is fine, attaching, itself to a tree, or a group of trees, it entwines itself round the stems, running up every branch and weighing down every branchlet and, in the end of April or beginning of May, is covered with flowers. —*Riddell. Fortune's Wanderings*, p. 66. *A Residence among the Chinese*, p. 242.

GLYCINE TOMENTOSA. Syn. of Dollichos uniflorus.

GLYCINE TRILOBA. Linn. Syn. of Phaseolus trilobus.—*Ait.*

GLYCYRRHIZA, a genus of plants belonging to the natural order Fabaceæ, or Leguminosæ, consisting of herbaceous plants with pinnated leaves, small flowers in axillary spikes, and roots running very much in the soil in which they grow. Species of Glycyrrhiza also extend into Affghanistan, whence liquorice-root, jeteemadh, is imported into India. The Glycyrrhiza with both smooth and scabrous pericarps, the Arabs call soos: Jetthimud is the Glycyrrhiza glabra, and is imported from the Red Sea. There is a Taverniera with a sweet root which has the same name. Glycyrrhiza echinata, is a native of Apulia, on Mount Gardano, in Greece and Southern Russia, extending into Tartary and Northern China. The whole plant is glutinous to the touch. The roots are horizontal, in taste like the common liquorice. This is sometimes called Russian Liquorice. *Bot. Mag* .252, *Mignan's Travels* p. 35.—*Eng. Cyc. Sim's Nees*, 328. *Royle.*

Liquorice	Eng.	Adi-modram	Tam.
γλυκυρριξα	Gr.	Yestimadhuka	Tel.
Jetimadh,	Hind.	Ati madhuramu	,,
Urit-manis	Malay.		

A native of the South of Europe, Crete, and Candia, also of Cochin China and China. The name liquorice, according to Du Theis, is a corruption of the French word 'reglisse,' which is itself a corruption of Glycyrrhiza. The roots abound in a saccharine mucilaginous matter, which is slightly bitter, and readily soluble in water. A powder, and the well-known common extract, are prepared from it. The decoction in different forms is a common remedy for coughs.

Mignan found the plant abundant throughout the country, burnt as fire-wood

Jetimad'h is only sold in the bazaars as a medicine—If imported it is the root of Glycyrrhiza glabra;— if indigenous, it is obtained from the root of Abrus precatorius. —*Ains. Mat. Med. p.* 24. *O'Shaughnessy, page* 293. *Eng. Cyc. Mignan's Travel* p. 35.

GLYCYRRHIZA TRIPHYLLA.

Zaisi, of Aslasus,	Aff. Root.	Jetimadh,	Hind.

Inspissated juice, rab-us-sus. Several species, possibly including that of Europe, G glabra, are common, wild in Affghanistan, where they are mentioned by Griffith, and where Bellew collected two at 5,000 to 6,000 feet. *Dr. J. L. Stewart, M. D.*

GOL. Hind. Round, globular, hence Gola a cannon ball; Goli, a musket ball.

GOLA. Hind. A caste employed as rice cleaners, or in salt manufacture.

GOLAB-JAM. Beng. Rose apple, Eugenia jambosa.

GOLA-DAS. Hind. Slaves.

GOLAGANDI. TEL. also Amada-kada. TEL. Cyanotis axillaris.—*Schult.*

GOLAKONDA MIRAPA, TEL. Capsicum frutescens, *L.* var. *β.* flavum. It is called by various names, as Golconda, Chilly, Nepal Chilly, &c.

GOLAKA. SANSC. A son born of a widow. Among the Mahrattas, the term Golak is considered to apply to a caste supposed to be descended from the illegitimate offspring of a woman of the braman caste; Randa-golak, is the adulterous progeny of a woman who has a husband, Runda-golak-golak, the illegitimate son of a widow. The members of the Golaka caste at Poona act as astrologers, agents, money changers and are held as no better than sudras.—*Wilson.*

GOLA-PURAB. HIND. An inferior tribe of Sunadh brahmans, who cultivate lands in the Agra district.—*Wilson.*

GOLAREE PASS. See Khyber, p. 521.

GOLCONDAH. A small town in the vicinity of Masulipatam but in the Hyderabad territory, from which, formerly, diamonds were obtained, the soil is not now worked.

GOLCONDAH. A fortress and small town on the left bank of the Moosa river five miles W. from Hyderabad. Golcondah was formed into a hindu kingdom in the reign of Mahomed Toghlak by a descendant of a royal house of Telinganah. A mahomedan dynasty was subsequently founded, here, by Kuli Kutub Shah. He ruled for sixty years during which he was employed in reducing the hindus eastwards to Masulipatam and Rajahmundry. Golcondah fell to Aurungzebe in 1677 after a protracted siege. In Orme's time, under the Asof Jahi dynasty, the Golcondah sovereignty included Arcot, Kurnul, Cuddapah, Rajahmundry and Chicacole. The town of that name has almost disappeared but the fortress on a fortified rock remains. It is commanded by a low range of hills to the north.

Gold is one of the precious metals. It is found in nature in its metallic state. It is occasionally found mineralised by tellurium. Native gold occurs in cubes without cleavage, also in grains, thin laminæ, and masses, sometimes filiform or reticulated. The color varies in shade, sometimes being a bright yellow, at others almost silvery white, from the quantity of silver with which it is mixed. It is very ductile and malleable. Hardness 2·5 to 3. Specific gravity 12 to 20, varying according to the metals alloyed with the gold. Native gold usually contains silver, and in very various proportions. The finest native gold from Russia yielded—gold 98·96, silver 0·16, copper 0·35, iron 0·05; specific gravity 19·099. A gold from Marmata afforded only 73·45 per cent. of gold, with 26·48 per cent. of silver; specific gravity, 12·666. This last is in the proportion of 3 of gold and 1 of silver. The following proportions have also been obtained; 3½ to 1, 5 to 1, 6 to 1, 8 to 1; and this is the most common; 12 to 1 also is of frequent occurrence. Copper is often found in alloy with gold, and also palladium and rhodium. A rhodium gold from Mexico gave the specific gravity 15·5 to 16·8, and contained 34 to 43 per cent. of rhodium. Iron and copper pyrites are often mistaken for gold by those inexperienced in ores: but, gold is at once distinguished by being easily cut in sizes and flattening under a hammer. The pyrites when pounded are reduced to powder; iron pyrites is too hard to yield at all to a knife, and copper pyrites affords a dull greenish powder. Moreover the pyrites give off sulphur when strongly heated, while gold melts without any such odour. Native gold is to a large extent obtained from alluvial washings. It is also found disseminated through certain rocks, especially quartz and talcose rocks, and it is often contained in pyrites, constituting the auriferous pyrites; the detritus affording gold-dust has proceeded from some gold-bearing rocks. Gold is widely distributed over the globe. It occurs in Brazil (where, formerly, a great part of that used was obtained), along the chain of mountains which runs nearly parallel with the coast, especially near Villa Rica and in the province of Minas Geraes; in New Granada, at Antoquia, Choco, and Grion; in Chili; sparingly in Peru and Mexico; in the southern part of the United States. In Europe it is most abundant in Hungary at Konigsberg, Schemnitz and Felsobanya, and in Transylvania, at Kapnik, Vorospatak, and Offenbanya; it occurs also in the sands of the Rhine, the Reuss, and Aar; and southern slope of the Apennine Alps, from the Simplon and Monte Rosa to the valley of Aosta; in Piedmont; in Spain, formerly worked in Asturias; in the county of Wicklow in Ireland; in Wales and parts of the west of England: in Sutherlandshire in the north of Scotland,

and in Sweden at Edelfors. In the Ural mountains there are valuable mines. There are mines in Africa at Kordofan, between Dar-fur and Abyssinia; also south of Sahara, in the western part of Africa from Senegal to Cape Palmar; also along the coast opposite Madagascar between 22° and 28° S. lat., supposed by some to have been the Ophir of the time of Solomon. Other regions in which gold is found are the Cailles Mountains in Little Thibet, Central Asia, India, Malacca, China, Japan, Formosa, Ceylon, Java, Sumatra, and the Philippines.

Until lately, nearly all the gold of commerce came from Asiatic Russia and Mexico, but recent discoveries of gold in California and Australia have opened new and vast sources of supply.

The imports into India, of bullion are continuous. The export of bullion from London to the undermentioned countries during the six months ending 31st December 1856, were

1856.	Gold. £	Silver. £	Total. £	Total of corresponding period last year £

1860-61	1,422,091	2,590,032
1861-62	1,619,562	2,643,089
	10,276,055	37,367,041

In 1848 the total amount of gold in use in the world was estimated by the best authorities at about £600,000,000 sterling and the annual supply was believed to be between eight millions and nine millions sterling. From the influx consequent on the opening of the gold fields of California and Australia, the amount in hand, in 1858, was computed at about £820,000,000 sterling, equivalent to about 205,000,000 ounces troy or 8,542 tons. Great as the amount seems, it could be all contained in a cubic block of gold only 23 feet in diameter. The gold coinage in Great Britain, France and the United States amounted in 1843, to £4,200,000 and in 1853, it was £41,800,000 or nearly ten-fold as large. *H. D. R.* p. 189.

In India, scales of gold are found in the gravel of river-beds over a great extent of country. The probability is, therefore, that the gold quartz is practically inexhaustible.

But no practical man has yet tested this quartz by roasting and crushing it, so as to determine whether the per-centage of gold produced would repay the expense of working on a large scale. In the process of quartz-crushing the quartz is first calcined in an ordinary kiln to assist the process of crushing; after being broken into smaller pieces, it subsequently undergoes the stampers. But a common flour mill the ordinary chert or mill-stone grit, will crush it better than any and millers aver that this work wears them less than even grinding Indian corn. The crushed or ground quartz flows with a stream of water into slime pits and labyrinths of narrow pipes, at the entrances of which the particles of gold sink according to their specific gravity. For the reduction of silver, copper, lead, and iron, complicated processes are necessary. But, in the separation of gold, a simple mechanical operation is all that is required to extract the metal from its matrix, whether that matrix be quartz, or slate, or granite. Where silver and copper particles are associated with gold, finer processes are however necessary for their separation; but for commercial purposes it would be sufficient to make the rude separation we have indicated on the spot where the gold quartz exists. A ton of Virginian quartz was found to yield 1 oz. 7 dwts 7 gr. of pure gold, or nearly an ounce and a half. Half an ounce per ton if worked upon the spot where the quartz is found would pay all expenses. About three quarters of an ounce can be obtained from Welsh quartz.

Gold is often mentioned as an article of commerce.

In the Bible (I. Kings, c. 9, v. 26) about 1,000 B. C. Solomon, king of all Israel, "made a navy of ships in Eziongeber, which is beside Eloth on the shore of the Red Sea, in the land of Edom." And these ships brought gold, silver and precious stones from Ophir and Tharshish in such quantities that king Solomon "exceeded all the kings of the earth for riches." Silver was so plentiful at his Court that it was "accounted nothing of." The king's drinking cups were made of pure gold, and his shields were covered with beaten gold. It has never been satisfactorily settled where Ophir and Tharshish were situated, but we are distinctly told that the navy of Tharshish brought "gold and silver, ivory and apes and peacocks," and it has been surmised by some writers that Tharshish was either China, or some islands in the China seas. Ophir, is also supposed to have been some district or port in the Red Sea, on the East Coast of Africa, or on the Malabar Coast or Coast of Malacca. The "precious stones" which king Solomon procured from Ophir are specially referred to. Some Portuguese historians, have supposed that it was Sofala, or some other place near the mouths of the Zambezi, on the east coast of Africa, whence the Tharshish fleet brought the rich merchandise which contributed so much to the splendour and magnificence of Solomon's kingdom. The Tharshish fleet is, however, said to have arrived at Eziongeber only once every three years, from which we may fairly infer that the voyage was a considerable one, or the ships had to go with the S. W. monsoons and return with the N. E. winds, or that they made a trafficking voyage from one place to another until the cargo was sold and another shipped. Ships or boats coasting from the Red Sea to the mouths of the Zambezi would scarcely take three years for such a voyage. We are inclined to believe, therefore, that king Solomon's navigators crossed the open seas and traded with India and China.

Eziongeber, on the shores of the Red Sea, (I Kings ix and 26,) is a little port at the head of the Elamitic, or eastern gulf of the Red Sea. This town more naturally belonged to the Midianites of Sinai, or rather to their friends the Egyptians. It was afterwards called Berenies by the Ptolemies; and its place is still pointed out by the Egyptian name of the valley in which it stood as Wady Tabe, the valley of the city, and is no doubt the town known seven centuries later under the name of the Golden Berenice, and not many miles from the modern Souakin, where gold was more common than in every other place of trade. Solomon's ships sent from Eziongeber, brought home chiefly gold from Ophir. From Ophir they also brought precious stones and ebony. *Sharpe's History of Egypt*, Vol. I, p. 107.

There are, however, conflicting opinions amongst the learned as to the meaning of Ophir, whether it was a country or it be the Arabic verb, Afr, to flow, to rush in, to pass on. If the latter etymology be the correct one, whatever place produced gold, would be styled Ophir by the Hebrews. There are, at present, in the Eastern Archipelago two places called Mt. Ophir—one of them a mountain in Sumatra, in the Palimbayang district 9,770 feet above the sea, to which the name was given by the Portuguese, and they gave the same name to a mountain 40 miles N. of the town of Malacca, 4,000 feet high. In the vicinity of both of them gold has been obtained.—*Bikmore* 403.

The Malabar coast, in particular, it is thought must be rich in gold, for the geological formation of the country is very similar to that which led Sir Roderick Murchison to foretell the existence of gold in Australia. Moreover, tradition indicated the mineral wealth of this part of India; and some writers set forth the opinion—an opinion, by the way, which is strongly advocated by Mr. Max Muller in his recent lectures on the science of language—that Malabar is the Ophir of Scripture. Undoubtedly Berenice, on the shores of the Red Sea, was one Ophir. Even while the gold of Ethiopia may have only been picked up by the unsettled tribes of the desert, it had yet been a source of great wealth to Ethiopia; but when Ethiopia was conquered by the Egyptians and its mines were worked by Egyptian skill, the produce seemed boundless. The gold was found in quartz veins within a slaty rock, at various spots in the Nubian desert, between Derr on the Nile and Souakin on the coast. They were said to bring in, each year, the improbable sum of thirty-two millions of minæ, seventy millions sterling, (Diod. Sic. lib. i. 49.) as was recorded in the hieroglyphics under the figure of the king in the Menmonium, who is there offering the produce to Amun-ra. To these mines criminals and prisoners taken in war were sent in chains, to work under a guard of soldiers; and such was their unhappy state, banished from the light of heaven, and robbed of everything that makes life valuable, that the Egyptian priests represented this as the punishment of the wicked souls in the next world. No other known mines were so rich. From the word, Noub, gold, the country received the name of Nubia, or the land of gold, and gold was shipped from the port afterwards by the Ptolemies named the Golden Berenice. Gold was henceforth more abundant in Egypt than in any other country in the world; and food and every natural product must have been dearer. Under these circumstances, while they may have imported iron and copper from Cyprus, oil and silver from Greece, with a few other articles from Arabia and Palestine, they could have exported very little beyond gold. The gold mines helped the people's industry in performing their great works in building and in war; but after a time it undermined that industry, and made the country an easier and richer prey for its neighbours. (*Sharpe's History of Egypt Vol.* I. p. 89.)

In Arabia, silver, iron, lead, and copper, are met with in different parts, the last, recently in Oman. Gold is mentioned by the ancient writers, and in all probability it will be found when the country is better explored, but at present it is not known to exist in Arabia.

Malabar. A Committee appointed by the Madras Government in 1832 to consider Lieut. Nicolson's proceedings, reported that nearly the whole of the province of Malabar, except that part immediately along the coast consists of lofty mountains covered with dense forest or thick jungle. The chain more immediately connected with the gold washing is formed of the Koondah and Mokoorty Hills to the south-east of Calicut and Neilgherries to the east, and the Wynaad mountains to the north-east. These send off numerous lateral ranges between which are chief valleys in most places closely covered with forest. The most extensive of these is that of Nelamboor including nearly the whole of the Ernaad talook, bounded on the east by the Neilgherries, on the north by Wynaad, on the north-west by a lateral range running south from the ghauts called the Wawoot Hills, and on the south by the Koondah and Mookoorty mountains. From these, on all sides, innumerable mountain streams descend, and uniting near Nelamboor, form the Beypoor river, of considerable magnitude, which falls into the sea about eight miles to the southward of Calicut. In the mountainous district of Wynaad, streams in the same manner descend through every valley and unite into large rivers which fall into the Cauvery in the Mysore and Coimbatore countries. The committee reported the whole of the above-mentioned mountains to be of primitive formation. In the Nelamboor valley, so far as the observations of the Committee went, the prevailing rock is gneiss, a stratified granitic rock. Above this, in most places, is a species of clay-ironstone, which from its softness, enabling it to be cut into the form of bricks for building, received from Dr. Buchanan the name of laterite. It is the overlying rock of the whole country between the ghauts and the sea to the westward, and many of the smaller hills are entirely formed of it. "When fresh dug it is perfectly sectile, but on exposure to the heat of the sun, and to the weather it becomes of considerable hardness. So far as the gold mines are concerned, it may be considered to be a deposit formed in the lapse of ages, from the gradual disintegration of the immense mountain masses in the neighbourhood; in which process part of the precious ore may be supposed to have been washed down along with the earthy particles.

However this may be, it is certain that gold exists more or less abundantly in the whole of the country on the western side of the ghats in every stream which takes its rise from the Koondah, Neilgherry, and Wynaad mountains, and in the sands of the sea-shore along the whole of South Malabar. It is throughout in the form of minute grains. One of the persons examined stated that he had once or twice seen a piece as heavy as a gold fanam (about the 1-80th part of an ounce Troy), but in all the specimens examined by the Committee, the portions were infinitely smaller. The principal washings are in the Ernaad, Wynaad, Neddinganaad, Koormenaad, Calicut, and Shernaad talooks, but Lieut. Nicolson, who during 1830, and 1831 and 32 was employed, with a body of pioneers, to ascertain the value of the gold mines in Malabar, then distinctly stated that he had traced the source of the gold to its matrix, in the rocks of the Coondah and Mookoorty Hills; in one of his later reports he mentioned that the miners in Malabar generally pursue the veins of quartz, and wash the portions of rock and earth composing them from a belief that they are most productive. About ten years subsequent to this, Capt. Newbold remarked that where plutonic rocks come in contact with the primary shists a greater tendency to metallic and silicious development is observed, and from the Himalaya to Cape Comorin, in the Malayan peninsula, Borneo, Sumatra, Assam, the Burman Empire, and in Hungary it is in veins of quartz, ferruginous quartz and their alluvium that gold is found in the greatest abundance. The gold rocks in the Madras Central Museum show the same fact of quartzoze rocks being the matrix of the gold in Southern India. In 1793, Mr. Duncan, Governor of Bombay, ordered a minute report to be made to him on the subject of the mines in Malabar, which still continue to be worked very industriously by the natives of the country. Afterwards in 1831, Mr. Sheffield the Collector of that province made their existence known to Government, when he stated that gold dust, weighing 11,449 fanams had been collected in a few of the talooks there: for gold is found in all the rivers of the Malabar province, from the stream which falls into the sea at Elatoor about 8 miles north of Calicut, as far south as the numerous streams flowing through the Palghaut valley, which form their junction about 15 miles below Paulghautcherry to the great Ponany river, and some of which reach the southern boundary between Cochin and Malabar about one hundred and ten miles to the south-east of Calicut.

Arliporamboor river, a feeder of the Todakul river.

Arankyum river, disemboguing at Caralondy.

Beypore river—gold is found in the beds of the several branches of this river which flow through the Nelamboor valley, before they all unite above Mambaat Angaddy.

Carampoya or Carambye river rises like the Ponapoya, q. v. with which it unites at Poolliumpara in Wynaad, and their united stream is then called Pamdy-paya, but this, on approaching the ghauts, again divides into two streams and the main branch called in the Nelamboor valley, the Carambge, rushes down the Alliumpully cherum.

Calicut. Pooloowye river in Calicut talook.

Iroopoonjay river in Calicut talook.

Coodernapoya river, a feeder of the Beypore river.

Caracoorpoya river, descends from Devalla to the right of the road through the Carcoor pass to join the Poonapoya river.

Capul Mines.

Carembat jungle near Carcoor.

Poonany in Moopeyanaa, see Wynaad.

Southern Mahratta Country. About the year 1830 the attention of the late Captain Newbold was drawn to the gold districts in the Dharwar and Belgaum collectorates, when travelling through Damul, and p. 44, Vol. xi. of the Madras Lit. Journal gives his report of the gold that he saw there, in the bed of a rivulet at Sattoor, a few miles from Dhoni, in the Kupputgode range of hills near Damul. Also in the sands of the Hurti rivulet, in the same range, a few miles to the south of Gudduk; and he mentions that gold likewise exists in the Kir talook of the Dharwar collectorate, near Chik Mulgoond. The gold of the Kupputgode range seems mixed with silver, for he obtained a small button of that metal from the auriferous ore collected in the sands near Dhoni, and he subsequently discovered a grey silver ore in a fragment of quartz that he picked up there. There has not been recorded any account of the products of the washings of Malabar, but in washing the sands of the Kupputgode range, there remains a black sand (menachanite) which Captain Newbold supposed to be probably derived from the decomposition of the dykes of basaltic rock, or the greenstone and hornblende rocks in the vicinity. Native gold-washers are in the habit of going out after the monsoon and washing the heavy deposits of crushed quartz (detritus) which the rains bring down from the Kupputgode Hills. Dr. Clarke, of Australia, however, having written to the Bombay Government informing them that, having studied a geological map of India, he could point out to them, with certainty, where gold must exist, the Government appointed Captain Aytoun, of the Bombay Artillery, to survey the Kupputgode Hills, and report whether they contained gold or iron. Captain Aytoun in 1852, found gold in the sand forming the beds of nullahs, which are mountain torrents in the rainy season and almost dry during the rest of the year. The particles of gold were, however, almost infinitesimal. An Australian colonist, Mr. Le Souef, who had come to India on other business, having heard, mention of Capt. Aytoun's discovery examined the locality and reported that he had, as he says.

'Found gold in payable quantities in the bed of a small river, close to the village of Soortoor, and bearing about west from it. This river extends for many miles, and at every place—say every 500 yards, for about eight miles in the bed of the creek, where I washed the drift, I found gold. I also sunk two shafts to make sure that gold existed in the bed rock, and from a handful

of dirt taken from one of these holes I obtained gold. The other pit filled with water so rapidly that I was unable to descend to the bottom. To work the bed of this river with advantage and profit it will be necessary to have it drained .....In one of my letters from Dhonee I stated that I had found a promising quartz reef, and that in a few days I should be able to report upon its gold-bearing qualities; but upon reflection I thought it better to abandon the idea of opening up a reef until I had made sure of the existence of fluvial or alluvial gold. Now that I have ascertained this fact, I would advise that one reef be opened at Dhonee and the other at Huttee Kuttee. It is my firm opinion that the part of the territory I have surveyed for gold had not been ocean-submerged, and, consequently, that these quartz reefs will give a more constant return of gold than those of Australia. I may mention that the majority of the reefs in the Kupputgood Hills run nearly north and south; all gold-bearing reefs in Australia and California run in this direction."

Subsequently Mr. J. Schott wrote to the Times of India stating that the geological position of this part of the country points out the presence of gold; yet there are so many obstacles to the profitable working of it that, he adds, I am surprised so much thought has been bestowed on the matter. The quartz he says, occurs in strata very much contorted, and is consequently found piercing the rock in all directions of the compass. The quartz, also occurs principally as small leaders or veins, and anything like a permanent and workable reef is rarely met with; but, independent of this as steam power is the only means we can employ to reduce a large quantity of quartz in the shortest possible time, the absence of timber for timbering up the mine, as the process of excavation proceeds, in the shaft and tunnels; also to burn the quartz after the manner of lime in order to free it from the many volatile and pernicious metals which too often interfere with the process of amalgamation if crushed in the crude state, the positions are so few in which alluvial mining is carried on by the natives, and also the results are so insignificant, added to the total absence of coarse gold, he concludes that the reefs are worthless, and, could discern nothing in them to warrant the belief that they are payable. The alluvial deposits, he confidently stated will never pay, as the deposit in which the gold occurs is confined to a few insignificant nullas and blind water courses, occupying the slopes and flats, the bed rock in every case being exposed more or less, denoting a very scanty supply of wash-dirt, the native gold washers (a very limited body) confining their operations to a stratum not exceeding five inches in depth. Twelve days work at Soortoor yielding from two to three rupees worth of gold, (about a penny weight) and he never in the whole course of his experience met with such careful and effectual washing as theirs, surpassing even the Chinese, who in Australia are considered perfection in that respect. I may here remark, he adds, that the country between Belgaum and Dharwar presents to the eye of the experienced far greater inducement in a geological point of view to prospect than the Dumal Hills; and should any one be induced to make a trial, let them always bear in mind that quartz to be payable ought to show gold, say in every third or fourth piece broken.

Ceded Districts, Bellary. Further to the east, the same kind of black sand is mixed with the gold found in the bed of the river at the village of Canahelly, near Bellary. It has been reported that gold has been detected in the Cuddapah collectorate, but it seems unlikely to have escaped the notice of Dr. Voysey, who mentions the fact of a large proportion of silver being found in the sulphuret of lead discovered 15 miles in a N. E. direction from the branch of the Penaar, south of Cuddapah. The only other places, in the Ceded districts, where gold is authoritatively mentioned as occurring, is at Suttangul, where Heynes at p. 343 of his Tracts describes it as having been discovered near Royacottah, not far from Pangampillay, near Hurrydroog.

There seems no doubt that the gold in these auriferous rivulets is only washed down from the neighbouring hills, and many years ago Captain Newbold suggested that the sands should be carefully examined every 40 or 50 yards, and the spot where the particles of gold no longer appear, most diligently explored, the adjacent rock laid bare, and if necessary an excavation made into it, but with our more perfect knowledge, now, of the matrices of this ore, the explorer, hammer in hand, might strike at once at the veins of quartz that traverse the rocks adjacent to the gold rivers.

Near Canevehully in the Bellary district, a nullah takes its rise about a coss from Bavehully taluk, a hamlet of Mydoor in the Harpunhully taluk, at a hill called Jageracullygoodda. There is also another nullah called Shegahulla rising in the same hill and runs into the Baegaly tank, where they say gold sand was formerly found. A man

cannot procure more gold than will pay him for his days labour.

Central Provinces. Further north in the Central Provinces, Mr. Burr describes gold as occurring in many of the rivers in the Nagpore district, and gold dust is now found in beds of rivers at Purnalia, Chota Nagpore. Gold dust is extracted from sand in the beds of rivers in Manubhoom and Palamow, but not in large quantities. Gold dust is found in the Paiqdhur nullah, in the Seonee district. The little stream rises in the Konye range of hills, and falls into the river Wyne-Gungah. The gold is obtained by washing the sand, and the natives say they never get more than four annas worth by a days work, and would consider it unlucky if they did, as the goddess who is supposed to make it would then leave their locality.

Gold is found in the Balaghat, being washed in the Deo and Son rivers, in the Sonbera nulla near the Panchera ghat in the Dhansua pargannah, and in the Nara river of the Mau tract; but the quantity obtainable scarcely repays the labourers.

Gold is also washed in the sands of the Banjar river, an affluent of the Nerbuddah.

Gold is washed in Bastar from the sands of the Kutri river, and towards Prattapur, and in the forks of the Kutri and Indravati rivers.

Gold particles are found in some of the nallas of the Chandah district, and diamonds and rubies were formerly obtained near Wairagurh.

Hyderabad. In the Hyderabad Territories, gold has been mentioned as occurring at Goodaloor, or Godalore, on the Godavery, where the late Dr. Walker, (p. 184 of Vol. XVI. of the Madras Lit. Society's Journal,) mentions its occurrence, where the Ramghere and Cummumet Circars meet, and also in several nullahs that feed the Godavery from the south. It is washed for, also, in the bed of the river, nearly opposite Marrigudum, in the Nuggur taluk, also where the Kinarsani nalla falls into the Godavery a little below Badrachellum.

Dalrymple's Oriental Repository (Vol. II, p. 472) mentions that in the bed of the Godavery near its debouchure are found, amethyst, garnet, crystal, onyx, and jasper, and that gold dust, is found in many places so soon as the monsoon floods have subsided.

Northern Circars. Gold washing is carried on at Sumbulpore and Cuttack and also in the beds of the Mahanuddy and its affluents. According to the late Mr. Mason, the natives obtain a little gold by washing in the streams near Vizagapatam. As we turn southwards, however, we do not observe mention made of any gold in the Masulipatam or Guntoor collectorates, nor do the specimens of rocks from these districts in the Central Museum indicate the presence of the ore there. In the Nellore collectorate, however, Dr. Voysey mentions the occurrence of copper in the veins of white quartz,—and at Callastry in the North Arcot collectorate, he states that the quartz rock contains lead ore mixed with silver.

Gold mines are mentioned by Heyne (Tracts p. 342) as being worked at Suttergul a few miles from Pungumpilly —(*Cat. Ex.*, 1862.)

South India. Gold, writes Mr. Burr, occurs in Coimbatore and the southern declivities of the Neilgherry Hills Capt. Newbold quotes Vol. I., p. 514 of Sir Whitelaw Ainslie's Materia Medica that gold was discovered by the late Mr. Mainwaring in the Madura district, where it occurs mineralized by means of zinc, constituting a blende which he thought resembled somewhat the schemnitz blende of Hungary.

The streams running through the Paulghaut valley, which unite about fifteen miles below Palghautcherry and form the great Ponany river, are repeatedly mentioned as containing gold; and in June 1832 Lieut. Nicolson visited Darampooray, at the foot of the Shevaroy Hills, Sattiamungalum, Donagancottah, Addivarum or Stremogoy and Metapollum, where gold, it is stated, is to be found and saw also the gold sands of Polygonuth, about 45 miles from Dindigul. Natives likewise wash for gold at the branch of the Cauvery, which runs past Darampooram.

Neilgherries. When describing the gold of the Kuppotgode range, Capt. Newbold mentions the existence of the ore around the base of the Neilgherry and Koondah mountains, in the Wynaad. Lieut. Nicolson, indeed, when working in Malabar stated that he had fairly traced the strata that contain gold in the direction of the Koondah and Mookoorty Hills, but his report was not subsequently confirmed. Gold, however, occurs in the Carcoor Pass, and at Devalla: and specimens of the rocks, from the gold mines at the latter place, are now in the Madras Central Museum, and a specimen of the gold rocks at Goondaloor. Mr. Burr, (p 72 Vol. XII. of M. L.S. J.) also mentions the southern declivities of the Neilgherry mountains as gold districts: Dr. Benza is however the only author who seems to state that gold has been found on the plateau of these hills, below Gradation Hall. It is a belief that owing to the similarity of the rocks of the detritus to the quartz veins of the Malabar coast, gold may be found in

these hills. An officer, who had been employed on the Malabar coast, for the purpose of ascertaining the existence of gold in the detritus of that coast, said that he found gold in the earth on the side of one of the hills of the Dodabetta group facing the cantonment."

Mysore. Captain Arthur of the Engineers found Native gold in Mysore, disseminated in quartz, and also in an indurated clay: also some specimens crystalized, in minute cubes. Captain Warren discovered gold in Mysore in 1800, betwixt Annicul and Poonganore, disseminated in quartz, and found it, also in the alluvial soil. Two specimens were sent by Lieut. Puckle from the vicinity of Bangalore, one in a matrix of dark blue quartz, and another in black sand, a sufficient quantity was procured to make a ring. It is not known how long the natives have been working for gold at Baitmungalum just above the ghats—but Heyne mentions that Captain Warren had learned the fact of the natives so employing themselves, in their leisure, and the fact is repeated by Sir Whitelaw Ainslie and Dr. Clarke, the latter of whom remarks that gold was discovered in the eastern provinces of Mysore by Lieut. Warren of H. M. 33rd Regiment in 1802,—who found it in the small nullahs or ruts or breaks in the ground at Warrigum, a small village 4½ miles S. W. of Baitmungalum, also on the banks of the Palar river, and the Ponian near Caargory: He found gold also at Marcoopium three miles south of Warrigum, where mines were worked by natives which had also been worked by Tippoo. Heyne likewise (p. 41) states that gold has been found near the hills to the S. E. of Ooscottah, and Newbold describes gold as having been discovered by Captain Warren, near the Batterine hills. These sites in Mysore might all be carefully examined, and the river ore traced to its matrix. The glacis-like slope at the foot of the Mysore hill facing the town, where a crumbling grey chlorite rock exists, might also be looked at. On the right hand side of the Mercara road, about two miles west of the town of Hoonsoor a whitish sand will be observed, in which, if washed, gold may be detected and it might be looked for also between Yeddadora and Saligram, about 18 miles from Hoonsoor.

The matrix rocks from the gold districts of the Madras Presidency, consist of steatite and ferruginous quartz; and such rocks are abundant in Mysore and Madura. Indeed among the steatite and quartz specimens which the Rev. Mr. Muzzy contributed from the Madura district, several closely resemble the rocks from the gold mines at Devalla and other places on the Western Coast. Gold, it is understood, was obtained in the Madura district, by the late Mr. W. Mainwaring, in a native sulphuret of zinc (blende).

Ceylon. Gold has been discovered at Saffragam in Ceylon. Ilam is said to be the Tamil name of Ceylon and to signify gold, but gold in Tamil is Ponnu.—*Trans-Himalayan and Trans-Gangetic.*

Central Asia. Wood mentions a torrent in Wakhan called Zerzamen, probably Zarzamin, "Gold-ground," He also says (p. 382.) all the tributaries of the Oxus are fertile in gold. Gold dust is also imported from Elache, in Khotan. (*Yule Cathay.* I. p. ccxxxvi. *Afghanistan.*)

Afghanistan. Gold and lapis lazuli are found at Huladat, near Bamian, and at Istalif north of Cabul, also in the Cabul river and auriferous rocks occur near Candahar.

Punjab Salt Range. Gold is found in minute scales in the sandstone of the Salt Range, in a lower range of hills running parallel to the Himalayan chain, between the rivers Indus and Jhelum and it is also found in small quantities in the sands of the Indus, Jhelum, Beas, and Sutlej; but the occupation of gold-washing is not very remunerative, amounting on an average to not more than from 3d. to 6d. a day, and the proceeds of the annual lease of gold-washing amounted for one year only to £84.

Tibet. Gold is found on the banks of the Basha stream, in Little Tibet. Vigne has no doubt that the drun or marmot of Little Tibet, are the "ants as big as foxes" noticed by Herodotus as throwing up gold. Nagyr is celebrated for its gold washings. Tavernier tells (p. 156) that "toward the Thibet, which is the ancient Caucasus, in the territories of a raja, beyond the kingdom of Chachmeir, there are three mountains close one by another, one of which produces excellent gold, the other granats, and the third Lapis Lazuli.—(*Tavernier Travels*, p. 156.) Thokjaluug in latitude 32° is the chief gold field of Western Thibet. It is a large desolate plain about 16,000 feet above the level of the sea, and in 1868, the Pundit sent by Captain Montgomerie saw a nugget weighing 75 tolas, or 2 lbs. In Thibet the gold fields are said to extend from Rudok to Lhasa, or eleven degrees of longitude = 700 miles. They also extend northerly, to between Aksu and Ili. Numer-

ous parts of Central Russia and China, also contain gold.

Indus and its neighbourhood. The Indus flood of 1842, strewed with gold the fields of Chuch, above Attock, and the sands of the Sutlej and other Himalayan rivers also contain gold. Dr. Thomson found a number of people a little below Khapalu washing the sand of the Indus for gold; but the produce seemed to be very trifling, and the work is only carried on during winter, when labour is of no value for other purposes. He purchased for a rupee (paying, he believes, a good deal more than the value) the produce in gold-dust of one man's labour for three weeks. He supposed, however, he only worked occasionally.—(*Dr. Thomson's Travels in Western Himalaya and Tibet*, p. 212.)

Kamaon Captain Hardwicke says, gold can be obtained from sand, in the Sirinagur district. The rivers of Kumaon abound in gold-dust, and this precious metal is sometimes found in large pieces. There is a gold mine at Dango Bookpa, twelve days journey S. E. of Mansarowar, and very lately they say one has been discovered between Goongeoo and Mansarowar, which was immediately shut up by orders from Lhassa. The people told Captain Gerard that after the sand of the river is washed so as to be free from all the lighter particles, it is mixed with quicksilver, and the gold is detected by observing the pieces tinged by that metal, which is afterwards evaporated by heat.—(*Capt. Gerard's Account of Koonawur*, p. 155.)

Gold is obtained from the sands of the Indus and between Attock and Kalabah, about 300 persons are employed in washing the sand for gold, which occurs in small flattened grains. (*Hist. of the Punj*, Vol. I, p. 43—45.)

Gold has been supposed to occur only in sand, washed down in greater or less abundance by the rivers of the Punjab. A Murree correspondent of the Delhi Gazette however, said that while sinking an experimental shaft in connexion with the proposed tunnel, on the banks of the Indus, a veritable gold mine was discovered. Under the stratum of slate a deposit of rich auriferous quartz was found. From the specimens, the mineral seemed to contain a large proportion of gold.

Dr. Cleghorn mentions that a little gold-dust is brought across the higher range through Chilas from the valley of the Indus where gold washing is carried on to a considerable extent.—(*Cleghorn Punjab Report*, p. 178.)

In the tertiary formations of the Salt Range, gold is found in minute scales, and has doubtless been derived from plutonic and metamorphic rocks, the disintegration of which has furnished the material of which the strata of the series are composed and in the beds of numerous nullahs which flow through the "meiocene" formations, the sand is washed for gold. Gold seems to be obtained in the largest quantity towards the Indus, north of the Salt Range. The gold washings of the Salt Range are nearly all in the Jhilam district. In the year 1850, 158 cradles were at work, and they were taxed from Rs. 2 to 5 per "troon;" the total tax amounted to Rs. 525. In the streams where gold-sand is washed, grains of platinum are occasionally found in small quantities; the gold seekers call the metal "safed sona," and reject it as useless, platinum has also been found in the Tavi river of Jammu territory, and in the Kabul river at Naushera.

At the Lahore Exhibition of 1864, there were specimens of gold from Karrar on the Markanda river in the Amballa district; from Spiti; from the Beyas near Haripur in Kangra district, from Lahaul, from the Jhilam river, from Kas Gabhir in the Jhilam district, from Attock and Hazara.

Gold has been found in large quantities between Umballa and Kalkah. In the neighbourhood of Pateealah is a small mountain stream, where gold is washed for by the Soonjbir or gold-washers.

Hindustan. Gold is obtained in the sands of the river Beyas: in those of the Gumti river: at Jompole:—in sand in the Moradabad district.

Assam. In Assam at Heerakhond, where diamonds also occur. Tavernier tells us (Travels p 156) that gold, "comes from the kingdom of Tipra, but it is coarse, almost as bad as that of China." Gold dust is washed in the Dikerie river in the Tezpore district, but all the rivers in the North of Assam probably contain the auriferous metal, and on approaching the, small strata that exist in the hills, the grains of metal found are of larger size. The value of the gold on the spot is rupees 16 for a quantity of the weight of a rupee. The Assamese use no cradle. A spot is selected and after digging down 4 or 5 feet, the sand is taken out and washed by passing water over it in any long leaf found at hand. The dust is then put into a small wooden or brass cup and a small quantity of quicksilver added, the mass is then gently moved together, the mercury taking up the gold and leaving the sand. The water is then drained

off and the mercury with the gold placed in a piece of charcoal, the centre of which has been hollowed out; this is then put into the fire and the smelting takes place, the gold-finder using a piece of bamboo as a blow pipe: when the whole mass is red hot, the charcoal containing the gold is taken out, dropped into water, and the shining metal appears. (*Cat. Ex.* 1862.) Gold also occurs in the Dirjumosh River, Assam.

In Burmah, gold dust is washed from the sands of many streams. It is found near Bamo; also in the streams of the Kyen-Dwen river, and in the sands of the streams in the vicinity of the coal mines of Thingadhau. The washings in Burmah are principally amongst the streams to the eastward of the Irawadi, though those to the west also yield it. The Kibiung stream is one in which it is thus sought. There are gold washings on a small scale, in many of the rivulets both of Pegu and of the valley of the upper Irawadi and of the Kyen-dwen which may have been more productive in ancient times. Gold is successfully washed in the streams, feeding the Irawadi near Thika-dau, but never with any system or skill. (*Oldham in Yule's Embassy*)

Auriferous deposits occur in the vicinity of Shoay Gween in the Province of Martaban. The gold discovered both in Assam and Martaban is of considerable purity, the latter, Mr. Oldham considers fully equal in value to the average quality of Australian gold. Though not quite so abundant as in California, yet there is, perhaps, no mineral, except iron, more universally diffused over the Provinces, than gold. It is found in the lead near their northern boundary. Gold is deposited by the Nars rivers at the mouth of the Martaban stream, a tributary of the Shoay Gween river. It is washed in the Meh-Tyne stream, also a tributary of the Shoay Gween river; it is deposited at the bottom of the Shoay Gween river and is washed in the Mehwine stream, a tributary of the Beeling River.

Malay Peninsula and Eastern Archipelago. This metal, is found in sufficient abundance to be worked, in the Malay Peninsula, Sumatra, the Northern Western and Southern sides of Borneo, the Northern and South-Western Peninsulas of Celebes, and in a few parts of the great Philippine islands of Luzon and Mindano or Magindanao. It has been coined for money at Achin, but in no other part of the E. Archipelago. Mr. Logan estimates the total produce of the Malay Peninsula at no more than 20,000 ounces: it is washed from the sands of the Tenasserim on the south, and the streams that tumble from the high granite mountains between Yay and Monmagon are constantly 'rolling down their golden sand' into the valleys around. It has been collected in small quantities, in the tin deposits east of Tavoy. Mr. O'Riley found gold in the tin from Henzai, half a degree south of Yai, and "almost all the creeks," says Dr. Helfer, "coming from the eastern or Siamese side of the Tenasserim river, contain gold. The greatest quantity is obtained close to the old town of Tenasserim where people wash it, and obtain sometimes one anna's weight each, during the rainy season." The richest deposit of gold in the Tenasserim Provinces, is, however, at the head waters of Tavoy river, where it is found in an alluvial or diluvial formation of red earth and pebbles, very similar to that in which gold is found in North Carolina. On the east side of the mountains, at the base of which the deposit rests, "the Siamese Government," says Dr. Morton, "have several hundred men permanently occupied, each of whom it is said is expected to deliver one tickal (about one rupee and a quarter) weight of gold dust per annum,—The Burmese authorities in former times also employed people in this work at the streams on the British side of the boundary, but though the quantity then procured was greater than at present, this does not appear to have ever been considerable. The method adopted is that of digging a longitudinal excavation in the sand, and washing from time to time the deposit found therein." On one occasion, the head native officer in Tavoy made an experiment at "the diggings" on Tavoy river, and by the washings, of nine days, obtained gold to the value of about ten rupees. This gold appears to contain a considerable proportion of silver. Mr. O'Riley says that the Assay Master at the Mint in Calcutta reported it.

Gold.....	87·895
Silver	9·244
Base metal,.....	2·864
	100·000

Gold is found in Nanning, near the hill, Buket Jalatang. But, in the Malay Peninsula gold is chiefly got at Ulu Pahang, Tringanu, Kalantan, Johole, Gominchi, and Jellye, at Reccan and Battan Moring, and other places, at the foot of Mount Ophir.

Ophir is a detached mountain thirty or forty or fifty miles east of Malacca, its height calculated at 5,693 feet. Gold dust is found abundantly near its base, which, at an early period, gave it the name Ophir, and later

suggested it as the source of Solomon's wealth, the Aurea Chersonesus of antiquity. It occurs there disseminated, and in thin granular veins, in quartz, and in alluvial deposits, such as beds of streams. It has been found near beds of tin ore.—(*Newbold's British Settlements*, Vol. I., p. 431. *John's Indian Archipelago*, Vol. I., p. 76.)

In all the larger specimens seen it is disseminated in small particles, and in streaks in quartz. Like the tin ore it has not been seen in the undisintegrated rock. (*J. I. A., No.* 11, *February* 1848.)

Siam. Gold is found in Siam, at Bang Taphan in the province of Xamphon, at the foot of the Three hundred peak Mountains. Crawfurd, had never heard of any attempt at estimating the amount obtained at Sumatra, Celebes, or the two Philippine Islands. (*Crawfurd Dict. page* 14.) The gold deposits of the Malayan Peninsula, Sumatra, Celebes, Timor, and New South Wales, are only found on the side of the range opposite to that against which the volcanic force has been directed.

Archipelago. The gold of the Archipelago at one time was imported into Calcutta. Mr. Crawfurd (Vol. XIV., p. 483) gives a table showing the amount so received from 1801 to 1814, from the west coast of Sumatra, and from Borneo and the rest of the Archipelago, a total of 146,195 ounces valued at £621,328,,15.

Sumatra. In the Island of Achen or Sumatra, after the rainy season, when the torrents are wasted, Tavernier says they find veins of gold in the flints, (quartz?) which the waters wash down from the mountains that lie toward the North-east. Upon the West-side of the Island, when the Hollanders come to lade their pepper, the Natives bring them great store of gold, but very coarse metal, if not worse than that of China. (*Tavernier's Travels*, p. 156.)

Borneo. Gold occurs in lumps in the alluvium of a mountain in Sarawak, named Trian. Several of the lumps weighed from three to four bunkal, and they were rarely less than one or two amass in weight. The produce of the Western side of Borneo, by far the largest, has been estimated as low as 52,000 ounces, and this, by parties, reckoning the Chinese population of the same country, most of it engaged in gold washing, as high as 25,000. On the other hand, Sir Stamford Raffles estimated the total annual produce of the Western part of Borneo as high as 225,335 ounces, which, at the value of 3*l.* 17*s.* the ounce, would give a total value of 867,539*l.*

Mr. Earl examined the gold mines in the neighbourhood of Montradok. Those nearest were about four miles to the eastward, the gold being found in stiff soil. The soil which contains the metal is found in small veins from eight to fifteen feet below the surface. If the depth of the vein be less than ten feet, a trench is dug, the whole of the upper stratum being removed, but if deeper, a shaft of three feet square is sunk perpendicularly into the vein, and the miner works into it about ten feet in both directions, sending the ore up in baskets. When it is all removed, another shaft is sunk into the vein twenty feet beyond the first, and the miner works back into the old excavation, extending his labours ten feet in the opposite direction. The gold is found in very small particles, for the most part as fine as sand. Large specimens, however, are occasionally found, not in lumps, but in small irregular pieces joined together by integuments, much resembling lead that has been melted and afterwards thrown into water. The gold dust is often adulterated with a glittering sand called passir B'rni or Borneo sand, from the place whence it is procured. (*Mr. Earl*, p. 286, 287.)

In Borneo, the gold which is found in alluvial soils is that of which the supply is most to be depended on. This, in Sarawak, is found and worked in many places, principally by the Chinese, though the Malay also occasionally work it on a smaller scale. It is not found in veins in any part of Sarawak, but in small particles distributed through the soil, nor does it extend to any great depth. Sir Stamford Raffles calculated the number of Chinese employed in the gold mines at Montrada and other places on the western side of Borneo at not less than 32,000 working men. When a mine affords no more than four bunkal (weighing about two dollars each, or something less than a tahil) per man, in the year, it is reckoned a losing concern, and abandoned, accordingly. Valuing the bunkal at eighteen Spanish dollars, which is a low rate of estimation, and supposing only four bunkal produced in the year by the labour of each man, the total produce is 128,000 bunkal, worth 2,224,000 Spanish dollars, equal to 556,000*l.*, at the rate of five shillings the dollar. But it is asserted, that upon the general run of the mines, seldom less than six bunkal per head has been obtained, and in very rainy seasons seven. Taking the medium at six and-a-half bunkal, the 32,000 Chinese will procure 208,000 bunkal, which, at eighteen Spanish dollars the bunkal, is 3,744,000 Spanish dollars, equal to 936,000*l*

(*Raffles' History of Java, Vol. I., p.* 236; *Mr. Low, Sarawak, Inhabitants and Productions, p*, 22, 23.)

The Borneo gold is very pure, and is worked with considerable profit by the Chinese. On one occasion, rain fell in great quantities in Sarawak, and a considerable portion of the face of the mountain called "Trian" was washed down into the plains below. The deposit was found to abound in gold, and afforded work for fully two thousand men for about a month or six weeks, and it was reckoned that at the smallest average, they procured a bunkal a month per man. The gold was in lumps, and not in dust, several of the lumps weighing from three to four bunkal, and they were rarely less than one or two amass in weight. This corroborates the statement in Mr. Low's work, though it is contrary to the received opinion, and the experience of the workings in the Brazils, where gold is rarely to be traced to the neighbouring mountains. (*Journal of the Indian Archipelago*, No. X. October 1849, p. 681.)

Celebes. According to Professor Bikmore (p. 378) gold is found in great quantities in Celebes. It occurs over all the northern peninsula from the Minahassa south to the isthmus of Palas. Tavernier also relates that "Celebes or Macassar produced gold which is drawn out of the rivers, where it rowls among the land." *Tavernier's Travels*, p. 156.)

Japan. Gold is found in many parts of the Japanese empire, sometimes it is obtained from its own ore, sometimes from the washings of the earth or sand and sometimes it is mixed with copper. The quantity in the country is undoubtedly great. An old Spanish writer of the seventeenth century tells us that in his day the palace of the emperor at Yedo, as well as many houses of the nobility were literally covered with plates of gold. In the beginning of the Dutch trade the annual export was £840,000 sterling and in the course of sixty years the amount sent out of the kingdom through the Dutch alone was from twenty-five to fifty millions sterling. Silver mines are quite as numerous as those of gold. In one year the Portuguese, while they had the trade, exported in silver £587,500 sterling: copper, lead, quicksilver, tin and iron also occur in Japan.

Thunberg tells us that the richest gold ore and which yields the finest gold, is dug up in Sado, one of the northern provinces in the great island of Nipon. Some of the veins there were formerly so rich, that one catti of the ore yielded one, and sometimes two, thails of gold. But of late "he says" he was informed the veins there, and most other mines, not only run scarcer, but yield not near the quantity of gold they did formerly, which we were told, was the occasion, amongst other reasons of the late strict orders relating to the trade and commerce with use, and the Chinese. There is also a very rich gold sand in the same province, which the prince causes to be washed for his own benefit, without so much as giving notice of, much less part of, the profit, to the court of Jeddo. After the gold mines of Sado, those of Surunga were always esteemed the richest, for besides that this province yielded at all times a great quantity of gold-ore, there is some gold contained even in the copper dug up there. Among the gold-mines of the province Satzuma, there was one so rich, that a catti of the ore was found upon trial to yield from four to six thails of gold for which reason the emperor hath given strict orders, not to work it for fear so great a treasure should be exhausted too soon. A mountain on the gulf Ookus, in the district of Omura, which had leaned on one side for a considerable time, happened some years ago to fall over into the sea, and there was found at the bottom of the place where it stood, so rich a gold sand, that, as I was credibly informed, it yielded one half of pure gold. It lay somewhat deep, and was to be fetched up by divers. But this rich harvest lasted not long, for a few years after, in a great storm and extraordinary high tide, the sea overflowed all that stop of ground, and covered at once these estimable riches with mud and clay to the depth of some fathoms. The poor people in the neighbourhood still busy themselves washing the sand about this mountain, which contains some gold, but in so inconsiderable a quantity, that they can hardly get a livelihood by it. There is another gold-mine in the province Tsikungo, not far from a village called Tossino, but so full of water, that they cannot go on with working it. However, the situation of the mine is such, that by cutting the rock, and making an opening beneath the mouth of the mine, the water might be easily drawn off. This was attempted accordingly, but as they went to work, there arose of a sudden such a violent storm of thunder and lightning, that the workmen were obliged to desist and to fly for shelter, which made the superstitious vulgar believe that the tutelar god and protector of the place, unwilling to have the bowels of

the earth committed to his trust, thus rifled, raised this storm purposely to make them sensible how much he was displeased at this undertaking. Nor was there any further attempt made since, for fear of provoking his anger and wrath still more. Such another accident, and which had the same effect, happened at the opening of a gold-mine in the island of Amakusa, for it was so suddenly filled with water, which broke out of the mountain, and destroyed all the works, that the miners had scarce time to escape and to save their lives. (*History of Japan*, Vol. I, p. 107 and 108.)

As for silver-mines, there are none in all Asia but only in Japan, but some years since at Delegora, Sangora, Bordelon and Bata, have been discovered plentiful mines of tin, to the great damage of the English, there being now enough in Asia of their own besides. (*Tavernier's Travels*, p. 157.)

Cochin China. Perhaps, in no part of the world, is gold found in such quantity or with less trouble than in Cochin China; nay, it would appear, from the description of that kingdom which is given in the Asiatic Annual Register for 1801, that gold there is almost taken pure from the mines, which are near the surface of the earth. (*Ainslie's Mat. Med.* p. 54.)

China. In China, gold is collected in the sands of the rivers in Yunnan and Sz'chuen, especially from the upper branch of the Yang Tsze-kiang called Kinsha-kiang or Golden Sanded River. The largest amount is said by Sir John Davis to come from Li-kiang-fu near that river and from Yung-chang-fu on the borders of Burmah. It is wrought into personal ornaments and knobs for official caps, and beaten into leaf for gilding, but is not used as a coin, nor is much found in market as bullion. Silver also is brought from Yennan, near the boarders of Cochin China and the mines in that region must be both extensive and easily worked to afford such large quantities as have been exported during the last five years. (*Williams' Middle Kingdom*, p. 144.)

Tavernier also tells us there comes gold from China, which the Chinese exchange for the silver which is brought them. For price they love silver better than gold, because they have no silver mines. Yet it is the coarsest metal of all the Asiatic gold.—*Tavernier's Travels*, p. 156. *Ainslie's Materia Medica*, p. 54. *Williams Middle Kingdom*, p. 144. *Times of India. Calcutta Review. GOLDAR. Duk. Sterculia guttata

GOLDEN ISLAND or Chinsan, is in the middle of the Yang-tse Kiang, or great river of China, where the width is near three miles. It is the property of the emperor. It is interspersed with pleasure-houses and gardens, and contains a large monastery of priests, by which the island is almost entirely inhabited. A vast variety of vessels in form and size are constantly moving about on this large river. *Macartney's Embassy*, Vol. I p. 27.

GOLDEN EAGLE, the Aquila chrysaetos, occurs in High Asia. Atkinson (p. 493) figures a young hart seized by a trained Golden Eagle; and the species appears to be C. elaphus. Pennant remarks in his Asiatic Zoology, that—"the independent Tartars train the Aquila chrysaetos for purposes of falconry for the chace of hares, foxes, antelopes, and even wolves. The use," he adds, "is of considerable antiquity; for Marco Polo, the great traveller of 1269, observed and admired the diversion of the Great Khan of Tartary, who had several Eagles, which were applied to the same purposes that they are at present;" and in the Naturalist for May 1837, (as quoted by the late Mr. Yarrell, in his History of British Birds,) we read that—"Captain Green, of Buckden, in Huntingdonshire, has now in his possession a splendid specimen of the Golden Eagle, which he has himself trained to take hares

and rabbits." Such a bird would be decidedly prone to pounce upon dogs, calves, sheep, &c.; and young children would be scarcely safe from it. The Lammergeyer (Gypaetos), is the so called 'Golden Eagle' of the Himalayan residents. *Indian Field.* See Birds.

GOLDEN FOOT. A title of the king of Burmah.

GOLDEN STREAM. The Chrysorrhœa of the ancients, is the Barrada river of Damascus.

GOLDEN-THREAD ROOT OF ASSAM. Coptis teeta.

GOLD EMBROIDERY. Many of the sarees, or women's cloths, made at Benares, Pytun, and Boorhanpoor, in Guzerat; at Narrainpett, and Dhanwarum, in the territory of His Highness the Nizam; at Yeokla in Khandesh, and in other localities, have gold thread in broad and narrow stripes alternating with silk or muslin. Gold flowers, checks, or zigzag patterns are used, the colours of the grounds being green, black, violet, crimson, purple, and grey; and in silk, black shot with crimson or yellow, crimson with green, blue, or white, yellow with deep crimson and blue, all producing rich, harmonious, and even gorgeous effects; but without the least appearance of or approach to glaring colour, or offence to the most critical taste. They are colours and effects which suit the dark or fair complexions of the people of the E. Indies; for an Indian lady who can afford to be choice in the selection of her wardrobe, is as particular as to what will suit her especial colour—dark or comparatively fair, as a lady of Britain or France. India in this manufacture stands unrivalled, and it makes some very gorgeous shamianahs and elephant saddle cloths

The gold and silver fancy fringes of Hyderabad are well known in India. Solid silver wire fringes and ornaments are made in Madura but they are surpassed by the silver thread of Hyderabad.

In the embroidered fabrics of India, it may be mentioned as a principle, that patterns and colours diversify plane surfaces without destroying or disturbing the impression of flatness. They are remarkable for the rich diversion shown in the patterns, the beauty, distinctness and variety of the forms, and the harmonious blending of several colours.

The oriental races have ever been celebrated for their skill in this art of embroidery which appears to have been practised in Assyria and introduced from thence into India. Pliny, however, mentions that it was a Phrygian invention, and in Rome embroiderers were called Phryigiones. In Babylon, clothes were woven of different colours and called Babylonica. During the early part of the middle ages, Europe obtained its most important embroideries from Greece and the East.—*J. B. Waring. Master pieces of Industrial Art. Exh. of* 1862. *William's Middle Kingdom* Vol. II p. 123. *Royle, Arts of India, &c.*, p. 506-507.

Burhanpur contains 8,000 masonry houses and a population of 34,137, most of whom are dependent in one way or other on the wire-drawing and cloth weaving industries of the place. The value of its fine fabrics depends mainly on the purity of the metals employed in the composition of the wire, and to secure this the wire-drawing has always been kept under government inspection. A hereditary tester called the "chaukasi" received and assayed all the silver and gold brought to the "taksal," or mint, (where the Burhanpur rupee was also coined), and here the wire was drawn out to a certain degree of fineness before being allowed to pass again into the hands of the manufacturers, an arrangement still continued by the British. The drawing now takes place only at Burhanpur and Lodhipura, a suburb of the old city. The silver bars are covered with a thin gold leaf weighing from four to forty-two masha, (of fifteen grains troy each); to each pasa, that is, from about half to six per cent. on the amount of the silver. The number of masha employed is called the "rang," (colour) of the wire. The adhesion appears to be effected purely by mechanical skill on the part of the workmen called "Pasa Tania." It is then passed by the same workmen through a series of holes in steel plates of diminishing size by manual power applied by means of a spoken wheel of the rudest construction. It is passed through forty of these holes before it leaves the Taksal, and is then reduced to about the size of an ordinary sodawater wire. Thence it goes into the hands of another set of operatives called Tania, who still further reduce it through a gradation of forty more holes, the last of which is as fine as a human hair.

Their apparatus is of somewhat more delicate construction, but the work requires neither the same skill nor hard work as the first operation. The wire is drawn by them down to various degrees of fineness, according to the work for which it is destined. The round wire is then given to the Chapria, who flatten it into an almost impalpable film, by hammering between two polished steel surfaces, an operation requiring, it is said, superior skill. In this state it is term-

ed "badla," and is used for some few sorts of work. The greater part of it has, however, to be spun into a thread along with silk before being woven up. This is done by persons called Bitai, who use no sort of apparatus for the purpose, excepting a couple of wooden spindles twirled by the hand. Indeed the beauty of the result obtained by such primitive implements must strike every one with amazement. The layer of gold on the finest wire must be of almost inconceivable thinness. The mixed thread is called "kalabatun," which is woven into the kimkhab and other brilliant fabrics worn by rich natives on high occasions.

The wire-drawers were originally Pathans introduced from Upper India by the emperor Akbar, but now all castes work at the trade. The fabrics are of many different sorts many of them of great beauty. Kimkhab (vulgarly kincob) which is of mixed silk and gold thread, is now little made in Burhampur, the Ahmedabad and Benares articles, from being produced both cheaper and nearer the great markets for such staffs, having driven it out of the field. The same may be said of mashrua, a fabric of silk warp with the woof of cotton thread wrought with a pattern in Kalabatun, though made to a small extent it is greatly inferior to the produce of Ahmedabad. The chief fabrics still made in the city are zari, a very rich light stuff in which the flattened wire is interwoven with silk in the warp, with a thread woof, chiefly made up into scarves and saris worn by females on wedding and other high occasions. Selari is half silk and half thread, with brilliant edging and borders of silk and gold thread, mostly in the form of saris and dopattas, Pitambar all silk with the same edging is a better sort of the same. Turbans, shashes, &c. are made in all these fabrics. The gold thread also is much woven up with silks into rich borders and edgings, exported to be attached to the cloth manufactures of other places, silk for these cloths is all imported, it is mostly from China; generally spun and dyed in fast colours at Puna, a little however is spun in the city from the material imported raw. The cotton-thread used is extremely fine, and is both English and made on the spot. The former costs in Burhanpur exactly one-fourth of the latter but it is greatly inferior both in strength and cleanness. The closely-twisted native thread breaks with a sharp crack, while the English article from its fluffy open character, parts without any noise. The English thread, from its greatly superior cheapness, has however, supplanted the native for all but the finest stuffs. The city thread is spun by the families of the weavers and others, the best being produced by the Palahi (Dher) caste. A coarser thread is generally spun throughout the country by the women of almost every caste. It is woven into every description of common cloth by the Burhanpur weavers, even the best of them, when out of fine work, having to take to the commoner stuffs. The latter now greatly preponderate in quantity, and it is said that every day the demand is getting smaller for the finer qualities. It is not difficult to account for this. The supersession by the rough and ready Marathas of the luxurious mahomadan princes and nobles was probably the first blow to the trade.

The average earnings of the weavers range from about five to ten rupees a month, besides what their families earn by spinning, dyeing and odd work connected with the trade.—*Dr. Watson.*

GOLD AND SILVER FILIGREE WORK. The native silversmiths of Cuttack have long been noted for the fineness, neatness, and lightness of their filigree work. This kind of work is executed, for the most part, under supervision, by mere boys, whose nimbler fingers and keener eyesight are supposed to enable them to bring out and put together the minute patterns with more distinctness and accuracy than their elders can; comparative cheapness is, perhaps, another reason for their employment. The ruling rates for this filigree work are from two to two and a half rupees, that is to say, taking the first rate, two rupees or four shillings is charged for every rupee weight of finished silver work, namely, one rupee for workmanship, and one rupee as the price of the silver. The filigree work in gold, of Delhi and other places, is famed. Next to muslins, and embroidered fabrics, filigree work is that for which Dacca is most celebrated but the art is also practised in great perfection at Cuttack, and in Sumatra, and China. The articles usually made at Dacca are Lady's ornaments, such as bracelets, ear-rings, brooches, chains, necklaces, &c. and attardans and small boxes for natives. The design best adapted for displaying the delicate work of filigree is that of a leaf. It should be drawn on stout paper, and of the exact size of the article intended to be made. The apparatus used in the art is exceedingly simple, consisting merely of a few small crucibles, a piece of bamboo for a blow pipe, small hammers for flattening the wire, and sets of forceps for inter-twisting it.—*Dr. Watson.*

GOLD AND SILVER WIRE. The drawing of silver and gold (*i. e.* silver covered with gold) wire, used as thread in embroidery

is extensively carried on in several places, and Benares is celebrated for this art. There are several varieties of silver and gold thread (badla) made at Dacca, as "goolabatoon" for the embroidery of muslins and silks; "goshoo" for caps and covering the handles of chowries; "sulmah" for turbans, slippers, and hookah snakes; and boolun for gold lace and brocades. Some of it is drawn almost as fine as a hair. In the time of Aurungzebe, a quantity of this article was made yearly for the Court at Delhi. A hundred sticks covered with it, and plain gold, and silver "badla" to the amount of £2,000 in value, appear among items composing the "Mul boos Khas Nuzr" or present of royal clothing annually sent to the Emperor. The Trichinopoly filigree work is as light and elegant as that of Malta or Genoa. *Dr. Taylor.*

GOLD AND SILVER TINSEL. Among the manifold and various manufactures of China, the gold and silver tinsel cloths of Pekin stand deservedly in high estimation, their chief value arises from the peculiar property which they possess of never tarnishing or becoming discolored. The gold and silver filigree work of the Chinese, equals any ever produced by ancient Venetian masters, and their chasing in silver is unrivalled.—*Sirr's China and the Chinese*, Vol. I pp. 384, 386. See Filigree.

GOLD FISH. Cyprinus auratus, seem to have long been known in China, but were introduced into Britain only two or three centuries back. They are seldom seen in India, but are very common in the Mauritius. They are supposed to be of accidental production as they are not found wild and their fins and tails greatly vary. Mr. Hodgson mentions the tameness of the large gold fish at Japan. No sooner did they see his little girl coming to the edge of the water, than they almost rose from their natural element to gasp and gasp, with open mouths, at the bread, biscuit, or cake which she was half afraid to offer them.—*Darwin, Species, Hodgson's Nagasaki, p.* 75.

GOLDFUSSIA, a genus of plants, of which the following species are known in India. They belong to the order Acanthaceæ and occur in the Khassya Hills.

G. anisophylla	G. isophylla	G. tristis
G. dalhousiana	G. lamifolia	G. zenkeria
G. decurrens	G. pentstemondes	
G. glomerata		

GOLDINGHAM, J. for many years, the Hon'ble E. I. Company's Astronomer at Madras. He gave an account of the monolith temples of Mahabalipuram in As. Res. Vol. IV. 407 and furnished Astronomical and Meteorological observations, 3 Vols. folio. 1827. Measuring the length of the seconds, pendulum at the equator.—*Ibid.*

GOLDSMITH, one of the five artizans among the hindus of India, the other four being the blacksmith, carpenter, brazier, and stone cutter. These all wear the poitu, zonar or sacred cord, and, though hindus do not reverence brahmins: those in the Malabar country follow the rule of descent by the mother and their women are polyandrists. See India, Kummaler, Poitu, Polyandry.

GOLEEREE, a pass in the Khyber mountains. forms the great middle route from Hindustan to Khorasan, by Dera Ismael Khan and Ghuznee: crosses the Suliman range in lat. 32°.

GOLENJUN. Guz. Hind. Galangal.

GOLI. Hind. a pill; also a bullet, from gol, round.

GOLIGA, Malay, also Mantika, also Matika, Bezoar.

GOLIMIDI also Golive, also Gilagaddi. Coix barbata, *R.* iii. 569. Common in rice fields and its seeds often therefore mixed with the paddy. Hence rendered "tares, Lolium."

GOL KADDU. Hind. Benincasa cerifera.

GOL KAMILA. Hind. Glochidion, *Sp.*

GOLKANKRA. Beng. Momordica Cochinchinensis.

GOLKAR. Karn. Sons of female slaves or bondwomen. *Wilson.*

GOL-KARA. Beng. Momordica mixta.

GOLKHANDLA. Hind. A kind of imported iron.

GOL-KHUYRA. Beng. Hollyhock, Althæa rosea.

GOLKONDAH CHILLY. Eng. Capsicum frutescens. *Linn.*

GOLLA. Tel. Karn. A shepherd. A man of a caste whose duty it is to graze sheep or cattle, sometimes employed as confidential servants and assistants in public treasuries also called Gollar, &c. *Wilson.*

GOL-METHEE. Beng. Cyperus seminudus.

GOLMIRICH. Hind. Piper nigrum, black pepper.

GOL-MULUNGA. Beng. Cyperus Roxburghii.

GOL-MARICH. Beng. Black-pepper, piper nigrum.

GOLSINK. Hind. A kind of bar iron.

GOLOMI. Sans. Acorus calamus. *Linn.*

GOL SIR. Hind. Ficus glomerata.

GOLUGU. Tel. Glycosmis pentaphylla. —*D. C.* Limonia pentaphylla.—*Roxb.*

GOLUK. A hindu race in Woon.

GOLUNDA ELLIOTTI, The Coffee rat of Ceylon, occasionally commits much damage, seemingly to get the bark, for they do not seem to eat the coffee berries. With their long sharp incisors they bite off with great smoothness the smaller and younger branches, generally an inch from the stem, and should the plants be quite young, just taken from the nursery, they bite them right off a few inches from the ground, and carry them to their nests in hollow trees. They appear irregularly, at intervals, from the jungles, and there is hardly an estate that does not now and then receive a visit from them. The Natives of Ceylon say that their food in the jungles is a species of Strobilanthus, called Nilu in Singalese, and that the rats only issue from their forest residence and attack the coffee estates when their forest food fails. The coffee-rat is an insular variety of the Mus hirsutus of Mr. W. Elliot, found in Southern India. They inhabit the forests, making their nests among the roots of the trees, and feeding, in the season, on the ripe seeds of the nilloo. When the seeds of the Nilloo, Singh.—Strobilanthes, on which they feed are exhausted, they invade the coffee plantations in swarms, gnaw off the young branches and divest the trees of buds and bloom. So many as a thousand have been killed in one day on a single estate. Like the lemming of Norway and Lapland, they migrate in vast numbers on the occurrence of a scarcity of their ordinary food. The Malabar coolies are so fond of their flesh, that they evince a preference for those districts in which the coffee plantations are subject to their incursions, where they fry the rats in cocoanut oil, or convert them into curry.—*Nietner on the Enemies of the Coffee Plant. Tennent's Sketches of the Natural History of Ceylon*, p. 3-44.

GOMEAH, a town in Hazareebagh.

GO-MEDHA. Sans. from go, a cow, and medha, flesh.

GOMEZ. The Portugese, Lorenzo de Gomez, was the first of the European navigators who approached the northern part of the island of Borneo, he arrived in 1518 in the ship St. Sebastian on his route to China. We presume that he gave to the country the name of Burne, but he says that the natives term it Brannai or Brunai. The travellers who have recently penetrated into different parts of the interior, the Dutch major Muller, Colonel Henrici, the members of a scientific commission, Diard, S. Muller and Korthals, as well as the rajah Brooke, assure us that the people have no general name for the island.

GOM-LAC. Dut. Lac.

This flowering plant has a red and white variety, and the red resembles red clover. It is cultivated in the gardens of Europeans and Natives in India and Burmah.—*Mason's Burmah*; *Riddell's Gardening. Gen. Med. Top.*, p. 187.

GOMTI RIVER of Meywar. Lake Kaukrowlis also called Rajsumund. This great national work is twentyfive miles north of Oodeypoor the capital of Meywar, and is situated on the declivity of the plain about two miles from the base of the Aravalli. A small perennial stream, called the Gomtee or serpentine, flowing from these mountains, was arrested in its course, and confined by an immense embankment, made to form the lake called after the ruler, Raj-sumund, or royal sea. The bund or dam forms an irregular segment of a circle embracing an extent of nearly three miles, and encircling the waters on every side except the space between the north-west and north-east points. This barrier, which confines a sheet of water of great depth, about twelve miles in circumference, is entirely of white marble, with a flight of steps of the same material, throughout this extent, from the summit to the water's edge; the whole buttressed by an enormous rampart of earth, which, had the projector lived, would have been planted with trees to form a promenade. On the south side are the town and fortress built by the rana, and bearing his name, Rajnuggur; and upon the embankment stands the temple of Kunkraoli, the shrine of one of the seven forms (saroop) of Krishna. The whole is ornamented with sculpture of tolerable execution for the age; and a genealogical sketch of the founder's family is inscribed in conspicuous characters. One million one hundred and fifty thousand pounds sterling, contributed by the rana, his chiefs and opulent subjects, was expended on this work, of which the material was brought from the adjacent quarries. But, magnificent, costly, and useful as it is, it derives its chief beauty from the benevolent motive to which it owes its birth: to alleviate the miseries of a starving population and make their employment conducive to national benefit during one of those awful visitations of providence in the shape of famine which from time to time recur in different parts of India.—*Tod's Rajasthan*, Vol. 1 p. 389.

GO-MUKHI. Hind. A bag used by hindu devotees, contains a rosary the beads of which are counted by the hand. Literally the two words mean cow's mouth.

GOMUL. A river of Afghanistan, course 160 miles. It rises about lat. 33°, long. 69° 6', at the foot of an offshoot from Safed Koh, runs S. W.; and a little E. of S. to Goolkuts; thence E., N. E., and S. E., until absorded by the sands of the Daman.

GOMUL or Goolairee. A pass in the Derajat in lat. 32°, long. 70° 30', and about 160 miles long. It runs 20 miles from the entrance of the road to the N. W., then 80 miles S. W., then N. W. to Ghuznee. This pass is of great commercial importance. Every spring, large caravans traverse it from Hindoostan to Afghanistan.

The Tree

Nawa,	Amboin.	Anau,	Malay.
Areng,	Malay.		

Gomuti is a fibrous product of the Arenga saccharifera, a horse hair looking substance produced at the base of the petioles, and is known by various names in the languages of the Archipelago. This fibrous substance is superior in quality, cheapness and durability to that obtained from the husk of the cocoa-nut. It has great power in resisting wet, and is used by the natives of the Indian islands for every domestic and naval purpose to which cordage is applied, a practice in which Europeans have, of late years, imitated them. The coarser parts are used as pens by all the tribes who write on paper, and as the arrows for blow pipes or arrow-tubes. The Gomuti, of all vegetable substances, is the least prone to decay, it is fastened like straw over bamboo thatch, round the ends of posts placed in the ground, is mixed with mortar, and is plaited by the Bornoese into ornaments for the arms, legs and neck. The Arenga saccharifera tree produces about six leaves annually, and each leaf yields from eight to sixteen ounces of clean fibres.—*Seeman.*

The Gomuti fibre, though well known in Eastern commerce and as used in Eastern shipping, is little known in the Western world. It is, however, occasionally heard of by the name of "vegetable bristles." Though a portion of the fibres may be likened to stiff bristles, the greater part is more like black horse-hair. This is celebrated in the countries where it is produced, both for its strength and for its imperishable nature, even when exposed to wet. It is supposed to be the same as the Cabro negro of the Spaniards of Manilla. The tree yielding it was described and figured by Rumphius ('Herb. Amb.,' i, p. 57, t. 13) under the name of Gomuto, or Saguerus; but the latter name being too similar to that of the true Sago tree, has been changed to Arenga, from the native name Areng, under which it was described by Labillardiere. The specific name has been given from the large quantity of sugar procurable from its sap by cutting the spadices of the

male flowers. The tree is valuable for several very distinct, and all very useful, products. It is described by Marsden, in his 'Sumatra,' under the name of Anou, as a palm of "much importance, as the natives procure from it sago (but there is also another sago tree, more productive), toddy, or palm wine, of the first quality; sugar, or jaggery; and ejoo." Dr. Roxburgh, writing in the year 1799, strongly recommended its extensive introduction into India and the Arenga now grows in Bangalore and to some extent in the Nuggur division of Mysore. The palm wine itself, and the sugar it yields, the black fibres for cables and cordage, and the pith for sago, independently of many other uses, are objects of great commercial importance. This palm is to be found in all parts, from the gulf of Bengal to all the Asiatic islands on its eastward, especially in low moist situations and along the banks of rivers. Dr. Roxburgh describes the trees (in 1810) which had been introduced into the Botanic Gardens at Calcutta about twenty-four years before, as from twenty to thirty feet in height, exclusive of foliage or fronds, which rise from fifteen to twenty feet higher. These fronds or leaves are pinnate, and from fifteen to twenty-five feet long. The trunk is straight, at first covered entirely with the sheaths of the fronds or leaves, and the black horse-hair-like fibres, called, by the Malays, Ejoo, which issue in great abundance from the margins of these sheaths. As the tree advances in age or size, these drop off, leaving an elegant, columnar, naked trunk. He further states that he had observed that each of the well-grown thriving trees produced about six leaves annually, and that each leaf yields about three quarters of a pound weight of these fibres, and, therefore, each tree about four pounds and a half. But some luxuriant trees yield at least one pound of fibre from each leaf. As these black fibres issue from the sides of the sheaths, they necessarily surround the stem, and may be cut off without injury to the tree. Even in commercial specimens, some may be seen covered both on the upper and lower surface, with dense cellular membranes, having between them a mass of these black fibres. These are supported by thicker or whalebone-like fibres, which are attached to the thinner fibres by cellular tissue. These stiff fibres are employed in Sumatra as styles for writing with, on the leaves of other palms, &c., as mentioned both by Marsden and Bennett. These fibres are further described as stronger, more durable, but less pliant and elastic than those of the coir; but they resist decay, and are therefore more fit for cables and standing rigging, though less suitable for running rigging. "The native shipping of all kinds are entirely equipped with the cordage of the Gomuto, and the largest European shipping in the Archipelago, find the advantage of using cables of it. It undergoes no preparation but that of spinning and twisting,—no material similar to tar or pitch, indispensable to the preservation of hempen cordage, being necessary with a substance that, in a remarkable degree, possesses the quality of resisting alternations of heat and moisture. The best Gomuto is the produce of the islands farthest east, as Amboyna and the other Spice Islands. That of Java has a coarse ligneous fibre; the produce of Matura is better. Gomuto is generally sold in twisted shreds or yarns, often as low as a Spanish dollar a picul, and seldom above two; which last price is no more than one sixth part of the price of Russia hemp in the London market. Were European ingenuity applied to the improvement of this material, there can be little doubt but it might be rendered more extensively useful. Milburn, also, in his 'Oriental Commerce,' mentions the Ejoo is, of all vegetable substances the least subject to decay, and that it is manufactured into cables, and the small cordage of most of the Malay vessels are made of it: "it is equally elastic with coir, but much more serviceable, and floats on the surface of the water." The fibres are employed, in making cordage for their nets and seines, for the rigging of vessels, and also for cables. These are described by all as remarkable for their tenacity and durability, and as not undergoing any change by exposure to wet, not even when stowed away in a wet state. In some experiments made by Dr. Roxburgh, some thickish cord bore 96 lb., and some smaller 79 lb.; while coir of the same size bore only 87 lb. and 60 lb. respectively.

Besides the above horse-hair-like fibres, there is at the base of the leaves a fine gossamer-like woolly material, baru, *Malay*, Kawal *Jav.* much employed in caulking ships, as stuffing for cushions, and as tinder.

Ejoo was sent to the London Exhibition of 1851, viâ Singapore, from Malacca, separated from stiff fibres, and as prepared for manufacture or export, and also prepared as sinnet or coarse line for making ropes or cables. The portion belonging to each leaf having apparently been cut off close to the sheath, and each measuring about three feet in breadth and two feet in length. The bundles of the coarse and fine fibres are about six feet in length, and about twelve inches in diameter, neatly tied up

with split cane. Interspersed among the coarser, there are some finer fibres, something like black wool. The sinnet is coarse, but strong, and broke with a weight of 85 lb., when coir of about the same size broke with 75 lb.; but the comparison is not very exact. Mr. Kyd, formerly a ship-builder of Calcutta, possessed a cable made of the Ejoo fibre, which he had had for four years exposed to all weathers, and which raised the bow anchor of a merchant ship of 500 tons, buried in the sands of the Hoogly; in two previous attempts at which, three Russian hempen cables had given way. Besides making strong and durable cordage, the Ejoo fibre is no doubt applicable to a variety of purposes for which horsehair and bristles are now employed.—*Royle, Fib. Pl.* p. 99. *Seeman on Palms. Voigt.* p. 636. *Roxburgh Fl. Ind.* iii. p. 626. *Hon'ble Mr. Morrison's Compendious Description.*

GOMUTUS, The Saguerus of Rumphius, is the Arenga succharifera of Labillardiere, one of the products of which is the Gomuto Hartwig says the outer rind of the fruit is poisonous and used to poison wells. The nuts have a delicate flavour. The reticulum or fibrous net at the base of the petioles of the leaves, called the gomuti is extensively used for cordage and cables. The small hard twigs found mixed up with the gomuti are used as pens and as the shafts for the Sumpits or blow pipes. Underneath the reticulum is a soft silky material used as tinder by the Chinese and as oakum for caulking.—*Hartwig.* See Arenga.

GOND. Hind. Typha angustifolia.

GOND. Hind. Gum, hence.

Gond-i-babul, gum of Acacia arabica, and of Acacia farnesiana.

Gond-chimbri, gum of Acacia modesta.

Gond-i-dhao, gum of Conocarpus latifolia.

Jinga, or Kani Gond, gum of Odina wodier.

Gond-i-kikar, gum Arabic.

Gond-i-phulah, gond of Acacia modesta.

Serval-gond, gum of Bombax heptal phyllum.

Gond-i-shaft-alu, gum of Armeniaca vulgaris, apricot.

Gond-i-siris, gum of Acacia serissa.

GOND. The province of Gundwana or Gondwana, on the old maps, occupied a large area in the centre of India. It was bounded on the S. W., and W. by the Godavari, Pranhita, and Varuda rivers and the Kaligong hills; the Narmada separated it from Malwa and Dumoh, and then the boundary line ran N. E. along the Kutne, and on the N. E. side it had Berar and Chota Nagpore. On the E. and S. E. its limits seem to have been but indefinitely fixed, it extended at least to a line drawn from Gangpur on the Brahmini to Bhadrachalam about 120 miles from the mouth of the Godavari, and included Sambhalpur, Sonpur, and Patna; but on Hamilton's map of 1820, it includes Kalahandi, Boad, and Sinbhum. Its length from S. W. to N. E. was not less then 380 miles and its average breadth fully 300, whilst its area was at least 115,000 square miles, or double the size of England and Wales.

The Gond tribes are scattered over the mountain ranges of this territory, though they do not extend quite so far to the E. as it does. They are found extending into Sarguja on the N. E. they are found in Karial and Kalahandi or Kharond along with the Khond and Uriya. In the South, says Mr. Hislop, they form the mass of the population of Bastar and a portion of the inhabitants of Jeypore (in the Madras Presidency), while they occupy the hills along the left bank of the Godavari, about Nirmal; and on the West, they are intermingled with Hindus of Berar for 30 miles from the right bank of the Wurda.

The Gonds are one of the most important of the aboriginal tribes of India and probably number 600,000 souls, they speak dialects of the great Turanian or Tartar family of languages, spoken by all the tribes from the Himalaya to Okotsk and to Lapland, and including the Hungarian, Krimean, and Turkish. In India, there are three or four distinct branches of this family of languages, and consequently of the Turanian race:—in the North, are the Himalayan dialects and tribes, from Upper and Lower Kanawar on the Sutlej to Butan of the extreme east. Then we have the Lohitic class—comprising with the Burmese and others of the eastern peninsula, the dialects of the Naga and Mikir tribes in Assam, and of the Bodo, Kachari, Kuki and Garo in Eastern Bengal. Nearly related to this class is the Kol or Munda family including the Kol, Sonthal and Bhumij of Singhbhum and Western Bengal, and the Mundala of Chota Nagpur. The fourth class is the Tamulic or Dravidian, to which belong to the Brahui of Baluchistan, the Gondi, the Tulava of Kanada, the Karnata of the S. Maratta country, the Todava of the Nilgiris, the Malayalam of Travankur, the Tamil and Telugu. The Kur or Muasi and the Korku in Hushangabad and westward in the forests on the Tapti and Narmada, until they come in contact with the Bhil of the Vindhya hills, and the Nahal of Khandesh belong to this Kol family, indeed Mr. Hislop held that the word Kur is identical with Kol. The close relation-

ship of the Kur and Sonthal, and their separation from the Dravidian may be illustrated by a few examples :—

English.	Kuri	Sonthal or Kol.	Gond, dialects.	Tamil.
Dog,	Sitn, chita..	Seta,	Nei,	Nay.

Man,	..Koro,	...	.. Manwal,	...Mandan.
Two,	.. Barku,	Bara,	..Rand,	...Erandu
Three,	..Apkor,	..Apia,	..Mund,	Mundru.

Mr. Driberg compiled a very complete grammar and vocabulary of the Mahadeo dialect of the Gond language, and the dialect of the Saonee Gonds was noticed in a paper by Mr. Manger.

From the geographical distribution of the Kol and Dravidian languages, Mr. Hislop concluded that while the stream of Dravidian population, as evidenced by the Brahui in Baluchistan, entered India by the north-west, that of the Kol family seems to have found admission by the North-east and, as the one flowed south towards cape Kumari, and the other in the same direction towards Cape Romania, a part of each appears to have met and crossed in Central India. This hypothesis rests on the presence of the Brahui where they are, a fact which is not inconsistant, however, with the supposition that the Dravidian tribes may also have entered India from the north-east or even across the Himalaya, as the Kanawar, Newar, Chepang, and other tribes have done, while the Kol tribes were an offshoot from a later horde, the main body of which entered the Eastern Peninsula. The Brahui may have been driven westward by the invading Arya from the upper Indus. To the early Arya the prior tribes were known as Dasi, and Dr. J. Wilson tells us they were not altogether barbarians, for they had distinctive cities and other establishments of at least a partial civilization. Then, as now, they were darker than the Arya: and, according to Dr. Wilson, the more marked Turanians in Gujarat and other provinces are still denominated the "Kali Praja" (corrupted into Parej) or black population. The Gond of Berar, is a hill race, occupying the Mailghaut and the southern skirts along with the Andh, the Kolamb and Koorkoo. All these have a physical resemblance, but each of them speaks a different tongue and in their features they are quite distinct from the people of the villages. There are 8000 of them in the Oomraoti district. In the Central India Provinces the chief Gond tribes are :—

Mari Gond, in Chanda.
Mariah or Gottawar, Upper Godavery.
Khutalnar, in Chanda.
Durweh, of do.
Aguriah, of Mundla.
Hulba, of Upper Godavery.

The Gondwana of the older maps is a wider extent of country than is now occupied by this race and is politically, rather than etymologically Gond. Whilst the Gond race were dominant, they were masters of all Gondwana, including the open and cultivated tracts about Nagpore, Raepore, Jubbulpore and perhaps as far as Ellichpur and to the south of the Godavery, where some Gonds are found amongst the Tiling population. Deogurh in the Satpura range, was the chief seat of their power. They immediately preceeded the Mahrattah, by whom they were ousted from the open and valuable tracts. The Gond do not now form any considerable part of the population of the plain champagne country, but the chiefs and large zemindars of the Satpura ranges and most of the men of importance in parts of Saugor and other districts north of the Nerbuddah are supposed to be Gond, through some claim to be Rajputs and others have become mahomedans. The Gond predominate from Sargujah, westward along the line of the Satpura hills, through all the hilly country of the districts of Mandla, Jubbulpur, Seoni, Chandwara, Baitul and Hoshungabad and in some degree to the neighbourhood of Asseerghur. They had varied fortunes, from the beginning of the present era, sometimes attacking other powers, sometimes defending themselves, sometimes aiding mahomedans, sometimes attacked by them, but, since Akbar's time, they have been subject to other nations. The term Gond, seems identical with Khond, supposed to be derived from the Hindi word Kond or Konda, a hill, indicative that they were regarded as a hill people. In the interior of the peninsula are Gond tribes, and the Khond, Kund or Ku, also Dravidian, who are estimated at half a million of souls. The Gond race is physically below the average of Europeans, in stature, and, in complexion, the Gond race are decidedly darker than the generality of the Hindu. They are well proportioned but somewhat thickset and muscular; their features are rather ugly ; they have roundish heads, wide mouths, with thickish lips and somewhat distended nostrils. Their hair is straight and black and the beard and mustache scanty. Their hair and features, according to Mr. Hislop, are decidedly Mongolian. They have an average amount of intellect and remark-

able quickness of observation. They are truthful in their statements, faithful to their promises, and are honest with each other, but do not scruple to plunder strangers. They are courageous, shy with strangers; simple minded, superstitious though free from fanaticism. They are habitually drunken, every feast or festival being attended with excesses. Their religion is as distinctively of Scythian origin as is their language and physique. Earthenware figures of the horse are offered instead of the living sacrifice. They propitiate the manes of their ancestors, by offerings of these earthenware horses, rice and other grains, eggs, fowls or sheep. The sacrifice of the cow was prohibited by the Bhonsla Government. Children everywhere, and many adults, are buried, but the Madia of Bastar and the Gond races who have conformed to hindu customs burn their dead. They have in all about thirty divinities, but a few of these are most worshipped. The Creator, under the name of Bhagwan, is occasionally worshipped in their houses by prayers, and by burnt offerings of sugar and ghi, but their chief worship is to the inferior divinities. The chief of these are

(1) *Badu dewa* (great god) or *Budhal pen* (old god) who is the same as the Bura pen of the Kond race and appears to be the same as Rayetal or the sun-god represented by an iron tiger three inches long, and is probably the same as the Marung Bura of the Sonthal. He is worshipped once a year, at the rice harvest, and a hog is then sacrificed to him. Among the Gaiti, he is represented by a copper piece, kept in a tree in the jungle. This they take down at the annual festival, clean a space of about a foot square, under a tree, in which they lay the pice, before which they arrange as many small heaps or handfuls of uncooked rice, as there are deities worshipped by them. The chickens brought for sacrifice are loosed and permitted to feed on the rice. Goats are also offered and their blood presented in the same manner. On the blood, arrack is poured as a libation to their deities. The pice is now lifted and put in its bamboo case which is shut up with leaves wrapped in grass and returned to its place in the tree, to remain there till it be required in the following year. Both Budhal and Matya (about to be noticed) are said to be sometimes of iron and a foot long.

(2.) *Matya*, called *Mata* by the Kurku, is both the god (or goddess) of the much dreaded scourge small pox and of the town. The Gond of Seoni represent Matya as the attendant or Kotwal of Budhal Pen, and they offer him a pig. The Kurku suppose Matya to reside inside the village and they make offerings of cocoanuts and sweetmeats but no blood.

The Gond have no images in their houses, and, at their religious ceremonies, they employ only the rudest symbols,—knobs of mud, stone, iron rods, pieces of wood, chains, bells, &c. Their festivals are associated with their crops and are celebrated under the Saj tree or Eim tree, three or four times in a year, as on the occasion of the commencement of rice sowing, when the rice crop is ready, and when the Mahwa tree (Bassia latifolia) comes into flower. In the south of the Bandara district are to be seen squared pieces of wood, each with a rude figure carried in front, set up somewhat close to each other. These represent Bangaram; Bangara Bai or Devi, who is said to have one sister and five brothers, the names of the latter being Gantaram, Champaram, Naikaram and Potlinga, the sister being known as Danteswari, which is a name of Kali. These are all deemed to possess the power of sending disease and death upon men, and under these or other names seem to be generally feared in the region east of Nagpore city. At Dantewada, in Bastar, about 60 miles S. W. of Jagdalpur near the junction of the Sankari and Dankan tributaries of the Indrawati, is a shrine of Danteshwari, at which, about 1835, it is said that upwards of 25 full grown men were immolated on a single occasion by a late raja of Bastar. Since then, numerous complaints have reached the authorities at Nagpore of the continuance of the practice. Amongst the Moria Gond, Bhawani is worshipped as the small-pox goddess, and as Maoli or Danteshwari.

3. *Sale*, or *Sali*, or according to the Gaiti Gond, Saleng, sits on the same gaddhi with the great god, to whom he is said to be nearly equal. An offering of a she-goat is made to him, and he is probably the protector of cattle.

4. *Gangara*, Ghagara, Gagaral, Gongara Mal, is the bell god, and is represented by a bell, or by an iron chain of four links.

5. *Palo*, of whom only the name is known. The suitable offering to Gangara and him is a cow.

6. *Gadawa* is the god of the dead, and is, perhaps, the same as Chawar, and identical with Dichali of the Chaibassa Kol.

7. *Kham or Kank* the last of the seven deities (sat dewala), is worshipped under the Saj tree, (Pentaptera tomentosa.)

Kodo-pen, is besides these seven, and is the horse-god, common to the Gond and Kur. Mr. Driberg supposes him to preside over a

village, and thus he would correspond to Nadzu Pen of the Kond. But Mr. Hislop conjectures he may be the god of crops, Kodo, the paspalum frumentaceum, being the grain chiefly cultivated by the Gond. In the wilder villages, near the Mahadeva hills, Kodo Pen is worshipped by new comers near a small heap of stones, through the oldest resident, with fowls, eggs, grain and a few copper coins which become the profits of the officiating priest.

Mutua or Mutya Deva among the Kurku, is a heap of small stones inside the village, besmeared with sandur. He is associated with the prosperity of the village and is worshipped with a goat, cocoa-nuts, limes, dates, and a ball of sandur paste.

Pharsi pen, or Pharsa pot, is represented by a small iron spear-head. This name may possibly be connected with barchi (hindi) a spear, and he may be identical with the Loha Pen of the Kond, the iron god or god of war. Pharsa, in Gondi, also, means a trident, which is an ancient Tartar weapon. He is worshipped every third or fourth or fifth year, at full of the moon Vaisakh, and on the occasion people assemble from great distances, and offering is made of a white cock, a white he-goat and a white young cow. The ceremonies are conducted with great secrecy, and no hindu or Gond woman even is allowed to be present. He is apparently the same as Dula Dewa, the god of the battle axe of the Gaiti Gonds, who represent Dula Dewa by a battle axe fastened to a tree.

Hardal, at Amarkantak, is worshipped as the cholera god, but Mr. Hislop supposed this to be another name for Budhal Pen. The Kurku style him Lala Hardal, and he possibly is the same as the Gohem of the Chaibassa Kol.

Bangarum is probably the god of fever, as among the Kol of Chaibassa, where he is associated with Dichali and Gohem, as also with Chondu the god of itch and Negra of indigestion.

Bhiwasu or Bhim Pen is, in the Mahadeva Hills, the god of rain where a festival lasting for four or five days is kept in his honour at the end of the monsoon, when two poles, about 20 feet high and 5 feet apart, are set up, and a rope attached to the top, by means of which they climb to the top of the pole down which they then slide. Offerings of fowls, eggs and grain are presented to him. All over Gondwana, he is generally worshipped under the form of an unshapely stone covered with vermillion, or of two pieces of wood standing from three to four feet above ground, like those set up for Bungaram. Before these, the Moria Gond regularly perform worship, previous to sowing. A little S. W. from Bajar Kurd, however, and North of Parsenni, is a formed idol of Bhiwasu, 8 feet high, with a dagger in hand and a barchi (javelin) in the other. A Bhumuk is the pujari or officiating priest, and the people worship on Tuesdays and Saturdays, making offering of hogs, he-goats, cocks, hens, cocoanuts. At an annual feast the potail gives two Rupees and hindu cultivators rice; the pujari takes a cow by force from the Gowar and offers it to Bhim Sen in presence of about twenty-five Gonds.

Sasarkund is a pool in the Mahur jungle where the Pain ganga is said to be engulfed. The Naikude Gond repair there, in pilgrimage, at the month Chaitra, to a huge stone that rises in a gorge, and goes by the name of Bhim Sen, before which Naikude Gond mingle with Raj Gond and Kolam in worship. Towards evening, the worshippers cook a little rice, and place it before the god, adding sugar. Then they smear the stone with vermillion and burn resin as incense, after which all offer their victims, sheep, hogs and fowls with the usual libations of arrack, the pujari appears to be inspired, rolls his head, leaps wildly about and finally falls down in a trance, when he declares whether the god has accepted the services or not. At night drinking, dancing and beating tomtoms goes on, and in the morning they return home after an early meal. Those unable to leave home perform similar rites beneath a Mahwa tree.

Waghoba, the tiger god, is worshipped by the Naikude Gond; and under the name of Bag Deo, by the Kurku.

Sultan Sakada is worshipped by the Kur.

Sakal Deva, or Sakra Pen, the chain god is worshipped in Seone and elsewhere.

Sanyal Pen or Sanalk, the spirits of the departed, are worshipped or propitiated for a year after death, but persons of note, head men of villages or priests, are treated as gods for years or generations, and sacrifices are usually offered at their Sthapana or shrines of earth.

Koitor, viz.

Raj Gond.	Katulya.	Ojhyal.	Koi-kopal.
Raghuwal.	Padal.	Thotyal.	Kolam
Daduvi.	Dholi.	Koila-bhutal.	Madyal.

Koitor are a section of the Gond, including the Raj Gond, the Raghuwal, the Daduvi and Katulya. The Koitor is the Gond par excellence: and some suppose the term derived from the Persian "Koh" a hill.

Koi is the name given to the Meria sacrificing tribes of Orissa.

Padal, Pathadi, Pardhan or Desai, is a Gond tribe who are the bards or religious counsellors of the upper classes of Gonds. From these has sprung a half caste tribe, who speak Maratha, and occupy themselves in spinning thread and playing on wind instruments.

Dholi, a Gond tribe who dwell in jungly districts and are employed as goat herds.

Ojhyal, a Gond tribe, wandering bards and fowlers.

Thotyal, meaning the maimed, a wandering Gond tribe, also called Pendabarya or minstrels of God, also Matyal because their songs are chiefly in honor of Mata. They make baskets.

Koila-bhutal, a wandering Gond tribe, whose women are dancing girls.

Koi-kopal, *i. e.* Gond Gopal, a settled race of Gond who are cow-keepers.

Madyal, a Gond tribe, called in Bastar Jhodia, are savages on the Beila Dila hills and in the remotest parts of Chanda. These women only wear a bunch of leafy twigs to cover them before and behind. In this, they resemble the Juanga to the south of the Kol country; the Chenchi near the Pulicat lake and to the north of Ellore and till about 30 years ago a similar custom existed amongst the Holier of the forests near Mangalore.

Kolam, a Gond tribe, along the Kandi Konda or Pindi hills, on the south of the Warda and along the table land stretching east and north of Manikgudh and thence south to Dantanpilly, running parallel to the right bank of the Pranhita.

Badya, a hill race, not Gond, occupying the tract between Chandwara and the Mahadeva hills, who have conformed to the hindus in their language and religious observances.

Halwa a hill race, not Gond, pretty numerous in Bastar, Bandara and Raepore, who covet the distinction of wearing the sacred thread, which right those in Bastar purchase from the raja.

Gaiti Gond, a tribe in Bastar who call themselves Koitor.

Moria Gond, the principal agriculturaists in Bastar.

Nai-Kude Gond a tribe that inhabit the jungles on both banks of the Pain Ganga, especially in the tract between Digaras and Umarkher and found about Aparawapet and as far as Nirmul. They have adopted the hindu dress and will not eat beef; but they live by the chase, cut wood and grass and are a terror to their neighbourhood, by their depredations.

Kur, also called Muasi, a hill tribe with a language quite distinct from the Gonds, living to the N. W. and W. of the Mahadeva hills.

Korkur or Korku a hill tribe dwelling to the N. W., and West of the Mahadeva hills speaking a language quite distinct from the Gond. They belong to the Kol or Munda family.

Binderwar. A Gond tribe who dwell in the hills of Amarkantak, near the source of the Nerbuddah river.—*Coleman*, p. 297. *Hislop, Review in Bombay Newspaper on Mr. Temple's editor of Mr. Hislop's remarks on the Gonds.* See Gonds.

GONDA. A station for European Soldiers.

GONDA. A branch of the Ahir caste.

GONDALA. See Inscriptions, p. 389.

GONDANA. A Mahrattah festival in honour of the goddess Devi.

GONDAR, A town in Amhara, the capital of the kingdom. This town is stated by Heuglin, (1862), to have contained from 6,000 to 7,000 inhabitants, but it is said to have been totally destroyed by the emperor Theodore.—*Par. Paper.*

GOND-BADUSTAR. Hind. Castor. Eng.

GONDHALI. The musician at the festival Gondana.

GONDHONA. Tel. Phyllanthus emblica.

GONDHUL. See Jat.

GONDI. Hind. also Gund and Gundni, Hindi, Cordia angustifolia, C. subopposititifolia, also Duk. C. obliqua, the fruit of C. angustifolia, is an orange colored, sweet and rather mucilaginous berry.

GONDNI. A bulrush.

GONDI. See Gond; India.

GONDOPHERRES or Gondophares, B. C. 55, who took the Aryan name of Pharahitasa.

Abagasus, king of kings, A. D. 70, in Arian Abakhafasa, Professor Lassen supposes this name to be identical with Vologeses. Mr. H. T. Prinsep supposes their coins to be of Parthians who established for themselves a separate and independent sovereignty in Kabul and the Parapamisus.

Abalgasius, A. D. 80, Capt. Cunningham described the Arian legend on the coins to be of the "Saviour king Abagasus, younger son of Undopherres." See Abdagasses. Greeks of Asia. Kabul, p. 439.

GONDWARA, means, literally, the country of the Gonds, a race who at no remote period possessed almost the whole of the country to the south-east of the Nerbudda, which before the war of A. D. 1818 formed the extended dominions of the Mahratta prince

of Nagpore. In the second century of the christian era, the Hai-haya dynasty ruled. It is now the British district of the Central Provinces.—*Malcolm's Central India*, Vol. I p. 31.

GONDOPOLA. Uria? A tree of Ganjam and Gumsur, extreme height 45 feet, circumference 2½ feet and height from the ground to the intersection of the first branch, 8 feet. Bandy wheels and ploughshares are occasionally made of this wood, but it is chiefly burnt for firewood, being tolerably common.—*Captain Macdonald.*

GONG or Loo, a Chinese musical instrument, composed of a mixed metal, (said to be tin, copper, and bismuth), resembling bronze in appearance. It is in the form of a large flat basin, with a ridge; and, when beaten with a stick or mallet, covered with woollen cloth or twist, emits a strong reverberating or ringing bell-like sound. Its value is in proportion to the quantity of metal it contains. In China gongs are suspended at the doors of courts of justice, where applicants for justice attend and sound.—*Crawfurd Dict.*

GONGA—? Sterculia acuminata.

GONGALI. Tel. Cumbly.

GONG-KURA. Tel. Hibiscus cannabinus.—*Linn.* Ambari.

GONGHO. Hind. Brassica rapa.

GONGOO or Gangaw. Burm. A tree of Amherst, Tavoy and Mergui, maximum girth 3 cubits, maximum length 32 feet, very abundant from near Mergui, along the coast as far as Amherst. When seasoned, it floats in water. It is used for tables, chairs and miscellaneous articles by the Burmese; it has a good, hard, tough wood, durable and recommended for shelves also for handles of all kinds of tools. (Vide Major (now General) Simpson's Report.)—*Captain Dance.*

GONGOSHEOLEE. Uria.? Dondeepoholo. Uria? A tree of Ganjam and Gumsur, extreme height 25 feet, circumference 3 feet and height from ground to the intersection of the first branch 7 feet. No use seems to be made of the wood. The flower which has a powerful perfume is offered in all the pagodas to the presiding divinity.—*Captain Macdonald.*

GONGYLOPHIS CONICUS. *Schneider*, a genus of serpents of India, of the Family Pythonidæ: as under:—

Fam. Pythonidæ.
Python molurus.—*Linn.*
„ reticulatus, *Schn.* Nicobar, Tennasserim
Boa constrictor.—*Linn.*
Gongylophis conicus, *Schneid*, Upper India.
Eryx Johnii, *Russell* of Punjab.

GONGARA. Hibiscus cannabinus.—*L.*

GONI. Hind. Gunny.

GONI CLOTH. Gunny of Crotalaria, juncea.

GONIOTHALAMUS HOOKERI. *Thw.* A middle sized tree of Ceylon at Hinidoon and Reigam Corles, at an elevation of about 1,000 feet.—*Thw. En. Pl. Zeyl.*, p. 6.

GONIOTHALMUS THWAITESII. H. f. et. T. Caloocaara. Sing. Not uncommon in the Central Province of Ceylon at an elevation of 2,000 to 4,000 feet.—*Thw. En. Pl. Zeyl.*, p. 7.

GONJI-PHAL. Duk. Limonia pentaphylla.

GONJI PANDU. Tel. Glycosmis pentaphylla.—*D. C.*

GONODACTYLUS CHIRAGRA. See Stomapoda.

GONTEMIA GOMARU CHETTU. Tel. Ipomœa filicaulis, also Pæderia fætida.

GO-NYEN, Burns, a vine producing pod three or four feet long, containing ten or twelve beans, ten inches in circumference. These beans, well boiled, are sometimes used for food.—*Malcolm*, Vol. I, p. 182.

GONYUCH. Hind. Lepidium latifolium.

GONZANG. Hind. Avena fatua.

GOOA. Beng. Betel-nut palm, Areca catechu.

GOOAL. Hind. A cow-herd. In Behar there are several subdivisions as Bhota, Bunarusya, Canougea and Choutaha. It is pronounced as Gwal. *Elliot.* See Ahir, Go, Goala.

GOOAL. Hind. A grain which in the North West Provinces is frequently sown with cotton, and given as fodder to cattle. It is also called Kowar. *Elliot.*

GOOA-MOUREE. Beng. Fœniculum panmori.

GOOBAK, also Gooya. Beng. Betel-nut tree, Areca catechu.

GOODA. Hind. also Goora. The name of a temporary place of refuge; hence the designation of many towns in India.—*Tod's Rajasthan*, Vol. I, p. 298.

GOODIA LATIFOLIA. One of the Leguminosæ, a genus of flowering plants, all natives of New Holland, colour of the flowers yellow, they never attain any great height, they may be raised from seed or cuttings, in a loamy soil.—*Riddell.*

GOOGA or Goga. In the lower Himalayas of the Punjab, there are many shrines to this mythological being. In one account he was a chief of Ghazni who was slain in war against his brothers Urjun and Surjun, but a rock opened, and Goga sprung forth armed and mounted; another account makes him

the lord of Durd-Durehra, in the wastes of Rajwara who died fighting against the armies of Mahmood.

The names Urjun and Surjun and Durd-Durehra are instances of the alliteration of which eastern races are so fond.

Chin and Machin is a phrase analogous to Hind and Sind, used to express all India, and Gog and Magog (Yuj and Majuj Arab, Pers) is applied to the northern nations of Asia; Sind and Hind are however capable of separation. The use of a double assonant name, sometimes to express a dual idea but often a single one, is a favourite oriental practice. As far back as Herodotus we have Crophi and Mophi, Thyni and Bithyni; the Arabs have converted Cain and Abel into Kabil and Habil, Saul and Goliah into Talut and Jalut, Pharoah's magicians into Risam and Rejam, of whom the Jewish traditions had made Jannes and Jambres; whilst Christian legends gave the names of Dismas and Jesmas to the penitent and impenitent thieves in the Gospel. Jarga and Nargah was the name given to the great circle of beaters in the Mongol hunting matches. In geography we have numerous instances of the same thing, e. g. Zabulistan and Kabulistan, Koli Akoli, Longa Salanga, Ibir Sibir, Kessair and Owair, Kuria Muria, Ghuz and Maghuz, Mastra and Castra, (Edrisi), Artag and Kartag (Abulghazi), Khanzi and Manzi (Rashid) Iran and Turan, Crit and Mecrit (Rubruquis), Sondor and Condor (Marco Polo). etc.

The name of Achin in Sumatra appears to have been twisted in this spirit by the mahomedan mariners as a rhyme to Machin; the real name is Atcheh. In every day conversation, in India, such alliterations occur, as Choki Oki, a chair, Kursi Gursi, a chair; Chavi-gavi a key, Keli-Geeli a key. Bach kach children· *Yule, Cathay.* See Quatremere's Rashid, pp. 243-246; D'Avezac p. 534; Prairies' Or. i. p. 399.

GOOGALA Sans. Hind. Balsamodendron agallocha W. & A.

GOOGOAN. A poor agricultural district in the Punjab.

GOOGUL. Beng. Amyris, Balsamodendron agallocha.

GOOGUL. Hind. A gum resin supposed to be identical with the Mooql of Arabia and to be the Bdellium of the ancients. A resinous substance named Googul (Hind), Mooql (Arab) is met with in all the bazaars of India. It much resembles myrrh, and is said by some good authorities to constitute the bulk of the article exported from Bengal as East Indian myrrh. Royle considers the Googul identical with the Bdellium of commerce and he ingeniously traces in Budleyoon and Madelkon, the Greek synonymes of Googul, the βδελλιον and μαδελχον of Dioscorides. A tree in the Seharunpore Garden, pointed out as the Googul tree, had scaly bark exactly conformable to Dr. Roxburgh's description of his Amyris. Dr. Ainslie, in Vol. I p. 29, gives an excellent summary of all the information extant when his work was published, regarding the interesting substance known as Bdellium. He adduces as synonymes of Bdellium, Kookool, Tam., Googooloo, Tel. Googul, Can., Hind. Aflatoon, Arab, and Mukul, Pers. He describes the gum resin as semi-pellucid, yellowish, or brown, inodorous and brittle, softening between the fingers, in appearance not unlike myrrh, of bitterish taste, and rather strong smell. He states, however, that it is all brought from Arabia and from Persia, where the tree is called Darakht-i-mukul; but, in the bazaars of India, it is said that the googul "comes from the hills." The medicinal properties of Bdellium are exactly like those of myrrh, and being much cheaper, it may be preferred for Dispensary practice. (*Royle*, p. 177. *O'Shaughnessy*, p. 287.)

Under the term Googul, however, the resinous exudations of several trees seem to be classed.

Under the Canarese and Mahratta names Dhoop and Googul, Dr. Gibson mentions two species of Canarium, one in Canara and Sunda, on the Ghats above, and the second species of great size cultivated near Bilgil, and at Siddapore. The choice gum resins afforded by these trees are extensively used in the arts, and exported both inland and to the coast.—*Wight Ill. Dr. Gibson.*

Olibanum a substance famed in ancient and used in modern times, is the Thus looban and goondur of the natives of India. Under the latter name, it is described by Avicenna, evidently referring to the λιβανος of Dioscorides, who mentions both an Arabian and an Indian kind. The latter Mr. Colebrooke has proved to be the produce of Boswellia serrata, Roxb. (B. thurifera, Colebr) the Salai or saleh of the hindoos common in Central India and Bundlecund, especially about the Bisrumgunge ghaut. It is probably also produced by B. glabra, which has the same native name, and though extending to a more northern latitude, is distributed over many of the same localities. It is common in the low hills above Mohun Chowkee. To this kind, according to Dr. Ainslie, the term googul is applied by the Telugu people. The resin of both species is employed as incense in India. Central India alone furnishes the greatest portion of

the Indian olibanum of commerce; as it is chiefly exported from Bombay. From the affinity in vegetable production between parts of Arabia, Persia and India, it is not improbable but the genus Boswellia may extend into those countries and afford that which is known as Arabian olibanum.

It is evident from the above that the Hindi term googul is applied to the gum resins of various trees, in Bengal and Bombay from Balsamodendron Roxburghii, the supposed source of the Bdellium of Scripture or Madalchon *Drury* but Balsamodendron Mokul, *Hooker*, of Hindostan and B. pubescens *Stocks* of Sind, also yield a gum resin known by the name of Googul. In the Himalaya, the gum resins of Juniperus religiosa, *Royle*, and, in the Boreghat near Bombay, of Canarium strictum, *Roxb.* are known as googul. The googoola of Tilingana is from the Boswellia glabra *W. et A.*

Thus several plants undoubtedly yield the bdellium of Scripture, and amongst others are the Balsamodendron Roxburghii *Arn.*; B. pubescens, of Sind, *Stocks*, B. Mokul, *Drury*, B. glabra *W. & A.*, and B. Africanum, of Senegambia. *Drs. Wight Illustrations Roxb. Fl. Indica; O'Shaughnessy*, p. 287. *Royle productive resources of India; Ainslie* I. 59. *Gibson. Birdwood.*

GOOGUL FIBRE is supposed to be obtained from the Isora corylifolia, the Valumbrikaya of the Tamul language.

GOOHA. SANS. A secret place, from gooh, to hide or cover, hence, Goohya. SANS., from goohya, requiring to be concealed.

GOOJERAT. A town and district in the Punjab. Near the town of Goojerat, a battle was fought and won by the Indian army against the Sikhs, on the 21st Jany. 1850. The products of the Goojerat district are grain, cotton, opium, safflower, tobacco, indigo, goor, wool and ghee. About half the grain is exported on camels, mules, bullocks and donkeys, but chiefly by boats to Pind Dadun Khan, and from thence by boat to Mooltan and Sind. The Cashmere people in Jelalpore and Goojerat are in a rather impoverished state Koftgari or gold-inlaying in iron is peculiar to Goojerat, and a very brisk business is carried on by the Koftgari workmen. Under former rulers, this inlaid-work was used chiefly in ornamenting weapons, but under the peaceful rule of the British Government the craftsmen now make principally baskets, trays, paper weights, paper knives, bracelets and ornaments. See Goozerat.

GOOJAR. A numerous race in the North Western Provinces of India, formerly notoriously predatory, but gradually becoming more settled to habits of peaceful industry. Their importance may be rated by their having given name to the Provinces of Goojerat on the Western Coast of India, and to Goojerat in the Punjab. They are sometimes considered to be among the prior occupants of India and have been so reckoned by Tod, who, declares them also to be a tribe of Rajpoots. Sir R. Jenkins, also, says that in the Nagpur Territory, they consider themselves to be Rajpoots and that as they are descendants from Lava, Rama's second son, they have an undoubted right to be so considered.

The Goojur are spread all over the Delhi Territory, the Upper Doab and Upper Rohilcund, and they enumerate 84 different tribes. In Delhi, the chief tribes are the

Chumayen,	Khare,	Rowal.
K' hutana,	Bursoee,	

In the Doab,—

Sookul,	Jindhur,	Budkana,
Bysle,	Peelwan,	Kusane,
Mavee,	Butar Adhuna,	Rouse,
Rat, hee,	ChecheKulseean,	Khoobur,
Bhuttee,	Ramayn,	Moondun,
Kusounee,	Khare,	Kudahun,
Bulesur,	Nagree,	Touhur,
Dede,	Chotkune,	Gorsee,
		Kunaua.

In Rohilcund,—

Butar,	Motle,	Jindhur,
K'h hoobur,	Sooradne,	Muhynsee,
K. hare,	Poorbur,	Kusane.
Jattee,		

All these tribes intermarry on terms of equality, the prohibited Gotra or tribe being only those of the father, mother, and paternal and maternal grand-mother. A great part of the district of Seharunpoor was called Goojerat during the eighteenth century. By the Goojar themselves it was said to consist of three parts, and the division is known amongst them to this day, and is usually adopted in ordinary converse. The Goojar race has largely pressed into the Central Provinces of Central India and have settled down to agricultural pursuits, and those in Hoshangabad and Nimar are good farmers. During the mutiny and rebellion of 1857-58 in Northern India, many of the Gujar of Hindostan again gave play to their predatory propensities. In 1811 Colonel Tod's duties called him to a survey amidst the ravines of the Chumbul, of the tract called Goojurgar, a district inhabited by the Goojur tribe. Turbulent and independent, like the sons of Esau, their hand against every man and every man's hand against them, about the middle of the eighteenth century, their nominal prince, Soorajmul, the Jit chief of Bhurt-

pore, had pursued exactly the same plan towards the population of these villages, whom he captured in a night attack, that Janmeja did to the Takshac, as described in the Mahabarat; he threw them into pits with combustibles, and actually thus consumed them. *Tod's Rajasthan*, Vol. I, p.—*Elliots, Supp. Gloss.*

GOJAREA. A river running near Telkoopie and Bagorah in Rungpoor.

GOOJERATI. A term applied to a mercantile race dwelling in Guzerat. They are of Rajput origin and are principally of the Jain religion.

GOOJLAH. A river of Sylhet.

GOOJRANWALLAH. See Punjab.

GOOL HIND. Persian a rose, but compounded with many words to indicate other flowers and flowering plants, Properly *Gul. Pers.* See Gal.

GOOL. BENG. Euphorbia tirucalli

GOOLA CHIN. BENG. Amaranth, Plumiera acuminata.

GOOLAB, distilled rose water, prepared in India, but largely imported from the Persian Gulf.

GOOLAL. HIND. A farinaceous powder which hindus throw on each others clothes during the Hooli festival. It is generally the meal of barley, rice, or singhara, dyed with Bukkum wood.

GOOLAL-TOOLSEE. BENG. Ocymum glabratum.

GOOL-ASUFUR. BENG. Three styled flax, Linum trigynum.

GOOL-DAOODI. BENG. Pyrethrum indicum.

GOOLDASTAH, or silver golden trees, decorated with imitations of jewels and precious stones used at ceremonials and on state occasions as a kind of epergne.

GOOLGA. BENG. Nipa fruticans.

GOOL-KHAIRA. BENG. Hollyhock, Althœa rosea.

GOOLKOO MOUNTAINS in lat. 33° 22', long. 67° 50', 30 miles S. W. from Ghuznee. Ghuznee is estimated at 1,300 feet.

GOOL-MUKHMUL. BENG. Gomphrena globosa.

GOOLOO. HIND. or Gulu, the pod of the Mahwa tree, Bassia latifolia. It yields a very useful oil, and is sometimes eaten by the poorer classes.

GOOLOOCHUNE. SIND. A mixture of puree, a pigment, and sandalwood, used to produce the yellow forehead mark of the hindu.—*Simmond's Dict.*

GOOLUNCHU. BENG. Cocculus cordifolius.

GOOM. CAN. Spilornis cheela. *Daud.*

GOOMA. A river in Kattywar, in lat. 22° 18', long. 71° 30' E., disembogues into the Gulf of Cambay. Length 88 miles.

GOOMADEE. TEL. Tagoomooda TAM. A large timber tree, a native of the mountainous parts of India. The wood of such trees as will square into logs from eighteen to twenty-four inches resembles teak, the colour is almost exactly the same, the grain rather closer, at the same time it is as light or lighter and is as easily worked. It is used for the decks of pinnaces about Chittagong, Dacca, &c., and is found to stand the weather without shrinking or warping better than any other wood known there. It seems to be the Gmelina asiatica.—*Rohde, M. S. S. Roxb.*

GOOMBAUT of West Indies. Abelmoschus esculentus.—*W. & A.*

GOOMBELIE. See Khyber, p. 512.

GOOMSOOR. A hilly tract lying between 29° 40' and 20° 25' N. lat., and 80° 10' and 85° 5' E. long., in the neighbourhood of Ganjam and Vizagapatam. For a long period after British occupation of the peninsula, the zemindar held the Goomsoor country, on payment of rent.

GOOMPTEE. See Kattyawar.

GOOMTEE RIVER. A tributary to the Ganges. It rises in a small lake or morass, 19 miles E. of the town of Pilebheet, in lat. 28° 35', long. 80° 10'. 520 feet above the sea. It runs S. S. E., into the Ganges, joining 30 miles below Benares, after a course of 482 miles. In the rainy season, boats of 4,000 or 4,200 maunds (40 tons) burthen, are sometimes seen proceeding down the river to Lucknow. It runs near Lucknow, Juanpore, Syedapoor and near Chougong in Comillah.

GOOMUL. See Khyber, pp. 512 and 513.

GOON. BENG. Sanseviera zeylanica.

GOONA. SANS. A quality, from goona, to advise.

GOONA-SINDOO. SANS, from goona, qualities, and sindhoo, the sea.

GOONA-DOSHA. MALEAL, from Goona, good, Dosham, bad, a form of marriage amongst the Nair people, the words mean for better for worse. See Polyandry, p. 109.

GOONAS. See Kunawer.

GOONCH. HIND. Roots of Abrus precatorius, a substitute for liquorice root. Also the seeds of the Abrus precatorius, which are used as weights by jewellers, also for necklaces, bracelets, and other trinkets. *Simmond's Dict.*

GOONDAH. A river rising in the Velunuddhee hills, in Madura, which runs S. E., into the Gulf of Manaar. Its length is 95 miles.

GOONDAMANI. Tam. Tel. The seeds of the Abrus precatorius, used as beads, as weights for gold, and silver, three of these make one canteroy fanam, which is about 5·87 grains.—*Simmond's Dict.*

GOONDASREE. A river near Bancoorah.

GOONDEE. A river near Baleatpore in Bancoorah.

GOOND. A plateau in N. Canara near Dandilli. It has a considerable forest tract, and near Dandilli is a negro race.

GOONG also Goonch, Guz, Hind. Seeds of Abrus precatorious, they are of various colours, red, and red and black and almost wholly black.

GOONGU. Beng. Abrus erythrospermus.

GOONONG. Malay. A hill.

GOONONG API or Burning island, in lat, 5 ° 40', S. 127 ° 21' E. is one of the Moluccas.

GOONONG-API. A volcanic island of the Banda group called by the French the grenade of Banda. The base of the volcano occupies all the islet. Its height is about 2,000 feet. It is covered with magnificent vegetation, commencing at the line where the waves cease to beat and continuing upwards to the point where the lava ceases to flow, being cooled by the air. This volcano is the curse of the group, the nutmeg is not cultivated and the island is occupied by a few emigrants from Timor.—*Bikmore.*

GOONONG BEDONG. A high mountain in the Natunas Islands in the China seas. The mountain is in L. 4 ° 3' N. It is also called Quoin hill. Another mountain in the Natunas is called Gunong Ranay.

GOONONG GEDEH, or the Blue Mountains, a high range in Java, about 30 miles inland from Batavia. Pangeango rises 9,954 feet: Salak 7,322 feet, and Kanrang 6,014 feet above the sea.—*Horsburgh.*

GOONONG GEDUNG, is a mountain about 7000 feet high, it is about 30 miles E. by N. ½ N. from Malacca, and is also called Queen's Mount also Mount Ophir.

GOONONG MAR-OPI. A sulphureous mountain in Java, 2,000 feet high. *Account of a tour on Java in As. Jl.* 1821, Vol. XII p. 224.

GOONZ. Mahr. A silver weight in the Bombay Presidency.

GOOPTA. A Sanscrit word meaning concealed, or hidden, hence, Gooptava-Dhoota. Sans, from goopta, concealed, avadhoota, to renounce. Gooptee-Para. Sans. From goopta, hidden, and para, a division of a town.

GOOPTA. A surname of a dynasty of ancient renown in India. Chandra-goopta was an illegitmate son of Nanda, of the Takshak race, who ruled Magada, when Alexander approached India. Nanda was assassinated by Chanikya his minister. He was succeeded in his succession by his eight legitimate sons, and then by Chandragupta, an energetic and talented prince who steadily opposed the progress of Seleucus, and recovered the territories up to the Indus He reigned twenty-four years, and was succeeded by his son Metra Goopta. See Gupta.

GOOPTEE. A sword stick.

GOOR, Neera, Seena, and Tandoor, rivers, affluents of the Bheemah river.

GOOR. Duk. Saccharum officinarum.

Jaggary,	Eng.	Bellum,	Tel.
Nullavellum,	Tam.		

A very coarse kind of sugar obtained from the sugar cane and the various palm wines, particularly that of the Phœnix dactylifera. Twelve pints of the sap are boiled down to one of goor, and four of goor yield one of good powder sugar.—*Ainslie, Mat. Med.* p. 266. *Simmond's Dict.*

GOOR. Bahram Goor, was famous for his liberty, gallantry, and love of the chase. He was the monarch whom the Greeks and Romans styled Varanes, and was the fourth monarch of the family. The famous imposter Mani, founder of the sect of Manichaeans, made his appearance in this king's reign, and was put to death by this king. Bahram Gor, is said, in some apocryphal histories, to have visited India in the fifth century, and to have left progeny there by a princess of Kanouj. See Gor.

GOORAKIEME. A Ceylon wood soft, fine, but open-grained, light.

GOORAKOO, Goodakoo or Goodak; called in Bengal tambakoo, the name given in the Peninsula of India to the compound of tobacco, for the hookah; from goor, raw sugar, and akoo Tel. leaf.—*Herklots.*

GOOROO. Sans. A teacher, from gree, to make known; hence, *Gooroo-mookhee.* Sans. from gooroo a teacher, and mookhi, belonging to the mouth: *Gooroomata,* Sans. from gooroo, a teacher: *Gooroo Prasada.* Sans. from gooroo, a teacher, and prasada, a favour, grace.

GOORANJEE, A river near Silwanee in Bhopal.

GOORANS. See Kurdistan.

GOORCHANEH. A tribe of Afghans, on the N. W. frontier many of whom live in the hills and some in the plains. They can muster about 2,000 fighting men. They are a debased and thievish set. A late chief was put to death by Sawun Mull. Their hill frontage is not more than twenty miles long, but it is inter-

sected by numerous passes, about thirty in number. Towards their southern limit stands the fort of Hurrund, a strong masonry structure, erected by Sawun Mull for restraining them. Near Hurrund, is an important pass leading towards Candahar. Raids of theirs were reported; in 1850, 1852, and in 1853, it was proclaimed that any of their hill-men found in the British territory would be seized and placed in confinement; in 1854, their headman entered into engagements to protect the passes, on which account they received an allowance of Rupées 1,000 per annum, since 1854 their conduct has not been marked by any flagrant misdeeds, and the embargo upon them was removed. In the midst of the Goorchanee passes are four passes in the separate charge of one Kosah chief, and two chiefs of the Rind tribe, for which they receive Rupees 300 per mensem. See Khyber, p. 508, 515, 518.

GOORDASPOOR. See Punjab.

GOORDUL-SHIM. Beng. Lablab purpurescens.

GOORKHA, a race residing in Nepal. In features and figure the true Goorkha are always singular and remarkable, from their broad Chinese or Tartar-like physiognomy, the small eyes, flat nose, and meagre whiskers, as well as his stout square make and sturdy limbs. These, in every description of costume, and in all degree of raggedness, are to be seen mingled with inhabitants of Kumaoon, Sirmore, and Gurwhal. In 1792, the Goorkha race mastered the whole of the valley of Nepal, and the hill country from Sikhim to the Gogra, and a party of them crossed the Himalaya, and appeared suddenly before Teeshoo Loomboo. The Llama and priests hastily evacuated their convents, and fled to Lhassa, and the place was plundered by the Goorkha, who retired immediately with their booty. The Tibetans applied to China for aid, and an army was collected for the punishment of this act of unprovoked outrage. The Goorkha submitted unconditionally to the Chinese commander, who imposed a tribute and triennial mission to Pekin, besides restitution of all the booty taken at Teeshoo Loomboo, and he took hostages for the performance of these stipulations. The rajah of Sikhim was at the same time taken under Chinese protection. Checked towards the east by these events, the Goorkha extended their dominion westward, subjugating Kumaon, Sirinugur, and all the hill country to the Sutlej.—*Egerton's Journal of a Winter's Tour in India*, Vol. I, p. 177. *Prinsep's Tibet, Tartary and Mongolia*, p. 18. *Fraser's Himalaya Mountains*, p. 223.

GOORI. Beng. Eriocaulon quinquangulare.

GOORI-KUCHOO. Beng. Colocasia antiquorum.

GOORI-SHIORA. Beng. Ficus rubescens.

GOORMA. A river of Rewah.

GOOROO. or Goorao, a hindu race in the Oomraoti district.

GOOROO-CHIKUDI-KAIA. Tel. Dolichos fabæformiis.

GOOSAIN. A hindu sect, in India. See Gosaen.

GOOSE.

Hansa,	Sanskrit.	Cheu,	Greek.
Kaz,	Hind.	Anser,	Lat.

This bird was domesticated in ancient times, it is mentioned in Homer, and was kept in the Roman capitol B. C. 328, sacred to Juno. There are three or four closely allied wild species, but the prevailing belief is that the Anser ferus, the wild Gray lag goose is the species from which the domestic breeds have come. The A. albifrons may have crossed. The rock goose, the Bernicla antartica, does not seem to have crossed. With the Egyptians, the egg of the goose was the emblem of Seb or Chronos. (*Bunsen.*) The goose was deemed the bird of wisdom in ancient Europe, in Asia it was the symbol of stupidity; on the other hand, the European goose is the Asiatic emblem of sageness. The goose, is of the tribe Lamellirostres, which may be thus shown—

Fam. Anatidæ, Gooses.

Sub-fam. Phœnicopterinæ, 1 gen. 1 sp. Ph. roseus.

Sub-fam. Anserinæ.

Div. i. Swans, 1 Cygnus olor; 2 C. artrata.
„ ii. Geese, 3 Anser, 1 Bernicla.
„ iii. Perching goese, 2 Dendrocygna, 2 Sarcidiornis, 1 Nettapus.
„ iv. Shieldrakes, 1 Casarca rutila, 1 Tadorna vulpanser.

Sub-fam. Anatidæ, 1 gen. 6 Sub-gen. 10 sp., viz., 1 Spatula, 3 Anas, 1 Daffila, 1 Chaulelasmus, 1 Mareca, 3 Querquerdula.

Sub-fam. Fuligulinæ, contains one species of the genus Biranta, and four species of Fuligula, viz.:—

Fuligula ferina. The Pochard, in circuit of northern regions, Barbary, common in India,

Fuligula nyroca 'Ferruginous Duck.' Europe, Asia, N. Africa: common in India.

Fuligula marila. 'Scaup Duck.' Circuit of northern regions: Punjab, Sindh. Nepal.

Fuligula cristata. 'Tufted Duck.' Europe, Asia, Barbary: common in India.

Fuligula rufina. (Palas,) is the crested Pochard.

Of *Anser*, the goose, the hans of India, the species A. cygnoides: A. cinereus: and A.

brachyrynchus; are known in India and the Punjab. Dr. Hooker mentions that A. Indica occurs at Siligori.

Anser cygnoides is domesticated in China.

Anser cinereus (*Anser ferus*; 'Grey-lag goose.') Europe, and Asia: common in India.

The domestic goose of India is a hybrid between A. cygnoides and A. cinereus.

Anser brachyrynchus. 'Pink-footed goose.' Europe, N Asia; Punjab (rare)?

Bernicla ruficollis (*Anser ruficollis*; 'Red-breasted goose.') N Asia, chiefly; rare in N. India.—*Darwin. Bunsen. Burton's Sind*, Vol. II, p. 137. *Hooker, Him. Journ.*, Vol. I, p. 399. *Catal. Cal. Museum.* See Cygninæ. Pelicanus platifrons: Birds.

GOOSEBERRY. The European Gooseberry grows in the Himalaya, but does not thrive or give much fruit, the Himalayan gooseberry, is the Ribes grossularia *Linneus*, or rough gooseberry, is not uncommonly wild, in the arid parts of the Upper Sutlej, Chenab, Jhelum and in Tibet, from 8,000 to 12,000 feet and was seen by Dr. Bellew, near the Safed Koh, at about 10,000 feet, but its fruit is small and intensely sour, and hardly ever eaten even by the natives: Ribes uva-crispa, is the smooth gooseberry: the country gooseberry of the peninsula, is the Cicca disticha *Linn*, its fruit the size of a gooseberry is round, succulent and subacid, is eaten raw and made into pickles and preserves and is cooling and wholesome. The fruit of Zizyphus jujuba is also, so named. See Grossularia.

GOOSHURA. Hind. The root of Barleria longifolia.—*Linn.*

GOOSROO, a river in the Myheer territories.

GOOTHOOBI. Beng. One headed cypergrass, Anosporum monocephalum.

GOOWA ROOREE. Beng. Fœniculum panmori.—*D. C.*

GOOYA-BABULI. Beng. Vachelli a farnesiana.

GOOZERAT, battle of fought 21st, Feby. 1849. See Goojerat.

GOOZUR. See Bhonsla.

GOP. Hind., also Gopa, also Gopala, also Kop, Hind., the avocation of a herdsman. Gopi, a herdwoman, from Go, Sans a Cow;

GOPALA. Sans. from go, a cow, and pala, nourishing, a herdsman. See Chaitanya. Krishna. Rudra Sampradayi.

GOPALA or Bhupala dynasty of Gaur. See Gour; Inscriptions, p. 377.

GOPAMOW. A town near Delhi, from which the nabobs of the Carnatic came. Anawar, the father of Anwar-ud-din, died there, his son Anwar-ud-din, was killed in battle at Amboor. Anwar-ud-din's son Mahomed Ali died at Madras in 1795, and his son Oomdut-ul-Umra died 1801. Azim ud-Dowlah, the nephew of Oomdut-ul-Umra succeeded and died in 1818. His son Azam Jah, died 1824 and the last nabob, Mahomed Ghouse, died 1855. The family were then designated with the title of Prince of Arcot.

GOPESWARA and Barahat are two towns in Garhwal, from which were received two bronze tridents, respectively twenty-one and sixteen feet high with an inscription in semi-barbarous Sanskrit without date.

The oldest inscriptions approach Allahabad No. 2, and the others nearly modern Deva Nagari. They have no religious invocation beyond Svastisir, and no mention of hindu gods whatever. In the more recent inscription on the Gopesvara trident, the invocation is Aum Svasti, and the spot is called sacred to Mahadeva. In the recent Sanskrit inscription from Gopesvara, the name of Prince Anik Mall occurs. The tridents are precisely of the form of the trident on the Indo-Scythic coins, with the axe attached to the shaft; the oldest inscriptions—which, however, from the form of the Deva Nagari, cannot be before the seventh century—are in relief upon the shaft, and make no mention of Mahadeva or hinduism; but the more recent are cut into the trident, which must have been taken down to admit of the incision. In one of these is the Aum and the name of Mahadeva, which had no association originally with the tridents. The facts strengthen the inference that the trident on the coins has nothing to do with hinduism. *J. B. As. Soc.* Vol. V. p. 347 and 485.

GOPESWARA. *Sans.* The distinguished god. *Tr. of Hind*, Vol. II p. 67.

GOPHER WOOD, of which the Hebrew ark was built, is supposed by some to be wood of Cupressus semperverens or common Cypress. But some commentators have supposed this term to be squared or planed wood; others the cedar, others pitched wood.

GOPI. A milkmaid, a herdwoman, generally applied to designate the herdwomen of Brindrabhan or Vrij, the native country of Krishna, with whom Krishna associated while a young man. Radha, daughter of Nauda, a pastoral chief was Krishna's first and favourite love, and the stories of his Gopi life, are much read by the hindus. It is said that on one occasion when the girls went to bathe in the river, Krishna stole away their clothes, from off the river bank, and up to the present day, the Vrijmai women, when they go to bathe, like the Gopi of old, leave behind their garments on the steps of the ghaut and make a rush to

the water and give a colouring of truth to the story. It is believed that the Rasmandali is typical of the zodiacal phenomena; that the nine Gopini are the personifications of the nou-ragini—the nine nobles of music; or the now rasa—the nine passions, excited by the powers of harmony. There is much in the hindoo mythology that is founded on an astronomical basis—much that perpetuates the early Vedic worship of the elements under a figurative garb. *Tr. Hind.* Vol. II. p. 61,71. See Kama, Hooli ; Krishna.

GOPHLA. HIND. Stauntonia latifolia.

GOPI CHANDANA, generally a common magnesian clay, used by hindus, to make the sectarian marks on their faces, breasts and arms. Vaishnava hindus employ a white earth from Dwarka, said to be the soil of a pool in which the gopi drowned themselves on hearing of the death of Krishna. It is also described as an aluminous yellow earth, brought from the Ganges at Hurdwar, and used to mark the foreheads of those who worship Vishnu : it is also given in medicine.—*Gen. Med. Top.*, p. 131. See Tripundra : Vibhuti.

GOPI-NAT'HA. SANS. from gopi, a name of Krisna, the wife of a milk-man, and nat-ha, a lord. See Chaitanya, Krishna, p. 546.

GOPURA, also called Gopuram, in hindu temple architecture, the tower over the porch. There are numerous beautifully sculptured gateways attached to the larger temples of the hindus, into which the people are not permitted to enter. On days of festivals, the figures of the deities are brought out of the temples through the gopuram, and placed in small open temples called Mantopa, to receive the adoration of the multitude.—*Cole. Myth. Hind.*, p. 381.

GOPUSTUMI, also written Gopashtami the name given to the 8th day of Kartik Shookl Puksh. On this day, as well as on the Godhun (Goverdhun), the day after the Dewali, garlands are suspended from the necks of cows, their horns, hoofs, and bodies are painted—and salutations are made to them. The whole ceremony reminds us of that observed on St. Anthony's day at Rome, when the beasts are sprinkled with holy water, and blessed by priests,

> Yet to me they seem'd crying alack, and alas!
> What's all this white damask to daisies and grass?
> Then they're brought to the Pope and with transport they're kiss'd.
> And receive consecration from Sanctity's fist.—*Elliot, Supp. Gloss.*.

GOPYAH. See Saraswati.

GOR. PERS., and Gad'ha, HIND. mean the 'wild ass,' and Bahram, the Varanes of the Greeks was surnamed Gor from his partiality to hunting that animal, the wild ass still ranges in the level wastes beyond Nushki. Various authorities state that Bahram Gor entered India in the fifth century, and left progeny by a princess of Kanouj. See Goor.

GOR. A celebrated tribe ; amongst the most illustrious of the Chohan feudatories ; a branch, until a few years ago, held Soopoor and about nine lakhs of territory. Col. Tod has no doubt the Gor appenage was west of the Indus, and that this tribe on conversion became the Ghor. Ferishta, writes concerning the proselytism of all the Afghan tribes, and Col. Tod is of opinion, that the Afghans are converted Jadoon or Yadu, not Yahudi or Jews. The Gor Rajpoot tribe, had only to convert Gor into Ghor.—*Annals of the Bhatti. Tod's Rajasthan*, Vol. II. p. 446. See Gori.

GORA. HIND. white, but when applied to cattle, it means brown.

GORA. See Bhairava.

GORA-BACH. BENG. Acorus calamus, *Linn.*

GORBAGRA. HIND. Eriophorum comosum.

GORAH BUNDAR river flows between lofty hills, beautifully wooded, and studded here and there with antique ruins, and huge masses of dark rock. The river abounds with crocodile. *Postan's Western India*, Vol. I p. 179.

GOROCHANA. SANS. Bezoar.

GORAD. See Hot Springs.

GORAGAMUDI. TEL. Eugenia bracteata *Roxb.*

GORAI. HIND. A clan of rajputs in the Agra district.—*Wilson.*

GORAKH MUNDI. HIND. Lippia nodiflora.

GORAKHNATH, at Gorakhpur, is a temple, which, according to local tradition, was founded by Siva, in the second of Treta age. It was converted by Ala-ud-din, into a mahomedan mosque. It was subsequently re-built in another place, but again appropriated by Aurungzeb to the mahomedan religion, but subsequently restored. It is the most celebrated of the temples of the Jogi sect.—*Wilson.* See Jogi or Yogi.

GORAKH PANW. HIND. Convulvulus pluricaulis also Heliotropium brevifolium.

GORAKHPUR. A town in L. 26° 46' 1"; L. 83° 18' 7", on the left bank of the Tapti, 130 miles N. W. of Dinapur. It is 340 feet above the sea. *Thorn.* See Inscriptions p. 385. Gorukpoor.

GORAKHPUR. In L. 22° 44', L. 81° 27', a town in Malwa, two miles W. of the left bank of the Seone; on the highest part of a plateau. The highest house of the village is 2,573 feet above the sea. The mean height of the plateau is 2,515 feet or 56 feet below the mean height of the village; by Aneroid. Schl., Rol.

GORALANA. Hind. Anabasis multiflora.

GORALANE. Hind. Caroxylon fœtidum.

GORA-LOG. Hind. Literally white people, a term applied to Europeans by natives of India, who call themselves Kala-log, or black people, also Kala-admi.

GORAM, A group of three islands in the East Archipelago. S. E. of Goram is a high group, composed of raised coral reefs 300 or 400 feet, with a volcano on the island of Teor which broke forth in 1659. In the Goram group, at Manowolko, east of Ceram, a slight infusion of Papuan on a mixture of Malay and Bugi, has produced a good looking people. The Goram people are wholly traders, every year they visit the Tenimber, Ke and Aru islands, the whole N. W. coast of N. Guinea, from Oetanata to Salwatty and the islands of Waigiou and Mysol. They also extend their voyages to Tidore, Ternate, Banda and Amboyna. Their prprahus are all built by the Ke islanders, who annually turn out hundreds of neat boats. The Goram people trade in tripang, medicinal Mussoi bark, wild nutmegs and tortoise shell, which they sell to the Bugi traders at Ceram Laut and Aru.—*Wall* II. 53 60, *Bikmore*, 243. See Adi, Island Papuan, India.

GORANTA. Tel. Lawsonia alba. *Lam*, also sometimes given to the balsam, Impatiens.

GORAPACHAR. A river of Gwalior in Sindhiah's territory.

GORDIL. Hind. Nepeta, *sp.*

GORDONIA. A genus of plants belonging to the Natural Order Ternstromiaceæ, one species, the Anan-pho, Burm. is a tree of Moulmein, and has strong wood, good for building purposes; another species, the Za-za, of the Burmese, is a large, common, timber tree of Martaban, the Anan-pho, seems to be G. floribunda.

GORDONIA FLORIBUNDA. *Wall.*

A-nan-pho, Burm. | Theet-ya, Burm.

A conspicuous tree of Moulmein, Chappedong, Tavoy and Martaban. There is some difference between the Tavoy and Moulmein trees; that of Moulmein has leaves precisely like G. obtusa "with shallow serrature;" but the leaves of the Tavoy tree are quite entire, and the Burmese have different names for them. The compact timbers of Gordonia floribunda, and Gordonia integrifolia are called "itch-wood" by the Tavoyers, from the itching which the crips or bark occasion when brought in contact with the skin. The timber is used for house posts, and for rice mortars.—*Mason.*

GORDONIA SPECIOSA. *Thw.*

Garria speciosa. *Gardn.*

A large tree, 40 to 50 feet high, rather uncommon, in damp forests of the central province of Ceylon, at an elevation of 5,000 feet and upwards.—*Thw. En. Pl. Zeyl.*, I, p. 40.

GORDONIA OBTUSA. See Gordonia floribunda.

GORDONIA WALLICHII, is a common tree in the Eastern Himalaya, much prized for plough-shares and other purposes requiring a hard wood: it is the "Sing-brang-kun" of the Lepcha, and in Sikkim ascends to 4,000 feet. Oaks at this elevation occur as solitary trees, of species different from those of Darjiling. There are three or four oaks, with a cup-shaped involucre, and three with spinous involucres enclosing an eatable sweet nut; these generally grow on dry clayey soil. Gordonia Wallichii is an erect and singularly handsome tree, much prized in all parts of the sub-Himalaya, and, by all the people, adopted for plough-shares and other purposes requiring a hard wood: it ascends 4,000 feet on the mountains. In very dry soils it is replaced by "Sal" (Vateria robusta), and more rarely by the Pinus longifolia.—*Journal of the Asiatic Society of Bengal*, No. XXIX, p. 425. *Hooker Him. Jour.*, Vol I, p. 157.

GORDONIA ZEYLANICA. *Wight.*

Var. *a.* lanceolata | Var. *b.* elliptica.

Grows in forests of the Central Province of Ceylon, at an elevation of 4,000 to 7,000 feet.—*Thw. En. Pl. Zeyl.*, I, p. 40.

GORITI CHETTU. Tel. also Goriti donka, also Koriti chettu, Plecospermum spincsum.—*Tric.*

GORGONIA NOBILIS. Red Coral.

GORGOONDY of Bombay? Calysaccion longifolia.—*Roxb. Wight.*

GORI; Hussain Gori, the first of the Ghori dynasty, succeeded to the throne of India in A. D. 1157 (other authorities say 1151 or 1155) by deposing Khusru Shah, the 13th and last of the Ghaznavide kings. Mahmud, the nephew and successor of Shahab-ud-din, was the 5th and last of the Gori dynasty. He imparted little influence on India, and was assassinated, accord-

ing to Orme, in 1212, but another authority give 1214. He had attacked the king of Khrism at Takash, and subdued the Ghikar tribe, but in A. D. 1206 while returning to Ghazni, he was assassinated by two of his own tribe.

GORIAN. See Jews. Kalmuck.

GORIWAR. An agricultural tribe in the northern circars.

GORKHAR, or wild ass, Asinus onager, has been often confounded with the Kiang, or wild horse; it inhabits chiefly the rather hilly districts of Beluchistan, part of the sandy plains of Sindh; and another animal is to be found, to the westward of Beluchistan, in Persia, which is called Koolan (Equus hemippus.) Dr. Barth lately mentioned that, according to the description given to him, he thinks the asses he saw in Africa identical with the Gorkhar, or wild asses, of Sindh and Beluchistan. The Gorkhur is also called Khur-guddha. Though an inhabitant of the Sindh desert, it most abounds in the southern part, about Dhat, and the deep rooè which extends from Barmair to Bankasirr and Buliari, along the north bank of the great Runn, or 'Salt Desert.'—*Tod's Rajasthan*, Vol. II, p. 328. See Kiang Mammalia.

GORK-MUNDI. Hind. Sphæranthus mollis.

GORMUCHAI. Hind. Pshtu Harmuzi.

GOROCH. Rus. Pease.

GOROCHAMUN—? Bezoar.

GOROCHANA. Sans. Bezoar.

GORONGTALU. See India, p. 356.

GOOROOHADO. Uria? A tree of Ganjam and Gumsur, extreme height 22 feet, circumference 2 feet height from ground to the intersection of the first branch, 10 feet, chiefly used for firewood though rafters are occasionally made of this wood.—*Captain Macdonald.*

GOROWLI. A feudatory chieftaincy in Bundelcund, with an area of 50 square miles, a population of 5,000 souls, and a revenue of Rs. 15,000.

GORNOSTAI. Rus. Ermine.

GORRE CHIMIDI. Tel. Andrographis echioides, *Nees*: the name means "sheep's mucus" the whole plant being very viscous.

GORRE PENTIKA. Tel. Leea, sp. This plant is from Palakonda. The name signifies "sheep's droppings."

GORRUKEENEE. Singh. Calophyllum calaba,—*Linn.*

GORSCHETSCHNUE POSSODU. Rus. Earthenware.

GORTSCHIZA. Rus. Mustard seed.

GORU CHIKKUDU. Tel. Cyamopsis psoraloides *D. C.* Dolichos fabæformis. *Roxb.*

GORU CHUTTU GADDA. Tel. Eulophia virens, *R. Br.* syn. of Limodorum virens, *R.* iii. 467. Whitlow-root.

GORUCKPORE. A town in the Benares district of the N. W. Provinces. The Goruckpore forests cover 120,000 acres mainly Sal Vatica robusta with an average of twenty-five well grown trees to the acre. The northern limit of indigenous teak is in Bundelcund. It has been planted in the Punjab, but in that dry climate it is poorly estimated. Great efforts have been made to bring the forest and jungle tract under cultivation. In the year 1883, 49,291 acres were allotted to Mr. Sym and to natives. The progress made by Mr. Sym in his grant was most gratifying, the improved aspect of the country, and, as it now appears, less unhealthy climate, bear witness to his perseverance, and not merely led to clearance of his own particular jungle, but proved a most efficacious example. See Gorakhpur.

GORWA. Hind. Arundinaria falcata.

GORUKHEE. Beng. Solanum rubrum serythropyrenum.

GORUKHYA-CHA-KOOLYA. Beng. Uraria lagopodioides.

GORUKMUNDI. Hind. Lippia nodiflora.

GORAKSHA. Sans. from go, a cow, raksh, to save,—a cowherd.

GORATNA CHETTU; Tel. Lawsonia inermis. Henna.

GOSAVI. Mar. A religious mendicant.

GOSAI. Sansc. from "Go" sense or passion and "sen" mastery written Gossain, followers of Sankara Acharya, of whom there are ten branches, from which they are styled the Das-nani—

Tirtha or shrine.	Bharati, goddess of speech.
Asrama, an order.	Puri, a city.
Vana a wood.	Giri, a hill.
Aranya, a wood.	Parvati, a hill.
Saraswati, goddess of eloquence.	Sagara, the ocean.

They are celebates and reside in a math or monastery and issue forth to beg. They are of three sects, one Saivava, worshippers of Siva, of whom some believe Sankara Acharya to have been an incarnation, these principally occupy peninsular India.

In Northern India, the Gosain are Vaishnava, worshippers of Vishnu: one of them, called Gokul Gosai, followers of Vallabha Acharya, who marry and follow religious pursuits: and Bengal Gosai, who follow the doctrines of Chitaniya. They also marry. Some Gossai vagrants used to go about naked. The Vaishnava and Saiva Gosaen have occasionally come in conflict, and, at Hardwar, on the Ganges, a celebrated place

of pilgrimage. Soldiers of the Bengal army had to keep the peace, ever since a battle occurred, about the beginning of the nineteenth century, in which they fought almost to extirpation. The descendants of Nityananda are gossains of Khurdah. The descendants of Adwaita are gossains of Santepoor and there, the principal idol is Shamchand. But one-third of the people of Santipoor are vaishnava.

The Gosai of Guzerat worship Siva. They wear orange-tawny clothes, and the teeluk, or sectarian mark upon their foreheads, is horizontal. This marking of the forehead and on other parts of the body, is forbidden by the Hebrew Scripture text, "Ye shall not make any cuttings in your flesh for the dead, nor print any mark, upon you. I am the Lord."—Lev. xix. 28. Bishop Patrick notes that this imprinting of marks or signatures was then understood to be fixing a badge or characteristic of the persons being devoted to some false deity.

The priests of Eklinga are Gosaen or Goswami. The high priest like all his order, is doomed to celibacy, and the office is continued by adopted disciples. Of such spiritual descents they calculate sixty-four since the sage "Harita," whose benediction obtained for the Gehlote Rajpoot the sovereignty of Cheetoe, when driven from Saurashtra by the Parthians. A numerous class of Gosaens have adopted celibacy, who yet follow secular employments both in commerce and arms; other Gosaens marry. The mercantile Gosaens are amongst the richest individuals in India, and at Oodipoor were thus useful when the Mahrattas demanded a war-contribution, as their privileged character did not prevent their being offered and taken as hostages for its payment. The Gosaens who profess arms partake of the character of the knights of St. John of Jerusalem. They live in monasteries scattered over the country, possess lands, and beg, or serve for pay when called upon. As defensive soldiers, they are good. Siva, their patron, is the god of war, and like him they make great use of intoxicating herbs, and even of spirituous liquors. In Mewar they can always muster many hundreds of the Kanfera Jogi, or 'split ear ascetics,' so called from the habit of piercing the ear and placing therein a ring of the conch-shell, which is their battle-trumpet. Brahmins and Rajpoots, and even Goojers, can belong to this order. The poet Chund gives an animated description of the body-guard of the king of Canouj, which was composed of these monastic warriors. The rana of Mewar, as the dewan, or vicegerent of Siva, when he visits the temple, supersedes the high priest of Eklinga, in his duties, and performs the ceremonies. The shrine of Eklinga is endowed with twenty-four large villages from the fisc, besides parcels of land from the chieftains. *Tod's Rajasthan*, Vol. II p. 141. Vol. I p. 516-17. *Tr. of Hind.* Vol. I, p. 21. *Ras Mala Hindoo Annals*, Vol. II, p. 312. *Elliott Sup. Wilson's Glossary* See Bal; Math; Choitunya, Rudra Sampradaya; Tripati.

GOSHA. Ar. Hind. Pers. Concealed. A gosha woman, means, a woman who carries out the mahomedan law of concealing herself from the sight of men, except certain near relatives Many hindu women, however, follow this rule. A mahomedan is called a Gosha Nashin, who has withdrawn from the world and become an ascetic, or who lives a recluse life. It means sitting in a corner, and the term is applied to a woman of rank, or respectability, though the term for her is properly, Gosha or Parda nashin.

GOSHOO. Hind. Gold thread used to embroider caps.

GOSHT'HA-YATRA. Sans. from gosh'ha, a cow-pen, and yatra, to go.

GOSHT-KHORA. Hind. Penoea sarcocolla.

GOSSAMPINUS RUBRA. Rheede. Ham. Syn. of Salmalia malabarica. *Schott.*

GOSSAMPINUS RUMPHII. Sch. syn. of Eriodendron anfractuosum, the white cotton tree. The floss, which it yields abundantly, is preferred to the product of the red cotton tree. The Burmese name is thæm-bau-lai.

GOSSYPION, Gr. Cotton; Gossypium.

GOSSYPIUM.

Cotton plant,	Eng	Karpasi,	Sans.
Kappas'ka jhar,	Hind.	Pangi,	Tam.
Carbasus,	Lat.	Patti chettu,	Tel.

The genus Gossypium belongs to the natural order Malvaceæ and its species, from the hair or wool which surrounds their seeds, are, next to food plants, the most important of the vegetable kingdom. There are now several recognised species, G. acuminatum, G. arboreum, G. barbadense, G. herba, G. hirsutum, G. obtusifolium, G. religiosum and G. vitifolium, De Candolle admits 13 species, and noticed others. Two others were described by Dr. Roxburgh, one by Roeusch, and another in the 'Flore de Senegambie.' Of varieties, Mr. Bennett says that he knows more than one hundred kinds, and they appear to him never ending. Dr. Royle, the most recent author who has treated expressly of the species, admits eight species, in which are absorbed some of De Candolle's; while others are avowedly unnoticed for want of materials for satisfactory determina-

tion. But from Dr. Royle's own observations, from Dr. Roxburgh's 'Flora Indica,' as well as from Swartz, '*Observ. Bot*,' for the West Indies, and the specimens in the British Museum, it is probable that several of the cultivated species are correctly determined. Other species, as G. punctuatum, from Senegal; G. obtusifolium, from Ceylon; and G. peruvianum, from Brazil, have been described, but Dr. Royle is of opinion that all the species of cotton may be reduced to four G. peruvianum (G. acuminatum); G. Indicum (G. herbaceum); G. arboreum; and G. barbadense. There can be no doubt that the cotton plant is indigenous in America, and the species of the old world appear to be Indian and Chinese. Cloth manufactured from cotton has been brought from the tombs of Peru, and cotton seeds have been obtained by Rosselini fom the monuments of Thebes. The Sanscrit name Karpasi has been taken into different tongues. The Hebrew word Karpas of the book of Esther (Ch. i. 6) and the Latin Carbasus are derived from it, and the Karpasus mentioned in the Periplus of Arrian, has been rendered by Dr. Vincent "fine muslin." Pliny (lib. xix. c. l.) mentions the cultivation in upper Egypt of a small shrub called by some gossypion, by others xylon, bearing fruit like a nut, from the interior of which a kind of wool is produced. The species of the cotton plant, grow in the warm tropical regions of America and Asia, but they are likewise extra tropical and Baron Humboldt mentions having seen it growing at 5,500 feet in Mexico and 9,000 feet of elevation in the Equinoctial Andes It is largely grown in China;—Dr. Royle mentions that it is cultivated in small quantities at 4,000 feet of elevation in 30° N. in the Himalaya and Dr. Stewart tells us that it is grown in many places all over the Punjab, as a hotweather crop, ripening up to christmas, and that it is cultivated up to the Kashmir valley (5,000 feet) but the quality does not appear first rate.—*Dr. Stewart's Punjab Plants*, p. 27. *Dr. Cleghorn Report Brit. Associat. Eng. Cyc. Dr. Royle Prod. Res. of India.*

GOSSYPIUM ACUMINATUM *Roxb. Wight Ill*; *Royle.*

Wa-ku-la,	Burm.	Pardi patti, pamidi patti,	Tel.
Brazil Cotton,	Eng		
Pernambuco,	,,		

This species is indigenous, growing in the mountains of Bengal and in Malacca. It is not cultivated, but as the wool is separated easily from the seeds, it is very desirable to make trial of it in agriculture, *Roxb.* III. 186, *Royle*, *Voigt.* 170.

GOSSYPIUM ANTIQUORUM. See Gossypium. Gossypium herbaceum,

GOSSYPIUM. ARBOREUM *Linn.*

Nu wa,	Burm.	True Cotton,	Eng.

This species is marked G. religiosum in Heyne's 'Herbarium,' and one specimen of G. Barbadense is marked G. arboreum in the 'Linnean Herbarium.' This species is found in the island of Celebes and in every part of India; it is noticed among lists of the plants of Arabia, and also of Egypt; it is planted near temples and habitations of devotees in India, and is stated to be sacred to the hindoo deities, and therefore employed only for making muslin for turbans. Stem arboreous, 15-20 feet, sometimes shrubby, young parts hairy, tinged of a reddish colour. Leaves palmate, 3- or 4- lobed, hairy, dotted with blackish spots of a dark green colour; lobes elongated, lanceolate, sometimes mucronate, sinus obtuse, glands one, sometimes three. Stipules oval-shaped, Flowers solitary, with short peduncles, intensely red, with a yellowish eye; and fruits the whole year. Leaflets of the exterior calyx cordate, ovate, entire, sometimes dentate. Capsule ovatepointed, 3- or 4- celled, seeds covered with a greenish coloured fur, enveloped in fine silky yellowish-white wool. According to Dr. Wight, almost the only distinction between G. religiosum and G. arboreum is, that the former has a yellow and the latter a purple flower and in the English Cyclopædia, the same facts as to the colours of the two species are stated. G. arboreum is an undoubted native of India, but G. religiosum is not; for according to Roxburgh and the most recent authorities it was introduced from China. Another marked difference between the two species is found in the colours of their wool, that of G. arboreum being white, while that of G. religiosum is tawny. *Madras Times*, *Eng. Cyc. W. Ic.* 1 *to* 10 *Royle Ill.* p. 99. *Roxb.* iii, 183 *Voigt.* 121.

GOSSYPIUM BARBADENSE. *Roxb.*

G. vitifolium, Cavanicilles.

Barbadoes cotton,	Eng.	Long stapled, cotton	Eng.
Bourbon	,, ,,	Upland Georgian,	,,
Sea island	,, ,,	Short stapled,	,,

This cotton plant, a native of the West Indies is cultivated in India. Stem shrubby, 6-15 feet, smooth; leaves, the upper 3-lobed, the lower 5-lobed; lobes ovate, acute, smooth, often pubescent on the under surface; leaflets of exterior calyx large, deeply laciniate; flowers large yellow; capsule ovate, acuminate, smooth; seeds 8-12, free, oblong, black, and without any other pubescence than the long fine easily-separable cotton: fruits the whole year. Swartz describes this species as extensively cultivated

in the West Indies: it is also one of the cultivated cottons of Egypt. It is more than probable that the Sea-Island or Long Staple cotton is a variety of this species, as its seeds agree in character. More than this it is not possible to say. *Wight. Ill. Royle Ill.* p. 100. *Roxb.* iii, 187. *Voigt.* 121. *Eng. Cyc.*

GOSSYPIUM HERBACEUM.—*Linn.*

Var. α. Daccanense.
β. Berarense, Berar cotton.
γ. Chinense, China cotton.
δ. Cawnporeense, Cawnpore and Doab cotton

This species grows in the Peninsula of India, in Hindustan, Bengal, the Malay Peninsula and the Archipelago. It is grown as a hot weather crop in many places all over the Punjab, ripening up to christmas, and is cultivated up to the Kashmir valley (5,000 feet) but the quality does not seem to be first-rate. It has large sulphur yellow flowers, with a dark blood red eye, and fruits nearly all the year through.—*Dr. J. L. Stewart*, p. 22. *Voigt.* p. 121.

GOSSYPIUM HIRSUTUM.—*Swartz.*

Green seeded cotton of AMERICA.
Short staple „ „
Upland cotton „
French cotton of the WEST INDIES.
Wa, BURM.

Shrubby, about 6 feet high, young pods very hairy. Leaves, the upper undivided, cordate, acute; the lower 3- or 5-lobed; lobes ovate, acute (triangular, *Roxb.*) hairy on the under and smooth on the upper surface. Petioles very hairy, dotted with black spots; glands 1 or 2 to 3; stipules lanceolate (Cavanilles); corolla, base yellow, purplish towards apex (uniform yellow, *Roxb.*); exterior calyx ovate-acute, very hairy, cordate, 3-toothed (Cav.) (laciniate, *Roxb.*); capsule large, ovate-acute; seeds many, free, clothed with firmly-adhering green down under the fine long white wool. (*Swartz.*) This species is cultivated in Jamaica and the East Indies according to Swartz. *Eng. Cyc. Roxb. Fl. Ind.*

GOSSYPIUM INDICUM. *Lam.*

Gossypium herbaceum *Linn. Roxb. W, Ic. Ill Royle.*

G. Indicum, Lam., the Gossypium herbaceum, of Linn., is herbaceous in temperate, and usually with bitriennial stems 4-6 feet high in tropical, countries, is no doubt the Xyon, syn. of G. antiquorum, and includes also the G. Indicum of Lamarck, which is the preferable name for this species, this and its varieties being those chiefly cultivated in India. It has been procured from China and the Malayan Peninsula, and also from Egypt. The younger parts of the stem, as well as the flower and leaf-stalks, hairy and marked with black spots. Leaves hairy, palmate, 3- (generally) 5-lobed, lobes broad and rounded with a little point, or in the woody varieties sub-lanceolate and acute, Stipules falcate, lanceolate. Flowers of a lively yellow colour, with a purple spot near the claw. Segments of exterior dentate, sometimes entire. Capsules ovate, pointed, 3- or 4- celled. Seeds free, clothed with finely-adhering grayish down under the short-staple white wool. *Eng. Cyc. Roxb. W. Ic. McCulloch.*

GOSSYPIUM NIGRUM. This is an ornamental tall growing shrub generally cultivated in gardens on account of its dark red flowers:—from the staple of the wool being short although fine, it is not of much value.

GOSSYPIUM OBTUSIFOLIUM. See Gossypium Barbadense.

GOSSYPIUM PERUVIANUM. See Gossypium Barbadense, Cotton.

GOSSYPIUM PUNCTATUM, from Senegambia, is probably a variety. It is that cultivated in the Mediterranean region, and must have been the species taken to America from Smyrna.

GOSSYPIUM RELIGIOSUM. *Swartz.*

Nankin Cotton.

Perennial. Stem 3-4 feet, branches and petioles a little velvety, hirsute towards the apex, and covered with black points. Leaves cordate, superior 3-lobed, inferior 5-lobed, deeply divided; lobes ovate-acuminate, entire, pubescent (some of the lower ones ovate-acuminate), one to three glands; stipules lanceolate, deciduous (cordate-acuminate, Roxb.) Flowers large, fulvous, peduncles short dotted; leaflets of the exterior

calyx large, cordate-acuminate; deeply laciniate, hairy and dotted; capsule ovate-acuminate; dotted, 3- 4- or 5- celled; seeds black, covered with firmly-adhering short tawny fur under the long tawny-coloured wool but very different from the colour of the Nankin cotton cloth which is supposed to be dyed. The cotton of this species does not promise to be profitable. There is considerable confusion with respect to the species which should be called G. religiosum. The distinguishing characteristic of what is considered such at present is the having tawny-coloured instead of white wool. There are, however, at least two distinct localities for this kind of cotton, one Siam, the other China. From the latter country it was introduced both into India and America under the name of Nankin Cotton. Dr. Royle is of opinion that two distinct species yield tawny-coloured cotton; one with small velvety-looking leaves and much dotted in every part, of which he has seen specimens from Macao, Tahiti, and Guzerat. The other is a much larger plant, with the general appearance and leaves of G. barbadense, of which they are specimens in the 'East Indian Herbarium.' Mr. Wilkinson also brought specimens from Egypt of a rather tawny-coloured cotton, with brownish seed, free from fur, which he says is there called 'gotun Hindee.' *Bombay Products, Eng. Cyc. Voigt.*, p. 121. *Roxb. Fl. Ind.*

GOSTANI DRAKSHA. Sans. Vitis vinifera.—*Linn* also Hatahura, the "purple grape" which is of elongated shape like a cow's teat, in Sans. gostani.

GOSWAMEE. Sans. From go, a cow, and swamin, a master.

GOT. In common parlance, got has the same meaning as the more classical Gotra of Wilson's Glossary. Properly, those only are Got (v. Colebrooke, Trans: R. A. S. Vol. II p. 237), which bear the name of some Rishi progenitor, as Sandilya, Bharadwaj, Bushisht, (Vasisht'ha), kasyapa; but it has become the custom to call each sub-division of a tribe a Got, and according to the Nirnyé Sindh; there are no less than ten thousand. The early genealogies of the Rajpoots frequently exhibit them as abandoning their martial habits; and establishing religious sects, or Gotras: Thus, Reh was the fourth son of Proorwa of the Lunar race, from him, in the fifteenth generation, was Harita, who with his eight brothers took the office of religion, and established the Causika Gotra, a tribe of brahmins." According to Col. Tod, both Got and Kamp, denote a clan, and in Rajputanah its sub-divisions have the patronymic terminating with the syllable 'ote,' awut, 'sote,' in the use of which euphony alone is the guide: thus, Suktawut, 'sons of Sukta;' Kurmasote, of Kurma; Mair-awut, or mairote, mountaineers, 'sons of the mountain.' *Elliot quoting Colebrooke, Miscell. Essays*, Vol. I p. 115, *Journ. R. A. S.*, Vol. III., pp. 354, 356; "*Sanscrit Dic.*" p. 298; *and Vishnu Purana*, p. 405 *Tod Rajasthan.*

GOTAMA. A name of Sakya Sinha, applied to him after his death, when he had become a buddha, and it is by this name that he is usually known in Burmah. It is also written Godama, Gaudama.

GOTAMA RISHI. See Jains.

GOTARZES. A Parthian king A. D. 45. See Greeks of Asia

GOT-BEGOON. Beng. Solanum torvum.

GOT-BOR. Mar. Zizyphus xylocarpa.

GOTHIC. A branch of the Indo Germanic stock of languages. The Goths consulted the heart of victims, had oracles, had sybils, had a Venus in Freya, and Parcæ in the Valkyrie. See Baber.

GOTH ISLAND, belongs to the Japanese empire.—*Marryat Ind. Archip.*, p. 173.

GOTHO. Uria. Carissa carandas.—*Linn.*

GOTRA. Sans. A tribe. Professor Wilson calls it a family, lineage, relationship by descent from a common ancestor of the same name; a family, a tribe, especially applied to races of brahmans—who reckon their descent from some celebrated saint or regard him as their primitive spiritual head. and whose designation they bear,—as the Bharadwaja-gotra, Kasyapa-gotra, Sandilya-gotra, &c. In Vol. II, p. 12, of the Hindu Theatre, Professor Wilson says, "it is asserted that thirteen Gotra or families of brahmins own their origin to as many divine sages called after their name. Kasyapa (Kusip) is one of the number. The Aswalayana Sutra of the Rig Veda contains the enumeration of the Gotra, and their subdivisions, but in a very involved and unintelligible style. The popular enumeration of them, however, is not uncommon; but it is nearly, if not wholly, confined to the south of India, where several of the representatives of these tribes yet claim exist."

He also says, at p. 3, of his note to "Johnson's Extracts from the Mahabharata" that in the south of India, brahmans are still found pretending to be sprung from some of the patriarchal families. This, however, is not correct, for, throughout the entire peninsula, every brahmin claims his own Got; and every marriage is regulated by the Got;

no brahmin marries into his own Got but into one not belonging to the same natural family. *Elliot Wilson's Hindu Theatre Wilson's Glossary.* See Got, Hindu ; Marriage.

GOTRABHID. Sans. from gotra, a mountain, and bhid, to divide.

GOTTE, also Gotti chettu. Tel. Zizyphus xylopyrus.—*Willd.* also Z. elliptica and Z. caracutta.—*Roxb.*

GOTTI GADDA. Tel. Spathium Chinense. *Lour.* syn. of Aponogeton monostachys *Linn.* The roots are much prized as food by the Yanadi race. —*Br* 271.

GOTUMBA. Sans. Byronia.

GOU-CHUNA, or Go-chunee is a field of wheat and Chuna or Cicer arietinum sown together. The practice of sowing culmiferous and leguminous plants together, is advantageous to the land, as well as to the crop. Dew readily forms on the leaves of the Chuna, which would not form on the wheat, and this, in seasons of drought is often the means of preserving both crops. Agriculturalists in Europe sow clover with barley, flax, and oats and Lent-corn.—*Elliot.*

GOUDRON. Fr. Tar.

GOUGHIA. A curious evergreen laurel-like tree, was found by Dr. Hooker at Chating in the Lachen valley of Sikkim. Its genus was named (*Wight, Ic. Plant*) after the Hon'ble Capt. Gough, to whom the botany of the Peninsula of India is indebted. It is a large and handsome evergreen, very similar in foliage to a fine rhododendron, and its hardier varieties would prove a valuable ornament on English lawns. Wight in Icones gives Goughia Griffithiana, and Neilgherensis.—*Hooker Him. Jour.* Vol. II, p. 33.

GOUGH, Hugh, Viscount, born in 1779, was the son of George Gough, Esq., of Woodstown, county of Limerick. He entered the British army in 1791, served at the capture of the Cape of Good Hope and the Dutch fleet in Saldanha Bay, 1795, and afterwards in the West Indies, including the attack on Porto Rico, the Brigand war in St. Lucia, and capture of Surinam. He proceeded to the Peninsula in 1809, and commanded the 87th at the battle of Talavera where he was severely and dangerously wounded, horses shod under him both at Barossa and Vittoria and Nivelle, again severely wounded, for which engagements he received the Gold Cross. He also commanded this regiment at the sieges of Cadiz and Tariffa where he was wounded in the head. At Barossa, his regiment captured the Eagle of the 8th French Regiment, and at Vittoria the baton of Marshal Jourdan. At Nivelle he was again severely wounded. He was nominated to the Mysore division of the Madras Army in 1837, and in 1840, went to command of the land forces against China, for which services he was made G. C. B. and a Baronet. He was appointed Commander-in-Chief in India; and on the 29th of December 1843, with the right wing of the army of Gwalior, he defeated a Mahratta force at Maharajpore, and captured 56 guns, &c. In 1845 and 1846, the army under his personal command defeated the Sikh army at Moodkee, Ferozeshah, and Sobrana, for which services he received the thanks of both Houses of Parliament, and was raised to the Peerage. During the last desperate struggle with the Sikhs in 1848-49, Sir H. Gough subdued the enemy, though at a great expenditure of human life. The next year he received from his sovereign additional rank in the Peerage, from the East India Company a pension of £2.000, and a similar sum from Parliament for himself and his next two successors.

Lord Gough died on Tuesday, 2nd 186 ? The son of a Limerick squire, he fought his way up to a viscountcy, a baton, and a fortune, by virtue of every quality of a good soldier. He was impatient in battle : though gifted with great powers of combination and strategy, his impulsive personal bravery, and rushing into the midst of the battle, by hurrying on one movement before the previous arrangement could be carried out, disarranged and rendered useless his own valuable plans. General Havelock said he was a man with a lust for danger ; he excited the warmest attachment in his soldiers, and his zeal succeeded almost as well as Suwarrow's. He never lost a battle,—for Chillianwallah, though a terrible destruction of life was not a lost battle, and at Gujerat, where, for the first time in his life, he took advice and let artillery have fair play, he destroyed the most dangerous enemy, save Hyder, the British ever encountered in India. The victory was due in no slight degree to the reckless daring with which he inspired all under his command.—*London Spectator. Men of the Time.*

GOUL, amongst the Persians, a fabulous spirit, sometimes represented as in the form of a beautiful young woman, that resorts to church yards. They affirm that it entices the traveller by its cries, and then tears him to pieces with its claws.—*Baron C. A. DeBode'e Travels in Luristan and Arabistan*, p. 23. See Ghoule.

GOUN. Burm. Boehmeria nivea.

GOUPHOCARPUS FRUTICOSUS. See Cynanchum argel.

GOUR. A small territory, well situated for defence, in the centre of the most rugged country of the Paropamesus. Mahmud Gori conquered Afghanistan from the Tartar race of Sabaqtagin in 1160, carried his army into India and took Benares; and died A. D. 1205, his empire was divided amongst his favourites and his freedmen, and Afghanistan fell to the share of Eldoz. Eldoz was soon dispoiled of it by a prince of Kharism, whose successor Jelal-ud-Din, was compelled to yield it to Jenghis Khan.

GOUR, called also Lucknouti, the ancient capital of Bengal, and its territory supposed to be the Gangia regia of Ptolemy. It stood on the left bank of the Ganges, on a stone embankment about 25 miles below Rajmahal. It was the capital of Bengal 730 years before Christ, and was repaired and beautified by Akbar, who gave it the name of Jannatabad, which name is still born by a part of the circar in which it was situated. According to Ferishta's account, the unwholesomeness of its air about the middle of the sixteenth century occasioned it to be deserted soon after; and the seat of government was removed to Tondah or Tanrah, a few miles higher up the river,—then to Rajmahal. Three causes however, viz: the removal of the capital, the desertion of its old bed by the Ganges, and the unwholesomeness of the region have contributed to turn Gour into a wilderness. No part of the site of ancient Gour is nearer to the present bank of the Ganges, than four miles and a half, and some parts of it, which were originally washed bythat river, are now 12 miles from it. Taking the extent of the ruins of Gour at the most reasonable calculation, it is not less than 15 miles in length (extending along the old bank of the Ganges), and from two to three in breadth. The rulers of Bengal, capital, Kanauj or Gour? who have been identified as the first, were the family of Bhupala. Abu'l Fazl, however, enumerates three dynasties as prior to this family. The first of the Vaidya rajas, was Sukh Sen, in A. D. 1063. Its last hindu king was Lakshmanan. He had been placed on the throne in infancy, and during his long reign had beeu a just and liberal ruler. In A. D. 1203, Bengal was overrun by Bakhtiar, a general of Mahomed Gori and the last hindu king escaped to Orissa. Gour is also, by many, supposed to have been founded by one of the physician dynasty of Bengal, not long before the mahomedan invasion; though Dow and Rennel state that it was the capital of Bengal 730 years before Christ —*Tr. of Hind.*, Vol. I. p. 94. *Rennell's Memoir*, p. 55. *Prinsep's Antiquities by Thomas*, p. 272.

GOUR. Bos gaurus; See Bos, Bovidæ, Mammalia.

GOUR, A river 11 miles from Jubbulpoor.

GAURA or Goura. Sanscrit pundits, of old, divided the colloquial languages of India into two classes, each containing five dialects, denominated respectively, the five Gaura and the five Dravida. By the term Gaura or Gauda, are meant the Bhasha or Pracrit or spoken tongues in northern India, some old ones of which have since ceased to be spoken, or have merged into others. At present the languages which may be considered Gaura are Bengali, Hindi with its neighbour the Hindustani, Punjabi, Gujarathi, Marathi, and the languages of Kashmir and Nepal, altogether nine. The pundits named the five Dravida or Dravira, viz., Telinga, Karnatika, Mahratha, Gurjara, and Dravira or Tamil proper, but, at present, Dr. Caldwell displaces the Gurjara or Gujarathi, and the Marathi, and considers the Dravida proper or Tamil, the Telinga, Talunga, or Telugu, and the Karnataka, Kannada or Canarese, to be the three principal languages of the Dravidian family, and he adds thereto the Malayalam, the Tulu, and the uncultivated Tuda, Kota, Gond and Ku, altogether nine Dravidian or Tamulian tongues. The Gour alphabet is the immediate parent of the modern Bengali, and it is to be seen in the ancient inscriptions at Budd'ha Gaya in the Nag Arjuna cave also in an inscription from Bhubaneswur in Orissa and in one from Brahmeswar in Cuttack.—*Dr. Caldwell's Comparative Grammar.* See Abhaya, Deva, India. Inscriptions.

GOURAHUR. An obscure tribe of Rajputs in Saheswan, Gungeree, Puchlunah, Budurea and Bilram, on the borders of Budaon and Aligurh.—*Elliot.*

GOURAMY, the Osphromenus olfax, *Comm.* an excellent fresh water fish, of China, grows to lbs. 20 in weight, has been introduced into Bengal, Madras, Neilgherries, Australia, Mauritius, Cayenne. It is esteemed of more delicate flavour than the salmon or turbot.

GOURA-NEBOO. Beng. Citrus bergamia (a species.)

GOUR BRAHMAN, one of the ten tribes of brahmans. They state that they came from Gour in Bengal, but there is much improbability in the story. There can be little doubt of Canoujea brahmans emigrating on the invitation of Adiswara, from Canouj to Bengal; we therefore, cannot account for the whole tribe of Gour brahmans not only leaving their native seats, but crossing through the country of the Canoujea, and dwelling

on the other side of them. If they emigrated in or about the time of the Pandawa, as universal local tradition would induce us to suppose, it would lead to the inference that the Canoujea are a more modern race. The Gour brahman appear in general a more ignorant race than the Canoujea brahman, and can seldom be got to give an intelligible account of their own sub-divisions, but it may be gathered that they amount to the number of forty-two. The most noted tribes of Gour brahmins are the Adh Gour, Joogad Gour, Kytt'h hul Gour, Googur Gour, Dhurum Gour and Sidh Gour —*Elliot Supp. Gloss.*

GOURD. ENG. Kikium, AR. Gourd is a term, like that of melon, and pumpkin, applied as a suffix to the fruits of species of the natural order Cucurbitaceæ or Gourd tribe and of the genera Cucurbita, Cucumis and Lagenaria.

Cucumis melo, is the melon. Benincasa cerifera, is the pumpkin or white gourd.

Lagenaria vulgaris, is the bottle gourd or white pumpkin.

Tricosanthes anguina, is the snake gourd.

Cucumus sativa, the cucumber.

Cucurbita maxima, is the squash gourd or red gourd.

Cucurbita aurantia, is the orange gourd.

Cucurbita ovifera, is the vegetable marrow.

The wild Gourd of 2 Kings iv and 39, is the bitter cucumber, Citrullus colocynthis.—*Voigt.* p. 58-59.

GOURD OIL. See Oils.

GOUREA. See Inscriptions, p. 390.

GOUR-GIA. PERS. Andropogon schænanthus. *Linn.*

GOURHA RAJ. See Inscriptions, p. 390.

GOURIA. SANS. White, or light yellow: from goura.

GOURI. A forest in which Parvati and Siva were surprised by the Rishi. See Uma.

GOURI, in hindu mythology the goddess of abundance, and is called Isa, also Isani or Parvati, also Lakshmi and corresponds to the Ceres of Greece. Her festival relates to the Bassant or spring, the vernal equinox. An image is made of earth, barley is sown and by watering and artificial heat is made to grow. In Rajputanah beautiful girls carry the idol and bathe it in the water, and return with it to the palace. The festival resembles that of the Egyptian Diana, at Bubastis, and of Isis at Busiris within the Delta of the Nile. During the festival, Iswara yields to his consort Gouri, and occupies an unimportant position near her at the waters edge, meanly clad, smoking intoxicating herbs, and, whether by accident or design, holding the stalk of an onion in full blossom as a mace or club, a plant regarded by some of the Egyptians with veneration, but held by the hindus generally in detestation: and why the hindus should on such an occasion thus degrade Iswara is not apparent. Gangori, is a hindu festival sacred to the goddess Gouri about the beginning of September, on the 7th of Bhadrapad when Parvati is worshipped as a tender maiden. It lasts three days. Col. Tod remarks that by the prefix of Ganga (the river) to Gouri, the Gangor festival is evidently one, essentially sacred to a river goddess, affording proof of the common origin of the rites of the Isis of Egypt and India. The Rajputs term a preceding festival the Ahairea or Muhoorat ka shikar in which the nobles hunt the wild boar.—*Tod's Rajasthan*, Vol. I. p. 575. See Gauri.

GOURI-SANKAR. A hindoo idol, in which the god Siva is represented in a sitting posture, with Parvati sitting on his knee, the bull Nandi at his feet and the Sinha or lion at hers. See Gouri; Burabur, Uma.

GOURINE. A sub-family of birds of the Order Gemitores, which may be shown thus:

ORDER IV.—Gemitores or Pigeons.
FAM. Columbidæ.
Sub-fam. Treroninæ 5 gen. 3 sub-gen. 23 sp. 3 Toria; 8 Treron; 3 Sphenocercus, 4 Ptilinopus Carpophagus.
Sub-fam. Columbinæ, 7 gen. 21 sp. 2 Alsocomus; 3 Palumbus; 2 Columba; 4 Macropygia; 2 Geopilia; 7 Turtur; 1 Chalcophaps.
Sub-fam. Gourinæ; 1 gen. 1 sp. viz., 1 Calænas Nicobarica

GOURKANI. The name of the tribe to which Timur belonged, also mirza Baber and his descendants. *Ferrier, History of Afghans*, p. 71.

GOUR-KAYET. One of the twelve subdivisions of the Kayet race they are chiefly to be found in Bengal. *Elliot, Supp. Gloss.*

GOUROOA also Gaurua, an inferior class of Rajpoots in Rehur and Nugeena of Bijnore, Iradatnugur of Agra; and Suhar Shergarh, and Huzoor Tahseel of Muttra. *Elliot Supp. Gloss.*

GOUR RAJPUT. One of the Chatees kula or 36 clans of royal rajpoots. According to Colonel Tod, (Vol.. I, p. 115), the ancient kings of Bengal were of this race, and gave their name to the capital Luk'hnoute. There are several of this clan in the N. W. Provinces of India, Colonel Tod gives the names of five Sak'ha of Gour, which do not at all correspond with those known in the N. W. Provinces, where they are divided into three classes called Bhut Gour, Bamun Gour, and Chumar Gour. *Elliot Supp. Gloss,*

GOUR TAGA, an important tribe of brahmanical descent, in the North West of India, extending over a great part of Upper Rohilcund, the Upper Doab, and the Delhi Territory. They state that they were invited from Bengal to the N. W. Provinces by raja Janamejaya for the purpose of exterminating snakes; which fable, no doubt veils, under an allegorical type, the important historical fact, that the serpents, for whose annihilation so much trouble was taken, were Takshac—Scythian buddhists. *Elliot, Supp. Glos.*

GOUT. The following prescription has been found very successful in gout: preceded by a warm purgative or two the medicine may be begun with and continued for some weeks after the attacks.—*Rp.* Pulv. Guiaci. Potass Bromid. Magnes Carbon āa gr. viii. One powder to be taken three times a day before meals.—*C. M. D.*

GOUTUM RAJPOOTS, once a very powerful clan in the Lower Doab of Hindostan. The class is now usually rated amongst the Chunderbuns; but they are not considered as holding a place amongst the 36 royal races.

GOVA. TEL. Guatteria cerasoides.

GOVA GUTTI. TEL. Species of Trichodesda.

GOVAPA. SANS. Tallow.

GOUSSEE. See Koutouktow.

GOVARDHAN, a mountain which the Yadu race worshipped. It is celebrated in Indian poetry and is still a great place of hindu pilgrimage. Nothing less than that it is the personification of Krishna himself is the opinion in which Goverdhun is held byhis followers. Devout votaries, perform the circuit of the mount, by going round its base prostrating themselves at each step on the way, and marking the space covered by their bodies. This is a vow or penance, which can be completed only in several years and one devotee has been heard of who had been able to go round but half the mountain in seven years. No hindu dares to bring home any stone from Goverdhun; it is said to be endued with life. The Luka-Luki or Hide-and-Seek tank, near Goverdhun, speaks of the early age of that game among the hindus, having been played by Krishna with the Gopini.

The mountain Goverdhun is fabled to have been reared by Krishna.

Chitra Rathas smil'd; and, warbling in a softer mode,
Sang the red light'ning, hail, and whelming rain.
O'er G'oeul green and Vraja's nymph-lov'd plain
By Indra hurl'd, whose altars ne'er had glow'd,
Since infant Krishna rul'd the rustick train
Now thrill'd with terror—Them the heavenly child,
Call'd, and with looks ambrosial smil'd,
Then with one finger rear'd the vast Goverdhon,
Beneath whose rocky burden
On pastures dry the maids and herdsmen trod:
The Lord of thunder felt a mightier God;

—*Sir W. Jones's Hymns to Indra*, Vol. XIII, p. 274. *Tr. of Hind.*, Vol. II, p. 114, 115. See Krishna, Tripati.

GOVERNOR GENERAL, one rules British India, with 2 Governors of Madras, and Bombay; 3 Lieutenant Governors of Bengal, N. W. Provinces or Agra, and the Punjab, and its dependencies. 4 Chief Commissioners, Oudh, Central Provinces, Burmah, Sind and Hyderabad, Assigned Territories; 1 Commissioner of Mysore; 2 Residents of Hyderabad and Nepaul; 2 Agents to Governor General for Rajputanah and Indore. A Governor General rules the Portuguese possessions of India; another Governor General, rules the Dutch East Indies, known as the Netherland possessions in India; the Spanish East Indies in the Philippians have another Governor General, and the French Possessions in India have a Governor.

GOVILA. TEL. Aristolochia Indica.—*Linn.*

GOVIND. The tenth Guru of the Sikhs, from Nanuk. He trained them as soldiers.

GOVINDA. SANS. from go, a cow, and vid, to share out.

GOVINDA, Gopala, and Gokala, are names of Krishna, derived from his pastoral avocation of herdsman, from go, a cow. Gopinath husband or lord of the Gopi is derived from his association with the Gopi herd women. Jyadeva, Jyad the bard of the Yadu race, in the opening of "the songs of Govinda," says "if thy soul be delighted with the remembrance of Heri, or sensible to the raptures of love, listen to the voice of Jyadeva, whose notes are both sweet and brilliant" Jyadeva opens the first interview of Krishna and Radha with an animated description of a night in the rainy season, in which Heri or Krishna is represented as a wanderer, and Radha, daughter of the shepherd Nanda, is sent to offer him shelter in their cot. Nanda thus speaks to Radha: "'The firmament is obscured by clouds, the woodlands are black with tamala trees; that youth who roves in the forest will be fearful in the gloom of night; go my daughter, bring the wanderer to my rustic mansion.' Such was the command of Nanda the herdsman, and hence arose the love of Radha and Madhava." The poet proceeds to apostrophize Heri, which the hindu bard terms Rupaca, or personal description.

"Oh thou who reclinest on the bosom of Camala, whose ears flame with gems, and

whose locks are embellished with sylvan flowers; thou, from whom the day-star derived his effulgence, who slewest the venom-breathing Caliya, who beamist like a sun on the tribe of Yadu, that flourished like a lotus; thou, who sittest on the plumage of Garuda, who sippest nectar from the radiant lips of Pedma as the fluttering chacora drinks the moon-beams; be victorious, O Heri."—*Malcolm's Central India*, Vol. II, p. 135.

GOVINDA CHANDRA. See Inscriptions, p. 391.

GOVINDA RAJA. See Inscriptions, pp. 383, 390.

GOVINDH SINHI. See Hindoo. Sikhs.

GOWDI, a name for the fish called the Sword Dragonet, a species of Callionymus.

GOWGIRD. PERS. Sulphur.

GOWHATTY, a town in Assam, 335 miles from Calcutta, it is on the left bank of the Brahmaputra river in long. 91° 40' E., and lat. 26° 20' N., and is 130 feet above the sea level.

GOWLA GUZ. HIND. TAM. A brown coloured seed, about the size of, and having much the same appearance as the coriander seed, but more oval. They have a pleasant, subaromatic and mucilaginous taste; and are considered by native practitioners as cordial and stomachic. They are imported into Bombay from the Persian Gulf, and are distinguished in the bazaars either with or without husks.—*Faulkner.*

GOWMUTTEE, a river near Bageswur in Almorah.

GOWRANDEE, a town in Manbhoom.

GOWRIPHAL. DUK. HIND. Rubus lasiocarpus. Rubus Indicus.

GOWR-GIA? PERS. Lemon grass.

GOWTUM. See Nyaya.

GOW-ZABAN. GUZ. HIND. PERS. Hart's ear, literally, Cow's tongue.

GOYOSOO. JAPANESE, a Custom-house or Town-hall: where all foreigners transact business and see Japanese officials.

GRA See Bodo.

GRACEMOUNT, in Lat. 30° 27' 6; N. and L. 78° 3'·0 E., in Garhwal, near the sanitarium of Massuri, at the cistern of General Sir Andrew Waugh's barometer is 6,590 feet, above the sea, and at the cistern of the barometer at Mary Villa, near Gracemount is 6,715 feet *G. T. S. Schlagentweit.*

GRACILLARIA COFFIFOLIELLA. The larva of this mines the coffee leaves, it is very common but of no importance to the planter.

GRACILLARIA LICHENOIDES. *Greville.*

Fucus lichenoides, TURNER.	Gigartina lichenoides, LAMOUROUX.
„ amylaceus O'SHAUGH.	Sphærococcus lichenoides, AGARDH.
Ceylon Moss, ENG.	Plocaria Candida, NEES.
Edible Sea weed, „	Mousse de Ceylon, FR.

A small and delicate fucus, well known for the amylaceous properties it possesses, and the large proportion of true starch it furnishes. The fronds are filiform; the filaments much branched, and of a light purple color. It grows abundantly in the large lake or back-water which extends between Putlam and Calpentyr, Ceylon. It is collected by the natives principally during the south-west mousoon, when it becomes separated by the agitation of the water. The moss is spread on mats and dried in the sun for two or three days. It is then washed several times in fresh water, and again exposed to the sun, which bleaches it, after which it is collected in heaps for exportation. 100 grains weight yielded the following proportions:—

Vegetable jelly,	54·50	Gum,	4·00
True starch,	15·00	Sulphate and phosphate of lime,	1·08
Ligneous fibre,	18·00		
Sulphate and muriate of soda,	6·50	Total...	99·00

—with a trace of wax and iron. For a decoction of Ceylon moss, take Ceylon moss ground to fine powder two drachms, water one quart, boil for twenty minutes, strain through muslin. By increasing the proportion of the ground moss to half an ounce, the filtered solution on cooling becomes a firm jelly, which when flavoured by cinnamon or lemon peel, sugar and a little wine, is an excellent article of light food for sick children, and convalescents. The whole thallus of this one of the Algæ is sometimes imported from Ceylon and the East Indies and used in Britain for dressing silk goods.—*Beng. Phar.* p. 276. See Plocaria, Ceylon Moss, Fucus, Edible Sea-Weed.

GRACILLARIA TENAX.

Fucus spinosus, LINN.	Gigartina tenax.
„ tenax. TURNER.	Gracillaria spinosa.
Eucheuma spinosa,	
Agar-Agar, MALAY.	Bulung, JAV.
Karang, „	Dongi Dongi, MACASSAR.
Sajor-karang, „	

Gracillaria tenax one of the Algæ, of the Order Rhodymeniaceæ seems to have as synonims, Gigartina spinosa also Gracillaria tenax also Fucus tenax of Turner. Mr. Williams and the Honorable Mr. Morrison say of the Gigartina tenax, that the Chinese people collect this sea-weed on the coast to a great extent, using it for food, and also in the arts, affording an excellent material for glues and varnishes. It is boiled and

the transparent glue obtained is brushed upon a porous kind of paper called "shachi" which it renders nearly transparent. It is also used as a size for stiffening silks and gauze, and extensively employed in the manufacture of lanterns and in the preparation of paper for lattices and windows. This and other kinds of fuci are boiled down to a jelly by the islanders on the south and extensively used for food, (*Williams*, p. 275.) The Honorable Mr. Morrison says Gracillaria tenax is the Fucus tenax of Turner: about 27,000 lbs. are annually imported into Canton, from the provinces of Fokien and Tchi-Kiang, and sold for 6*d.* to 8*d.* the pound. The Chinese make it the basis of an excellent glue and varnish, and employ it chiefly in the manufacture of lanterns, to strengthen or varnish the paper and sometimes to thicken or give a gloss to silks or gauze. Mr. Neill thinks that the gummy substance called Chin-chou, or hai-tsai, in China and Japan may be composed of this substance. Windows made of slips of bamboos and crossed diagonally, have frequently their interstices wholly filled with the transparent hai-tsai glue. *Mr. Niell, Williams, Middle Kingdom* p. 275, *Hon'ble Mr. Morrison's Compendious Summary.* See Algæ, Agar-Agar, Eucheuma; Glue; Fucus; Plocaria.

GRACULA. A genus of birds of the sub-family Graculinæ of which there are four species, the G. religiosa *Linn*, being that best known from its facility in learning to speak.

GRACULA RELIGIOSA. LINN.

Mina,	HIND.	Mancho,	JAV.
Beo,	JAV.	Teeong,	SUMAT.

Found in Java, Sumatra and the Great Eastern Islands. It is easily domesticated, and learns to whistle and talk and imitate human speech with greater facility than any other bird. *Eng. Cyc.* See Birds.

GRACULINÆ. A Sub-family of birds containing 10 gen. 27 sp. viz., 4 Gracula, 1 Ampeliceps, 3 Acridotheres, 4 Sturnus, 1 Psaroglossa; 9 Sturnia, 2 Calornis; 1 Pastoz; 1 Enodes; 1 Mina. See Birds.

GRACULUS, a genus of birds of the *Fam.* Pelicanidæ, in which family are 5 gen. 12 sp. viz., 2 Phæton, 2 Sula, 3 Pelecanus, 4 Graculus, 1 Plotus.

GRADUL. DUK. Entada pusætha, D. C.

GRÆCO-BACTRIANS. See Khutri. Rajpoots. Greeks in Asia.

GRAEN or Grane, also Quade, the Gerra of Pliny, in lat. 29° 23' N., long. 47° 58' E., is inhabited by Arabs. It is on the west side of the Persian Gulf, and carries on trade with the Red Sea, Sind, Guzerat and the west coast of India.—*Horsburgh.*

GRAHA. SANS. The planets. A moveable point in the heavens. In hindu astronomy the planets have each a great number of names, or epithets; many of which are to this day unknown to Europeans. The following, however, are known to every Indian, because they serve to give a name to the seven days of the week; Ravi, or Surya, the Sun. Chandra, or Soma, the Moon. Mangala, or Cuja, Mars. Budha, Mercury. Curu, or Vrihaspati, Jupiter. Sucra, or Bhrigu, Venus. Sani, or Saturn Besides these, the hindu astronomers consider Rahu, the Moon's ascending and Ketu her descending Nodes, as obscure planets, which occasion the Eclipses of the Sun and Moon. Graha, when the terms Madhya and Sphuta are prefixed to it, signifies the mean, and apparent place of the planet in the hindu sidereal, or fixed zodiac. Graha laghava is the name of a treatise on Astronomy, written about the 4657th year of the Cali yug (A. D. 1555). The Graha, or planets of the hindus are sometimes worshipped together, and at others separately; Surya or Ravi, the sun; Soma or Chandra, the moon, Mungula, Budh, Vrihaspati, Sukra, Shuni or Sani, Rahu, and Ketu.—*Cole. Myth. Hind. p.* 38. *Kala Sanhita Warren.*

GRAHAM, Dr. Robert, a botanist, who described Dr. Wallich's Leguminosæ. Author of a Catalogue of the plants growing in Bombay and its vicinity, published in 1830, but it has unfortunately been of little use, owing to the absence of descriptions rendering it impossible to identify in a satisfactory manner the species referred to He died at an early age in India, and is buried at Candallah, in the Deccan.—*Hooker f. et Th.*

GRAHA PARIVRITHI. SANS. An account of time used by the inhabitants of the Southern Provinces of the Peninsula of India. It consists of a cycle of 90 Solar Sidereal years of 365d. 15g. 31v. 30p. Indian, or 365d. 6h. 12' 36" European time. Its epoch is A. A. C. 24, and it is constructed of the sum of the products of revolutions of Mars (15) Mercury (22) Jupiter (11) Venus (5) Saturn (9) and Sun (1).

GRAHAST-ASRAMAM. See Hindu.

GRAHILOTE or Gehlote, a rajput tribe of the Sooryavansi, the chief of which is the rana, Lord of Cheetore. By universal consent, as well as by the gotra of this race, its princes are admitted to be the direct descendants of Rama, of the solar line. A pedigree is deduced from him, and connected with Soomitra, the last prince mentioned in the genealogy of the Pooranas. —*Tod's Rajasthan*, Vol. I, p. 82.

GRAINE, a kind of harpoon in use on board of ships for striking the larger fish.

GRAINE DE NAVETTE. Fr. Rape seed.

GRAINES DE ANIS. Fr. Aniseed

GRAIN-PITS or trenches for storing grains are selected in elevated dry spots. Their size being according to the nature of the soil. All the preparation they undergo is the incineration of certain vegetable substances, and lining the sides and bottom with wheat and barley stubble. The grain is then deposited in the pit, covered over with straw, and a terrace of earth about eighteen inches in height, and projecting in front beyond the orifice of the pit, is raised over it. This is secured with a coating of clay and cow-dung, which resists the ordinary rains, but is renewed as the torrents injure it. Grain can be kept in these for years without injury.

GRAINS OF PARADISE, are small fruits produced by species of Amomum, the Amomum Grana Paradisi *Linnæus*, and Agrandiflorum, *Smith. Eng. Cyc.*

GRALLATORES or Waders, an order of birds as under:

a. Tribe, Pressirostres.

Fam. Otidæ, Otis and 3 sub-gen. 4 sp. viz 1 Houbara; 1 Eupodotis; 2 Sypheotides.

b. Incertæ sedes.

Fam. Glareolidæ, 1 gen. 2 sp. viz. 2 Glareola orientalis, lactea.

Fam. Charadriadæ.

Sub-fam. Cursoriinæ, 2 gen. 2 sp. viz. 1 Cursorius Coromandelicus, 1 Macrotarsius bitorquatus.

Sub-fam. Esacinæ, 2 gen. 2 sp. viz. 1 Esacus; 1 Œdicnemus.

Sub-fam. Vanellinæ, 4 gen. 6 sp. viz. 1 Hoplopterus; 1 Sarciophorus; 3 Lobivanellus.

Sub-fam. Charadrinæ, 2 gen. 2 sub-gen. 10 sp. 1 Squatarola; 2 Charadrius; 1 Eudromias, 6 Hiaticula.

Fam. Chionidæ, 1 gen. 1 sp. 1 Hæmatopus ostralegus.

Fam. Recurvirostridæ, 2 gen. 3 sp. 2 Himantopus; 1 Recurvirostra avocetta.

Fam. Scolopacidæ, 16 gen. 32 sp. viz. Ibidorhynchus; 4 Totanus; 3 Actitis; 6 Tringa; 1 Terekia; 2 Limosa, 2 Numenius; 1 Eurinorhynchus; 1 Calidris; 1 Philomachus; 1 Strepsilas; 1 Phalaropus; 1 Scolopax; 1 Macrorhamphus; 6 Gallinago; 1 Rhynchæa.

Fam. Palamedeidæ.

Sub-fam. Parrinæ, 2 gen. 2 sp. viz. 1 Metopidius; 1 Hydrophasianus.

Fam. Gruidæ, 1 gen. 1 sub-gen. 3 sp. viz. 2 Grus; 1 Anthropoides.

c. Cultirostres.

Fam. Ardeadæ,

Sub-fam. Tantalinæ; 6 gen. 7 sp. viz. 1 Falcinellus; 1 Geronticus; 1 Threskiornis; 2 Tantalus; 1 Platalea; 1 Anastomus.

d. Incertæ Sedes.

1 Gen. Dromas ardeola.

Sub-fam. Ciconinæ; 3 gen. 6 sp. viz., Mycteria; Ciconia; 2 Leptoptilos.

Sub-fam. Ardeinæ, 1 gen. 7 sub gen. 19 sp 4 Ardea; 6 Herodia, 1 Butorides; 1 Ardeola; 1 Nycticorax; 1 Tigrisoma; 1 Botaurus; 4 Ardetta.

e. Tribe Macrodactylæ.

Fam. Rallidæ, 7 gen. 15 sp. viz. 1 Porphyrio; 1 Gallicrex; 8 Porzana; 1 Ortygometra; 3 Rallus; 1 Gallinula; 1 Fulica

Many of these are migratory and come annually into India across the Himalaya. Mr. Hodgson says the Grallatorial and Natatorial birds begin to arrive in Nepaul from the North, towards the close of August, and continue arriving till the middle of September. The first to appear are the common snipe, and jack snipe, and Rhynchœa; next, the Scolopaceous waders (except the woodcock;) next, the great birds of the heron and stork, and crane families; then, the Natatores; and lastly, the wood-cocks, which do not reach Nepaul till November. The time of the re-appearance of these birds, from the South is the beginning of March; and they go on arriving till the middle of May. The first which thus return to Nepaul are the snipes; then come the teal and ducks; then the large Natatores; and lastly, the great cranes and storks. The Grallatores which visit Nepaul, or pass over it, are much more numerous than the Natatores; the wild swan was only once seen in Nepaul in the mid winter of 1828, when the apparition suggested a new version of the well known hexameter.—

'Rara avis in terris, *alboque* simillima cygno.'

None of the Natatores stay in Nepaul beyond a week or two, in autumn, (when the rice fields tempt them) or beyond a few days, in spring, except the teal, the widgeon, and the coot, which remain for the whole season, upon some few tanks whose sanctity precludes all molestation of them. There are cormorants throughout the season upon the larger rivers within the mountains; but none ever halt in the valley, beyond a day or two: for so long, however, both they and pelicans may be seen, occasionally, on the banks just mentioned.

The Larus and Sterna are birds which usually affect the high seas,—but Mr. Hodgson had killed both the red-legged Gull, and a genuine pelagic Tern, in the valley of Nepaul. But so had he fishing Eagles; and in truth he adds, who shall limit the wanderings of these long-winged birds of the etherial expanse? See Migration of birds.

of Brazil, in Buenos Ayres, in Chili, at the Cape of Good Hope, and in the temperate zone of Australia, wheat predominates; barley, however, and rye make their appearance in the southernmost parts of these countries and in Van Diemen's Land. In New Zealand the culture of wheat is said to have been tried with success, but the inhabitants avail themselves of the Acrostichum furcatum as the main article of sustenance. Hence it appears that in respect of the predominating kinds of grain, the earth may be divided into five grand divisions, or kingdoms —the kingdom of rice, of maize, of wheat, of rye, and lastly, of barley and oats. The first three are the most extensive; the maize has the greatest range of temperature, but rice may be said to support the greatest number of the human race. (*Schouw, in Jameson's Edinburgh Philosophical Journal April* 1825.)

The number of the Indian species are estimated by Voigt at 1,300. The abundance of wholesome fæcula contained in the seeds of some species renders them peculiarly well adapted for the sustenance of man; and if wheat, barley, rye, oats, maize, rice, and guinea corn, are the kinds of cereal grasses more commonly employed, it is because of the large size of their grain compared with that of other grasses; for the few which are unwholesome in their natural state are Lolium temulentum, a common weed in many parts of England, the effects of which are undoubtedly injurious; Bromus purgans and catharticus are said to be emetic and purgative; Bromus mollis is also unwholesome, Festuca quadridentata is said to be poisonous; Molinia varia is injurious to cattle: and some other species are supposed to affect the milk of cows which graze upon them. Among corn-plants of India not generally known may be mentioned Eleusine coracana, called natchnee on the Coromandel coast, and Nagla Ragee, or Mand, elsewhere in India; Setaria germanica, yielding German millet; and Panicum frumentaceum. The tropical grasses differ from the extra tropical ones by their greater size, some like the bamboos, being fifty to sixty feet high; by their larger leaves; by their frequently separate sexes, and by their softer, more downy and elegant flowers. The value of grasses as fodder for cattle is hardly less than that of corn for human food. The best fodder-grasses of Europe are usually dwarf species, or at least such as do not rise above four or five feet from the ground. The most esteemed are Lolium perenne, Phleum and Festuca pratensis; Cynosurus cristatus and various species of Poa and dwarf Festuca. The fodder-grasses of Brazil are of far more gigantic stature, and perfectly tender and delicate. In Australia the favourite is Anthistiria australis, or Kangaroo Grass; in India, A. ciliata is also in request; but the most common Indian fodder-grass is Doorba, Doorwa, or Hurryalee (Cynodon dactylon). Gama Grass (Tripsacum dactyloides) has a great reputation as fodder in Mexico; and attention has lately been directed to the Tussac Grass of the Falklands (Festuca flabellata), a species forming tufts five or six feet high, and said to be unrivalled for its excellence as food for cattle and horses. Sugar is a general product of grasses. It exists in great quantities in the Sugar-Cane (Saccharum officinarum). Maize so abounds in sugar, that its cultivation has been proposed in lieu of the sugar-cane. (*Eng. Cyc.*)

Among the grasses there are both land and water, but no marine plants, and their limit is the utmost range of the vegetable kingdom; Indian species are as under:

Pasture grasses of India.—In the provinces, besides grain, Camels and Elephants are fed upon the leaves of various trees. The goats, sheep, and cattle, are pastured upon what are called the waste land, or the jungles of the villages; the last are fed also upon chopped straw, and the stalks of the joar (Sorghum vulgare), cut into small pieces; while horses, besides pulses, are fed upon grass brought in by men called grass-cutters, but who rather scrape off the ground the creeping stems and young leaves of the grass called Doob or Dhoorba or Hurryallee (the Cynodon dactylon of Botanists),

This grows throughout the year, is fortunately the most common species throughout India, and succeeds particularly well in the Northern parts where lawns and pastures of moderate extent are made by planting pieces of its creeping stems. It is also much used for forming a covering for the banks of rivers, ramparts, and esplanades. The high lands of the Ballaghaut also possess a grass of which cattle are amazingly fond, and which has so strong an aromatic and pungent taste, that the flesh of the animals, as well as their milk and butter, become scented with it. This species is allied to the Lemon grass, and is very abundantly diffused towards the North-west of India. There are, however, numerous other grasses common in India which cattle delight in; but the greater number of these flourish most in the rainy season. Their rapid growth, and the great height they attain, as well as their withered and dry nature towards the close of the year, soon however unfit them for pasture grasses. The inhabitants of many parts of India remedy this, by burning down the old and dried up grass, when the young blade shoots up and affords excellent pasturage. India being at one season deluged with rain, and at another parched up with heat, with only a few months of temperate climate, cannot be expected to possess any pasture grasses similar to those of European countries. But as grasses are among the most universally diffused of plants, we find some suited to every season, indigenous in all parts of India, and affording food for its various herbivorous animals. For the purpose of pasturing improved breeds of sheep, the hills and tableland, from Coimbatore to Kandeish, and the frontier provinces from Gujarat to Hurriana and Saharunpore seem alone suited. But the Himalaya, enjoying a temperate climate and a European-like vegetation have also abundant and excellent pasturage. During the rainy season, when the temperature is moist but equable, the Himalaya have many grasses resembling those in the plains. These are associated with others belonging to European genera, which are able to withstand the winter's cold: so that throughout the year, nearly, there is abundant pasturage in the neighbourhood of the Himalayan villages. Of this the inhabitants avail themselves, by driving their herds of cattle, and flocks of goats and of sheep, to different ranges and elevations, according to the season of the year. The sward upon these mountains is short and thick, and very closely resembles that which is met with on the mountains of Scotland and Wales; while the sheep are as much esteemed for their mutton as those fed in the plains upon grain. Dr. Royle, in his illustrations of the Botany of the Himalayan mountains, has stated that these grasses belong to such genera as Agrostis, Fox-tail grass, Cat's-tail, Meadow-grass, Fescue, Cock's-food, Bent-grass, Oat-grass, and others. Also, that many of the same species which are accounted the best pasture grasses in England are among those found in the Himalaya, as Cock's-foot grass; Annual, Narrow-leaved, and smooth-stalked Meadow-grass; Cat's-tail or Timothy-grass; Purple Fescue-grass, which from its greater produce is considered preferable to that specially called Sheep's Fescue-grass. In the climate where these grow naturally, nothing would be easier than the introduction of any other of the superior pasture grasses of Great Britain; but this is hardly necessary where the natural pasturage is so good. Certain of the pasture lands were so much valued by the Native Governments, that some of the pasture of the sandstone-hills, south of the Kistnah river, where the lemon-grass is found, were reserved for their own cavalry, or the right to cut and sell it was rented to the highest bidders. To improve the pastures or increase the quantity of fodder in the warm and moist parts of the plains of India, it will be necessary to have recourse to the grasses of other climates, as to those of the West-Indies and South America. The Guinea-grass and the Sott's-grass of Jamaica are both highly esteemed in that island, while some of the pasture grasses of Brazil and of the banks of the Amazon, are described as being of a gigantic size, and at the same time perfectly tender and delicate. Closely connected with the subject of the pasture grasses is of that of providing green food for horses, camels, and elephants, and one to which little attention has been paid, though the supply has much diminished in the neighbourhood of towns and large stations. To this Dr. Wallich called attention in his evidence before the Committee of the House of Commons in 1832, stating, that for any number of animals, either for conveyance or for consumption, any quantity of food might be produced in the utmost possible abundance in India, but suggested that a more ready and plentiful supply of food for elephants and camels should be provided by planting those trees (such as particular Indian fig-trees) which form the staff of life for them, and which are extremely easily cultivated. In the Madras Presidency, considerable exertions were made about the year 1796, in every where planting what was called the Bastard Cedar (Gua-

zuma ulmifolia) as green food for cattle.—*Royle's Productive Resources of India.* The need for care on this point increases with the extending cultivation, Rye grass and clover grow well in upland districts in India, and when sown fresh have been found to answer admirably on the Shervaroy, Pulney, Baba-Boodun and Neilgherry Hills. In Guzerat, the cultivators feed their cattle on the sweet stalks of the joari and bajri —*Spry's Suggestions* p. 46.

Guinea Grass.—Has been cultivated to a considerable extent in India and Ceylon with more or less success according to the care and attention bestowed on it. When well manured and kept clear of weeds it grows more luxuriantly and admits of being cut every six weeks or two months. A small patch, near Colombo, which, beginning with about three quarters of an acre, gradually extended to above an acre and a half, for seven or eight years supplied 3 or 4 milch cows and from 5 to 7 horses continually with all the grass required for their consumption and latterly left a surplus which was dried for bedding and hay. When first planted it frequently attains a height of even 9 feet and a stalk taken promiscuously from a small patch planted about the year 1857, in Combaconum measured 10 feet 4½ in. in length, but when cut two or three times it grows thicker but not so high. It is exceedingly excellent feeding for horses and cattle, and is generally preferred by them to the ordinary country grass, though horses which are hard worked seem to prefer the grass roots supplied by the grass cutters. It should not be given to cattle fresh, but the supply for one day should be cut the day previous, and it should not be cut too close to the ground but the stalk ought to be left 7 to 9 inches high. It is a good plan to move the ground between the roots every time the grass is cut and the ground should be heavily manured after every three or four cuttings. It is very hardy and may be easily propagated. It requires abundant moisture but will not live in a soil which is at all marshy. It answers best planted in small tufts 1 ft. 2 in. to 2 ft. apart, which rapidly spread into stools from 6 in. to 1 ft. in diameter. (*Mr. Caldwell in Literis* M.S.S.) Lucerne has been successfully acclimated in the Dekhan, and has long been largely cultivated by natives for sale to Europeans and for their own cattle.—*Spry's Suggest*, p. 63. The Prangos Hay plant grass of Mr. Moorcroft, of Tibet, was found by him to be employed as winter fodder for sheep and goats, and frequently for neat cattle. Moorcroft, writing from the neighbourhood of Droz describes the Prangos Hay plant as producing fatness in a space of time singularly short, and likewise as being destructive to the River Fluke; he therefore justly concluded that it would be an invaluable acquisition to any country, to the climate of which it was suited, as its highly nutritious qualities, its vast yield, its easy culture, its great duration, its capability of flourishing on lands of the most inferior quality and wholly unadapted to tillage, impart to it a general character of probable utility unrivalled in the history of agricultural productions. When once in the possession of the ground, for which the preparation is easy, it requires no subsequent ploughing, weeding, manuring, or other operation, save that of cutting and of converting the foliage into hay."—(*Moorcroft in a letter to W. Butterworth Bayley, Esq., formerly Chairman of the Court of Directors also Travels p.* 179.)

Various attempts have been made to introduce the Prangos Hay plant into Great Britain, but hitherto unsuccessfully; and it is probable it will only succeed and be valuable in a climate similar to that where it is found indigenous. The Prangos is highly valued in the cold and arid region of Tibet, where it is indigenous, and which Mr. Moorcroft (*Tr.* p. 179) thought would be valuable as fodder for sheep and cattle in European countries. It is found in Tibet, and also most abundantly on Ahatoong, a low trap hill in the valley of Cashmere; but there it was not so vigorous as in its Tibetan habitat. Though abundant in various directions, the Cashmerians do not esteem it of any value, and Dr. Falconer is of opinion that its importance has been much over-estimated, in consequence of its being the only food in many of the bleak and barren tracts of Tibet. In Cashmere, where, far from a deficiency of herbage, there is actually a superabundance of pasture grasses, it is necessarily much less esteemed. The Prangos will, therefore, most probably be a valuable acquisition only in countries devoid of good natural pasturage, and of which the climate is favourable to its growth. (*Royle. Pro. Res.*)

Joint Grass, says Mr. Bonynge, is not generally known in India. I never, he says, met with it in the South, N. West, or in Bengal. It grows in the Tartar country; generally in the margins of forests, where there may not be too much shade; a forest being partially cleared, it springs up in places where it perhaps never existed before, or if it did, not for centuries past. The grass will run to a length of some fifteen feet, and will rise, if there be any support, five or six feet; if not, will grow up some three or four feet by its own support,

It is not a wiry grass: the joints are some six or eight inches long; with four or five blades of grass about the same length growing out from each joint. The joints near the ground are harder and brittle; those near the top, soft and juicy—with a luxuriant termination of soft blades, similar to those from each joint, but softer and thicker. On my arrival in the country I found there were no cows, goats, or sheep. These I introduced, and at the same time a quantity of gram, upon which sheep are fattened in East India. After the arrival of the cattle they declined the gram, and I found on inquiry that they had been browsing on this grass, and upon which they continued to feed. They all became as fat as if fed on the gram, (a kind of pulse,) which remained on hand, there being no use for it.—*Bonynge, America*, p. 159. The principal of the Indian grasses, and perhaps the most generally diffused, is the Doob-grass (Cynodon dactylon), a creeping plant possessing much nourishing property in its long stems, no less than in its leaves. This endures the greatest elevation of temperature, as its roots penetrate far below the surface, and although during the dry monsoon giving no sign of life, it puts forth its tender leaves on the first approach of the rains.

A very nourishing grass, possessing a powerful aromatic odour, is met with on the elevated lands above the Ghauts of the south, as well as in the north-west provinces. So strong are its aroma and flavour, that the flesh, milk, and butter of the animals feeding upon it become in time sensibly affected both in taste and smell.

Upon the many slopes of the Himalaya there are found abundance of good nourishing pastures, admirably adapted to the requirements of cattle and sheep, and upon which many herds and flocks are reared when the dry season forces them from the plains below. Throughout the flat countries, and spread over vast tracts of indifferent soil, we meet with grasses, or rather herbage, in sufficient abundance, but generally either coarse and poor, or rank and distasteful to animals. In swampy or sterile plains these reedy grasses often fail to tempt even the coarse-feeding buffalo and rhinoceros; and it is a common practice amongst all the Indian villagers, at the end of the dry season to set fire to these tracts, on which the long withered herbage readily ignites, and after the first monsoon showers furnishes a rapid and abundant supply of young sweet blades. In some parts of India, especially at the larger towns, it is customary to cut grass for hay, as fodder for horses during the excessively dry months, but latterly artificial grasses have been introduced for this purpose. The Guinea-grass and Mauritius-grass are both admirably adapted for feeding cattle. Some grasses are twisted into bands; others are employed for thatching, and some for platting, screen and mat-making, in the form of pulp and used for paper making. Many grasses might be converted into half-stuff for paper-makers and have the great advantage of affording large quantities of a cheap material. The grasses abound in India; in the plains are numerous species of genera little known in Europe; maize, joar, and many millets are cultivated in the rainy season; and in the cold weather, wheat, barley, oats, and millet; In the Himalaya many of the pasture-grasses are the same as in Europe, and the cereals are cultivated in the spring and summer, with some rice in the rains. Several indigenous grasses are employed for making mats, baskets, ropes, sacks, nets and sails. The Moonja of the natives (Saccharum munja) is collected after the rainy season and kept for use, as it is employed in tying up their cattle at night and for ropes for their Persian wheels. It is said also to be one of the grasses employed for making tow-ropes by the boatmen about Benares. The Shur or sara of Bengal (Saccharum sara), or the Pen reed grass, is employed by the boatmen about Allahabad and Mirzapore, and esteemed as a tow-line for its strength and durability, even when exposed to the action of water. It is said to be beaten into a rude fibre and then twisted into a rope. The sacred grass of the hindoos, the dab or koosha of the brahmins (Poa cynosuroides), is also made into rope in North-West India. Other species of Saccharum are used for thatching and for screens, and some for making writing-pens and for arrows. The fibres of the Khuskhus or Vetiveyr are more remarkable for agreeable odour than for their tenacity, while the Bamboo, the most gigantic of grasses, might be enumerated with timbers rather than with fibres, though its split stems are often employed for making mats in India, and the young shoots for paper making by the Chinese. The Nul or Nar of Bengal is employed for making the mats known by the name of Durma which are formed of the stalks split open. In Sindh the grass called Sar, which perhaps is Arundo karka, has its culms, sur jo kanee, made into chairs, and its flower-stalks beaten, to form the fibres called moonyah, are made into string or twine (moonyah jo naree), and into ropes (moonyah jo russa). The boatmen of the Indus universally employed the Moonja (probably Saccharum moonja) as a towing rope

and for the rigging of their vessels, in all places above Sukkur. Two-inch ropes, often fifty fathoms in length, made of Munja fibres, are sufficient for dragging their largest or 1,200-maund boats up the Indus, against the full force of the stream. The rope is also light, so advantageous for rigging, and bears without injury, alternate exposure to wet and to subsequent drying; both qualities being essential for a tow-rope. The upper leaves, about a foot or so in length, are preferred, are collected into bundles and kept for use. (*Royle Ind. Fibres*, p. 30.)

Dr. Griffith collected nearly one hundred different grasses in the Tenasserim Provinces, but Mr. Mason is not aware that the description of a single species has ever been published. Throughout India, the pasture lands are everywhere left to nature; there is generally a right of common pasturage; and there is nothing to prevent the village cattle from roaming at discretion. The first step, therefore, towards the improvement of grass lands must be the establishing and keeping up a strong and sufficient fence.

Laying down Grass.—After the erection of a good fence, the next step to be taken in laying down pasture land, is to prepare, pulverize and clean it, and having brought the ground into good condition to apply manure.

Manure.—With respect to the manure best adapted for increasing grass crops, perhaps stable sweepings and the vegetable mould of decayed leaves mixed half and half, is the most serviceable. It is obvious that where there are mounted corps there can always be at command a large quantity of stable sweepings for pasture lands, and if care were taken to collect urine, and other drainage of stables and dung hills, this would be found even more efficient than solid manure. The urine should be preserved in tanks, which might be formed at a short distance, and the fluid conveyed in pipes would be found a most useful top-dressing; the tanks should be covered to prevent evaporation, and by applying them towards the end of the rains would be washed in without being carried away. If, however, fertilizers of this description are not procurable in sufficient quantities, recourse must be had to other manures; and the alluvial soil which forms the upper layer at the bottom of tanks will be found to answer well. The best season for the application of manure is just before or during the rains.

Foreign Grasses.—The next question that presents itself is that of the introduction of foreign grasses. After consulting all the available records of agricultural experience on this matter; it appears that the best way to obtain good fodder at a moderate cost is to pay attention to the indigenous grasses of the country, which, by irrigation and judicious manuring, may be greatly improved—such grasses being always chosen as are suitable to the soil. The Durva or Hurryallee grass (Cynodon dactylon), unquestionably the best species which India possesses for forage, was cultivated with great success at Vellore by Major Ottley, R. In upland districts rye grass and clover grow, and both these exotics, when sown fresh, have been found to answer exceedingly well on the Shervaroy, Pulney, Neilgherry, and Bababoodun Hills. The Guinea grass has been strongly recommended in Bengal and S. India.

Inoculating Grass.—In poor soils such as that of the Carnatic, grass seeds do not take so well as in rich land; and there is great difficulty in procuring a good sward. In this case recourse must be had to planting, or, as some call it inoculating grass. This is done by taking pieces of turf from the banks of river or tank, and spreading them over the land to be laid down after it has been prepared in the same manner as it would have been to receive the seed. The turf should be taken up in little square pieces, and spread over the surface of the ground, leaving small interspaces between each piece. A stone roller or a wooden beater should then be employed to press them into the ground. In a few days the interspaces will be found to be filled up, and a complete carpet of turf to be formed.

Paring and burning the surface of poor soils.—Before putting down the turf, poor stiff lands should be divided by ditches, ploughed in deep furrows, and exposed as much as possible to the wind and sun. Such soils may with careful culture and irrigation become permanent meadow land, but it is essential to get them into a sound state by most carefully clearing them of nuth-grass and weeds before laying down grass seeds, and subsequently by keeping the land free of coarse grass by hand weeding. Paring and burning the surface have been found useful, and if beneficial in the first instance, the operation may be repeated with advantage. The Cynodon dactylon or Hurryalee Grass, of India, is considered the best for horses. Root creeping through the loose sand, with strong fibres at the nodes. Stem rarely exceeding six inches in height, creeping to a considerable extent, matted, very smooth. Florets, all on one side of the spike-stalk, awnless, purplish, and ranged in two close alternate rows. All the stems which lie near the

ground take root, and by this means, though an annual plant, it increases and spreads very wide. It yields abundance of seed, of which small birds are very fond. It has been found a successful plan to allow the seed to ripen before the hay is cut, as it then propagates itself by the seeds, in addition to the runners. This grass is also found in Great Britain, but in that country its produce and nutritive properties are comparatively insignificant, while here it constitutes $\frac{3}{4}$ of the pasture. Respecting this grass Sir W. Jones observes (As Res. Vol. 4 p. 242.) that it is the sweetest and most nutritious pasture for cattle; and its usefulness, added to its beauty, induced the hindoos, in their earliest ages, to believe that it was the mansion of a benevolent nymph. Even the Veda celebrates it, as in the following text of the A't'harvana: "My Durva, which rose from the water of life, which has a hundred roots and a hundred stems, efface a hundred of my sins, and prolong my existence on earth a hundred years."—*Dr. Cleghorn, Grasses.*

GRAM, or Gramma. HIND. A village.

GRAM. ANGLO-INDIAN. The name given to two pulses, in use in India as food for cattle, rarely eaten by man; one is the Dolichos uniflorus called horse gram, or Madras gram, or culty, which is boiled, the other is Cicer arietinum, the Bengal gram or Chenna, which is bruised and soaked and is deemed the more nourishing. The term, Cicer, is derived through the Italian Cece, and from the French name Chicker, comes the English name "Chick-pea." The term, "arietinum" is derived from the resemblance of the seed to a ram's head. The word used by Europeans in India, is gram, of which the origin has been much disputed, and it is believed, is quite unknown. The chenna has been tried in England, but not successfully. The analyses of gram show as under:—

Composition.	Bombay Bazaar.	Bombay Bazaar.	Gram husked Madras.	White variety Gram Saharunpoor.

GRANGEA ADANSONII. CASS. Syn. of Grangea maderaspatana, *Poir.*

GRANITE, a metamorphic rock, occuring in most part of the world. Granite and syenite seem the chief up-lifting rocks of India; they burst through upraised sandstones, clay-slate, mica-slate, chlorite-slate, and lime-stones. This feature of granite and syenite disturbing stratified rocks can

be traced from near Ceylon northwards, at intervals, through the table-lands of the interior; through Mysore, the Ceded Districts, Hyderabad, Berar and across the Nerbudda into Central India, where the granite for a time disappears. Volcanic trap is visible, however, in the bed of the Jumna, near Allahabad, in latitude 25° north, and in the ascent to Mussoorie by Kuerkoolee, the granite re-appears and makes a great eruption at the Chur mountain on the southern slopes of the Himalaya. But near Gungotree, at the source of the Ganges, is described as the grand granitic axis of the Himalaya, one of the greatest and most magnificent outbursts of granite in the world. It traverses these mountains in numerous veins—westwards towards the Borenda pass, and eastwards towards Kamet, Nandadevi and Nandakot, upraising the metamorphic schists which form the highest peaks of the snowy range. Granite is often liable to decay, various causes lead to this change, its felspar is acted upon by moisture and by alternations of temperature; mica is acted upon by moisture; quartz by lime in solution, the silicic acid of the quartz having a great tendency to combine with the lime, carbonic acid generated in the earth or taken down by rain assists materially in dissolving the lime contained in the felspar, and other portions of crystalline lime that are frequently associated with granites. The frequent changes in the electric condition of the atmosphere and of the earth act upon all the constituents of granite, but more particularly upon the hornblende which contains the oxide of iron in considerable proportion: this and the alumina of both the felspar and hornblende swell with moisture and contract on drying, but the most extraordinary change that occurs in old granites and which has not yet been accounted for, is quartz passing into an opaque soft pulverulent mass. Sir Charles Lyell and others attempt to explain it by the evolution of carbonic acid gas from under ground, but it appears to be more probably due to the electricity of the earth. Felspar in decaying forms kaolin or porcelain earth. Quartz is little liable to decay, but occasionally passes into a substance resembling tripoli, Mica decays into a yellow, brown, or green soapy earth, and hornblende into a brownish powdery loam. Many of the temples of Southern India are constructed of granite. Its preservation, and the sharpness of its carvings, testify to its great durability and the absence of wear and decay makes it difficult to determine, from appearances, the age of many oriental buildings made of it. The best granite quarries are at Bangalore, Sadras, Cuddapah, Vizagapatam, and Bellary; it is quarried by the action of fire, by wedges, or by gunpowder, &c. Ornamental granites of bright colors occur in several localities, those of Salem, Chittoor and Seringapatam are flesh colored, red, green, yellow and grey. Those of Arcot and Goodoowanchairyare pure white. The Bellary and Bangalore sienites, are red, grey, and white, with the colors blended in about equal proportions. The two last may perhaps be considered the most durable in India, some of the pale-grey granites and pegmatites or binary granites of Southern India contain a large proportion of felspar which leads to their decay. The carvings at Conjeveram, Tricheacoonum, Sadras and Chellumbrum, have lost a good deal of their sharpness from this cause; while those at Tarputree, Woontimitta, Hera Toombal, and other places in the Ceded Districts are nearly as sharp as when first executed. In a few temples and mahomedan tombs, the most richly cut pillars and ornaments are hewn out of basalt, augite, or basaltic hornblende. The best specimens of this kind of carving are at Vellore, Seerah, Tinnevelly, Humpee, Adony, Dummul, and Anagherry. The carvings have often a polished surface resembling black marble, but they are so hard as to strike fire with steel.—*M. E. J. R.*

Grapes, the fruit of the vine, are grown in Europe, America, Asia, most part of British India and in China. There are 87 species of the genera Vitis, Cissus and Ampelopsis, but the Vitis vinifera is the only one known as the grape vine. The Vitis indica, the Amclouka of the Indian Peninsula, Bengal and Himalaya, produces beautiful clusters of round purple berries and a large grape which is very fair eating: it is not the common vine of Europe which nevertheless is probably from this Himalayan plant, the Vitis indica. The origin of the common grape being unknown, it becomes a curious question to decide whether the Himalayan Vitis Indica is the wild state of that plant: a hypothesis strengthened by the fact of Bacchus, &c., having come from the East. The wild grapes of Isaiah v, 2. are a species of Solanum. In China, grapes are plenty and tolerably good, but the Chinese do not make wine. (*Hooker, Him.* Vol. II p. 187.) Grapes dried before being ripe and pounded are used in Kabul as a pickle. Wherever the grape is grown, many varieties occur; about 1,000 varieties exist but many of them are worthless. In the Punjab several varieties of grapes are recognized. "Kandahari," a purple grape; "kishmishi," a small seedless grape, producing what are called in England "Sultana raisins", these are of the varieties called "sahibi surkh" and "sahibi ablak;" the Khatan grapes produce the large common raisins, called "munakka;" "Gholab dan," a white grape; "Husaini" grapes come to Lahore from Kabul, in round boxes packed in cotton wool; "Sahibi," a superior (white); grape "Fakhri," sometimes called "askari," a black grape; "Munakka" and "Abjosh munakka," are grapes dried in the sun; to make "Abjosh" grapes they are plunged into boiling water, and then dried in the shade; "Rish baba;" "Dida-i-gau," a white grape, with some spots on the skin, which are said to resemble a cow's eye; hence its name; pious hindus refuse to eat this grape on this account.

"Karghani" (white), called from the name of a place; "Angur Jalalabadi," called also "Khatta Angur," grown at Charbagh, a few miles from Jalalabad; "Charangur," grown also at Jalalabad. There is a fruit which is called angur, but is not a grape really, it is properly called "Khaya ghulama." The common sort of grapes, are "rocha-i-surkh" and "rocha-i-safed," also "toran." Green grapes are sold in the plains, in the winter time are the "hosaini," or "shaikh kalli" varieties; they are of large size, pale green color, and of delicate flavor, they are picked before being quite ripe, and packed between layers of cotton wool, in round boxes, made of white poplar wood, and tied up with a string of goat's hair; these are exported in thousands and called "Angur khatti," There is yet another, the "akta" grape, which produces bloom raisins, called "dagh," or more properly "kishmish-i-daghi," which are prepared by dipping the ripe bunches of fruit into a boiling solution of quick-lime and potash (hence called abjosh, lit. infused in water) before drying in the shade.

In the Indian Peninsula, there are several varieties but the common leek-green is the most esteemed, though many persons like the Habshi grape. In the arid regions of Rajputanah, where they depend entirely on the heavens for water, and where they calculate on a famine every seventh year, nothing that can administer to the wants of man is lost. The seeds of the wild grapes, as the bhoorut, buroo, herraro, sewun, are collected, and, mixed with bijra-flour, enter much into the food of the poorer classes. They also store up great quantities of the wild ber, khyr, and kharil berries; and the long pods of the karjra, astringent and bitter as they are; are dried and formed into a flour. Nothing is lost in these regions which can be converted into food,—*Ans. Mat. Med.* p. 10. *Powell's Hand Book, Punjab Products, Voigt, Cal. Hort. Suburb*, p. 27. *Williams, Middle Kingdom*, Vol. IV p. 45. *Fortune's Wanderings*, pp. 22, 63. *Hooker's Himalayan Journal.* Vol. II p. 187. *Tod's Rajasthan*, Vol. II p. 200

GRAPHIC SLATE. A slate that "soils and writes," as Dr. McClelland described it, is found east of Tavoy, and another and softer variety is found in Maulmain. They may be justly regarded as varieties of graphic slate. —*Mason.*

GRAPHITE.

Black lead, | Plumbago, ENG.

Occurs in Travancore, Ceylon, Vizianagrum, at Gurjolee, and at Almorah. See Blacklead, Carbon, Plumbago.

GRAPPI. IT. Grapes.

GRAPSUS STRIGOSUS. One of the Crustaceæ. See Crabs, Crustacea.

GRAPTOPHYLLUM HORTENSE. *Nees.*

Justicia picta—*Roxb.*

Gnwæ-ban, Sa-lat nee,	Burm.	Judi mara,	Maleal.

A flowering plant, with large crimson flowers, native of Java, commonly cultivated in gardens.

Var. b. G. lurido-sanguineum, the Salat.-nee of the Burmese is larger and has dark blood colored leaves.—*Voigt.* 488.

GRASSA. Sp. also Aceite-de-pescado. Sp. Blubber.

GRASS CLOTH, or China Grass Cloth, is fabricated from the fibre of the Urtica nivea of Linnæus, the Boehmeria nivea of Gaudichaud. Though this beautiful fabric has long been known, it is only in comparatively recent times that it has been ascertained to be manufactured from the fibres of the Boehmeria nivea. It is met with bleached and unbleached. It is extensively used by the Chinese, being woven into narrow pieces and into handkerchiefs; the export being chiefly to India and the United States, many handkerchiefs being sent to the latter country. Clothes are sent from the Chinese market to South America, made from grass-cloth and nankeen. No account of the quantity has been kept. See Bœhmeria.

GRAS, the griffin of Rajputanah. The Naguni, is half serpent, half woman. At Barolli, the Gras and Naguni are represented in a highly finished sculpture.—*Tod's Rajasthan*, Vol, II, p. 716.

GRASSES.

Myek. Desha,	Pin. Burm Heb.	Ghas,	Hind.

Is extensively cultivated in the South of China, for weaving floor matting of various degrees of fineness, the coarser kinds of which are used also to construct sheds to screen workmen when building houses and even the walls of the huts tenanted by the poor; the best comes from Lientan, west of Canton. No grasses are cultivated in China for food for animals, but the country produces many species fitted for rearing flocks and herds. Drs. Hooker and Thomson estimate the grasses of India at one-thirtieth of the entire flora of India. A great deal of Coix (Job's tears) is cultivated in the Khassia Hills about Moflong: it is of a dull greenish purple, and though planted in drills, and carefully hoed and weeded, is a very ragged crop. The shell of the cultivated sort is soft, and the kernel is sweet; whereas the wild Coix is so hard that it cannot be broken by the teeth. Each plant branches two or three times from the base, and from seven to nine plants grow in each square yard of soil: the produce is small, not above thirty or forty fold. In India, grass is rarely cultivated for grazing purposes as it is in Europe, and it is but seldom cut and stacked as hay; but in the Rakhs of the Punjab, and in the "bar" tracts, during the rains, the whole surface of the plain is covered with grass. Sseveral sorts—no less than thirty—each with its distinctive name, were collected in the rainy season near Lahore. Dr. Hooker tells us that at 4,000 to 5,000 feet elevation in the Khasia, he has collected upwards of fifty species of Gramineæ alone, in an eight miles' walk, and twenty to thirty Orchideæ; but these are quite exceptional cases. Their rapid growth and subsequent dryness render many Indian grasses unfit for pasture at the end of the year. Grass-cutters, who provide horses, usually search for and collect the dubh grass (Cynodon dactylon). Dr. Royle mentions that the grasses of Hariana (Sirsa and Rohtak)—and indeed it is true of the Rakhs generally, consist of species of Panicum, Pennisetum, Cenchrus, Chætaria, Vilfa, Dactylolenium, Chloris, Eleusine, Achrachne, Poa, Eragrostis, and Andropogon: and, to these, species of Saccharum, and Rottböllia should be added. Besides various grasses, other fodders are employed: in one place a clover or lucerne, "Shotal," is grown; also Sinji, but this principally by Europeans for their horses and other cattle. Cattle are usually fed (besides grass) on bhusa, or as it is called in Punjabi "turi," the chopped straws of wheat and barley, besides which they get "Karbi," the dried stalks of jawar (H. sorghum); this latter when green and fresh is called "Charri." Chopped leaves of the ber (both Z. vulgaris and Z. nummularia), called "mulla," are much used, and are said to be fattening. Dr. Henderson mentions that in Shahpur and one or two other districts, turnips are grown very extensively for feeding cattle during the cold weather and they often attain a larger size than in Europe. A few of these are used in times of famine for food, as the "markan" grass, the wild Sawank, and "Phog," the seed of Calligonum polygonum, is used as human food in the Punjab in times of famine. Dhaman or anjan (Pennisetum cenchroides) is considered the best grass for cattle, rapidly improving their condition and increasing their produce in milk. Jhang is a scented grass, probably Andropogon schœnanthus, and the root of A. muricatum forms the Khaskhas used in matting tatties and screens for cooling purposes.—*Powell Hand Book Econ. Prod. Punjab*, pp. 244 and 245. *Royle Ill.*

Him. Botany p. 421. *Mason's Tenasserim. William' Middle Kingdom*, p. 277. *Hooker's Himalayan Journal*, Vol. II, p 289. See Food. Graminaceæ: Rushes.

GRASS CUTTER, in India, generally, two servants are attached to each horse, a groom and a grass-cutter. The latter gene rally brings in the roots of the hariali or d'hub grass.

GRASS FERN. Pteris graminifolia. See Ferns.

GRASS HOPPER. One of this tribe, a species of Decticus, is kept by the Chinese in cages for fighting.

GRASS-HOPPER WARBLER. Locustella raya.

GRASIA. Hind. Garasio' Guzerat. In western India, a military chief. The term is derived from Grass, a Sanscrit word, which signifies a mouthful, and has been metaphorically applied to designate the small share of the produce of a country, which these land-owners claim. *Malcolm's Central India*, Vol. I, p. 508. See Kattyawar.

GRASS OIL OF NEMAUR. Roosa-katel. Hind. This valuable oil was first brought to notice by Dr. Maxwell in 1824, and was further described by Dr. Forsyth in 1826. The oil is obtained from the Andropogon calamus aromaticus by distillation; 250 to 300 small bundles of the grass are placed in a boiler, covered with water, and distilled. About a seer of oil is obtained in the receiver. Dr. Forsyth describes it as volatile, extremely pungent, of a light straw colour, very transparent, with a peculiar, rich and agreeable odour. Dr. Forsyth adds, that it is very highly esteemed by the wealthy natives for the cure of rheumatism, especially that of the chronic kind; two drachms of the diluted oil are rubbed over the pained part in the heat of the sun or before a fire twice daily. It causes a strong sensation of heat or pricking, lasting for two hours or longer. The natives also regard it as an efficacious remedy in slight colds. They anoint the soles of the feet with the oil and it is stated that slight diaphoresis is thus produced. Other grasses furnished fragrant oils, as the lemon grass oil, or essence of verbena, ginger grass oil, citronelle. *Trans. Med. and Phys. Soc.* iii. p. 219.—*O'Sh.* p. 639.

GRASU-GADA. Tel. Batatas edulis.

GRATIOLA MONNIERA L. & G. Portulacea. Weinm. syns. of Herpestes monniera.—*Ham. Bch: Kunth.*

GRATIOLA SERRATA.

Notched Hyssop, Eng. | Bhoomia-neem, Hind.

Grows wild during the rains, used as a bitter by the poor. *Genl. Med. Top.* p. 173.

GRAUWERK. Ger. Calabar skins.

GRAUCALIDÆ. A family of birds comprising 3 gen. 5 sp. viz. 1 Graucalus; 3 Campephaga; 1 Lalage.

GRAVET. A term in Ceylon applied to the space outside the principal forts in Ceylon. The Singhalese word, Cadawetta, describes the enclosure or boundary of a temple or city, or a royal chase. It was adopted by the Portuguese, after the erection of these fortresses, to define the limits of the lands they had been permitted by the native princes to appropriate, and the word Garvetta is still used in the patois of the Portuguese descendents. When the Dutch seized the forts the word passed into Gravette, which appears on their records, and from the British, in turn, took the present term Gravets. *Tennent's Christianity in Ceylon*, p. 291.

GREASE FOR RAILWAYS. The mixture used by the East Indian Railway for axle-grease is this.

Tallow, ...	50 lb.	Castor oil, ...	30 lb.
Country soap,	20 ,,	Water about	10 Gals.

Melt the tallow in a large vessel, cut the soap in slices and put into the water when the latter is warm. When the soap is fully dissolved pour the water containing it into the tallow after which add the castor oil; immediately after the latter is added, take the mixture off the fire, and while it is cooling let it be stirred constantly till cool. The mixture may require a little more or less water according to the temperature of the weather.

GREAT ASIATIC BANK. The depth of water on these banks averages about 30 fathoms, deepening rapidly as the edge is approached, and shoaling gradually towards the land. And, where the earth has not risen above the waters surface, great submarine banks are to be traced from one island to another.

GREAT BASSES. See Basses.

GREAT CONSTANTINE. See India, p. 313.

GREAT CROWNED PIGEON. See Columbidæ.

GREATER GALANGAL. Eng. Alpnia galanga *Swz.*

GREAT INDIAN PENINSULAR RAILWAY, was the first in India, was commenced from Bombay, in 1851; twenty-one miles to Tannah, were opened on the 16th April 1853. It was ultimately extended across the Western Ghauts to the cotton districts of the interior.

GREAT KING, also Saviour, Soter, the title assumed by the Arsacidæ. See Bactria.

GREAT KING; Sri Nara. See Inscriptions p. 386.

GREAT MILLET. Eng. Sorghum vulgare.—*Pers.*

GREAT MOGUL. A designation employed by the nations of Europe as the title of the emperors of Delhi, most of whom were descendents of the moghul Baber.

GREAT NICOBAR ISLANDS, one of the Nicobar group. See India; Nicobar Islands.

GREAT PULO LAUT. See Pulo Laut.

GREAT THIBET. See Lhasa.

GREBE. A water bird with semi-palmate feet known, in India, as a diver. See Birds, Colymbidæ, Podiceps.

GREAT PIPE-FISH. One of the Syngnathidæ; See Fishes.

GRECO-BACTRIANS. See Greeks of Asia. Inscriptions, p. 372.

GRECIAN MYTHOLOGY is largely mixed up with the mythology of India,—the Ceres of Greece, has the Lakshmi and Sri of India, Eros of Greece, is the Indian Kama, Yama or Dharmarajah is the Grecian Pluto—the Grecian Dionysius is the Indian Rama; Vaitarini in the hindu pantheon has its supposed analogue in the river Styx and Cerberus has corresponding dogs.

Durga, is the analogue of Juno.
Narada, god of music = Mercury,
Krishna = Apollo.
Bhawani = Venus.
Kali or Durga = Proserpine.
Agni = Vulcan, fire, ignis.
Swaha, wife of Agni = Vesta.
Aswini-Kumara = Castor and Pollux.
Aruna = Aurora.
Atadeva = Diana.
Kuvera = Plutus, god of riches.
Indra = Jupiter, god of the firmament.
Varuna = Neptune, god of the water.
Prithivi = Cybele, goddess of earth.
Viswakarma = Vulcan, architect of the gŏds.
Kartikeya or Skanda = Mars, god of war.
Kama = Cupid, Eros, god of love.
Surya or Arka = Sol, the sun.
Hanuman, the monkey god, son of Pavana = Pan.
Rama, god of wine = Bacchus.
Heracula, an Indian deity = Hercules.
Aswiculapa = Esculapius = Genii.
Vaya = Æolus.
Sri = Ceres.
Anna-Purna = Anna perenna.

The religions of the ancient Greeks, though forming collectively one vast polytheistic system, were exceedingly numerous, and dissimilar in their character. Greece and Asia Minor seem to have been parcelled out among a number of deities, each of whom was the paternal god of some city or race, having not only separate rites, but a form of worship widely different. Each deityhad his favourite abode, and local attachment to some valley, or grove, or town, to which the power and presence of the divinity especially belonged, and hence in Bœotian Thrace, we trace the orgies of Bacchus; in northern Thessaly, the worship of Apollo; on the Corinthian shores, the rites of Neptune; in Argos, the temples of Juno; and in Ephesus, the worship of Diana. Though acknowledged to be divine out of their own peculiar domains, yet their worshippers were rather averse to proselytism, fearing lest, by an extended communication, the local influence of the deity should be weakened. The sacred object of Ephesian worship, was carefully preserved, from the period of its first formation, through the ages which intervened, till the demolition of pagan temples, which followed upon the rise of christianity. The image consisted of a large block of wood, of beech or elm, but, according to some, of ebony or vine, shaped into a likeness of the goddess, and evidencing its remote antiquity by the rudeness of its workmanship. The first statues were unshaped blocks and stones; and, hence, the word column, was generally used by the Greeks, to denote a statue. Greeks worshipped Baal. They identified Baal with Zeus as they did Astarte with Venus. The heaven-fallen idol of Ephesus was not a representation of the elegant huntress of classic fable, but an Egyptian hieroglyphic, a personification of nature. In this character she was pictured as a woman, having a number of breasts, to denote, according to Jerome, that, as nature, she was "the nurse, the supporter and life of all living creatures."—*Milner's Seven Churches of Asia*, p. 83. *Sir W. Jones.* See Deo. Gruma deva.

GREDA. Sp. Chalk.

GREEKS OF ASIA. Alexander the Great in his advance towards the Indus, formed military stations in Bactria, and after his demise, when the generals of his armies set up for independence, Bactria was carved into a kingdom, which, with varying limits, lasted from B. C. 256 to A. D. 207.

Professor Lassen supposes the existence of four Greek kingdoms, viz., *first*, that of Bactria. A *second* eastern, under Menander and Apollodotus, comprehending the Punjab and valley of the Indus, with Kabul, and Arachotia or Kandahar, added in times of its prosperity. A *third*, western, at Herat and in Seistan. A *fourth*, central, of the Paropamisus, which

latter region Mr. Prinsep is inclined to give to Bactria, because of the bilingual as well as the pure Greek coins of Heliocles and Antimachus, kings of Bactria. Mr. Thomas, in Prinsep's Antiquities, gives Major Cunningham's Table. The countries over which the Greeks ruled were seemingly Bactria, Sogdiana; Margiana; Paropamisadæ; Nysa; Aria-Dranga; Arachosia; Gandharitis, Peukelaotis, Taxila, Patalene, Syrastrene and Larice, but their limits were incessantly varying, the dynasties in Asia, founded after the death of Alexander the Great, by his generals, &c., were as under:

I *Syria.*.

B. C.

334 Alexander the Great; born 356, died 323.

312	Seleucus	I,	Nicator.

88	Antiochus	XII,	Dionysius of Josephus.

83 Tigranes, of Armenia.

69 Antiochus XIII, Asiaticus.

65 Syria became a Roman Province.

Antiochus Soter succeeded Seleucus Nicator, and in the reign of his successor, Antiochus Theos, Arsaces, a Scythian, who came from the north of the Sea of Azoff, induced the Persians to throw off the Greek yoke, founded the Parthian empire, and made Rhages his capital. This was likewise the period of the foundation of the Bactrian kingdom by Theodotus the governor of it, who, finding himself cut off from Syria by the Persian revolution, declared his independence. Arsaces is called Asteh by Eastern writers, and is said to have been a descendant of the ancient Persian kings. When he gained the kingdom it is said he promised to exact no tribute and merely to consider himself as the head of a confederacy of princes united for the double object of maintaining their independence and freeing Persia from a foreign yoke. This is the commencement of that era of Persian history called by Eastern writers, Mulook-ut-Tuaif, or commonwealth of tribes.

In A. D. 906, Rhages was taken by Ismail, founder of the Samani dynasty. It ceased now to be a seat of empire, and in A. D. 967, became the capital of the house of Shemgur, a race of petty princes who maintained a kind of independence, while the dynasties of Saman and Dilemee divided the empire of Persia. In A. D. 1027, Rhages was the last conquest of Mahmood of Ghazni.

II *Bactria.*

The sole evidence of the long line of Bactrian kings, exists in the emanations from their mints, exhumed from time to time in and around their ancient seats of government. In the almost total absence of annals, whether occidental or oriental, their coins furnish nearly all the testimony at present available with which to reconstruct the story of the survival, re-institution and extinction of the dominant Hellenic element, on the site of Alexanders furthest conquest in the East, and of those potentates who swayed the destinies of these lands for upwards of two centuries. Professor Wilson gives a list of them from Theodotus I., B. C. 256 to Pantaleon B. C. 120. Then of Barbaric kings Su Hermæus, Kadaphes and Kadphises; from B. C. 100 to B. C. 50. Of an Indo-Parthian dynasty: The Indo-Scythian princes of Kabul: and a classification of their cotemporaries. Mr. Thomas, in Prinsep's Antiquities, quotes Major Cunningham's table.

B. C.

256 Diodatus I } Bactriana (including Sogdia-
243 ,, II } na, Bactria and Margiana).

247 Agathocles } Paropamisidæ and Nysa.
227 Pantaleon }

220 Euthydemus—Bactriana, Ariana (including Aria, Drangia, Arachosia and Paropamisidæ), Nysa and subsequently Gandharitis, Peukelaotis, and Taxila.

196 Demetrius, ditto, ditto, and later in his reign, Patalene, Syrastrene, Larice.

190 Heliocles—Bactriana and Paropamisidæ.

190 Antimachus Theos.—Nysa, Gandharitis; Peukelaotis and Taxila.

185 Eucratides—Bactriana, Ariana, besides Patalene, Syrastrene and Larice, as well as Nysa, Gandharitis; Peukelaotis and Taxila.

173 Antimachus Nikephoros—Mysa, Gand., Peuk., and Taxila, contemporarily with Eucratides' retention of the rest of his dominions.

165 Philoxenes succeeds to Antimachus Nikephoros' kingdom.

Nicias'—ditto, with the exception of Taxila.

165 Apollodotus succeeds Eucratides in Ariana, as well as Pata., Syr., Larice.

Zoilus, Diomedes, Dionysius } follow Apollodotus in Ariana alone.

159 Lysias succeeds these in Paropamisidæ, and obtains Nicias' dominion of Nysa, Gand. Peuk; while Mithridates I., possesses himself of Ariana, having previously gained Margiana from Eucratides.

Antialcidas succeeds to Lysias' kingdom.

Amqutas.

Archebius follows Antialcidas

161-140 Menander reigns in Paropamisadæ Nysa, Gand., Peuk., Taxila, Por. Reg., Cath., Patalene, Syr. Larice.

135 Strato—succeeds, with the exception of the countries of Pata., Syr, Larice. which fall to Manas.

Xippostratus, Telephus } follow Strato.

Of all the kings who followed Eukratides, Menander and Apollodotus alone are mentioned by classical authorities.

The history of the country of the Kophones river, i. e. Bactria, Aria and Kabul, is obtained from coins, many of which have bilingual inscriptions, the one Greek, on the obverse, some of excellent workmanship but often of very barbarous forms, the other on the reverse in that called Arian, Arianian, Bactrian and Kabulian. According to the prevalent authority, of Lassen, James Prinsep, Professor Wilson and others, this language is said to be Sanscrit, but Dr. Moore asserts it is Hebrew. It is written from right to left. Colonel Tod says the Aswa or Asi was one of the four tribes which overturned the Greek kingdom of Bactria. The ancient hindu cosmographers claim the Aswa as a grand branch of their early family, and doubtless the Indo Scythic people, from the Oxus to the Ganges, were one race.—*Barbaric kings.*

BC.

126 Hermæus—rules over Parop.—Nysa, Gand. Peuk. (The Su-sakarace obtain Aria, Drangia and Arach, from the Parthians.)

Manas—has Taxila, Por. Reg. Cath. Patalene, Syrastrene, Larice.

105 Kadphises—(*Yuchi*) takes possession of Hermæus' kingdom, and Taxila from Manas (Kozola Kadaphes).

Vonones, Spalygis, Spalirises } Paropamisadæ.

110 Azas—succeeds Manas obtaining also in 90 B. C. Nysa, Gand., and Peuk.

80 Azilas—succeeds Azas in the three latter,—adding Taxila and the Paropamisadæ.

80 The Soter Megas obtains the dominions of Azas, and subsequently those of Azilas.

60 The Yuchi again possess Paro, Nysa and Taxila etc.

26 Gondophares, reigns in Ariana. Abdagasses (and Sinnakes or Addinigaus) ditto in ditto, less the Parop.

A. D.

44 Arsaces (Ornospades or Orthomasdes) ditto ditto.

107 Pakores Monuesses—ditto ditto (Hiatheleh) in Bactriana.

207 Artemon—in Aria, Drangia, Arachosia.

(*Smith's Bio. Dic. Ferrier's Journal* p. 55-68. *Malcolm's Hist. of Persia. Prinsep's Antiquities by Thomas*, Vol. II, p. 176, &c.)

The family name Arsaces was that applied to all the kings of Parthia, hence called the Arsacidæ. There were military colonies of Macedonians established at Alexandriad, Caucasum, Arigæum, and Bazira, and garrisons at Nysa, Ora, Massaga, Peucelaotis and at Aornis, a mountain range, supposed to be the mountains of Mahaban

in the Pir Panjal or Mid Himalayan range. (See Kafir.) It would appear that the Greek colonists in the Punjab had first been placed under Philip, while the civil administration of the country remained in the hands of its native princes. Taxiles and Porus. Afterwards, on the murder of Philip by the mercenary soldiers, Alexander (Anabasis vi, 2, vii) directed Eudemos and Taxiles to govern the country until he should send another deputy. It is probable, however, that they continued to retain the charge; for after Alexander's death in B. C. 323, Eudemos, contrived by his general Eumenes to make himself master of the country by the treacherous assassination of king Porus. (Diodorus xix, 5). Some few years later, in B. C. 317, he marched to the assistance of Eumenes, with 3,000 infantry and 5,000 cavalry, and no less than 120 elephants. With this force he performed good service at the battle of Gabiene. But his continued absence gave the Indians an opportunity not to be neglected; and their liberty was fully asserted by the expulsion of the Greek troops and the slaughter of their chiefs,—Justin xv, 4.—"Præfactos ejus occiderat": again "Molienti deinde bellum adversus præfactos Alexandri." Chandra Gupta was present when Porus was murdered, and he became the leader of the national movement, which ended in his own elevation to the sovereignty of the Punjab. Justin attributes his success to the assistance of banditti; Justin xv, 4.—"Contractis latronibus Indos ad novitatem regni solicitavit." But in this, Colonel Cunningham thinks he has been misled by a very natural mistake; for the Aratta, who were the dominant people of the Eastern Punjab, are never mentioned in the Mahabharata without being called robbers. (Lassen, Pentapot. Indica.) "Aratti profecto latrones," and "Bahici latrones." The Sanscrit name is Arashtra, the "kingless," which is preserved in the Adraistæ of Arrian, who places them on the Ravi. They were the republican defenders of Sangala, or Sakala, a fact which points to their Sanskrit name of Arashtra, or "kingless." But though their power was then confined to the eastern Punjab, the people themselves had once spread over the whole country.—"Ubi fluvii illi quini * * * ibi sedes sunt Arattorum." (Lassen, Pentapot Indica, from the Mahabharat.) They were known by the several names of Bahika, Jarttika, and Takka; of which the last would appear to have been their true appellation; for their old capital of Taxila or Takka-sita, was known to the Greeks of Alexander; and the people themselves still exist in considerable numbers in the Punjab hills. The ancient extent of their power is proved by the present prevalence of their alphabetical characters, which, under the name of Takri, or Takni, are now used by all the hindus of Kashmir and the northern mountains, from Simla and Sabuthu to Kabul and Bamiyan. On these grounds Major Cunningham identifies the banditti of Justin, with the Takka, or original inhabitants of the Punjab, and assigns to them the honour of delivering their native land from the thraldom of a foreign yoke. This event occurred most probably about 316 B. C., or shortly after the march of Eudemos to the assistance of Eumeres. It was followed immediately by the conquest of Gangetic India, Justin. xv. iv., and in 316 B. C., the rule of Chandra Gupta was acknowledged over the whole northern peninsula, from the Indus to the mouths of the Ganges. According to Col. Tod, the Yavan, or Greek princes, who apparently continued to rule within the Indus, after the Christian era, were either the remains of the Bactrian dynasty, or the independent kingdom of Demetrius or Apollodotus, who ruled in the Punjab, having, as their capital, Sagala, changed by Demetrius to Euthymedia. Beyer says, in his Hist. Reg. Bact, p. 84: that according to Claudius Ptolemy, there was a city within the Hydaspes yet nearer the Indus, called Sagala, also Euthymedia; but he scarcely doubts that Demetrius called it Euthydemia, from his father, after his death and that of Menander. Demetrius was deprived of his patrimony A U. C. 562. Sagala is conjectured by Col. Tod to be the Salbhaupoora of the Yadoo when driven from Zabulisthan, and that of the Yuchi or Yuti, who were fixed there from Central Asia in the fifth century, and, if so early as the second century, when Ptolemy wrote, may have originated the change to Yuti-media, the 'Central Yuti.' Numerous medals chiefly found within the probable limits of the Greek kingdom of Sagala, either belong to these princes or the Parthian kings of Minagara on the Indus. The legends are in Greek on one side, and in the Sassanian character on the reverse. The names of Apollodotus and Menander have been decyphered, and the titles of 'Great King,' 'Saviour,' and other epithets adopted by the Arsacidæ, are perfectly legible. The devices, however, resemble the Parthian. These Greeks and Parthians must have gradually merged into the hindu population. Recent travellers, Burnes, Masson, and Ferrier, met with tribes who claim a Grecian

descent. According to Burnes, the Mir of Badakhshan, the chief of Darwaz in the valley of the Oxus, and the chiefs eastward of Darwaz who occupy the provinces of Kulab, Shaughnan, and Wakhan north of the Oxus; also the hill states of Chitral, Gilgit and Iskardo, are all held by chiefs who claim a Grecian origin.

According to Ferrier, however, the whole of the princes who claim descent from Alexander are Tajik who inhabited the country before it was overrun by Turki or Tartar tribes. The Tajik, now mahomedans, regard Alexander as a prophet. The Badakshan family are fair but present nothing in form or feature resembling the Greek. They are not unlike the modern Persian, and there is a decided contrast between them, the Turk and Uzbek.—*Tod's Rajasthan*, Vol. I, p. 232. *Prinsep's Antiquities by Thomas*, Vol. II, p. 176. *Smith's Biographical Dictionary. Ed. Ferrier's Journal*, p. 55 68. GREEN COPPERAS, or Green Vitriol.

Sulphate of Iron	Eng.	Ferri sulphas, Ferri vitriolatum sal-martis,	Lat.
Sulfate de fer,	Fr.		
Schwefelsaures eisen,	Ger.		
Heracussis,	Guz. Hind.	Taroosee,	Mal.
Hera-tootia,	„ „	Zunkur madnee,	Pers.
		Tootiya-subz,	„
Solfate di ferro,	It.	Anna bugdic,	Tam.

Green copperas called also green vitriol is a principal ingredient in dyeing, in the manufacture of ink, and of Prussian blue; it is also used in tanning, painting, medicine, &c.—*McCulloch. Faulkner.*

GREEN-DYE PLANTS. See Dyes.

GREEN-DYE RHAMNUS. See Rhamnus.

GREEN GALLS. See Galls.

GREEN GARNET. See Garnet.

GREEN GRAM. or black gram. Eng. Phaseolus mungo.—*Linn.*

GREEN SHANK. The Indian Greenshank, has been separated from Totanus glottis by the name T. glottoides; and the latter name is adopted by Mr. Gould for the Greenshank of Australia. Upon comparison of fine specimens from Scotland and Norway with others obtained in the Calcutta provision bazaar, no difference whatever can be discerned. The alleged T. glottoides is simply the bird in its winter plumage, in which it is less known in Britain than in its summer garb.

GREEN STANDARD The troops of the Green Standard are divided into 1202 ying, battalions or cantonments, of which there are but five in Peking, under the command of the Captain-general of the Gendarmery. These ying vary widely in strength; and a number of them, also differing in different places, composes a piau of which there are 43, or a "chinpiau" of which there are 72, in the eighteen provinces. M. Huc speaks of these (Vol. I, p. 404) as estimated at 500,000 strong.

GREENS. Vegetables used for food, called in Hindi "baji."

GREENSTONE. A volcanic rock common in the Peninsula of India. It is exceedingly hard and difficult to work, but it takes a most beautiful and durable polish, as in the magnificent mausoleums of Golcondah, the tombs of Hyder Ali and Tippoo Sultan at Seringapatam, and in many of the sculptures of the Carnatic pagodas.

A stone much used for building and ornamental purposes in Madras; it occurs in many parts of Southern India and is known under the names of freestone and grey granite. It is hard and durable but more expensive than the granites, from the greater labor of quarrying and cutting the blocks; at Madras the cost of this stone is from Rs. 1-4-0 per ton. This material is used in buildings and in religious sculptures, the natives also occasionally make domestic articles of it, such as round mill-stones, pestles and mortars, door-posts, lintels, &c. *Carter's Geological Papers on Western India.*, p. 9.

GREEN TOURMALINE. See Schorl. Tourmaline.

GREEN TURTLES. See Chelonia.

GREEN VITRIOL. Sulphate of iron. See Green copperas.

GREIN SCHARLAKENBESSEN. Dut. Kermes.

GREISHER. See Kelat, p. 489.

GRENADES. Fr. Pomegranate.

GRENAT. Fr. Garnet.

GRENDI. Sans. also Tagarum. Sans. Ruellia strepens.

GREWIA. A genus of plants, of the Natural order Tiliaceæ, the Linden tribe, fifty-three species of Grewia have been discovered in the East Indies the principal of which are

abutilifolia.	microstemma.	sapida.
asiatica.	microcos.	sclerophylla.
columnaris.	occidentalis.	sepiaria.
denticulata.	oppositifolia.	trichodes.
floribunda.	paniculata.	tiliæfolia
humilis.	populifolia.	ulmifolia.
elastica.	rotundifolia	umbellata.
hirsuta.	pilosa.	viminea.
lœvigata.	polygama.	villosa.

Grewia oppositifolia is employed in the Himalaya for making ropes, and G. elastica, Dhamnoo of the natives, is valued for the strength and elasticity of its wood. Cattle are fed on the leaves of some species, G. didyma, grows at moderate elevations in the Himalaya. The pleasant-tasted sub-acid fruit of several species is eaten by the natives of India, but principally used for making sherbet. Asiatica, or phalsa, is cultivated in gardens.

The species of Grewia are of frequent occurrence in the peninsula of India, and perhaps there is no tree more generally diffused throughout the Tenasserim Provinces than a species of Grewia, whose terminal bunches of flowers may be seen on almost every knoll in the country. At Tavoy, when vessels require spars, they are usually furnished from a small tree which grows on the sea-board, belonging to this genus.

The Mai-va of the Burmese in Tavoy and the Tha-ran of the Burmese of Moulmein are two species of Grewia. The wood of a species of the Madras Provinces makes good walking sticks.—*M. E. J. R. Eng. Cyc. Mason. Voigt. Roxb.*

GREWIA ASIATICA, *Linn. Roxb. W. & A.*

Falsa,	Beng. Hind. Tam.	Dowaniya,	Singh.
Pharaho,	Sind.	Putiki,	Tel.

Grows in the peninsula of India, in Bengal, northern India and the Punjab and is a large tree of Pegu, like G. floribunda, but not so plentiful. Commonly cultivated in the plains of the Punjab for its pleasant, sub-acid, small berry-like fruit, eaten and used for making sherbet. A spirit is said to be distilled from it and the fruit is much prized by mahomedans, who prescribe it to cool the body in fevers. Cultivated at Ajmeer, both large tree and small bush varieties, the large tree is very beautiful when in new foliage. The shrub is generally cultivted in most fruit gardens; it bears a dark purple berry, when ripe, containing one or two small stones. The fruit is generally made into sherbet by pouring boiling water on it, and when cool, adding sugar to the taste. The plants grown readily from the seed are generally cut down almost to the ground in November, and even the leaves are burnt round the stalks, after which the roots are opened and manured, and watered occasionally, when new shoots spring out, and the fruit is borne near the axilla of each leaf; when of a dark purple, they are ripe and fit for use. The appearance of its leaves has caused Europeans to mistake it for the hazel. The leaves and buds are officinal. Grewia asiatica and G. tiliæfolia both yield a useful bast. Wood, white colour and adapted for every purpose of house building.—*Drs McClelland. J. L. Stewart, Ainslie*, p. 225. *Irvine. Riddell. Cleghorn Punjab Rep. Kullu and Kangra*, p. 82.

GREWIA BETULÆFOLIA. Juss.

Gangi,	Tr. Ind.	Khircha,	Tr. Ind.
Inzare,	„	Ganger	Sutlej.

A small shrub growing North West from Delhi, on the hills beyond the Indus and up to 3000 feet as the Salt Range. Its small tasteless fruit is eaten by the natives.—*Dr. J. L. Stewart.*

GREWIA ELASTICA Royle.

Dhamun,	Hind.	Farri,	Punjab.
Dhamono,	„		

A tree, fifteen to twenty feet high, found in the Sutlej valley between Rampur and Sungnam at an elevation of 4,000 feet; common in the Himalaya at moderate elevations, and grows in Kimmedy, Ganjam and Gumsur. It affords timber which is highly valued for its strength and elasticity and much used for bows, buggy shafts, and bangy sticks. Its fruit is used to make sherbet. In the N. W. Himalaya, the branches are periodically cut in winter time as provender for the cattle.—*Cleghorn Punjab Report*, p. 64. *Royles Ill. Him. Bot.*, p. 104.

GREWIA FLORIBUNDA, *Wall.*

Myat ya,	Burm.	Ta-yau,	Burm.
Mya ya gyee,	„		

A very common tree, throughout the Rangoon, Pegu and Tounghoo districts, but scarce in the Prome and Tharawaddy districts. It is a good serviceable timber for all ordinary purposes of house-building. The bark affords a coarse strong fibre, not much employed, however, by the Burmese.—*Dr. McClelland Cal. Cat. Ex.* 1862.

GREWIA HIRSUTA. Javelliki. Tam. A shrubby plant; fruit hairy, common in the jungles.—*Jaffrey.*

GREWIA HOOKERII, *McClelland.*

Phet woon. Burm.

Very plentiful in Pegu. It attains a girth of about 3 to 4 feet, and grows up tall and remarkably straight. It is found with teak in the forests of Pegu and Tounghoo. Wood white coloured and adapted for every purpose of house-building.—*Dr. McClelland.*

GREWIA MICROCOS. Linn.

Grewia ulmifolia,	Roxb. Wight.	Microcos mala,	Ham.
Grewia affinis,	Lindl.	Microcos stauntoniana,	G. Don.
Microcos paniculata,	L.	Arsis rugosa.	Lour.
Mya-ya	Burm.		

A shrub in the Peninsula of India, and found as a small tree on elevated ground of

British Burmah. Wood not used. A cubic foot weighs lbs. 51. In a full grown tree on good soil the average length of the trunk to the first branch is 10 feet and average girth measured at 6 feet from the ground is 4 feet.—*Dr. Brandis. Cal. Cat. Ex.* 1862.

GREWIA OBLIQUA.

Darsook mara, CAM. | Damun, MAHR.

A tree of Canara and Sunda, found mostly below, seldom grows large. Wood used in agriculture, house posts, &c.—*Dr. Gibson.*

GREWIA OPPOSITIFOLIA. BUCH.

Daman, HIND. | Bihull, SINDI PANJ.

Grows in the Kheree Pass, and in the Dhera Dhoon, is found in the Sutlej valley between Rampur and Sungnam at an elevation of 5.000 feet. The branches are periodically cut in winter time as provender for the cattle. Its inner bark is employed in the Himalaya for making ropes, is used for cordage and coarse cloth and to make into a kind of paper.—*Royle Ill. Cleghorn Punjab Rep. Kulu and Kangra*, p. 82.

GREWIA PANICULATA. ROXB. ?

Microcos tomentosa, SM. | Hunu-kirille, SINGH.

According to Mr. Mendis, a tree, of the southern province of Ceylon, where its wood is used in house-building. A cubic foot weighs 44 lbs. and it is esteemed to last 25 years. But Voigt calls it a shrub, and it is possible that Mr. Mendis' botanical name requires attention.

GREWIA ROTHI.—*D. C. W. & A.*

Bather; bekhar; nikki,	PANJ.	Siri Jana,	TEL.
Kolupu,	TEL.	Jibilika chettu,	,,
G. salvifolia,	ROXB.	Tadika chuvva,	,,

A tree of the Punjab, Circars, and of the Cuddapah Nalla Mallai; has a light, ash-colored wood, with a straight grain, hard and strong, is much used and very serviceable. Wood very hard and much used in the Circars, makes good walking sticks.—*Capt. Beddome. Mr. Latham. Madras Hort. Gard.*, 44.

GREWIA ROTUNDIFOLIA. OONOO. a wood of moderate strength.

GREWIA SPECTABILIS. ?

Phet-woon, BURM,

Very plentiful; attains a girth of about three to four feet and grows up tall and remarkably straight. They are found with teak in the forests of Pegu and Tonghoo. Wood white colored and adapted for every purpose of house building.—*Dr. McClelland.*

GREWIA TILIÆFOLIA.—*Vahl., W.. Ic. Roxb.*

G. arborea, *Roxb. in E. I. C. Mus.*
G. variabilis, *Wall.*

Damun,	MAHR.	Tharra,	TEL.
Chadachy maram,	TAM.	Dhamono,	URIA ?
Sadachoo ,,	,,	Karkana,	,, ?
Talathi ,,	,,		

In Coimbatore, a considerable tree and the wood is soft and easily worked. It is useful for inferior building and common purposes: but is said to be unfit for cabinet purposes, for which, in appearance, it seems well adapted, on account of its hygrometric properties, which cause it to contract and expand, however well seasoned, with every change of the weather. It is a common forest tree in the Bombay coast jungles; rare inland, and there the wood is not deemed of any value for household purposes, agricultural implements, or cabinet work. The wood is used for the same purposes as the Benteak, for which it is often sold at Calicut. It grows very large on the mountains of the Circars, and is there a valuable timber, much used for handles of axes, pellet-bows, cowars, and walking sticks. In Ganjam and Gumsur, the Dhamono (Grewia tiliæfolia) is of extreme height 35 feet, circumference 3 feet, height from ground to the intersection of the first branch, 20 feet. It is used for cot frames and bandy wheels; the handles of axes, knives, spears, mamoties, pickaxes, and carpenters' tools are made of this wood, which is also burnt for firewood, being tolerably plentiful. Grewia tiliæfolia (or Grewia elastica) is said to yield the Damonu or Karkana of the Parla Kimedy jungles, from which many hundred poles could be obtained. It closely resembles lancewood or hickory. It is procurable in the bazaars eight inches broad, and is used for house posts, gig shafts, dhooli poles, spear handles and fishing rods. It seems eminently suited for purposes where strength, lightness and elasticity are required. The bark should be allowed to remain, and the poles should be steeped in water and then rubbed with oil. The bark gives a strong rope. (*Note*—It would seem from these remarks either that the quality of the timber of this tree varies in different localities, or that the timbers of two trees have been brought for examination.)—*Roxb. Voigt. Drs. Wight and Gibson. Captains Beddome and Macdonald. Melvor. M. E. J. R.*

GREWIA ULMIFOLIA. ROXB. WIGHT. Syn. of Grewia microcos.—*Linn.*

GREY, Sir William, K. C. S. I., a Bengal Civil Servant. He entered the service about the year 1840, and held the offices of Private Secretary to Sir Herbert Maddock; Junior Secretary in the Bengal Office; Under Secretary in the Foreign Department;

Secretary to The Bank of Bengal; Secretary to the Bengal Government; Director General of Post Offices; Home Secretary; Member of Council, and Lieut. Governor of Bengal. He possessed a calm judgment, a critical form of mind, brief, almost Socratic in method, and a man of progress. He improved postal communication, telegraphs, railway, police, education and jails; and he was a sound financier and economist. In 1865 he urged on the Indian Government the need for retrenchment.

GREY ANTIMONY. Eng. Sulphuret of Antimony.

GREY or Annulated Ipecacuana, also Grey also Red, Ipecachuana. Cephaelis ipecacuana.

GRIAS CAULIFLORA. The stem flowering anchovy pear of Jamaica. It might be introduced into India.

GRIESWORZEL. Ger. Pareira brava.

GRIFFITH, William, a medical officer of the Madras Army, famed for his extensive knowledge of Indian Botany. Author of numerous works on this branch of science; he accompanied the army which marched in 1838-39 from Sind, through Quetta and Kandahar to Ghazni and Kabul. From Kabul he crossed the chain of the Hindu Kush to Bamian and Singhan, and spent some time in the Kuner valley. His collections there, though formed under circumstances of great difficulty, are very good, amounting probably to about 1,000 species, many of which are deposited in the Royal Herbarium at Kew, his posthumous notes and journals, were published in Calcutta edited by Dr. McClelland, under the auspices of the Indian Government; and his collections, from Malacca, Tenasserim, the Khasia mountains, and the whole Assam valley, Mishmi and Naga hills and upper Irawadi, Calcutta, Bhotan, Simla, Sind, and Afghanistan, are probably not under 9,000 species which is by far the largest number ever obtained by individual exertions. He also made a collection of birds in Affghanistan.

A mural tablet erected to his memory in the Cathedral of Madras says he was born at Ham, in the county of Surrey, March 1810. He had attained to the highest eminence in the scientific world: and was one of the most distinguished botanists of the age. He acquired his knowledge by personal investigation in the different provinces of British India and in the neighbouring kingdoms, from the banks of the Helmund and Oxus to the Straits of Malacca, where, in the capacity of Civil Assistant Surgeon, he died 9th February 1845, in the 35th year of his age, and the 13th year of his public service in India. His early death is deeply deplored by numerous private friends; and his loss to the cause of science elicited a public and emphatic expression of regret from the Governor General of India. This tablet is erected as an humble tribute to his memory, by a few of his medical brethern of the Madras service. *Hooker f. et Thomson.*

GRIHA SENA. See Inscriptions p 376, 389.

GRIHA KUTUMBINE, literally, the head of the house or of the family.

GRINDING of grain in India is still done by the hand mill as in Isaiah xlvii 12. Matt. xxiv. 41.

GRIHASTHA. A hindu married householder. Sans. from griha, a house, and st'ha, to remain.

GRIHAST'HA-DHARMA. Sans. From grihast'ha, situated in a house, and dharma, religion.

GRIMUGRIM. Hind. Hordeum cæleste.

GRINDSTONES. The Natives of India prepare a grindstone composed of shell lac as its basis, and corundum powder or other hard mineral as the grinding material. In Coimbatore persons of the barber caste are the manufacturers of these. The process is sufficiently rude. The stone being pounded and reduced to the form of fine grained gunpowder is heated in a chatty. The lac is then added and the two stirred together until the mass is of the consistence of dough when it is turned out and beat and kneaded into the required shape. There are only two articles used in its construction, but not using a mould, the operation is tedious and the finished article when completed, and not by any means of first rate excellence. The principal objection to them seems to be the extreme hardness which renders them less effective than if the lac by a small admixture of a softer substance were rendered somewhat more yielding. Upon the whole, as made there, it is a rather rude but durable machine. It was stated that at the Hoonsoor farm, where pearl barley is prepared, English grind-stones for making it required frequent renewal, but that one of this description has now been in use 5 years. The stone used in Coimbatore is powdered coarse garnet sand, found in the beds of the neighbouring hill streams. The Corundum stones met with for sale in the bazaars are usually small, generally more rounded and water worn on the edges, as if collected in the beds of mountain streams from among the pebbles they bring down. In making a lac grindstone simply of Gum Lac, and finely pulverized corundum stone, these are heated separately to facilitate their more perfect ad-

mixture and combination. They are then thrown into a mould and strongly beaten and kneaded to give compactness and expel all air bubbles.—*M. C.*

The native carpenters, blacksmiths, and shoemakers, have long been acquainted with the good qualities of the grindstones of Southern India, and give good prices for some of them. European workmen also use country stones for sharpening their tools.

The best coarse grindstones are those from Verdachellum in South Arcot, Triputty, and Ootramaloor in Chingleput, Kurse Mungalum near Vellore, Woontimetta and Chellamacoor in the Cuddapah District, and Podelay and Woodiagherry in Nellore. A soft sandstone suited for filters occurs at Rajahmundry, and hard gritty kinds, like the Bhurrstone of France, in the Peddaredapully Talook of Nellore and near Ghooty. Some of the sandstones of the Guntoor, Bellary, Madura and Mysore Districts are very similar to those used as grindstones and flour mill-stones in England. The best dry whetstones are those of Nuggur, Matoor Hill in Guntoor, Triputty, Arnee and Needacheria in Bellary.

Fine grained sandstones of a sharp cutting quality occur at Gootemokoda and Dyda in Guntoor, at Chellumacoor and Chettywarreepully in Cuddapah and in the Pedelay Talook and Woodingherry Hill in Nellore.

A stone resembling the Ayrstone, or Snakestone, occurs at Koopookonda, 8 miles west of Vinacondah in Guntoor.

Good substitutes for Turkey stone, occur at Cuddapah, Woontimetta, Chellumacoor and Humpsagur, and varieties of green and gray granular felspar, at Seringapatam, Nellore, and on the banks of the Godavery. The latter are well suited for putting a fine edge on razors and gravers.

Soft sandstones resembling Bathstone and Tripoli abound near Nellore, Bellary, Cuddapah and Hurryhur.

Very fine silicious and magnesian earths, such as Rottenstone, Alkaline Loam and Armenian Bole, occur near Soondoor, Bangalore and Cuddapah.

Hones, silicious and slaty limestones of every quality accompany the extensive beds of lithographic marble near Kurnool, Guntoor, Bellary, Datchapilly and Gooty.

Chert or hornstone suited for paving Flint and Porcelain Mills, occurs in large quantities at Baulapilly near Arcot, Naggery and Woodiagherry Hill in Nellore.

Corundum and emery are valuable on account of their hardness which approaches that of the diamond, and are very abundant in the Madras Presidency, occurring in about 28 different localities. The best qualities are the moderate sized picked crystals from Guntoor, Hyderabad, Coimbatore, Nuggur, and Salem. Some varieties, particularly the tabular shaped crystals, appear to be much associated with lime and fibrolite, and are frequently accompanied in those localities by more valuable minerals, as the ruby, sapphire, spinel, beryl and garnet. Emery frequently accompanies the corundum, the best samples are from Salem, Nuggur and Nellore, and fine tabular emery at Caligherry Hill, Nellore.

Corundum is found at Guntoor, Hyderabad, Salem, Mysore, Gram (45 Miles N. W. of Seringapatam) Nuggur, French Rocks, Burkunemilly and Yedkunkal, Kulkaire in the Division of Churajapatam, Norluk in Narsipoor, Deysam, Carbunpully, Appianhully, Nullapardy, Mundium in Astragam, Cuddor; in Salem at Namaul, Viralamoodoo, Cholasigammy, Carasel, Aupore, Mallapollye, Gopaul Chetty pollium, Teelanegerry, Coundapaddy and with rubies at Salem.

Naggery Hills, clove brown with iron garnets and cochineal red garnets, Yalanegery and Coundepaddy in Salem. It is also found at Travancore, of a green color, and accompanied by Aquamarine.

Sandstones occur of different qualities, from the coarsest soft grit, to the hardest freestone, the most compact snakestone, and the toughest chert. The sandstones appear to be the most universally diffused rocks in Southern India; occurring in sixteen different Districts, and often in beds or strata of enormous extent, as in the South Arcot, Nellore, Cuddapah, Bellary, Mysore and Nagpore Districts.

At the Madras Exhibition of 1855, a large and complete series of grinding, sharpening, and polishing materials, was exhibited by Surgeon E. G. Balfour, from the Museum, along with a voluminous printed Report prepared for distribution amongst the Ordnance, Commissariat and Engineer Officers. The Jury considered many of the substances of excellent quality, that several of them might be judiciously introduced as substitutes for similar articles now procured from Europe, and that a large and remunerative trade in some of them might be carried on. The Jury recommended a First Class Medal for this series under the heads of Sandstones, Hones, and Polishing substances.

GRINDSTONES.

Sharpening stones used by native saddlers, shoemakers, horse-shoers, cutlers, &c.

Basalt. Called Sanakal from Chelput, five days journey from Madras near Trinamullay, used by shoemakars. Also from near Streepermatoor, used by saddlers for sharpening awls and knives.

Hornblende Rock. (Greenstone) used by horse-shoers as a whet for sharpening the large Hoof Cutter.

Green Quartzose sandstone. From Vellore, used formerly by horse-shoers but now re-placed by sills of Corundum and Lac.

Red Quartzose sandstone. Ditto. ditto

Yellow Quartzose sandstone. From Woodiagherry used formerly for giving a first edge to swords, daggers and implements, hard and rough, and well suited for grindstones.

Hones Purchased in the bazaar, probably from Nellore, Cuddapah or Guntoor. Black Turkey oil-stones, containing much lime, fine grained ditto. from Tarputry.

Rolled masses of granites are sold in the bazaars as Corundum and Emery, and irregularly crystallized granites are sold as Emery; said to be procurable at Calastry, near Naggery, Naglapoorum and the surrounding Hills.

Materials suited for grinding, polishing and sharpening.

GRINDSTONES.

North Arcot. From Kurse Mungalum near Vellore, a stone called Muddy Sagapoo Culloo, Brown Steatititic sandstone.

From Baulapilly near Arcot, Grey Chert for paving Porcelain Mills. From Chumbaukum-droog, Qartzose Rock suited for paving Porcelain Mills Emore grit, a nodular, bluish gritty limestone from the bed of the Pulicat Marine Lagoon. From Trichoor brownish sandstone. From Muddoor, Arnee, bluish grey sandstone suited for Grindstones. From Triputty and Kurkumbady, Yellow red and purplish sandstones.

South Arcot. From Verdachellum and Sadras, sandstones of good quality.

Bellary. From Nedacherla, sharp grained and fine grained sandstone. From river near Bellary, silicious sandstones. From Hospet Chetty-warrepully and Humpsagur, Hones of various qualities.

Chingleput Cootharam pallum near Conjeveram, Coarse Grit From Ootramaloor, Red Grit.

Sandstones suited for Grinding purposes.

Cuddapah. From Chellamacoor, Greyish brown schistose granular sandstone. From near Cuddapah, Bluish grey compact Magnesian lime, suited for fine sharpening stones, From Woontimitta a fine grained schistose sandstone, suited for a Ragstone

Ganjam. From Chitterpoor and Nengaum, liver brown granular sandstones. These are very sharp in the grain. From Ganjam, reddish white granular sandstones

Guntoor. From Palnaud, purple and lilac slaty sandstones fine in grain. Honestones, black limestones, lithographic marbles. From Gootemookoola and Dyda, hones: from Koopookoonda 8 miles west of Vinacondah, below the signal pond, rough sandstone glistening with Mica. From Matoor Hill, schistose ragstone.

Hyderabad From Ellichpoor and Kotah, sandstones with Fossils

Kurnool. Sandstones, Hones and Lithographic marble, abundant, and of every quality and size

Madura. From Vurdeputty and Passumallee, Granitic, coarse grained grindstones.

GRISLEA TOMENTOSA.

Moulmein. From Tan-goon-gee, Thum-litandan (Mountain), Gungo and Amherst Hills, yellowish sandstones fit for Grindstones.

Mysore. From Nugger good grindstones called Sanekul and finer whetstones.

Nagpore. From 10 miles west of Kamptee, soft sandstones suited for dry whetstones. From 6 miles east of Kamptee, finer grained varieties.

Nellore. From the Podelay, Panoor and Pedda Redda-pully talooks, red, yellow, purple, brown and grey sandstones. From Pullaybootoo, fine grained standstones.

Rajahmundry. Soft sandstones suited for filters and grindstones.

Singapore. From the mouth of the river, a good sandstone. *Surgeon Balfour in Madras Museum Report: Madras Exh. Jur. Rep.*

This tree is found in the islands of the Indian Ocean, in China, and in every part of the continent of India, especially in the jungly tracts at the foot of its several ranges of mountains. It grows in the N. W. Himalaya up to 4,000 feet, and it is common in exposed places, in the Maturatte and Oova districts of Ceylon up to an elevation of 4,000 feet. It is a rare tree in Ajmeer, but is very common in the Prome district. It is not found in Tounghoo district. Its bright red calyx retains its colour till the seeds are ripe, gives the whole plant a very showy appearance, and points it out to the collectors of its flowers, which form an article of commerce, and are used for a red dye. In the bazaars of Bengal they are found in a dry state, under the name of Datoke. It is a very ornamental tree both in foliage and blossom, and would do well in compounds. This is very distinct from the Dhan, which is the common fire-wood of Ajmeer. The petals are officinal at Lahore, where they are used as a dye, as well as a medicine. The red petals, contain much tannic acid. These scarlet flowers generally come to Ajmere, from Kotah and Harowtie: are considered stimulating and given to women in labour. One seer costs

in Ajmir four annas, its leaves are used in infusion as tea, but both the red flowers and leaves are use for dyeing purposes. In the Northern Circars, the leaves are employed in dyeing leather. Sheep-skins, steeped in an infusion of the dried leaves take on a fine red, of which native slippers are made. The dried flowers are employed in Northern India, under the name of Dhauri, in dyeing with Morinda bark; but perhaps more for their astringent than for their tintorial properties. Dr. Gibson states that in Kandesh the flowers form a considerable article of commerce, inland, as a dye. It grows abundantly in the hilly tracts of the Northern Circars. The gum called dhaura or dhau-ka-gond, is brought from Mewar and Harowtee, and is abundant, white in colour, like the katira and tragacanth gums, swells in water; in dyeing cloth it is applied to those parts that the dye is not wished to touch; it is eaten in "luddoo;" one maund costs ten rupees. Its wood is used for fuel and by the abkar, or liquor distillers, for fermenting liquor: its leaves are used in infusion as tea. *Irvine. Gen. Med. Top.*, p. 133. *O'Shaughnessy Bengal Dispensatory. GROBAGAN, here, at the centre, on the limestone district, is a mud volcano, 16 feet in diameter. The black mud every two to five seconds bubbles up and subsides; it rises to a height of 20 to 30 feet, then explodes with a dull noise, scattering a shower of warm black mud in every direction, round about are warm brine springs from which salt is extracted Its eruptions are most frequent in the rainy season. It is called "kuwu," "the place of abode," and an old legend is that it is the residence of a monster snake whose writhings cause the eruptions. *Oldham in Yules Embassy.*

GROSNAM. See Kunawer.

GROSSULARIACEÆ, the currant worts, or currant tribe, is the Grossulaceæ of Lindley. They are unarmed, or thorny shrubs, arranged in five genera, one of which, the genus Ribes, occurs in India R. grossularia L, is the gooseberry: R. rubrum, L, is the red currant and R. nigrum L, is the black currant. Dr. Royle regards the Himalayan Ribes as a distinct species and names it R. himalense.—*Voigt.*

GROUHONEE. Uria? Kubatee Uria?

A tree of Ganjam and Gumsur, extreme height 80 feet, circumference 6 feet, and height from the ground to the intersection of the first branch, 12 feet. The platform of the cars used at the Juggurnauth festival is often made of this wood, but it is chiefly used for firewood, being tolerably common. The bark is said to be used medecinally in diarrhœa.—*Captain Macdonald.*

GROUND CHUMPA. Kæmpferia.

GROUND-FISH. The Bora chung, of Bhootan, inhabits the jheels and slow running streams near the hills, but lives principally in the banks, into which they penetrate from one to five or six feet and are found generally two in each chamber, coiled concentrically like snakes; the entrance to these retreats leading from the river into the bank is generally a few inches below the surface, so that the fish can return to the water at pleasure. The mode of catching them is by introducing the hand into these holes. It is not believed that they bore their own burrows, but that they take possession of those made by land-crabs. Dr. Campbell says they are not more capable than other fish of moving on dry ground. The bora-chung would appear to be an Ophiocephalus, probably the O. barka described by Buchanan, as inhabiting holes in the banks of rivers tributary to the Ganges.—*Tennent's Sketches of Nat. Hist. of Ceylon*, pp. 367-8.

GROUND NUTS. Earth nut.

Bhooi Moong,	Beng.	Bhoysing,	Guz. Hind.
Moong Phoolli,	„	Mani-manoti,	Sp.
Japan pulse,	Eng.	Cacahuete,	„
China pulse,	„	Ver Kadalo,	Tam.
Pindar nut,	„	Veru Shanagalu,	Tel.

The ground-nut is the fruit of the Arachis hypogœa, or hypocarpogea. The plant has somewhat the appearance of the dwarf garden-pea, though more bushy. It is cultivated in the South of Europe, largely in America, Africa, Asia, Australia and the Archipelago. From the circumstance of its introducing its fruit or pod into the earth, for the purpose of ripening its seed, the Arachis, or earth-nut, has obtained its name. The flowers, leaves and stems, are produced in the ordinary manner seen in the pea tribe. When the yellow flower has withered and the seed fertilised, there is nothing left but the bare stem which had supported it. This stem, in which is the germ of the future fruit and pod, now grows

rapidly in a curved manner, with a tendency to arrive shortly on the surface of the ground, into which the now naked stem penetrates several inches into the earth. In this obscure position the fruit takes its ripened form, and is either gathered from its hiding place or left to the future season, when its time of rising into new existence calls it from its natural position. When mature, it is of a pale yellow color, wrinkled, and forms an oblong pod, sometimes contracted in the middle; it contains generally two seeds, a valable article of food in the tropical parts of Africa, America and Asia. They are sweetish and almond-like, and yield an oil, when pressed, not inferior in quality to that obtained from the olive. The leaf resembes that of clover, and, like it, affords excellent food for cattle. The cake, after the oil is expressed, forms an excellent manure. The Arachis seeds are usually sown in the dry, warm weather, from May to June, and are placed at the distance of eighteen inches from each other. Insects are fond of them; and if the season is cold and unfavourable to them, or the growth retarded, they become musty and bad, or are eaten by insects. The mode of obtaining the oil is nearly the same as for other pulse or seeds; and under favorable circumstances the Arachis will produce half its weight of oil. When heated and pressed the quantity is very considerably increased. This oil is good for every purpose for which olive or almond oil is used. For domestic purposes it is esteemed, and it does not become rancid so quickly as other oils. In lamps the brilliancy of its light is superior to that of olive oil, and its durability is seven minutes per hour beyond the combustion of the best olive oil, with the additional advantage of scarcely any smoke. Under the term Ground Nut or Manilla oil there was exported from the Madras Presidency, in the four years 1852-53 to 1855-56 chiefly to the United Kingdom, Bombay, and the Indian French ports, to the amount of 334,024 gallons valued at Rupees 2,12,896. It is extensively cultivated in Southern Asia. It thrives well on a light sandy soil, and is very prolific. In some parts of America it yields from 30 to 80 bushels of nuts per acre. On the Western Coast of Africa it is planted to a great extent. In South Carolina the seed is roasted and used as chocolate. The leaves are used medicinally, it is greedily devoured in the green state by cattle. Two varieties are grown in Malacca, the white seed and the brown seed, and also in Java, in the vicinity of sugar plantations, the oil cake being used as manure. It is there known as katiang. The seeds are consumed as a cheap popular luxury, being half roasted, and then eaten with salt. The oil is calculated to serve as an efficient and very cheap substitute for olive oil, for pharmaceutical purposes. It burns with little smoke, with a clear flame, and affords a very full bright light, answering perfectly in Argand lamps. The oil cake affords also an excellent food for cattle. *Eng. Cyc. Ed. Phil Mag. Simmonds. Jury. Rep. Mad, Ex. Useful Plants. O'Shaughnessy.*

GROUND NUT OIL.

Manilla nut oil,	ENG.	Katsjang meniak,	MALAY.
Willayeti-mung-ki-		Ver-kaddalai yennai,	TAM
Phulli-ka-tel,	HIND.	Manilla nuna,	TEL.
Booi-sing ka tel,	,,	Veru Shanaga nuna,	TEL

This valuable oil is obtained by expression from the ground nut, the fruit of the Arachis hypogœa, which is grown largely in tropical America, the West Coast of Africa, Australia, East Indies and the Archipelago. In the year 1848-49—37,000 gallons were shipped from madras, but in the two following years the exports exceeded 1,00,000 gallons but fell to 57,207 gallons in 1852-53. In form, the nut, is a long, light shell, containing two kernels covered with a brown rind, when shelled they are white in appearance. The pod is woody and dry, containing the peas, or nuts, as they are called, hence the common names, ground-nut or pea-nut. It is a low creeping plant, with yellow flowers, and after these drop off, and the pod begins to form, the tendrils put out from the plant and take root in the earth, where the nut is produced and ripened. The fruit is picked from the ground by hand, and the vines are a favorite food for horses, mules, and cattle. From 30 to 80 bushels are produced on an acre. The seeds contain about 44 per cent. of a clear pale yellow fixed oil, which is largely used in India for lamps, 1,950 parts of seed, separated from their coverings and blanched, give 1,405 of kernels, from which, by cold pressure 703 parts of oil are procured. It is capable of being refined so as to answer the purpose of a salad oil and supersede those of the olive and the almond, which are but precarious in their crops, and this oil is so very useful to machinery that the naval steam cruisers on the African coast have adopted it. Price of ground nuts from the River Gambia and from Siera Leone per ton at £10 per ton sell in London at £11. Nearly all these nuts are transhipped to France, where they command a ready sale; are there converted into oil, and thence find their way over the world in the shape of olive oil,—the skill of the French chemists

enabling them to imitate the real Lucca and Florence oils, so as to deceive the nicest judges. Indeed, the oil from the pea nuts possesses a sweetness and delicacy that cannot be surpassed. It does not seem to be consumed to any large extent in India, although the nut itself is much eaten by the poorer classes. It is said to be used for adulterating gingely oil in North Arcot, where it costs from Rs. 1-8, to 2-12, per maund. In the Nellore District, the seeds are procurable at Rs. 1-8, per maund and in Tanjore about 200 acres are cultivated producing annually 75 candies of oil at Rs. 2-6 per maund. Its value in London in January 1855 was £47-10 per ton. *Madras Tariff, Tanjore Local Committee, Lieut. Hawkes, Simmonds, Commercial products.*

GROUND RATANS. The excellent walking sticks known to the British under this name, are made from the Rhapis flabelliformis which grows in Liu-kiu and Southern China. See Marsh Date. Calamus.

GROVES of trees were planted by the ancient Egyptians within the court yards of their temples, but the laws of Moses, (Deut. xvi, 21,) forbad the Hebrews to plant any tree near the altar of the Lord, though the Alexandrian Jews, in later times, planted groves near their synagogues. Individual trees, throughout India, are regarded as habitations of spirits both good and bad, and noon day is the particular period at which their evil influence is exercised. In the Fiji islands a fine grove exists in the Rew-a district, near the Mission Station of Mataisuva, and at a point of the coast termed Na Vadra Tolu (the three screw-pines), probably from three Pandanus odoratissimus trees, still a common plant in that locality, having stood there. Leaving the Mission premises, and keeping along the sandy beach, an enormous yevuyevu tree (Hernandia sonora, *Linn.*) presents itself, forming a complete bower, which leads to a curious group of vegetable giants. A venerable vuturakaraka (Barringtonia speciosa, *Linn.*) more than sixty feet high, has thrown out several huge branches, two of which form, in connexion with the stem, bold arches. Yesi (Afzelia bijuga, *A. Gray*) and Baka (Ficus) seem to have been those principally selected. The vesi furnished the best timber of the islands, and may, as the most valued tree, have been thought the fit residence of a god, as there is nothing in its appearance that is extraordinary,—the beech most nearly resembling it in look. These sacred groves and trees are not worshipped as gods, but as in the Odin religion are looked upon as places where certain gods had taken up their abode.—*Fiji Islands.*

GRUB, a term familiar to coffee planters in Ceylon and the Peninsula of India, applied to insects which injure the coffee plant and coffee berry. Mr. Nietner's list of the enemies of the Coffee tree holds good in general for the entire coffee region of Ceylon. He tells us, however, that the brown and white bug and the black and white grub, are the only important enemines of the coffee tree, and that the destruction caused by Arhines, Limacodes, Zeuzera, Phymatea, Strachia and the Coffee rat, appear to be of a more local and occasional nature and are therefore of less importance. There are three pests which are chief—the white bug, the brown bug and the black bug.

Bug.—The appearance and disappearance of the coffee bug he tells us is most capricious. It comes and goes—now rapidly spreading over a whole estate, now confining itself to a single tree amongst thousands ;—here, leaving an estate in the course of a twelve-month, there, remaining permanently. Sometimes spreading over a whole estate, sometimes attacking a single field, then leaving it for another and another. But the white bug prefers dry, and the brown damp, localities, the latter being found more plentiful in close ravines and amongst heavy rotting timbers than on open hill sides, and it is probably to this predilection, that the shifting of the insect is attributable. The bug, of course, seeks out the softest and most sheltered parts of the tree,—the young shoots, the under sides of the leaves and the clusters of berries.

The injury done by the white bug seems more severe than that from the brown, but not being so plentiful as the latter, it is of less general importance. The white bug is especially fond of congregating amongst the clusters of berries, which drop off from the injury they receive, and trees often lose their entire crop in this manner. The injury

produced by the brown bug is the weakening of the tree and is thus more general, but the crop does not drop off altogether nor so suddenly. With white bugs on an estate the crop can hardly be estimated; with brown bugs it can.

White grub.—Under this name are included the larvæ of various Melolonthidæ, the cock-chafers of Ceylon, which do much harm to coffee plantations, young and old, by eating the roots of the trees. Mr. J. L. Gordon of Rambodde considers the white grub to be by far the greatest enemy of the coffee trees which the planter has to contend with, as he never knew a single tree recover after their attack, and he adds that they had destroyed, at Rambodde, in two years, between eight and ten thousand trees of fine old coffee. Mr. Gordon used to dig up the soil at the foot of the trees and take out such grubs as he could find.

Black grub.—The larvæ of the moth called Agrostis segetum, is the very destructive "black grub." This pest is about an inch long and is most abundant from August to October. The caterpillar lives in the ground but comes out at night to feed, and is very common and injurious. They attack not only coffee trees, but all sorts of vegetables and flowers and are very destructive to gardens and in the field, as they eat every thing that is artificially raised, despising grass and weeds. They generally appear only on certain fields and will not go over an estate. The insect is not confined to Ceylon; its ravages are well known in India, at the Cape of Good Hope, and Europe where it injures the grain and beet root crops. In Ceylon it only attacks young coffee trees, gnawing off the bark round the stem just above the ground. Where the trees are very small, they are bitten right off and the tops sometimes partially dragged under the ground, where the grubs may easily be discovered and dislodged. The damage which they inflict on plantations may be estimated when it is mentioned that Mr. Nietner lost by them in one season, in certain fields, as many as twenty-five per cent. of the young trees he had put down.—*Nietner on the Enmies of the Coffee Plant.* See *Bug;* Coffee.

GRUHAPRAVESAM. See Hindu.

GRUHA-PATU. Sans. from graha, a planet, and pati a lord.

GRUNSPAN. Ger. Verdigris.

GRUNTH. The grunth is the name of the book of the Sikh religionists written in the Goomoocki character modified Nagari." This book is placed in the holy temple of Umritsir and is greatly reverenced by the Sikh sect.

The founder, Nanak, was the son of a grain-factor at Talwundee, in the neighbourhood of Lahore. He was born in the year 1469, and in early life deserted the humble shop of his father to seek in study and retirement a more genial occupation for a naturally reflective mind. The tenets of the hindu and mahomedan of that day alike dissatisfied him; and he came forward as a reformer of his country's faith. For the gross polytheism of hindu mythology he substituted what maybe defined a high philosophic deism, and succeeded in collecting together a large body of followers, whom he called Sikh, or "disciples;" and these he organised under a theocratic form of polity, being himself recognised as their Gooroo, or "teacher." For many years this rapidly increasing body of converts continued to lead a peaceful meditative life, absorbed in the study of their holy book, the "Grunth," which contained all the recorded dogmas of their founder. They gradually spread over other parts of India, a college of them existed so far south as Patna probably founded by Gooroo Tegh Bahadur. An interesting account of this college is given in an early number of the Asiatic Society's Journal, from the pen of C. Wilkins, Esq., dated March 17, 1781. But in the beginning of the seventeenth century, Govind Singh, the tenth gooroo, gave a new character to this religious community. He was a man of a naturally warlike spirit and ambitious views, and thirsting to be revenged for domestic wrongs, soon converted the hitherto contemplative Sikhs into a band of warriors. These were the men who a century afterwards formed the flower of Runjeet Singh's army, and whose rampant fanaticism presented so formidable an array on the different battle-fields during the Sutlej and Punjab campaign. Of the Sikh religionists, the highest class are the Bedi. Like the Syud race, who claim a priority over all mahomedans, as being lineal descendants of Mahomed, these Bedi rank first among the Sikh, as being descended from Gooroo Nanuk, the founder of their sect. They form by virtue of their descent, the heridatary priesthood. They are to be found in greater or less numbers in all parts of the Punjab: in the districts lying at the base of the Kangra hills, at Goojranwalla in the middle of the Rechna Doab, at Gogaira on the Ravi, and at Shahpur, on the Jeelum, and a few at Rawul Pindi; they are also occasionally to be met with to the south of the Sutlej. But their home and stronghold is at a town named after their founder, Derah Baleæ Nanuk, on the Ravi, near Buttalla. So

notorious has been the crime of infanticide among them, that a Bedi was generally known by the opprobrious title of Kori Mar, or "daughter-slayer."

The Bedi, adopted as their patronimic the name of the tribe to which their ancestor, Nanuk, belonged. But there are Bedi still of that original tribe, who are not descendants of the Gooroo, nor, indeed, Sikhs at all. With these men pride, and pride alone, prompted to the crime. The fear of poverty arising from marriage expenditure would have little weight with them, as, unlike the impoverished Rajpoots, they were generally men of wealth and affluence; they held fertile Jaghcers and their priestly coffers were well filled with the offerings and dues of their race. But in defence of the unnatural custom, which they did not attempt to deny, they, like the Rajpoot races, were ready with a traditionary obligation laid upon them by an indignant ancestor. The story is thus given by Major Herbert. Edwards When a bridegroom and his party were departing, the two sons of Dhurm Chund, accompanied them to give them rooksat. The weather was hot, the party out of temper and they took a malicious pleasure in taking the young Bedi further than etiquette required. When the lads returned home footsore, Dhurm Chund asked if the Khutra had not bid them to turn back sooner? The boys said 'No,' and it was then that the old man, indignant at all the insults which the bridal of his daughter had brought down upon him from an inferior class, laid the inhuman injunction on his descendants, that in future 'no Bedi should let a daughter live.' The boys were horror-stricken at so unnatural a law, and with clasped hands represented to their father that to take the life of a child was one of the greatest sins in the Shastras. But Dhurm Chund replied, 'that if the Bedi remained true to their faith, and abstained from lies and strong drink, Providence would reward them with none but male children, but, at any rate let the burden of the crime be upon his neck, and no one else's. And from that time forth Dhurm Chund's head fell forward upon his chest, and he evermore walked as one who bore an awful weight upon his shoulders. "With consciences thus relieved, the race of Bedi continued for three hundred years to murder their infant daughters, and if any Bedi, out of natural feeling, preserved a girl, he was excommunicated by the rest and treated as a common sweeper. Through the mists of this story it seems clear that religious pride, and horror of giving a daughter to an inferior caste, and not pecuniary considerations, first led the Bedi to adopt the custom of female infanticide. *McGregor's History of the Sikhs*, Vol. I, p 44.

Major H. Edwardes's Jullundhar Report on Infanticide.—Browne's Indian Infanticide, pp. 115, 116, 117.

GRUNT'HEE. SANS, From grantha, a book, one who is learned in the Granth.

GRUS. A genus of birds belonging to the family Grnidæ in which are the genera Grus and Anthropoides. Grus antigone, the Saras, breeds south of the Himalaya: and specimens too young to fly are occasionally brought for sale even to Calcutta. Turner, describing the lake "Ramtchoo," as frequented by great abundance of water-fowl, wild-geese, ducks, teal, and storks, which on the approach of winter, take their flight to milder regions, says prodigious numbers of the Saras, the largest species of the crane kind, are seen here at certain seasons of the year, and they say, that any quantity of eggs may there be collected: they are found deposited near the banks. "I had, he adds, several of them, given to me when I was at Tassisudon, during the rains; they were as large as a turkey's egg, and I remember being told that they came from this place; but whether or not they were those of the Saras, I cannot venture to pronounce." Instances are known of the Saras breeding in captivity, a pair was allowed the range of a large walled garden (protected from jackals) containing shallow inundated enclosures for the growth of rice: their nest was commenced under water, and raised for some inches above the surface; the eggs are two in number, about $3\frac{3}{4}$ inches long by $2\frac{1}{2}$ inches broad, of a bluish-white, with a few distantly placed rufous specks and blotches. Major Cunningham, in his 'Ladak,' &c., remarks that "the water fowl swarm on the lakes and on the still waters of the Upper Indus. I have, he says, shot the wild goose, on the Thogji, Chanmo and Chomoriri lakes at 15,000 feet; and Col. Bates and I shot three teal on the Suraj Dal, a small lake at the head of the Bhaga river, at an elevation of upwards of 16,000 feet."

Grus Australasiana, Gould, is the 'Native Companion' of the Australian Colonist and until recently, was supposed to be identical with Gr. antigone, (L.), or the Indian Saras or Surhuns. The Australian crane has much more of the aspect of Gr. vulgaris, *Pallas;* but is considerably larger.

Grus cinerea the European or common Crane. Europe, Asia, N. Africa: migratory; now rare in Britain: common in India during the cold season. As described by Major Lloyd

observed by himself in Scandinavia, it " usually breeds in extended morasses, far away from the haunts of men. It makes its nest, consisting of stalks of plants and the like, on a tussock, and often amongst willow and other bushes. The female lays two eggs," &c. The words 'Crane,' Grus, Geranos, with the Hindustani Saras, Kakarra, Karrach, &c., all have reference to the loud trumpeting voices of the birds in question, which form a very distinct group by themselves, that should be confounded with no other. The so-called 'Gigantic Crane,' or 'Adjutant' can merely clatter its mandibles together. The 'Indian Field' says they know of no 'black variety of Crane' inhabiting Asia: the word Crane is often used so vaguely that it may mean any large wader; and the term 'black' is employed somewhat vaguely. Black individuals of the variable common bear may well occur, 'Black Squirrels' in the Altai are evidently the common grey or ash-coloured squirrel of all North Asia; the skins of which are familiar to Europeans in the shape of muffs and tippets, *Indian Field See Birds; Cranes.*

GRUSTU. Hind. Viburnum fœtens.

GRYLLUS MIGRATORIUS, the common locust. There are however other locusts, one of them, of a red colour.

GSER. Hind. Pronounced Ser, Thibetan, gold.

GUAH. Hind. Pavia indica,. Indian horse chesnut. See Juah, Kulu.

GUAIACUM OFFICINALE.

Lignum vitæ,	Eng.	Guajaco,	It.
Gayac, Bois-saint,	Fr.	Guaicum: Lignum	
Pockhaln,	Ger.	vitæ,	Lat.
		Guagaco,	Sp.

This shrub has been introduced into the Madras Gardens, and found to thrive remarkably well, readily flowering and fruiting. Its chief value is for medicinal purposes, but the wood, about 4 inches in diameter, is very hard and close grained, suited for turning. It is a native of Jamaica and Hispaniola. Both the bark and wood are used as sudorifics in the treatment of gout, rheumatism, and chronic or secondary syphilis. It is asserted that a native of St. Domingo first made known to Europeans the sudorific virtues of this tree. The wood from its extreme hardness is much used for screws, presses, blocks, and pullies. The trunk of the guaiac tree is from 60 feet upward; in temperate climates the growth is exceedingly slow, not more than one line annually. The resin is obtained either by spontaneous exudation, or by taking a billet of wood with a hole bored through its centre, lengthwise, and, setting fire to the upper end—the melted resin flows along the tube to a receiver placed beneath it. Internally taken, either wood or resin excites a sensation of warmth in the stomach, and dryness of the mouth and throat (*Duncan*). It increases the heat of the skin, accelerates the pulse, and proves diaphoretic, if the patient be kept warm, or diuretic, if the surface of the body is exposed to the air. In large doses Dr. Duncan says it acts as a purgative. Guaiac is given in cases of foul ulcers, hospital gangrene, thickened ligaments, mercurial ulcerations, and in various forms of scrofula. The wood is used in decoction, the resin in pills, emulsion, or tincture; 10 to 30 grs. may be given daily. Dr Duncan states that half an ounce of the tincture with three ounces of water is a sudorific dose for an adult, if he attend to keep himself warm. —*O'Shaughnessy McCulloch's Commercial Dictionary*, p. 609.

GUAICUM WOOD, from Guaicum officinale of *Linn.*

GUAKA. Sans. Areca catechu.—*Linn.*

GUAKU. or Nalla kakasi Tel. Randia uliginosa DC. The orthography of this name as given by Mr. Beddome, is doubtful.

GUALAMA or Singalese Devil Bird, has not yet been identified, whether it be an owl or a night hawk. Its shout is clear, resembles that of a human being and can be heard to a great distance. *Tennant.*

GUANA.

Zib,	Ar.	Biyawak; Bewak, Ma-	
Iguana or Inguana		nawak, Manuwak,	Malay.
Lizard,	Eng.	Ghoda-sala,	Sans.
Ghore-pore,	Hind. Duk.	Udumbu, Udumu,	Tam. Tel.

The iguana of India is generally found about old walls, and ruinous buildings; it is about two feet long; tail long, round, and tapering: back, tail, and throat are serrated; its whole surface is covered with shining scales. The flesh is eaten by the mahomedans of India, and, in the West Indies, it is salted and barrelled for exportation. In India the body of the dried Guana is made into an electuary, with a certain portion of ghee, and used as a strengthening medicine in consumptive complaints. An animal oil is obtained from it.—*Faulkner.*

GUANO, the accumulated dung of sea birds, found on manyislands. The white layer of the first year, is considered the best. A variety of guano found in the limestone caves on the Tenasserim coast, is much used as a manure by European and

Chinese planters in Pinang and Province Wellesley.

M. A. Ramonde, Professor of Natural History at Lima, was sent in 1853 by the Peruvian Government to the Chincha Islands, in order to ascertain the quantity available and he remained more than six weeks, making observations on the origin of the guano deposit and on the birds to which it owes its existence. In some places, he found the guano deposit 30 metres in depth. From the bodies of animals as well as from various manufactured articles found in it, he concluded that the deposit belongs to the present epoch of the earth's history. The birds observed during his visit were Pelecanus majus, *Molin :* Carbo Gaimardii, *Lesson ;* C. albigula, *Brandt :* Sula variegata, *Tschudi :* Spheniscus Humboldtii, *Meyen :* Plotus anhing, *Lin :* Rhyncops nigra, *Lem :* Larus modestus, *Tschudi :* Puffinaria Garnotii, *Lesson :* Sterna inca, *Lesson.* These species do not all live constantly on the islands, some of them only appear at the breeding seasons. The pelicans do not appear to produce much guano as they almost always inhabit the cliffs and their excrement falls into the ocean. The same may be said of the species of Carbo. The species of Sula contribute more to the deposit, their number being greater and their habitations being more in the interior of the islands. The species of Plotus and Rhyncops are very rare, those of Larus are more numerous, the Sterna only visit the islands to lay their eggs, but their numbers are so very great that they must contribute in a great measure to the formation of guano. The Spheniscus abounds in the southern island which is inhabited. These birds not being able to fly hollow out habitations for themselves in the guano. The birds which produce the largest quantity of guano are the Puffinaria : their number is incalculable. *L. Institut, May* 1856.—*Ed. New. Phil. Jour., November* 1856, p. 178.

GUAR. Hind. Dolichos uniflorus.

GUAR PHALLI. Hind. Cyamopsis psoraloides. Dolichos psoraloides, Lam. D. fabæformis, Willd.

GUARAPO, a drink prepared from sugar cane.

GUARDS. The accounts of the early travellers in India speak of female guards of the haram. According to Manouchi, that of Shah Jahan consisted of a hundred Tartar women, armed with a bow, a poignard, and a scimetar. The practice seems to have been originally hindu, if it was not universally Asiatic. The nobles at Hyderabad, still in 1870, retained a female guard, and the women attendants of mahomedan ladies of Madras are styled Moghulani.—*Hind. Theat.* Vol. II, p. 304.

GUAREA TRICHILIOIDES. Its bark is a violent emetic and purgative. Wight in Icones, gives G. paniculata. — *W. Ic. O'Shaughnessy,* p. 246.

GUATTERIA, a genus of plants belonging to the Anonaceæ, a tropical order of plants, chiefly inhabiting America and the East Indies. The order includes about 15 genera and 250 species, more than half of which occur in India;

Uvaria ..	... 42	Unona. .	... 23
Guatteria ..	... 17	Artobotrys...	... 5
Orophœa...	... 2	Polyalthia...	.. 1
Miliusia...	... 1	Hyalostemma	... 1
Lobocarpus...	... 1	Saccopetalum	... 1
Pattonia...	... 2		

There are nine species of Guatteria known in India viz. :—

G. anonæfolia, Tavoy.	G. fasciculata ?
„ cerasoides, India.	„ longifolia, India, Java.
„ cinnamomea, Singapore	„ sesquipedalis, Khassya
„ badajamba, Chittagong.	„ suberosa, India Khassya.
	„ villosa, Monghyr.

GUATTERIA CERASOIDES.—*Duval. W. & A. : Hook & Thom. Fl. Ind.*

Uvaria cerasoides, *Roxb., Cor.*

Hoom,	Mahr.	Duddaga. Dudduka,	Tel.
Nulœli ? maram,	Tam.	Chitta duduka,	„
Mulili ? maram,	„	Chilka ? dudugu,	„

This moderate sized tree grows in the Bengal, Madras and Bombay Presidencies. In Coimbatore, the wood, seen in a three or four years old branch, was white and close grained. It is a tree common in the Bombay coast and ghat forests ; less so inland and may be easily recognised by its great straightness, and handsome appearance. Its wood is there reddish and close grained, useful in carpentry, as well as for naval purposes, as boat-masts, small spars, &c. On the Godavery it appears to be a tolerably hard wood and does not seem to warp. The natives, on the Godavery, do not however, use it, and say that it is soft. Mr. Latham writes of it as occurring in the Nulla Mullai, as a white and tolerably hard wood. The natives, he says, use it little, but he considers it a useful wood.—*Drs. Roxb. Voigt., Wight, Gibson and Birdwood Captain Beddome. Mr. Latham.*

GUATTERIA LONGIFOLIA. — *Wall. ; W. & A.*

Uvaria longifolia,	*Roxb.*	Unona longifolia,	*Dun,*
Debdari,	Beng.	Thevatharu,	Tam.
Mast tree,	Eng.	Asoka chettu	Tel.
Asok maram,	Tam.	Asokam,	„
Deva-daru,	„		

A very handsome, erect growing, large tree, of India and Java, but with a soft and useless wood. It is much grown in Madras, as a highly ornamental tree, and it should be planted in avenues more than it is at present: the true Jonesia asoka is rarely seen in Southern India.—*Drs. Roxb. Voigt. M. E. of* 1855.

GUAVA TREE. ENG.

Psidium pomiferum, *Linn*	P. pyriferum.	
White guava tree, ENG.	Safri am,	HIND.
Red „ „ „	Loue kiæ,	SIAM.
Jam, Jam amrood, HIND.	Coia maram,	TAM.

There are two kinds of guava fruit grown in India and in the islands of the E. Archipelago,—one white within and one red. The wood is extremely close grained, tough, and compact, and is preferred for making wooden mallets, and other things required to stand hard knocks. It is also used for wood engraving. In Tenasserim, the guava is planted perhaps more extensively than any other fruit tree in the country. Loudon says "the fruit ripens freely in Britain, but is of little merit." The white guava is the species more usually cultivated but the red is not uncommon. —*Mason. Ains. Mat. Med.*, p. 211. See Psidium.

GUAZUMA. A genus of the family Sterculiaceæ; G. ulmifolia sometimes known as Bastard cedar, the Gunstock-tree, was introduced into Madras from South America and presents, between its outer bark of sapwood, a fibrous mass about half an inch in thickness, richly impregnated with mucilage, which is extracted by macerating for twelve hours, in warm water, and is greatly employed in the West Indies and in South America in clarifying sugar, as a Kydia is in India. G. tomentosa yields fibres.

GUAZUMA TOMENTOSA.—*H. B.; Kunth. W. & A.; W. Ill.*

G. ulmifolia, *Wall.*

Bubroma guazuma, *Willde, Sp.*

Bastard cedar, ENG. | Rudraksha chettu, TEL.

A tree introduced by Dr. Anderson about the end of the 18th century from America, grows in Ceylon, common in the Dekhan, pretty common about Madras, evidently planted. The fruit is tubercled, about the size of a cherry. Its young bark abounds in mucilage and is used in the W. Indies, S. America and the Mauritius to clarify sugar.

It was largely cultivated at one time in the Madras Presidency under the name of Bastard Cedar, as fodder for cattle. The fibres of its straight, luxuriant, young branches were submitted to trial by Dr. Roxburgh, and while the sown hemp broke when dry, with 160 lbs. and 209 lbs. when wet, that of the Bastard Cedar broke with 100 lbs. when dry and 140 lbs. when wet.—*Dr. Cleghorn in M. E. J. R.; Thw., Voigt, Dr. Riddell, Dr. O'Shaughnessy*, p. 226. *Riddell. M. E. Jour. Rep. Royle Fib. Pl.*, pp. 267 and 268.

GUBAR. An unbeliever in mahomedanism, in general, but the word is more specially applied to a fire-worshipper. Meninski says "Ignicola, magus infidelis, quivis paganus." The word is more familiar in the people of Europe under the aspect of Guebret, the Parsee of Western India. A small remnant of this race existed in Persia, chiefly at Yezd, in Khorasan. Being persecuted and annoyed by the mahomedans, most of their country-men have emigrated to India, where, especially at Bombay, they flourish under the name of Parsee. *Lieut. Colonel Stuart's Journal of a Residence in Northern Persia*, p. 171. *Elliot's Supp. Gloss. See Ghubr.*

GUBBA. TEL. Round.

GUBBADARA or Surudu. Symphorema involucrata, R. ii. 262; 186—*W. Ic.*

GUBBAKAYA Lagenaria vulgaris, *Ser.*

GUBBINS. Three brothers who served in India in the Bengal Civil Service, Charles Gubbins wrote an account of the Seven Pagodas, at Mahabalipuram, Martin Gubbins wrote a history of the siege of Lucknow.

GUCH. HIND. Coriaria Nepalensis, Viburnum continifolium, V. fœtens; Amal guch, Hind. is Prunus paddum.

GUCHCHA. SANS. Andropogon nardus? *Rottl.*? *Ains.*

GUCHCH'HI. HIND. of Kashmir. A kind of morel, plural guch'hian.

GUCHEE. A bundle of one hundred betel leaves.

GUDA. A race in Sindh, from intercourse between Sind'hians and Sidi women, they were equally slaves with their mothers, and could be bought or sold at will. *Postan's Sindh*, p. 359.

GUDA, also Gura. SANS. Sugar, jaggree.

GUDAMA TIGE. Vitis adnata, *Wall*—Cissus adnata, *Roxb.*; 405.

GUDAL. HIND. Xanthium strumarium.

GUDARA. See Hindu; Ukhara.

GUD BATTAL. HIND. Linum trigynum.

GUDDEE, or Gaddi. HIND. A throne, or cushion. See Gadi.

GUDDEE. HIND. A sheaf of corn.

GUDDEE. A tribe resembling the G'hosi. They are now mostly mahomedans, and have a few scattered communities in several pergunnahs, such as in Gurhmooktesur and Surawa of Meerut, and in the Rampoor territory. It is not unusual to call any converted hindoo a Guddee, which is looked on by

a mahomedan as a term of reproach. *Elliot Supp Gloss.*

GUD'DA. Tel. Calico.

GUDDEE-JAT. See Kohistan.

GUDEER. A feast celebrated by shiah mahomedans.

GUDELGU. Tel. Bear.

GUDDI MARALA. Tel. Bryonia garcini. *Willde.*

GUD'HA. Hind. an ass, a donkey.

GUDHE-KA-HUL, or Gadhe-ka-hal. Hind. literally a "Donkey's plough." Before the British domination in India, it was not uncommon to yoke donkeys in a plough and drive them over the ruins of a captured fort, as a mode of showing supreme contempt for the vanquished enemy. The furrows thus raised were levelled by the Lohe-ki-mye, or iron harrow. Horace says (Carm. I. 16).

* * Exitio gravi
Stravere, et altis urbibus ultlæ
Stetere causæ, cur perirent
Funditus imprimeretque muris
Hostile aratrum exercitus insolens.

This mode of wreaking vengeance has been in especial favor with eastern nations, and was practised by Jenghis Khan and Timoor with unrelenting severity. Hence the common expression "I shall sow barley where you now stand," as in the vaunt of the bandit minstrel Kurroglow, at p. 138 of "Popular Poetry of Persia." *Elliot Supp. Gloss.*

GUDHE-PAR-CHARHANA. Literally to seat upon a jackass. This is a punishment more commonly known by the Arabic Tushheer, publication, celebration; which is rendered by Golius, "Per urbem duci jussit sontem in exemplum; fere asino aut camelo impositum." *Elliot Supp. Gloss.*

GUDI. Tel. A temple. This may be the word, from which "pagoda" has been obtained. Pai-gudi, a devil temple.

GUDIGAR. Karn. A caste in Mysore, carvers in sandal-wood horn and ivory. *Wilson.*

GUDI KUM, also Gudia. Hind. Meconopsis aculeata.

GUDUCHI. Sans. also Amurta, Sans. Tinospora cordifolia.

GUDUMBAT. Hind. Rhus vernicifera.

GUDU MUSALI. Hind. Dubiæ: Umbelliferæ.

GUDUREA. A shepherd, also written gadaria. There are several sub-divisions of the Gadaria in Hindustan, Neek'hur: Tusselha or Puchhade, Chuck, Dhangur, Bureyea, Pyhwar and Bhyeatur. Of each of these there are also many divisions. *Ell. Supp. Gloss.*

GUEO. See Ka.

GUEST. Amongst several of the eastern nations, the duties of hospitality to a guest are still strictly regulated as in ancient times, Luke x. 7, says, 'Go not from house to house' and it would be a great offence among the hindoos, if a guest after being made welcome at a house, were to leave it, and go to another, also Luke xiv, 16., &c. 'a certain man made a great supper, and bade many.' Messengers are sent to invite the guests to a hindoo feast; when not only relations, but all persons of the same division of caste in the neighbourhood, are invited. A refusal to attend is considered as a great affront. 'And yet there is room.' On some occasions, so numerous are the guests, that there is not room for them to sit in the parterre of the person who makes the feast, and a larger yard is therefore borrowed. See Feast.

GUETTARDA SPECIOSA. Linn. *Rheede, Roxb. W. & A. W. Ic.*

Cadamba jasminiflora, Lin.	Jasminum hirsutum, Willde.
Nyctant heshirsuta, Linn.	
Pannir ka phul, Duk.	Nil-pitcha, Singh.
Rava-pu, Malbal.	Pannir maram, Tam.
Himma, Sans.	Panniru chettu, Tel

A small but very handsome tree with large white fragrant flowers, in blossom throughout the year. It grows at Caltura and near Galle in Ceylon and is cultivated in Indian gardens: amongst hindus, the tree is sacred both to Siva and Vishnoo. Flowers extremely fragrant: corals white and tube long. *Roxb.: Riddell. Ain.'s Mat. Med.* p. 158. *Thw-Enum: pl Zeyl.* II. p. 153.

GUETTARDEÆ. A section of a natural order of plants including 21 Morindæ, 2 Myrmecodia, 2 Hydnophytum, 1 Hypobathrum, 20 Mephitidia, 2 Vangueria, 7 Guettarda, 2 Timonius, 3 Hamiltonia, 1 Leptodermis, 1 Myonima.

GUEVO UPAS, or Valley of Poison, is at the side of the volcano Papandayang, in Java. It is 500 feet below the run of the old crater, which is now the Telaga-bodas or White Lake. It is a small bare place with many crevices from which carbonic acid is poured, and many dead animals, dogs, cats, squirrels, rhinoceros, tigers, birds and snakes are seen in it. *Bikmore*, p. 53.

GUFA. Hind. Antennaria contorta.

GUGAI. Hind. of Chenab, Lahaul, &c., Pavia Indica, Indian horse chesnut.

GUGAIRA. Hind. Careya arborea. *Roxb. Rheede W. & A.*

GUGAL. Hind. Dolomiæa macrocephala, also Myrsine Africana.

GUGAL. A term applied in India, to the fragrant resins of several trees, also to the trees themselves. The resin is also called Gugal-ka-gond, or the gum of the gugal tree. It is the fragrant gum resin of Balsamodendron Roxburghii, the Amyris agallocha, a

tree which is plentiful in the Ajmeer hills, and which yields a fragrant gum resin used in sacred fumigations by the brahmins; it is no doubt the Bdellium of the ancients. It has a similarity to myrrh; is used also in flatulencies taken in ghee: is one of the ingredients in the incense or "dhoop."—*Gen. Med. Top.* p. 135. See Gum. Guggilam.

GUGCHI. HIND. Brassica rapa.

GUGGAR or Gharghar. An affluent of the lower Saraswati.

GUGI. HIND. Saussurea sorocephala.

GUGIL. Juniperus communis.

GUGGILAM. TEL. Bdellium. This is the same name as the word Gugal, and in combination, when applied to a tree, indicates particular plants, as guggelam chettu, *Ægiceras fragrans*, *Kon.* Guggulu or Sala, is Vatica robusta and Guggilapu chettu, is Boswellia glabra the combinations of the word Gugal, being applied to trees yielding resins. *Elliot Fl. Andhr.*

GUGGUR. A river near Munni Majra in the Sabathoo district, running near Rajpoorah in the Umballah district.

GUGUL also GUGULA. SING. B'dellium. B'dolach.

GUHA, or Griha Sena. Griha Sridhara. Sena 2nd. See Inscriptions, p. 389.

GUHURWAR, also written gaharwar, a tribe of Rajpoots found in Dera Mungulpoor, Bithoor, Gajmow, Canouj and Bilhour in the Central Doab. The Guhurwar of K'hera Mungrore in Mirzapoor have been converted to mahomedanism and those of Mahaich in Ghazeepoor are reckoned an inferior branch. The chief of the Guharwar, resided at Bidjypoor a few miles to the west of Mirzapoor, where the liberality of the British Government enabled him to keep up some show of respectability. At the time of the first occupation of Benares by the British he was a fugitive from the tyranny and oppression of the Goutum Bhoonhar, who had expelled the Guhurwar family in A. D. 1758. The Guhurwar may be considered one of the most interesting races of the Upper Provinces yet much obscurity hangs over their origin and lineage. They are recorded among the 36 royal tribes of Rajpoots and are said to be of the same family as the Rathor with whom it is said they never intermarry. *Elliot, Supp. Gloss*

GUHWARA. HIND, A swinging cradle.

GUHYA. SANS. in hindu mythology, when the goddess Sati burst, and the gods in her womb came forth, this part of her body fell in Nepal, where, at a place called Guhyast'han, they continue to be devoutly worshipped,—*Wilford Moor*, p. 108. See Jati.

GUHYACA, servants of Cuvera, the deformed deity of riches—into such beings the dark souls of men, addicted in this world to selfish gratification, transmigrate. —*Moor*, p. 108. See Sati.

GUIA KHUTAI. A Bokharian hakim presented Dr. Honigberger with a hard, pitch-like plaster spread on a small piece of red linen which he pretended had been prepared in China, and which was capable of removing every kind of pain, simply by application. One and the same plaster serves for several cases. The form is square, three or four inches in diameter; each of them bears a Chinese seal. According to the assertion of the hakim its constituent parts are sweet oil and litharge, the latter, as an impalpable powder, is added to the former. The Bokharian doctor pretended that every pain without exception, must yield to its application. It should be applied as near as possible to the affected part; for instance, in headache, it ought to be applied on both temples or on the forehead, in ear-ache behind the ears; in carious tooth-ache a small piece should be put into the hollow of the tooth. It acts as a rubefacient, without blistering. —*Dr. Honigberger*, p. 282.

GUICOWAR, a feudatory chieftain of India who resides at Baroda, the capital of the territory left to him. The family are of the cowherd race, and formed part of the great Mahratta confederacy, to whose supremacy the British succeeded, and the Guicowar of Baroda then came under British control. See Baroda, Gaekwar, Guzerat, India Kattywar.

GUIENNE. See Rhodia.

		Gachcha chettu,	,,

A great thorny climber, with yellow flowers and with long briar-like trailing and climbing shoots. It grows in the East and West Indies; commoner in Bengal than Madras and is grown in the Archipelago.

Bonduc Nut. Kutculega. HIND. is the seed of Guilandina bonducella, an irregularly round, grey seed, the almond or kernel is white, very hard, and intensely bitter; gets a blood red colour from nitric acid. Mr. Piddington detected in the nuts, oil, starch, sugar and resin; further analysis is desira-

ble. Bonduc nut is the commonest anti-periodic in the Bazaar medicines of Bengal, and it is undoubtedly one of considerable utility, especially in convalescence from fever. If it do not stop the paroxysm the first time it seldom fails the second. The common way of exhibiting this substance is to give of the nut finely powdered, and of black pepper, each 6 to 20 grs. three times daily.

Bonduc Nut Oil. Calichi kai yennai, TAM. is mentioned by Ainslie, as useful in convulsions and palsy. *Irvine's Med. Top. of Ajmir.* *Ind. Ann. Med. Sci. for April* 1856, p. 192. *Roxb. Flor. GUIMAUVE. FR. Althæa alhugas.

GUINDY. A hamlet and country seat of the governor of Madras.

GUINEA. See India, Kayaboka, New Guinea, Papuan.

GUINEA FOWL. This bird is believed to be descended from the Numida ptilorhyna of the hot arid parts of E. Africa, but it has become wild in Jamaica and St. Domingo, and has there become small with black legs.

The Guinea fowl is the Bohemian of the barn-yard. They are hardy, and prolific and are valuable in gardens, as they rarely scratch the ground, are eager in their search for insects, and, with a scraping motion of their bill, gather the seeds of grasses. *Darwin.*

GUINEA GRASS, Panicum jumentorum has been cultivated to a considerable extent in India and Ceylon, with more or less success according to the care and attention bestowed on it. When well manured and kept clear of weeds it grows luxuriantly and admits of being cut every six week or two months. A small patch, near Colombo, which, beginning with about three quarters of an acre was gradually extended to about an acre and a half, and for seven or eight years, supplied 3 or 4 milch cows, and from 5 to 7 horses continually with all the grass required for their consumption and latterly left a surplus which was dried for bedding and hay. When first planted it frequently attains a height of even 9 feet, and a stalk taken promiscuously from a small patch planted lately in Combaconum measured 10 feet 4½ inches in length, but when cut two or three times it grows thicker but not so high. It is exceedingly excellent feeding for horses and cattle, and is generally preferred by them to the ordinary country grass, though horses which are hard worked seem to prefer the dry grass roots supplied by the grass cutters. It should not be given to cattle fresh, but the supply for one day should be cut the day previous, and it should not be cut too close to the ground, but the stalk ought to be left 7 to 9 inches high. It is a good plan to move the ground between the roots every time the grass is cut, and the ground should be heavily manured after every three or four cuttings. It is very hardy and may be easily propagated. It requires abundant moisture but will not live in a soil which is at all marshy. It answers best planted in small tufts 1 foot 9 in. to 2 feet apart, which rapidly spread into stools from 6 inch to 1 foot in diameter. *Spry's Suggestions* p. 15 *Mr. Caldwell in Literis, M.S.S.* See Graminaceæ: Grasses.

GUITAR. A musical instrument similar to the Cithera, supposed to have obtained its name from the Sih-tara, the three stringed, and supposed to be the source of the word guitar.

The Oil.

Kala Til-ka-tel, HIND.	Valisalu nuna, TEL.

The seed of this plant in shape is like the black cummin seed, and a sweet tasted oil is manufactured from it and used for nearly the same purposes as the Sesamum. It is procurable in the Nuggur Division of Mysore at Rs. 3-8 per maund, but is considered inferior to Sesamum or gingely oil. The seeds yield about 34 per cent. of oil, which sells at about 10*d.* per gallon. It is exported under the name of Niger seed. It was first shipped to London experimentally in 1851. It is grown in very large quantities in Chota Nagpore, being a favourite crop, of easy cultivation, and giving good returns. *Mad. Exh. Jur. Report of* 1855. *Cal. Cat.* 1862.

GUJU-DUNTU. SANS. from gaja, an elephant, and danta, a tooth; the elephant toothed; a name of the hindu god Ganesh.

GUJANANA. SANS. from gaja, an elephant, and anana, the face.

GUJAR, the name of a race spread through Hindustan who are supposed to have given their name to the Gujerat dis-

trict of the Punjab and to the country of Gujarat. They are well known agriculturists in the North Western Provinces. Whether of the hindu or mahomedan faith, they, everywhere, prefer pasturage to the plough, The Gujar, are numerous, everywhere, in the Sikh territory, and the Gujuru, in Kashmir, are shepherd proprietors, said to have come from Guzerat in the Punjab. They live in log-houses, in recesses at the foot of the Punjal, and in the woods. The Gujur are a numerous tribe in the Punjab, probably of primitive antiquity. They have not lost the pastoral habits of their race, though they devote much attention to agriculture, and they are more industrious and less predatory than their brethren of Hindustan. Professor Wilson says some of them profess to descend from Rajput fathers by women of inferior castes. Sir John Malcolm says the Gujar have raised themselves to power by means not dissimilar to those used by the Jat Almost all the thieves in Hindustan are of this tribe.—In 1857, in the Revolt, in India, the whole of the Gujar villages around Delhi, rose for plunder. The instant the strong arm of government was removed, these and other predatory races resumed their ancient habits.—*Wilson's Glossary. Malcolm's Sikhs*, p. 136. *Elliot's Supp. Glossary. Rec. of Govt. of India.*

GUJERAT, a town in lat. 32° 32' N., long. 74° 3' E., in the Jech doab of the Punjab on the Rotas road, between the Chenaub and Jhelum, at eight miles from the right bank of the Chenab. It is also the name of a district in the Punjab. Near the town the British in 1846, gained a battle over the Sikh.—*Rennell's Memoir*, p. 85.

GUJERAT, a peninsula in the N. W. corner of the peninsula of India, bounded on the south and east by the Gulf of Cambay, on the north by the Gulf of Cutch, and on the west by the Arabian Sea and North Indian Ocean. It belongs in part to the British, but has many native feudatories. The climate of Gujerat, Behar, Doab, Delhi, and Malwa resembles that of the States of North Egypt, and North Syria. Its chief towns are Ahmedabad, Cambay, Kaira, and Puttan Somnath, and a large portion of it is known as Kattyawar. The language spoken, called Gujerati, is a dialect of Hindi. The inhabitants are of very varied origin.—See Goojarat, India, Government, Mahratta, Kattyawar, Inscriptions.

GUJI. Hind. wheat and barley sown together.

GUJI. Beng. Climbing hedyotis. Hedyotis scandens.

GUJJU KANNE KOMALI. Tel. Boerhavia stellata.—*Roxb.*

GUJJU MAMIDI. Tel. also Mamidi chettu. Tel. var. of Mangifera indica—*Linn.* Dwarf mango.

GUJJU NARIKEDAM. Tel. Cocos nucifera.—*Linn.* The small variety, growing in Ceylon. Gujju in Telugu, means "short."

GUJ-PIPAR, according to Dr. Irvine, is supposed to be the root of Borassus flabelliformis, brought from Cabul: is astringent, and is given in medicine, to promote digestion: one seer costs two rupees. *Gen. Med. Top. p.* 135.

GUJ-PEEPUL or guj-pipar Beng. is the sliced dried fruit of Pothos officinalis. Potentilla officinalis. syn. of Scindapsus officinalis.—*Schott. General Med. Top.* p. 135.

GUJRA, or Soomurrun, bracelets made of coloured thread, worn at the Maharrum.

GUKKAR or Kahkar, or Ghakar, a warlike tribe in the time of Mahmud of Ghazni, inhabiting the Salt Range or Johd mountains between the Indus and the Behut (Hydaspes.) The Gukker, Gugger, and other aborigines of Hazara have most of them been mastered by Pathan invaders from beyond the Indus. The Mogul, and subsequently the Doorani, failed to master them, but the Sikh rulers, after having been frequently foiled, at length nominally accomplished their subjugation by stirring up internal faction and by the perpetration of acts of cruelty and treachery.—*Rec Govt. of India.* See Kahkar. Khyber, pp. 508, 517.

GUKER. Se Behera.

GUL. Beng. Guz. Hind. Pers. A rose, in combination, a flower, &c. hence.—

Gulab. Hind. rose-water. Rosa centifolia. R. macrophylla.

(bun) gulab. Hind. Rosa macrophylla.

Gul-abbas. Hind. Mirabilis jalapa.

Gul-abbasi. Hind. Colour of Marvel of Peru, magenta colour.

Gulabe. Hind. Trifolium Indicum.

Gulab ghurei. Hind. Rosa brunonis.

Gulabi. Hind. Crotalaria medicaginea, C. medicinalis.

Golab-i-rang, pink colour.

Gulab-i-sad-barg. Pers. Rosa centifolia.

Gulab-jam, also Gulab-jamun and Gulabi-jam. Duk. Eugenia jambos.—*Linn.*

Gulab jangli (Rosa burmanniana).

Gulab-ka-atr. Hind. Otto of Roses.

Gul-ab-ka-pani. Guz. Hind. Rose water.

Gul-ab-ka-phul. Hind. the Rose flower.

Gul-ab-pash. Rose water sprinkler, a bottle from which rose water is sprinkled.

Gulab-zira. Hind. Rosa centifolia.

Gul-i-dar-chini. Smilax China.
Gul-i-gul-ab. The Rose water rose.
Gul-i-nari. ? Hind. ? Cedrela toona ?
Gulistan, a rose garden.
Gul-i-surkh. Rosa centifolia.
Gul-jafri. Hind. Pers. Tagetes patula.
Gul-khaira. Hind. Althæa rosea, also Lavatera cachemiriana.
Gulkhand. Hind. conserve of roses.
Gul-i-kivia. Pers. Pandanus odoratissimus.
Gul-i-kysu. A flower which grows in the Punjab, from which a yellow dye is produced, with which they dye the shawl wool.
Gul mukhmal. Hind. Gomphrena globosa.
Gul-nasar, kul-nashtar. Hind. Erythrina arborescens.
Gul-paighambari. Hind. Arnebia echioides.
Guli-pista. Hind. Pistacia vera.
Gul-seoti. Hind. Gul-sewati. Rosa glandulifera.
Gul-shabbo. Hind. Polianthus tuberosa.
Gul-shan. Hind. Eranthemum pulchellum
Gul shandai, Hind. Tulipa stellata.
Gul sparlie. Hind. Arnebia echioides.
Gul sutei. Hind. Matricaria chamomila.
Gultun. Hind. Cedrela toona.
Gul zer Hind. Calendula officinalis.
Gul-banu, embroidered red silk cloth.

GUL, fire-balls for the hooka, a piece of hot charcoal for lighting the pipe or hooka; also the cinder, or refuse that comes from a hooka, pipe or chilam, when smoked out.

GULA. Mal. Sugar.

GULABA-PU. Tam. Rose.

GULA BATU. Malay. Candy.

GULABATAN. Properly Kalabatun. Gold embroidery.

GULAB SING was the raja of Jamu in the time of Runjit Sing. He was a Dogra rajput, brother of raja Dhian Singh, and raja Suchit Singh. He was cruel, tyrannical and exacting, but tolerant in religious matters. After the Sutlej campaign, the treaty of Lahore, dated 9th March 1846, left the British Government in possession of the hill and plain country, between the rivers Beas and Sutlej, and of the hill country between the Beas and the Indus, including the provinces of Cashmere and Hazara. The British Government conferred on Gulab Sing, territories in the hills, and recognized his independence. Gulab Sing began life as a horseman in a troop commanded by jemadar Khooshal Sing, then the favourite chamberlain of Runjeet Sing. He soon raised himself to an independent command, in which he distinguished himself by making prisoner Agur Khan, chief of Rajaoree. For this service the principality of Jummoo was conferred on his family and Gulab Sing took up his residence in Jummoo, whence he soon extended his authority over his rajpoot neighbours, and eventually into Ladakh. He took an important part in the negotiations which followed the battle of Sobraon. A separate treaty was concluded with him at Umritsir, on 16th March 1846, which put him in possession of all the hill country and its dependencies between the Indus and the Ravee, including Chumba and excluding Lahoul, on payment of seventy-five lakhs of Rs., and in exchange for the Cis-Ravee portion of Chumba. By a subsequent arrangement, in 1847, Chumba came again entirely under the British Government. In 1857 maharajah Gulab Sing died, and was succeeded by his son Runbeer Sing to whom the right of adoption was guaranteed by sunnud, and the chief now holds sway over Cashmir, Jummu, Kishtwar, Zangskar, Ladakh and Balti. *Prinsep's Antiquities, by Thomas; Aitchesons Treaties.*

GULA-CHIN. Duk. Plumieria alba.

GULAL. Hind. a red powder formed of barley flour or rice flour, or flour of the water nut, Trapa bispinosa, tinted with sappan wood, or sanders wood, much thrown about in the Ram Nami and in the Holi festivals of the hindoos.

GUL-AMBARI Beng. Hind. A sort of bright lilac, in which the crimson and the blue are not thoroughly combined, so that there is the effect of a 'shot.'

GUL-ANAR. Hind. Flowers, Punica granatum of scarlet-color pomegranate flower.

GULANCH. Hind. Tinosporia cordifolia.

GULANCHA. Beng. also Gudancha. Hind. Root and stem of Cocculus cordifolius. —*D. C.* Menispermum cordifolium. It is intensely bitter. A transverse section is very porous and radiated. A decoction is a valuable bitter tonic and alterative, dose one ounce flavoured with honey thrice daily, is the Pachana preparation of the native physician.—*O'Shaughnessy Beng. Phar.*, p. 277.

GULAR. Hind. Ficus glomerata, Kath gular. Hind. is the Ficus cunia.

GULARICH. Hind. See Gurcha.

GULATTI. Hind. Dolichos uniflorus. Horse-gram.

GUL-BADAN. Pers. A red silk cloth for ladies' trousers.

GULBAHAR. HIND. Grislea tomentosa.

GUL BAJI or Gul-abbas. HIND. and DUK. Mirabilis jalapa.

GUL-BEL. DUK. Menispermum cordifolium syn. of Cocculus cordifolius.—*D. C.*

GULBHANGA. HIND. Hemp. The flower bearing or female plant of the hemp. Gulbhanga-i-bihisht, a sweetmeat.

GULBODLA. HIND. of Hazara, Sterculia villosa.

GUL CHAND. HIND. Gardenia florida.

GOOL-CHINI, Chrysanthemum Indicum. —*Linn.* Indian chrysanthemum; Christmas-flower.

GUL-CHETUR, a famous field at Tanessur, close to the Grand Trunk Road; about 30 miles south of Umballa.

GULD. DAN. Sw. Gold.

GUL DAODI. HIND. syn. of Chrysanthemum Indicum.

GULDAR. HIND. Cedrela toona. C. serrata.

GULDAUDI Chrysanthemum Indicum.

GULDER. HIND. Staphylea emod.

GULEEZ-SHAH. A Mohurrum fuqeer.

GULERI. HIND. An iron from Gwalior used for wire drawing.

GULFS IN INDIA. The chief are the Gulfs of Cambay, S. E. of Guzerat; of Cutch, north of Guzerat: the two southern prongs of Celebes form the Gulf of Boni which stretches three degrees northward into the centre of the island. Its entrance is about 80 miles wide, but narrows to 30 miles, till at its head it again expands to 45 miles. The Great Wall of China ends at the Gulf of Lian-tung. The Gulf of Tadjoura, was described by Lieutenant Barker I. N. Bores occur in Southern Asia on several rivers, in the Gulf of Cambay, in the Ganges, the Irawaddy the Sittang and on some China rivers.

GULF WEED. Fucus natans or the Sargasso, is found in large masses between the parallels of 18° and 34° of North latitude, and its utmost eastern limit extending to 36° E. L.. It is of a greenish yellow colour, is abundant on the Florida reefs, but continues to vegetate as it floats about in the circular currents after it has been torn from its attachment. The masses give shelter to a great number of fish, mollusks and crustacean animals. Fucus natans, is the Gulf weed, which travellers to and from India, meet with in the Atlantic.

GUL-GAJUBA. Flowers of gajuba from Bombay: cooling, in various mixed prescriptions: one seer costs two and a half rupees. *Gen. Med. Top.*, p. 136.

GOOLGEEAN, Goolgooleean, or Goolgoolly, swollen rice mixed with molasses formed into balls.

GULGAZRANG HIND. Crimson brown, maroon.

GULGULA. A town near Bamian, destroyed by Changez Khan, at a comparatively modern period. Changez Khan, from some cause not now remembered, being highly exasperated with the people, came upon them suddenly, put them without mercy to the sword, and overturned and demolished the place. It is said that at a day's journey from Bamian, to the south west, were the remains of an extensive fortress, called Band-i-Berber, erected near a large lake. *Moorcroft's Travels*, Vol. II. p. from 387 to 393.

GULHAR. HIND. Nympha lotus.

GULI. HIND. Argyreia speciosa, *Swt.*

GULI. GUZ. also nil, GUZ. Indigo.

GULI. HIND. DUKH. Coral.

GULI. TEL. Capparis grandis. *Linn.*

GUL-I-BADAWURD. HIND. Carduus nutans.

GUL-I-BANAFSHA, violet flowers.

GUL-I-GULAB, rose-flower.

GUL-I-GULAB. A series of fortresses which have a communication with each other. They are situated near the Persian Gulf, about five fursangs from Behbehan, and the river Kheirabad, the Ab-i-Sherin or Indian River, flows close to the foot of the rock on which they are built, one fort above the other.

GUL-I-GHAFISH. HIND. Flowers of Gentiana *sp.*

GULILI. HIND. Fluggea leucopyrus.

GUL-I-IZKHAR. HIND. Andropogon iwarancusa.

GULIVINDA. TEL. Abrus precatorius. *Linn.*

GULKHAND. GUZ. HIND. Conserve of Roses.

GUL-KESU, flowers of the dhak tree, Butea frondosa.

GUL KHAIRA, Malva rotundifolia.

GULKUNDAL. HIND. of Jamu; sterculia villosa.

GULLA, lit. grain or corn, money, properly Ghillah.

GULLA, GILA, GADDI. TEL. A kind of grass, not identified.

GULLI-MILNA. HIND. A form of salutation, the embracing described in Scripture, as falling on the neck.

GOOLLEE, Coral. Vide Tusbeeh.

GULLEE AFREEDEE. See Khyber, pp. 510 and 511.

GULLEM CHETTU. TEL. Capparis grandis.—*Linn.*

GULLER. DUK. Ficus racemosa.

GULLI. DUK. Coral. Red coral.

GUL-MASUFIR HIND. Pers. Kusumbha, Carthamus tinctorius.

GUL-MEDAK. HIND. Jacynth, but generally understood to be an imitation gem of a deep orange color.

GUL MURG. See Kashmir.

GULUBAND, anything worn in any way about the neck.—Dress, properly Galliband.

GULONCHI. HIND. ? A tree of Chota Nagpore, with hard, white timber.— *Cal. Cat. Ex.*, 1862.

GUL SANJUD. HIND. Elæagnus conferta.

GULPISTA. PERS. Bazgand. GUZ. HIND. galls produced on the Pistachio tree (Pistacia vera), a native of the South of Europe, and of Asia. They are imported into Bombay from the Persian Gulf, and are used in medicine by the natives of India.—*Faulkner. Birdwood.*

GUL-TAKIA, or Girday, a pillow for the cheek, properly Gal-takiah.

GULUBAN, or Guluwan, from Gulu, Kashmiri, a flock, horse grazers in Kashmir, descendants of the warlike Chakh, the warriors of Kashmir who opposed the invasion of Akbar.

GULU. HIND. Cannabis sativa.

GULUNGA ?—Hemp.

GULUSU ? Tel. an article of Jewellery.

GULUWAN of Kashmir. See Gulubau India, p. 337.

GULWAIL. DUK. Cocculus cordifolius.

GULY MARA. CAN. Rhamnus jujuba.

GUM.

Gomme,	FR.	Gatah pulut,	MALAY.
Gummi,	GER.	Goma,	SP.
Gond,	GUZ HIND.	Pisini,	TAM.
Gomma,	IT.	Banka,	TEL.
		Jigata.	,,

Gums and resins, are divisible into Gums, Gum Resins and Resins.

Gums are soluble in water, but not in alcohol.

Gum Resins, being compounds of gum and resins, are partially soluble in water, partly in alcohol; the gummy matter being separated by one, and the resinous matter by the other.

Resins are soluble in spirits, from which they are, in a considerable proportion, separated by water. The resins melt on the application of heat, but not so the gums. The chief gum producing trees, &c. of Southern Asia are:

Babool gum, Tumma, Acacia arabica.
Kut or Kheir gum, ... ,, catechu.
Vel-vela-pisin, ... ,, ferruginea.
Dirisana gum, ... ,, sirissa.
Gum arabic, ... ,, speciosa.
Gum arabic, ... Acacia sundra.
Konda Tangedu jigata. Acacia xylocarpa.
Bel-gum, ... Ægle marmelos.
Mutty pal, ... Ailanthus Malabaricus
Gum Arabic ... Albizzia odoratissima.
Kalabanda jigata, ... Aloe perfoliata.
Meisakshi, ... Amyris commiphora.
Cashew gum, ... Anacardium occidentale.
Neem-gum, ... Azadirachta indica.
Myrrh (moor) ... Balsamodendron myrrha.
Bdellium (googul), ... Balsamodendron myrrha.
Elipi, ... Bassia longifolia.
Pachontee, ... ,, elliptica.
Bauhinia gum ... Bauhinia parviflora.
Olibanum (saleh gond) Boswellia thurifera.
Boorooga gum ... Bombax Malabaricum.
Pulas, Modugu gum ... Butea frondosa.
Jilledu jigata, ... Calotropis gigantea.
Tangedu jigata, ... Cassia auriculata.
Gum of ... Chloroxylon swietenia.
,, ... Cordia rothii.
Katira gum ... Cochlospermum gossypium.
Gum, ... Conocarpus latifolia.
Palay, caoutchouc, ... Cryptostegia grandiflora.
Kuttimundoo, ... Euphorbia kuttimundoo.
Wood apple gum, ... Feronia elephantum.
Assafetida, ... Ferula asafetida.
Caoutchouc, ... Ficus elastica.
Marri jigata, ... Ficus indica.
Atti or medi jigata, ... Ficus racemosa.
Dekamuunee, ... Gardenia lucida.
Gamboge, ... Garcinia pictoria.
Gutta percha, ... Isonandra gutta.
Vutta thamara, ... Macaranga indica.
Mamidi jigata, ... Mangifera indica.
Pogada jigata, ... Mimusops elengi.
Moringa gum, ... Moringa pterygosperma.
Assafœtida (hing), ... Narthex asafœtida.
Oodi gum, ... Odina wodier.
Devardaru jigata, ... Phyllanthus turbinatus
Gum mastic, ... Pistacia atlantica
,, ,, ... ,, cabulica.
,, ,, ... ,, lentiscus.
Gum arabic, ... Prosopis spicigera.
,, ,, ... Prunus armeniaca.
Kino, ... Pterocarpus marsupium.
Gum of ... Salix caprea.
Somida jigata, ... Swietenia febrifuga.
Neredu jigata, ... Syzygium jambolanum
Gambier, ... Uncaria gambir.
Keekur gum, ... Vachelia farnesiana.
Choar-kulli, ... Soymeda febrifuga.

Gum of.....Sterculia urens.
" .....Xanthoxylon hostile.
Yellapi,..... .....Zizyphus jujuba.

Resins and Gum Elastics.

Abies Smithiana..... ...resin.
Ammoniacum.....Ooshik.
Amber, Kahroba,.....Cutch, Assam and Kemaon.
Anime,.....Bombay from Africa.
Benzoin, Loban,... ...Straits, Sumatra.
" a kind of, ...Malabar.
Caoutchouc,..... .....Ficus elastica, Assam.
Copal, Soondroos,..... Vateria Indica, Canara
Dammer, Ral and Dhoonia,... ... .Shorea robusta, Balasore, foot of Himalaya, Canarium strictum.
Deodar Oil, Kelon-ka-tel..... .....Cedrus deodara, Himalaya.
Galbanum,.....
Guggilam,.....
Gutta Percha,..... . Isonandra, Singapore.
Mastic, Mustajee,.....Bombay.
Mysakshi..... ....
Myrrh (Moor),.....Balsamodendron myrrha.
Bdellium (Googul),... „
Olibanum (Salehgond) Boswellia thurifera.
Turpentine,..... ... ...Pinus excelsa, resin.
Piney, Pandum, ...Vateria Indica, Canara.
Resin,.....Beerbhoom.
Theetsee,... ....Melanorrhœa usitata, Assam.
Turpentine, Gunda baroza,..... .....Pinus longifolia, Seharunpore.
Wood Oil, Gurjun, Dhoonatel,..... ..Dipterocarpus turbinatus, &c., Chittagong.

Curvaiala maram. Tam. Acacia arabica, gum well known, procurable in abundance.

Wadallee maram. Tam. Acacia catechu, gum dark coloured, sweetish tasted.

Vel-vaila maram Acacia ferruginea, gum of this trèe does not seem good.

Karray vagay maram. Acacia odoratissima, the finer specimens, a fine gum, very like good gum arabic, obtainable in abundance.

Curun galli maram. Acacia sundra, very good, pleasant tasted and adhesive.

Vilva pissin. Ægle marmalos. A fine pure sweet tasted gum, much resembling and fitted to form a good substitute for gum arabic, for which it is sold in the bazaar mixed with other gums—only obtainable in small quantities.

Peru maram. Ailanthus excelsa, scarcely deserves the name of gum, it seems rather resinous than gummy.

Vapum maram. Azadirachta indica, a pretty good gum, well tasted and is mixed with other sorts and sold as gum arabic—abundant.

Ellipi maram. Bassia longifolia, a dirty gummy substance, but not fit for use, when so many better are to be had—smell heavy and disagreeable.

Catoolugoo maram. Bombax malabaricum, a white, rather pure, gum.

Avaram pissin. Cassia auriculata, a dark brown dirty looking substance, soft and demulcent, but insipid in the mouth—used as a demulcent.

Kodawah porsh. Chloroxylon swietenia. A clear transparent brownish red gum, not very soluble and bitterish taste—does not seem good.

Vellay naga maram. Conocarpus latifolia, a fine pure gum, but its qualities not otherwise known—used in common with others as gum.

Narvali maram. Cordia rothii, gum hard and tough, apparently not good as a gum.

Vullam pissin. Feronia elephantum, gum exceedingly good, a superior gum arabic, for which it is substituted.

Mah maram. Mangifera indica. The common mango tree yields a soft dark dirty looking gum, it has the softness of boiled india-rubber with little or no solubility. When first taken into the mouth, it yields a somewhat terebinthine flavour: it exhales an unpleasant smell.

Mullee vemboo. Melia azadarachta, a tolerable gum.

Murungoo pissin. Moringa pterygosperma gum not bad looking, soft, little soluble, and not adhesive.

Woody maram. Odina wodier, a pure soft sweet tasted gum.

Vunny maram. Prosopis spicigera, gum clear, looks well, is largely collected as a very good gum arabic.

Vengay maram. Pterocarpus marsupium, a hard brittle astringent secretion, much resembling kino in its sensible properties.

Choar kulli maram. (Soymida febrifuga) ?? Pretty clear transparent gum, slightly tinged with red and with a slight dash of bitter in the taste.

Vellay bootalli or pootalli maram, Sterculia urens, a curious gummy looking substance, softening in the mouth but not having the proper adhesiveness of gum. It much resembles traga-

canth, in the way it softens in the mouth, and Roxburgh states that it was sent to Europe as a substitute, but was not found to answer.

There are two leading modifications of gum, one of which is represented by Gum-arabic, and the other by Gum-tragacanth: there are many intermediate varieties, amongst which Cherry-tree gum, may be distinguished and the different kinds of gums have been classed under the generic terms of Arabine, Tragacanthine, and Cerasine, from Cerasus, a cherry-tree. Gum-arabic is the produce of several species of Acacia growing in Arabia, India, Upper Egypt, Senegal, &c., and, in India, the gums of Ægle marmelos, Feronia elephantum, Azaderachta indica, Melia Azaderachta, Odina wodier, and Prosopis spicigera, are all sold as gum-arabic. It occurs in rounded pieces, or tears, and in fragments, up to the size of a walnut, or larger; these are of irregular shape; the colour is either white, yellowish, or dark white yellow; there is scarcely any odour and the taste is mawkish and glutinous; the sp. gr. varies from 1·50 to 1·50. It breaks readily into small irregular pieces, with an uneven vitreous fracture. It dissolves almost completely in water; 100 parts of water of 212° Fahr take up 19 parts of gum. The solution is, however, purer when made with cold water, and keeps better: it is sometimes used as a glaze or varnish, and for the purpose of giving a gloss and stiffness to ribands, calico, &c. At an average of the 3 years ending, 1842, the gum-arabic entered for consumption in the United Kingdom amounted to 18,176 cwts. a year. It sells at £ 2 to £ 14 the cwt.

Gum Senegal, from the island of that name on the coast of Africa, is largely used by the calico-printers instead of gum-arabic.

Gum tragacanth is the produce of certain species of Astragalus, growing in Asia Minor, Armenia, and Northern Persia. It is usually in the form of white or yellowish semi-transparent flakes, or curled vermicular pieces, which are very tough and require, before they can be powdered, to be dried at 212°, when they lose about 10 per cent. of water, and become brittle. When steeped in water this gum swells into a bulky mucilaginous mass, which, when boiled with water, gradually acquires the appearance of a solution of ordinary gum. Gum-tragacanth is used for some of the purposes to which gum-arabic is applied. It is often sold in the shops as gum-dragon.

Cherry-tree gum, including that of peach and apricot trees, and other species of Prunus, resembles inferior gum-arabic in its external characters, but is only partially soluble in cold water.

Gum Arabic; Gum Senegal: Gum of the Cherry and other stone fruit trees; Gum Tragacanth; Gum of Bassora flow spontaneously from the branches and trunks of the trees producing them. A kind of gum is extracted from seeds and roots by boiling water. The various species of the genus Acacia yield these gums, and some of them gum-resins. The Acacia and its gum-yielding properties have been known from the remotest antiquity. The Shittah-tree, mentioned by Isaiah and also in Exodus, is supposed to have been an Acacia Hippocrates speaks of the Egyptian Acacia and of the white Acacia, distinguished, he says, by its white bark, white-wood, and white flowers; and from this tree his "white fragrant ointment" was probably made. The exudation of gum is thus explained by DeCandolle:—"The gummy matter resides in the bark and albumen; it is the nutritive juice of the plant; and its escape, therefore, is analogous to hemorrhage in animals: hence plants in which it spontaneously occurs are always in a sickly state. The mechanical cause of the expulsion of the juice is dependent on the unequal hygrometric properties of different parts of the stem. The wood absorbs more moisture from the air than the bark, and hence it swells more. In consequence of its enlargement, it distends the bark, which, by the internal pressure of the wood, gives way, and gummy matter escapes." Dr. Pereira remarks that DeCandolle's hypothesis is quite in conformity with facts respecting gum tragacanth mentioned by Labillardiere, who states that the gum only flows in abundance during the night and a little after sunrise. A cloudy night, or a heavy dew, is, he thinks, necessary for its production, for the shepherds of Lebanon only go in search of this substance when the mountain has been covered during the night with thick clouds. The gum of the Acacia-tree flows in a liquid state from the branches and trunks, and hardens by exposure; the more sickly a tree appears, the more gum it yields, and the hotter the weather the more abundant it is. A wet winter and a cool or mild summer are unfavourable to the production of gum. According to the locality producing it, gum arabic is known as Turkey or Arabic gum, Barbary or Morocco gum, Senegal, East India, and Cape gum. Each of these varieties of gum is employed to give lustre to crapes and silks, and the mucilage of gum arabic is largely used for this purpose and for cementing into cakes the various pig-

ments used by artists in water-colours. Tragacanth gum differs from the gum of the Acacia in not being soluble in water, but swelling up when placed in water, and thus forming a mucilage. There is the flaky tragacanth and the vermiform; the former being the variety usually brought to Britain, while the latter is commonly employed on the continent. This gum is gathered about the end of June, from the Astragalus tragacantha of Crete, and surrounding islands. The chemical differences between the gum Arabic, gum Senegal, and gum tragacanth are as under:—

	Gum Arabic.	Gum Senegal.	Gum Tragacanth.
Carbon, ...	41·906	43·59	40·50
Hydrogen.....	6 788	6·23	6 61
Oxygen.....	51·306	50·07	52·89
Nitrogen,.. ...	a trace	0·11	0·00
	100·000	100·00	100·00

The examinations of Guerin and others have shown that these gums consist of soluble and insoluble portions. The soluble gum is called Arabin; this is soluble in both hot and cold water, but insoluble in alcohol, ether, and oils. The insoluble gum is called Bassorin, which is insoluble in both hot and cold water, but it absorbs water and swells up. The tragacanth contains most of the latter; while the Arabin is the largest constituent of the gum Arabic. Gum tragacanth is largely employed in calico-printing, and it has many uses in the Arts.

Catechu, from the Acacia catechu, is rather an extract than a gum. It is manufactured in Burma, Canara, the Western Dekhan, Behar, and in Northern India. Dr. Forbes Royle says the Kat'h manufacturers move to different parts of the country in different seasons, erect temporary huts in the jungles, and selecting trees fit for their purpose, cut the inner wood into small chips. These they put into small earthen pots, which are arrayed in a double row along a fire-place built of mud: water is then poured in until the whole are covered; after a considerable portion has boiled away, the clear liquor is strained into one of the neighbouring-pots, and a fresh supply of material is put into the first, and the operation repeated until the extract in the general receiver is of sufficient consistence to be poured into clay moulds, which in the Kheree Pass and Doar, where he had seen the process, are generally of a quadrangular form. This catechu is usually of a bloodred colour, and is considered there to be of the best quality.. By the manufacturers it was conveyed to Seharunpore and Moradabad, whence it followed the course of commerce down the Ganges, and met that from Nepal, so that both may be exported from Calcutta. Of three varieties of catechu in the markets the Acacia catechu and the Gambir catechu are the best. Catechu has long been employed in India for tanning skins; its tanning properties are stated to be so great that skins are tanned by it in five days. It has also been used in India to give a brown dye to cotton; and catechu has lately been very extensively employed in the calico-printing works of England. The salts of copper with sal-ammoniac cause catechu to yield a bronze colour, which is very permanent. The proto-muriate of tin produces with it a yellowish brown. A fine deep bronze hue is also produced from catechu by the perchloride of tin, with an addition of nitrate of copper. Acetate of alumina gives a brown; and nitrate of iron a dark-brown, grey. For dyeing a golden coffee-brown, catechu has entirely superseded madder, one pound of it being equivalent to six pounds of that root.

Gum Kino is the juice of the Pterocarpus erinaceus, P. marsupium, Eucalyptus resinifera, &c. Kino has much the same properties as the catechu; it has been proposed to employ it in dyeing green. Although the colour of the kino is a deep red, it has the power of communicating a green colour to the salts of iron.

Gamboge, is a vegetable gum resin, the first notice of it we have is by Clusius, in 1605, who described a piece brought from China, by admiral Van Nock, in 1603. The gamboge which Europe obtains is received principally from Siam, a small quantity coming from Ceylon and the Western Coast of India. The Singalese method of collecting the gamboge is by cutting pieces of the bark completely off, about the size of the palm of the hand early in the morning. The gamboge oozes out from the pores of the wood in a semi-liquid state, but soon thickens, and is scraped off by the collectors the next morning without injury to the tree, the wounds in the bark soon healing, and becoming fit to undergo the operation again. Gamboge is much used as a pigment, and in miniature painting, it is employed to colour varnishes and lackers. Many of the mucilages, as those of quince-seed, of carrigeen moss, and the like have their uses in the arts, but they are not of sufficient importance to demand any especial detail.

Rosin or Common Resin of Europe and America is obtained as a residuary matter in the process for obtaining the

oil of turpentine, Turpentines must be regarded as an oleo-resin. In their natural state they are either solid or semifluid, the oil of turpentine being obtained by distillation of American turpentine with water. From the United States Dispensatory we learn that turpentine is procured "from the Pinus palustris, partly also from the Pinus tæda, and perhaps some other species inhabiting the southern states. In former times, large quantities were collected in New England; but the turpentine trees of that section of the Union are said to be nearly exhausted; and European commerce is almost exclusively supplied from North Carolina and the south-eastern parts of Virginia. In collecting this turpentine "a hollow is cut in the tree a few inches above the ground, and the bark removed for the space of about eighteen inches above it. The turpentine runs into this excavation from about March to October; more rapidly, of course, during the warmer months. It is tranferred from these hollows into casks." Old and concrete American turpentine is often sold as frankincense.

Canada turpentine or Canada balsam, is obtained from the Abies balsamea in Canada. Between the bark and the wood of the trunks and branches of these trees are vesicles containing the oleo-resin, which exudes when they are broken. Canada balsam is much used by varnish-makers in the manufacture of some of the most transparent varnishes. It is also extensively employed by opticians as a cement. The great value of Canada balsam for optical purposes, depends on its transparency and its refractive power, which is nearly equal to that of glass. When used to connect the pieces of an achromatic lens, it prevents the loss of light by reflection and excludes moisture and other foreign bodies from the space between the surfaces of the glasses. In Nicol-prisms (single image prisms of Iceland Spar) it serves the important purpose of transmitting the ordinary ray, and of interrupting the passage of the extraordinary one; its index of refraction being intermediate between that of Iceland spar for the ordinary ray, and that of the same substance for the extraordinary ray—(*Pereira.*)

The spirits, essence, or oil, of turpentine, for it is known by all these names, is obtained by submitting to distillation a mixture of American turpentine (which has been melted and strained) and water in proper proportions. The produce of oil of turpentine from the crude article is about from fourteen to sixteen per cent. There is a preparation sold in the shops as sweet oil of turpentine, for painting without smell; this appears to be nothing more than carefully rectified oil. The common oil contains some resin, which colours it, and renders it unfit for many of the purposes for which the superior article is required.

Camphene is the rectified oil of turpentine, and when new, it burns admirably in the camphene lamps; but by exposure to the air it becomes resinified, and is then unfit for use. The wick of the lamp carbonizes, and resin is deposited around it, causing the lamp to smoke, at the same time as the illuminating power of the flame is greatly diminished. When the camphene has thus suffered by age or exposure, it must be again rectified by distillation from carbonate of potash, or some similarly active substance, to deprive it of this. This resinification of the turpentine is due to the absorption of oxygen, which, according to the chemists, produces pinic and sylvic acids; it is also stated that formic acid is formed during the process.

Turpentine is extensively employed, as the solvent of the other resinous bodies, in the formation of varnishes; its solvent powers in this respect, renders it exceedingly valuable to the artist, and also to the manufacturer. The rectified oil of turpentine has been much used as a solvent of caoutchouc. It has been stated by Bouchardt, that the unrectified oil dissolved India-rubber with great difficulty; whereas the oil rectified without water was an excellent solvent, but that it was rendered still better when it was distilled from bricks.

The Terebinth tribe of plants produce a variety of resins and resinous oil, as the olibanum, myrrh, &c.; amongst these terebinthine products is Scio turpentine, called also Chian and Cyprus turpentine the product of the Pistacia. It is produced largely in the Island of Scio, and is obtained by cutting cross-ways with a hatchet the trunks of the largest trees; the turpentine runs down on flat stones placed to receive it, each tree yielding about eight or ten ounces.

Mastic Resin.—This is also produced in Scio, from the Pistacia lentiscus, the mastic or lentish tree. The process of collecting is in most respects similar to that employed in obtaining the other resins. That which collects on the branches of the trees is called mastic in the tear, and fetches the highest price, while that which falls to the ground constitutes the common mastic. Mastic varnish is well known from its transparency, and other valuable proper-

ties; one of which is its peculiar toughness and tenacity even when spread in the thinnest coat, on wood or on canvas. This is due to the presence of a peculiar resin, which does not possess any acid properties, and which has a composition C. 40, H. 31, O. 2,—the acid resin of mastic containing four equivalents of oxygen.

Olibanum.—This was the frankincense used by the ancients in their religious ceremonies. Moses speaks of it in Exodus, and it long formed a constituent in the preparation of incense It is produced in India from the Boswellia thurifera but there are also African and Arabian varieties.

Myrrh.—This gum resin was an object of trade more than 3,500 years ago. It is produced in various parts of Asia and Africa, the Myrrh-tree bearing the scientific name of Balsamodendron myrrha undetermined. According to Ehrenberg it exudes, like cherry-tree gum, from the bark of the tree. Turkey myrrh is considered the finest, the East Indian being the second in quality. This gum resin has not found any extensive applications in the Arts; it is employed medicinally, as a dentifrice, and in the preparation of fumigating pastiles.

Elemi.—This gum resin is the product of a tree still undetermined; and although it is of considerable importance, and is imported in large quantities, the locality producing it is not distinctly known. Dr. Peirara took much pains to ascertain its commercial route, and he found that all the importations of it which he could trace were from Amsterdam or Hamburgh. It would appear that elemi formerly came from Ethiopia by way of the Levant; it is therefore probable that it comes through Holland from some Dutch settlement in the East, and also from Africa, some small quantity probably being received from the Brazils. This gum resin forms an essential ingredient in many of the finest varnishes.

Balm of Gilead called also Opobalsam and Balm of Mecca, is procured from the Balsamodendron Gileadense, a middle-sized tree growing in Arabia. But little of the true balm of Gilead reaches Britain. The same may be said of another of the terebinthine resins, Bdellium, which is obtained from India and from Africa.

Copal.—This important resin exudes spontaneously from two trees, Rhus copalinum, and Elœocarpus copalifer, the first being an American and West Indian, and the second an East Indian tree. Another variety of copal is obtained from the coasts of Guinea. The American species comes to Britain in flat fragments; whereas the East Indian is generally obtained in roundish masses. The latter furnishes the finest varnishes. Fresh essence of turpentine dissolves it completely, but old turpentine will not do so. It is stated that essence of turpentine, digested upon sulphur, will dissolve double its own weight without letting any fall. The oil of rosemary also dissolves copal with great readiness. An excellent varnish may be made by dissolving one part of copal and one of essence of rosemary, with from two to three parts of pure alcohol.

These are the more important of the gums and resins employed in the Arts. Their employment has been greatly facilitated by the discovery of new solvents, such as the new alcohols and ethers, naphtha, benzole, chloroform, and others. The art of the varnish-maker is an important one, and it requires, for its successful prosecution, a considerable amount of chemical knowledge, and the greatest care. Copal, mastic, and amber varnishes are much employed by the artist and by the photographer for the preservation of their works. The latter is perhaps superior to any of the other. Far less attention is paid to the peculiar properties of varnishes than could be desired. The artist employs a varnish for the purpose of securing his labours from the combined influences of light and air; but it must never be forgotten that he is employing a material which is itself constantly passing, by the absorption of oxygen, into a state of disintegration. It is known that many varnishes rapidly change colour, and that some are more liable to crack than others are. A few preliminary experiments may be made of great value. For example, if portions of various samples of varnish are spread upon a plate of glass and dried, we have the means of determining many important points. Cover one half of the varnished glass with an opaque screen, and expose the other half to sunshine day by day; by placing the glass upon a sheet of colourless paper, it will be seen whether any colour has been imparted by the action on the sunshine. After a few days, if the whole arrangement is placed in spirits of turpentine, the varying degrees of solubility may be noted; and from this may be determined the rate at which, under ordinary circumstances, oxygen is absorbed—the rate, indeed, at which the elements of destruction proceed. Thus a considerably greater degree of permanence may be secured, than when the artist, trusting only to the varnish maker, employs a preparation about which he knows nothing. *Robert Hunt, in London Art. Journal December* 1858.

Dammar is a vernacular term for the resins of various trees growing in India and in the Eastern Archipelago. In Bombay Dammar is also applied to pitch and in the ports on the Telinga coast, resin and oil are boiled together and sold under the name of keel to pay ships and boats bottoms. The Ral of Northern India and exported from the Panjab is not similar to that of the Shorea robusta and throughout India, ral and rala are terms applied to all resinous substances. The resins of Vatica robusta and of V. tambugaia form the chief part of the dammars of India. These are very brittle and like the resin of Vateria Indica are amber coloured.

The resin of the Vateria Indica is amber coloured and very tough. It is known as the Piney Dammar, the white dammar of Malabar, Indian Copal, and Indian gum anime. This resin when resin and soft, is Piney Varnish. The tree is the Elœocarpus *Retz*, the Chloroscylon dupada, *Buchanan*.

Paini maram, TAM. | Dupada Chettu, TEL.

The resin.

Kundrikam, TAM. | Vellai kundricum.

It is largely exported from the forests of Travancore and Western Ghats.

Black dammar of Malabar, is the product of Canarium strictum.

White Dammar. The Dammara Orientalis one of the pinaceæ yields the *White dammar* of Singapore. It occurs in fragments of variable size, marked with reddish streaks, transparent, amber-like, brittle, with brilliant fracture, very inflammable, inodorous, and tasteless. This resin flows from the Dammara orientalis which grows on the lofty mountains of Amboyna. It hangs from the branches, and resembles stalactites, the pieces being sometimes as large as the hand, and 4 to 8 inches long; some pieces are like anime resin. This substance, in conjunction with wood oil, makes a useful coarse varnish for doors, windows, &c. It is also sometimes employed as a pitch in dockyards; and by farriers in the preparation of certain plasters. When melted with gingelee oil, it is used for covering corks in bottles, to preserve them from the white ant.—*Ains. Mat. Med.*, p. 152.

A preparation is made by boiling with oil and in the neighbourhood of the ports of peninsular India, is sold in thisform under the Telegu name of keel. It is also used boiled with wood oil as a varnish for house beams, doors, &c., and by painters to render oil drying.—*Rohde M. S. S.*

Dammar and wood oil are boiled to form a varnish for house beams, doors, &c., and painters add dammar to oil, to render oil drying.

Cowdie or Kaurie-gum, called also Australian dammar, and Australian dammar of N Zealand is the product of Dammara Australia.

Dammar in India supplies the place of pitch and rosin, and in the Tenasserim Provinces is the product of three different genera, belonging to the wood oil tree family—the shorea, the hopea, and the dipterocarpus.—*Mason.*

The Dammar, called Pwai-ngyet, Burm. is found in the bazaars throughout Pegu. It is yielded by the Shorea robusta, or the Saul-tree of India. This tree occurs plentifully in the forests on the Shan side of the Sitang, east of Tounghoo, and also, but to less extent, in the forests of the Prome district. Dr. McClelland did not find, however, that the dammar is obtained from these forests, as none of the trees appeared to have been perforated for it, so that the supplies of this article were probably brought down to Pegu from forests beyond the frontier.—*McClelland.*

The Dammar of China and the Eastern Archipelago, is a kind of indurated pitch flowing spontaneously from several trees in the Indian islands; there is a hard sort, and a white, softer kind. It is found in large lumps, both under the trees and on their trunks, and in large quantities. It is mixed with a softer kind which makes it less brittle; and is then used for closing seams in boats, and other wooden vessels. As it is seldom brought to China except in native vessels, there is no means of ascertaining the amount, but it is probably not very large. It can be obtained in Borneo for 50 cents per pecul.—*Compendious Description.*

The meaning of the word "dammar," in Malay and Javanese is "resin," and it is the produce of several forest trees, of which the sap exudes spontaneously, and on being exposed to the air acquires a flinty hardness from which the epithet "batu," a stone, is given to it to distinguish it from a softer substance, "kruin" or wood oil. The dammar is found either in larger masses at the foot of the trees which yield it, or floating in rivers, drifted to them by the floods of the rainy season. It is produced in such abundance, and gathered with so little labour, that its market price seldom exceeds four or five shillings a hundred weight. The natives of the country apply it to most of the uses to which tar, pitch, and resin are put and it forms an article of exportation to continental India. Most of the family of Dipterocarpeæ yield resinous balsamic juices, those of the genus

Dipterocarpus, the wood-oil, and of Vateria, indurated dammar. The natural order abounds in Sumatra, Java, and Borneo, which are the chief sources of the dammar of commerce.—*Crawfurd Dictionary*, p. 118.

Dammar of Bengal is the resin of Shorea robusta,—*Ben. Phar.* 204. *Dispensatory p.* 617.

Dammar, white, occurs in fragments of variable size, marked with reddish streaks, transparent, amber-like, brittle, with brilliant fracture, very inflammable, inodorous, and tasteless. This white dammar resin flows from the Pinus dammara, which grows on the lofty mountains of Amboyna. It hangs from the branches, and resembles stalactites, the pieces being sometimes as large as the hand, and 4 to 8 inches long; some pieces are like anime resin.—*O'Shaughnessy*, p. 617.

Dammars of N. East of the Peninsula.

Saul tree dammar is the resin of Shorea robusta and of other species. The Vatica tumbagaia grows also to a limited extent on the west coast, but yields little if any of the dammar collected there. The dammar of the Shorea robusta occurs in sticks much resembling in shape the black dammar but differing widely in colour and consistency. In colour it varies from a light yellow to a dark brown. The two colours being very frequently found in the same lump and giving it the appearance of having a regular 'grain' Friable and differs from the white dammar of the western coast in its inferior hardness, opacity and its peculiar form, and from the black dammar in its colour. There are extensive tracts of Googulam (Vatica) jungles in the Goomsur and Cuttack provinces. The Khond and Woodia races living in and near these jungle, wound trees in several places. The resin issues and is collected when sufficiently solid. The dammar collected from the decayed parts of the tree is of a dark colour: the tree is called Guggilam in Telugu and tala gotsa in Urya. The Khoond and Urya make the leaves into the plates from which they eat their food and also roll up tobacco in them to smoke like a cheroot. In time of famine the above tribes live on broth made from the fruit of this tree.

Gum Ammoniac.

Ushek, Feshuk, AR.	Gomma Ammoniaco, IT.
Gomme Ammoniaque, FR	Ammoniacum, LAT.
Ammoniack, GER.	Samugh bil sherin, PERS.
Astruck, GUZ. HIND.	Goma Ammoniaco, SP.

This bitter, nauseous, bad smelling gum-resin is used in medicine. The plant producing it is still doubtful, but Dorema ammoniacum; Ferula ammonifera *Fée*, F. orientalis and F. persica have all been named as its source.—*OShaughnessy*, p. 364.

GUM ARABIC.

Tolh, AR.	Gomma Arabica, IT.
Samagh Arabi, ,,	Kapitha, SANS.
Gomme Arabique, FR.	Pisini, TAM.
Arabische Gummi, GER.	Banka, TEL.
Gond, HIND.	

Gum Arabic, is the gum of various trees of the genus Acacia. A. vera, *Willde* of Arabia and northern Africa. A. Arabica, of Arabia and India. A. seyal of Egypt and Senegambia; A. senegal *Willde* a native of Western Africa, A. tortilis, *Forsk*: A. Ehrenbergi *Hayne*, both of Arabia, and A. karoo *Hayne*, of Morocco and Bombay. In addition to these in India, the gums from A. farnesiana, A. leucophlæa, Ægle marmelos, Odina wodier, Azadirachta and others are all used under this name.

Gum Arabic is imported in immense quantities from Africa into Aden; none is collected and very little produced in Arabia. (*Malcolmson Hamilton.*) It is, also, produced in Upper Egypt and Nubia. M. Pallme describes the whole of the arid desert country as covered with Acacia trees, and the gum as being collected in Kordofan, especially in the district of Bara, in November, December and January, from ten to fourteen hundred weight being conveyed on camels from Bara to Dongola on the Nile, whence it is conveyed to Cairo, and thence distributed to Europe. Much is also conveyed to the ports of the Red Sea, and from thence to the opposite coast of Arabia, whence it is re-exported to Bombay, and from thence to Europe. This is probably yielded partly by the Acacia vera and A. arabica but chiefly by A. seyal, A. Ehrenbergii, and A. tortilis. M. Pallme says that the gum-tree of Kordofan differs materially in the shape of the tree, its leaves, and spines, from the Mimosa nilotica, that is, Acacia vera. Mr. Johnston, when near the Hawash, had given to him a lump of soft Gum Arabic, nearly a pound in weight, and of most agreeable flavour, like a green ear of corn. He mentions at the same time, that the trees were without exception. the longthorned Mimosa, and tall enough to ride under. It was probably the A. tortilis or A. seyal.

Gum Senegal is exported from Portendic, Sierra Leone, and the French settlements on the Senegal, being produced chiefly in the desert country to the north of the Senegal. Acacia vera is stated by the authors of the Fl. de Senegambie to yield the pale and fine varieties, A. albida (A. Senegal, *Willd.*), and A. Adansonii the inferior reddish varieties. A. seyal, A. vera and A. arabica, being found in Senegambia,

probably also yield some of the gum exported from the western coast.

Barbary Gum is exported from Mogador on the west coast of Africa, and is produced in a similar kind of country. It is an inferior kind, and, moreover, a mixture of two or three kinds. Acacia gummifera is thought to yield some of this gum. Jackson gives "attalet" as the name of the tree which produces this gum.

East India Gum is exported to Europe chiefly from Bombay, having been previously conveyed there from the coast of Arabia; so that it is chiefly of African origin. But some of Indian origin is also exported from Calcutta by the name of Babool Gum, which is that of the Acacia arabica, and is of good quality, but gum is yielded also by Acacia serissa and Vachelia farnesiana, also by species of other genera.

Gum is also imported into Europe from the Cape of Good Hope, yielded by Acacia karroo; and A. decurrens yields gum in New Holland.

Gum Anime, a gum resin, imported to some extent into India and China. It is the product of the Hymenæa courbaril, the Courbaril locust tree, of South America, which has been introduced from South America into the Tenasserim Provinces and is easily propagated. This gum resin is of a pale brownish colour, and is met with in commerce partly in translucent and somewhat unctuous grains or tears and partly in large brittle masses. But the commercial article is doubtless the product also of the Vateria indica or Gum Copal tree, and the V. Roxburghii, which yield almost a precisely similar resin. For ordinary purposes, these may be used indifferently; but where purity is demanded, copal is almost insoluble, while anime is wholly soluble in alchol.

Gum Benjamin. See Loban.

Gum Dekamallee, is the gum of Gardenia lucida; it exudes in amber-coloured transparent drops, at the ends of young shoots, from which it is collected. It is a strong disagreeable smelling gum-resin; procurable in most Indian bazars. It is much used by native doctors as an external application, when dissolved in spirits, for cleaning foul ulcers. It is now used by some European practitioners in cases of worms in children.

At the Madras Exhibition of 1855, Dikamali resin produced by the Gardenia lucida of Roxburgh, was shown from Canara, Mysore and Guntoor. It is fragrant resin, useful in Hospitals, most useful in preventing vermin breeding in wounds, keeping away flies from sores, on account of its strong aroma, and it is an article in the materia medica of the village farrier. It deserves more attention.

Dekamallee from Gardenia gummifera is stated by Dr. Gibson to be produced within the Bombay Presidency, its effects in preventing the access of flies to festering wounds and running sores is remarkable.—*Royle Productive Resources, Eng. Cyc. Hamilton's Senai, Hedjaz*, pp. 278-9. *Roxb. Cor. pl.* ii. 149. *Hon'ble Mr. Morrison, Compendious Description*; *Drs. Mason; O'Shaughnessy, Faulkner; Vegetable Kingdom* 287. *Poole St. of Commerce*: See Vateria; Gums and Resins. *Spry's Suggest*, p. 67. *Mad Ex. Jur. Reports.*

GUMADI. Tam. Gmelina arborea.—*Roxb.* also Gmelina parviflora.

GUMADI-KAIA Tel. Cucurbita hispida. also Cucurbita maxima.—*Duch.*

GUMADU, also Tella Goomadi. Tel. Gmelina asiatica.

GUMAR or Gumber or Gumbar or Gumbari. Beng. Gmelina arborea.—*Roxb.*

GUMATTI. Hind. Mines in Mandi, Kangra Hills, &c., whence a dirty gray rock-salt is obtained.

GUMBAR. Hind. Brassica rapa.

GUMBAREE. Hind. A tree of Cuttack, found more or less plentifully throughout the forest jungles of the Sumbulpore district and the Tributary mahals, on the banks of the Mahanuddy, Brahminy, and Byturg rivers.—*Cal. Cat. Ex.*, 1862.

GUMBAZ. Ar. Per. Hind. a dome, a mausoleum. The gumbaz covering the tombs of the Adal Shahi kings, at Bejapore and Gogi, are of magnificent dimensions and in good preservation. Those at Gulburgah are also large but are greatly delapidated. The Gumbaz at Golcondah, near Hyderabad in the Dekhan, over the Kutub Shahi kings are in good order, though of small dimensions. Those over the Imad Shahi of Berar are remarkable. Over the Birud Shahi of Beder there are large gumbaz, but mostly in ruins, and those at Roza between Dowlatabad and Ellora are small and mean, in appearance, though the emperor Aurungzeb who died at Ahmednuggur is buried there.

GUMBER, a river of Subathoo.

GUMBEER, a river of Jeypore, flows near Mhow.

GUMBEER. See Kush.

GUMBHARA. Beng. and Sans. Gmelina arborea tree. It has a light coloured wood, close grained and light, grows in the Sonthal jungles, but scarce. It is used for planks and in constructing palkees. It is this

wood with which the beautiful lac ornaments are made, such as work boxes, envelope cases, pen trays, &c., for which Sooree is celebrated.—*Ind. Engineers' Journal*, July 1860.

GUMBO. Eng. of W. Ind. Abelmoschus esculentus.— *W. & A.*

GUMCHA. Guz. Gumchi Duk, seeds of Abrus precatorius. Goomchi ki jar, Root of Abrus precatorius. *Lin.* wild Jamaica liquorice.

GUM DRAGON. A name for Gum tragacanth.

GUMHAR. Hind. Gmelina arborea.

GUM KINO the resin of Pterocarpus marsupium. See Gum Kino.

GUMMEDI CHETTU. Tel. Gmelina arborea.

GUMMI. Ger. Gum.

GUMMI GUTTÆ: CAMBOGIA. Lat. Gamboge.

GUMMIGUTT. Ger. Gamboge.

GUMMY GARDENIA. Gardenia gummifera.

GUMMUDU TIGE. Tel. Batatas paniculata.—*Choisy.*

GUMPANA KARRA. Tel. also Gumpana chettu. Tel. Odina woodier.—*Roxb.*

GUMPI KAMLU, or Kamawaru. Tel. A sudra caste in Southern India who do not permit any stranger to enter their houses.

GUMRUK. Guz. Hind. Pers. Custom house, also Mahsul. Pers. Customs.

GUMSUR. See Goomsur, India.

GUMTI, a river in India, an affluent of the Ganges, runs near Lucknow, Sultanpur, and Janpur. At Benares, after the Ganges has received the waters of the Kali Naddi, the Gumti and other tributaries, the average discharge, each second of the year, has been estimated at 250,000 cubic liquid feet. By the latter end of July, all the lower parts of Bengal, contiguous to its banks are overflowed, forming inundations of a hundred miles in width, where little appears above the surface of the flood, save isolated villages and trees. Boats of every kind then steer a direct course, husbandry and grazing are alike suspended, and the peasant sculls his boat across the fields. In some parts of Bengal, whole villages are every now and then swept away by changes in the course of the Ganges through districts, from which, a few years before, it was several miles distant.—*Cal. Rev., Horsfield.*

GUMUDI. Tel. Syns. of Cucurbita maxima?—*Duch.* of Hedysarum tuberosum? and of Pueraria tuberosa?—*D. C.*

GUMUDU CHETTU. Tel. Gmelina asiatica.—*Linn.*

GUMUDU-TEKU. Tel. Gmelina arborea.—*Roxb.*

GUMUDU TIGE. Tel. Batatas paniculata. *Choisy.*

GUMURU. See Tin.

GUNS. Several of the guns in the Peninsula of India are of great size. That with the largest diameter is at Bejapore. It was cast at Ahmednuggur about A. D. 1549 by a native of Constantinople, named Rumi Khan, also Hussain Khan, and the bed of its foundry, was still unlevelled in A. D. 1839, it was close to Rumi Khan's Gumbaz which had been converted into a house. The gun was dragged to Bejapore by means of elephants and bullocks. Rumi Khan was the Mir-Atish, or Commandant of Artillery under the Nizam Shah, Bhairi dynasty, of Ahmednuggur. The length of the gun he cast is 15 feet and calibre is 2 feet 4 inches, and the editor crawled into it in 1841. It remains placed on a bastion of Bejapore, and hindus have besmeared it with red lead and worship it. Another gun may be seen not far off, on the summit of the high tower called the Oopuree Boorj, measuring thirty feet in length, and composed of bars of iron curiously welded, or rather bound together. The legend current regarding the Oopuree Boorj is that one of the kings, wishing to get his city fortified with as little expense to himself as possible, gave each of his nobles a certain portion of wall and rampart to build, and excited the greatest emulation among them as to whose work should be best done. One of the chief nobles was absent at this time, and, on his return, found the city completely walled in, and his peers rejoicing in their patriotic endeavours. Stung at being excluded from such a grand work, he expostulated with the king, who, to comfort him, promised him that he should build one that would surpass in height and splendour the work of the others. Hence this tower. A gun 27 feet long, is now lying on the top of Gawilghur hill, and one 21 feet long is on the walls of Beder.

GUN. Hind. Pavia Indica.

GUNACHA. Hind. Rubus lasiocarpus.

GUNA-LACHAMA river rises in lat. 15° 40', long. 78° 49' and runs in a very circuitous course, E.N.E.—S.S.E.—S. E., into the Bay of Nizampatam. Length, 155 miles.

GUNAPENDALAM. Tel. Dioscorea globosa.—*Roxb.*

GUNCH also GUNCHA. Hind. Abrus precatorius.—*Linn.*

GUNCH-GAJI. Hind. Mucuna prurita.

GUND. A plateau on the Malabar Coast, it is chiefly from this that the demands for

timber, by H. M. naval department are intended to be met. In 1861, some progress had been made in working this valuable forest Capt. Taylor, Indian Navy, explored the Black river and took the levels. He reports favorably as to the quantity of teak, and that, although there is a succession of small rapids amounting to a fall of 120 feet in the river, the timber can be floated down, though not without some difficulty.—*Dr. Cleghorn, Madras Conservator's Report*, p. 4.

GUND. Hind. Cordia angustifolia.—*Roxb.*

GUND. Guz. Gum.

GUNDA. Hind. Hora elia —*Singh.*

GUNDA, a knotted string tied round the neck of a child, &c., as a charm.

GUNDA, four of any thing. This word is given under Ganda: like the Dam, the Ganda of accounts and the Ganda of practice do not coincide.

GUNDA BAROSA, also Gunda Feroza. Beng. Hind. also Aval kundur — ? Boswellia thurifera resin.

GUNDA GILLA of Silhet, Bauhinia scandens.—*Linn Willde.*

GUNDAK. Hind. also Gundaki. Sing. Sulphur.

GUNDAK-KA-TEL. Guz. also Gundak-katezab, Sulphuric acid.

GUNDAK, a river of Hindustan. See Gandak; Salagrama; Topes.

GUNDAL. Sans. Tel. Cyperus hexastachys.—*Rottl.* Wight says the true name is Gundra 'a fragrant grass' also a plant bearing a fragrant seed, which, with the addition of la 'what eats,' becomes Gundala, a name of the Chakor or Perdix chakor, *Gray*, which is said to eat the seeds above mentioned. *Elliot Fl. Audhr.*

GUNDAM. Pers. Wheat.

GUNDAMNI. Tam. or Gandamani. Tam. Abrus precatorius.

GUNDANCHA. Hind. See Gulancha.

GUNDAO. See Khyber, p. 510.

GUNDAPOOR. See Khyber, p. 518.

GUNDARI. Guz. See Sugar cane.

GUNDATU. Dekh. Aristolochia bracteata.—*Retz.*

GUNDA TUNGA GADDI. Scirpus kysoor.—*R.* i, 230.

GUND BEDUSHTAR. Per. Castor.

GUND-BEL, also Olacha, Guz. and Hind. Lemon grass.

GUNDEBIGULA. Tel. also Pantangi. Tel. Briedelia montana.—*Roxb.*

GUNDGURH. This mountain, prior to British supremacy, was a stronghold of bandditti, who infested the high road passing through Hussan Abdul to Peshawar. At the foot of one of its northern spurs, opposite to Hurreepore, is the strong village of Murree, where the Sikhs were several times repulsed by the mountaineers, and where Major Abbott found an asylum during the late insurrection.—*Rec. Gov. of India* No. 11.

GUNDHA-GOORANA. Beng. Andropogon glaber. *Roxb.*

GUNDHEL. Hind. Pæderia fœtida.

GUNDHEL, or gandhel Tel. a sweet smelling grass (from Gundh perfume) is most probably the same as the Gundhbel, which Royle ("Ant. Hind. Med." p. 143), says is the Andropogon calamus aromaticus, from the leaves, culms, and roots of which a fragrant essential oil is distilled.

GUNDHA BADHALI. Beng. Pæderia fœtida, Dog's bane, also Hedyotis villosa.

GUNDHA-BINA. Beng. Andropogon citratum: Lemon grass.

GUNDHA-VUNIK. Sans. a spice seller, From Gundhu, spices, and vunik, a tradesman.

GUNDHA-DHAMA. Sans. From Ganda, a scent, and dhama, a place.

GUNDHA-GOONA. Beng. Smooth grass. Andropogon glaber.

GUNDHA-KAST'HA. Beng. Lignum aloes. Aloe-wood, Eagle-wood.

GUNDHA MALUTEE. Beng. Echites caryophyllata.

GUNDHANA. Beng. Hind. Allium porrum, Leek. Allium ascalonicum, Shallot.

GUNDHA RAJ. Beng. Cape jasmine, Gardenia florida.

GUNDHA RAS. Beng. Gendarusa vulgaris.

GUNDHARVA. Sans. the divine songstress from gana, a song, and dharma, a person's own profession. See Gandharva.

GUNDHAVAHA. Sans. From gandha, a scent, and vah, to carry.

GUNDHEREE. See Khyber, p. 516.

GUNDO-BINA, Beng. Andropogon schœnanthus. *Linn.*

GUNDI. Hind. Buttons.

GUNDINA. Pers. Allium porrum, the leek.

GUND-MAR. Hind. Kash. Wormwood. Artemisia Indica. *Willd.*

GUNDNI, Hind. Cordia angustifolia.

GUNDO BHADALI. Beng. Pæderia fetida. *Linn.*

GUNDOLI, of the Baora, the antilope. Cervus capra. *Pallas.*

GUNDRA. Sans. Tel. Cyperus hexastachys.—*Rottl.* also Panicum uliginosum.—*Roxb.* This is Roxburgh's species of Panicum. The true kind, said to be a favorite

food of the Chakor, is probably a more nutritious, cultivated species.

GUNDRA. Sans. Tel: Saccharum sara.—*Roxb.*

GUNDAK. The name of two rivers of Hindustan, the Chota or little Gunduk river, passes through the Muzuffernuggur and Goruckpore districts. The great Gunduk and the Boor Ganga run through Chuprah. The Gunduk is a tributary to the Ganges. It rises near Dhawalagiri peak in the Himalaya, runs S. S. E. S. W S. E. into Ganges, near Patna, after a course of 407 m. In its course it receives the Trisula-ganga, 100 miles long; Marachangdi 100 miles long; Naling, 110 m., and about 40,000 sq. m. are drained. Though navigable continuously through its whole course downwards from Bhelunji, there are in the part of its channel nearer that place many rapids and passes, where, the course being obstructed by rocks, navigation becomes difficult and dangerous. The Gundak or Sarjoo from the Kemaon mountains, passes through Kesul-des, the dominion of Desaratha.

GUNDA MEDA. Tel. Celastrus paniculata. *Willde.*

GUNDAN. Mahr. Diospyros cordifolia, and Ehretia ovalifolia.

GUNDANA. Allium porrum. Leek.

GUNESHA. Sans. From Gana, a company, and eesha, a lord, the hindoo deity Ganesh. See Ganesh.

GUNESHA-JANANI. Sans. The mother of Ganesha; from Janna, birth.

GUNG, also Gunch. Guz. Hind. See Goong.

GUNGA. Sans. From gam, to go.

GUNGA. The river Ganges; the Godavery. See Ganga, Ganges; Inscriptions p. 383. Triveni; Vamana.

GUNGADHARA. Sans. From Gunga, and dhara, to hold.

GUNGADHARA-SHASTRI. Sans. He who knows the shastra, is called a shastri.

GUNGAPAT. A river in Sindiah's territory.

GUNGAPOOTR, or gangaputr, a tribe of inferior brahmins (literally, sons of the Ganges) found chiefly in Benares, Bithoor, and Sheorajpoor in Cawnpoor. *Elliot.*

GUNGARANI. Tel. Conocarpus acuminata.

GUNGARAVI. Tel. Thespesia populneus.

GUNGA SANDURAM.— ? Lead.

GUNGA-VAKYAVALI. Sans. From vakya, a word, and abali, a train.

GUNGARI. Hind. Rosa brunonis.

GUNGA-VANSA. See Inscriptions, p. 388.

GUNGA-VASA. Sans. From Vasa, a residence.

GUNGAVULLY. A river of the plain of Dharwar, rises in lat. 15° 45,' lon. 75° 10,' and runs S. S. W., into the Indian Ocean. Length, 100 m. It has no tributaries of any extent; and area drained imperfectly known.

GUNGAWULLY and Sadashewghur are shipping ports, on the western coast of India. Gungawallee was at one time the chief place of export for Canara timber, consequent on its position nearest to the Mogadda jungle above, and to the south of the Arbyle ghaut. *Gibson's Bombay Forest Report of* 1857-58-59-60, p. 55.

GUNGEL. See Kunawer.

GUNESHPURI. See Hot springs.

GUNGILL. A streamlet near Timurnee in Sehore.

GUNGLIUM. Tam. properly Kungiliam, dammer.

GUNGLU. Hind. Brassica rapa.

GUNG-MEN. Burm. Amomum *sp.*

GUNGRU. Hind. Dioscorea deltoidea.

GUNGUM. Hind. Carum carui.

GUNGWAR. See Bazeegur and Nut.

GUNH. Hind. of Kulu, Pavia indica, Indian horse chestnut. See Guah.

GUNHAR. Hind. of Kaghan, Kashmir, &c., the amaranth, A. speciosa or A. frumentaceus. See Chaulai.

GUNI. Beng. Tel. Gunny.

GUNIYARE. Beng. Premna spinosa.

GUNJA. Sans. Tel. Abrus precatorius. —*Linn.*

GUNJA. Beng. Hemp, Cannabis sativa.

GUNJ, or Ganj, usually written by Europeans, Gunge, is a granary, a market, and especially one of grain. It is used chiefly as an affix to proper names as Islamgunge, Hurdoa-gunge, Captain-gunge; just as chip, or chipping, which are of the same meaning as Gunge, is in England, as Chipping-sod-buny, Chep-stow, Cheppen-ham, Cheap-side.—*Elliot.*

GUNJI. Hind. properly Ganji. Hind. Starch.

GUNJILL, a river near Kotra in Hoshungabad.

GUNKIRI. Hind. Adiantum caudatum.

GUN METAL.

Stuck-good,	Dut.	Metallum tormentorum,	Lat.
Stuckgut,	Ger.		
Bronzo,	It.	Metal de Canones,	Sp.

It is used for casting statues, cannons, bells, frames, stands for argand lamps, ornaments, &c. Bronze is an alloy of copper and tin, the quantity of tin, employed varying according to the effect desired to be produced. Analysis has shown that ancient weapons and tools contained 8 to 15 per

cent. of tin; medals from 8 to 12 per cent. tin, with 2 parts zinc added to each 100, for improving the bronze colour. The modern alloys of copper and tin have led to the production of a variety of metals bearing different names, as Soft gun metal, Brass ordnance metal, with 8 to 12 per cent. tin, the various Bell metals and the Chinese gong with 20 per cent. of tin: and speculum metal of 126·4 of copper to 58·9 of tin. —*Tomlinson.*

GUNNA. Sans. Amarantus campestris.

GUNNA. Duk. Ganna. Hind. Saccharum officinarum. Sugar-cane from which Sugar is produced. Gunna, the name for the Sugar-cane, differs but little from that which is used in almost all languages to express the same object. Hebrew Kaneh, Arabic and Persian Kunnat, German Kanne, Greek, Latin, Italian, Spanish, and Anglo-Saxon Canna; and hence the English cane, and sugar-cane, and the many words derived from it, which are applied to vessels and utensils bearing resemblance to the shape of hollow reeds; as can, canakin, canal, canister, and canoe, which latter is evident from the passage in Juvenal (*Sat.* v. v. 89.) Minshen ascribes a similar origin to the word gun, "Gune, ex Lat.; canna, quia consistit canna ferrea;" regarding which it is to be observed that no one has succeeded in giving a better etymology. From the Hebrew name is the Haneh, or measuring reed of the Jews, equal to six cubits; which has its counterpart in the "bans" measure of the hindus, the Roman decempes and the Greek akaina, all of six cubits, or ten feet—*Elliot.*

GUNNANGI. Tel. Peltandra, *sp.*—*W. Ic.* a plant is common on the hills near Nuzid in Masulipatam.

GUNNERA SCABRA used for tarts like the stalks of a species of rhubarb.

GUNNIS. See Ganesa.

GUNNY.

Guni,	Beng.	Koni,	Tam.
Gunpat, Guni, Pat,	Hind.	Gona,	Tel.

A strong coarse sack-cloth manufactured largely in Bengal, for making into bags, sacks, and packing generally. The material from which this article is manufactured is the fibre of two plants Corchorus olitorius, and C. capsularis, both of which, but particularly the former, are extensively cultivated throughout lower Bengal. Besides a large domestic consumption of gunny, the whole rice, paddy, wheat, sugar, saltpetre, &c., of the country, as well as the pepper, coffee, and other foreign produce exported from Calcutta, are packed in bags or sacks made of this article; and which is put to similar uses all over India, and other places to which it is exported. It is woven of various lengths and generally about 8 inches wide. Buchanan describes the process of growing the hemp and preparing the article in the neighbourhood of Bangalore. The sugar of India is brought to England in them, and they are very largely exported to America for packing their cotton. In the year 1850-51, the Gunnies and Gunny cloth exported from Calcutta were in number 9,035,713, valued at Rs. 2,159,782, two thirds of this amount being sent to North America, the Coromandel and Malabar coasts, Pinang and Singapore. Besides this, 58,950 gunny bags were exported from Madras and Bombay, re-exports to the value of half a lac of rupees. The kind of cloth of which the gunny bags are made, is called in Bengal, "Chata," in Tamil "Koni," Tel. Goni also "Tat." It is of three different kinds, and is always woven in pieces from three quarters to one cubit wide, of which two or three are sown together, at the sides, into one piece, before offering it for sale. The first kind, intended for bedding, is four to five cubits long, and from two and a quarter to three cubits wide, and sells at about 8 rupees per 100 pieces. Secondly that intended for covering bales of cloth is of the same dimensions, but is thicker than the former kind, and costs from 6 to 10 rupees per 100 pieces. Thirdly that intended for making rice and sugar bags, is five cubits long and one and a half, or one and a quarter cubit wide, and ten bags cost four or five rupees. On all the Eastern frontier, of Bengal, a great proportion of the women are clothed with coarse cloth, made from the jute.

The exports from British India of gunny bags and gunnies were of the following value:

Year.	£.	Year.	£.
1850-1 ..	158,421	1856- 7...	376,253
1851-2 ..	299,720	1857- 8...	217,092
1852-3...	201,667	1858- 9...	392,424

—*McCulloch. Faulkner. Rohde. M. S. S. Balfour's Commercial products. Cat. Ex.* 1862. See Corchorus.

GUNOBUR. Hind. Pinus gerardiana.

GUNONG. Malay. A hill.

GUNONG API. A volcanic island in the Banda group. Since the Banda islands were discovered, there have been at least thirteen great eruptions of this volcano. That of 1820 was very severe and another occurred in 1824. See Banda, Goonong, Java.

GUNONG BERNUM. A lofty mountain an hundred miles to the North of the Lulumut group of the Malay Peninsula.

GUNONG GERAI. A mountain of Kedah or Quedah, also called Quedah Peak. It is the highest hill on the Quedah main and its summit is estimated at 5,000 feet above the level of the sea. According to Dr. Ward, north of Quedah Peak is an immense plain almost level with the sea, covered near the coast, with rising mangroves. *Newbold's British Settlement, Vol.* 2, p. 4.

GUNONG SUNGI PAGU. See Johore.

GUNPALOS. Hind. Pyrus kumaonensis.

GUNPAT, Guni Pat. Guz. Hind.? Gunny, properly Gonpat.

GUNPOWDER.

Pulvis pyrius,	Lat.	Mandu,	Tel.

Gunpowder is a compound of sulphur, charcoal and nitre. The sulphur and charcoal in a state of fine powder are mixed with the saltpetre moist as it comes from the refinery. This compound, known as "green charge," is long and carefully ground under iron and stone runners. This green charge mixture is then milled into gun-powder under large iron runners, that used for Enfield or Snider for six, and fine sporting powder for twelve, hours. It leaves the mill in a state partly of soft cake or mill cake and partly of dust. These are then pressed into a hand cake at the rate of 70 tons on the square foot, and by the corning and granulating processes it is broken up into the grain, dried and glazed to the form in which it is sold as gunpowder.

The sulphur of European commerce is chiefly obtained from Sicily and the volcanic districts of the Mediterranean; the finest, known as "Lercara Firsts," sells at £7 the ton in the London market, as an ingredient in gun-powder, and its value consists of the low temperature at which it inflames. Sulphur is largely produced in the volcanic islands of the Archipelago and can be readily extracted from iron and copper pyrites. The total of the annual rates at which powder has been manufactured in the three Presidencies for ten years, gives an average of 3 annas per lb. for Bengal, nearly 4 annas for Madras, and 4 annas 6 pie for Bombay. When to the prime cost is added the packing and carriage, it will be seen that 4 annas and 6 pie is about the actual average cost.

The gunpowder made in Madras is dried on a black drying terrace on which the temperature ranged as under, at noon.

Sir John Davies is of opinion that the art of printing, the composition of gunpowder, and the magnetic compass, which he says, are justly considered in Europe as three of the most important inventions or discoveries of modern times, had their first origin in China.

White Gun-powder, was a discovery of Augendre which until Dr. Pohl lately turned his attention to it had fallen into complete oblivion, viz., an explosive substance composed of 28 parts of prussiate of potash, 23 of cane-sugar, and 49 of chlorate of potash. This mixture is white, and may be used as gunpowder; it is lighter than common gunpowder, but its strength is greater in the ratio of 167 to 100 for an equal weight of each; and in the ratio of 129 to 100 for equal volumes. Hence only 60 grammes of white powder are necessary to produce the effect of 100 grammes of black, which, moreover, leaves a residue of 68 grammes, while the former only leaves 31½ grammes. White gun-powder has further the advantage of not heating the gun so fast as the other, because the temperature of its flame is much lower; it is easier to manufacture, less hygroscopic, less inflammable by percussion, and more economical than black gun powder. It remains to be seen whether its corrosive action on fire arms be greater or less than that of its rival. *Davies China, Quarterly Review, July* 1868.

GUN-POWDER PLAY is the well-known "Laab-ul Barut," firing matchlocks in the air in the east to rejoice.

GUNSTOCK-TREE. Guazuma. *Sp.*

GUNTA BARINGA.

Bhui Jamb,,	Beng.	Sirri-tekku,	Singh.
Gund barunghi,	Duk.	Chirru-dekku,	Tam.
Barunghi.	Sans.	Ghantu bharangha,	Tel.
Bhoomi Jombuka,	„		

Ganta baringa is the root of a plant grow-

ing in the hills about Lamsingi to the W. of Vizagapatam. It is mentioned by Ainslie, (*p.* 112, *1st Ed. 4to.*) under its Tamil name 'chirudekku. The same drug is contained in the Canara and Travancore collections: the plant yielding these roots is still doubtful. This root continues to be used in Southern India by native practitioners as a febrifuge. Ainslie says, "it is a small, knobby, somewhat warm and slightly bitterish tasted root which the natives prescribe in fever and catarrhs. From the word Paringhee, it is perhaps brought from some foreign country." From its low price Dr. Cleghorn was inclined to think this improbable. Of its absolute antiperiodic qualities nothing seems to be known with accuracy, the Vyteans consider an infusion or decoction of the leaves and tender shoots of this plant, as attenuant and diaphoretic: they are said to be slightly bitter and not unpleasant to the taste. Mr. W. Fergusson of Colombo is of opinion that Premna herbacea. *Roxb.* is the plant that produces the Gunta baringa. *Mr. Fergusson in literis. Elliot Flor Andh. M. E.* J. R. *Ind. Anns. Med. Sci. for April* 1856, p. 397. *Ainslie's Mat. Med.*, p. 112.

GUNTA CHETTU. Tel. Lawsonia alba. —*Lam.*

GUNTA GALIJERU. Tel. also Gunta kalagara. Tel. Eclipta prostrata.—*Roxb.*

GUNTA KAMINAM. Tel. also Bodasaram. Tel. Stemodia viscosa.—*Roxb.*

GUNTHER, Dr. A., a learned naturalist. In 1860, Lieut.-Colonel Playfair and Dr. A. Gunther published a work on the fishes of Zanzibar. Dr. Gunther, in addition to all that he had written in the proceedings of the Zoological Society and other Journals, in the years 1860 to 1868, brought out seven volumes of a catalogue of the fishes in the British Museum.

GUNTOOR, a Madras collectorate formed out of the Northern Circars. The district has a population of 570,083 and takes its name from that of the chief town, Guntoor. Its principal river is the Kistnah, and its principal towns Ventapollam and Nizampatam. Guntoor was granted to the British in 1768 by the nizam subadar of the Dekkan, was subequently taken by him, but finally regranted in 1785, on the occasion of the war against Hyder Ali and the Mahrattas. In the district of Guntoor, irrigation works were neglected, and in one year, in consequence of drought, a famine destroyed one-half of the population, and caused a loss in revenue, for ten years, estimated at £800,000.

GUNUKA. Sans. from ganna, to count.

GUNUNG MARAJ. See Banka Islands.

GUNYUN. Hind. of Ladak Carum carui, *Linn.* the carroway seed plant.

GUPTA. A dynasty that ruled in Northern India. The following is a table of the Gupta kings, according to the views of two writers who have made them a subject of special study.

Col. Cunningham.		*Professor Lassen.*

Mr. Thomas gives the Gupta dynasty thus. He appends no dates. In the early part of his career.

I. Gupta.	V. Chandragupta.II
II. Ghatotkacka.	VI. Kumaragupta.
III. Chandragupta. I	VII. Skandagupta.
IV. Samudragupta.	VIII. Budhagupta.

GUPTA. The Chandragupta known to the Greeks as Sandracottus, in the early part of his career, led a wandering life in the Punjab, (See Turnours Introduction to the Mahawanso, p. xli., quoting the Tika or Commentary), and was most probably engaged with his fellow-countrymen in opposing Alexander. His chief adviser, the brahmin Chanakya, was a native of Takshasila or Taxila, the capital of the Western Punjab; and it was in that country that Chandragupta first established himself by the complete expulsion of the Greek troops left by Alexander (Justin, xv. 4.—"Auctor libertatis Sandracottus fuerat.") It would appear that the Greek colonists in the Punjab had first been placed under Philip, while the civil administration of the country remained in the hands of its native princes, Taxiles and Porus. Afterwards, on the murder of Philip by the mercenary soldiers, Alexander (Anabasis vi. 2, vii) directed Eudemos and Taxiles to govern the country until he should send another deputy. It is probable, however, that they continued to

retain the charge; for after Alexander's death, in B. C. 323, Eudemos, contrived by the treacherous assassination of king Porus by his general Eumenes, to make himself master of the country (Diodorous xix, 5.) Some few years later, in B. C. 317, he marched to the assistance of Eumenes, with 3,000 infantry and 5,000 cavalry, and no less than 120 elephants. With this force he performed good service at the battle of Gabiene. But his continued absence gave the Indians an opportunity not to be neglected; and their liberty was fully asserted by the expulsion of the Greek troops and the slaughter of their chiefs.—Justin. xv. 4 says "Præfactos ejus occiderat"; again "Molienti deinde bellum adversus præfactos Alexandri" Chandragupta was present when Porus was murdered. He afterwards became the leader of a national movement, which ended in his own elevation to the sovereignty of the Punjab. Justin attributes his success to the assistance of banditti; Justin xv. 4.—"Contractis latronibus Indos ad novitatem regni solicitavit." But in this Colonel Cunningham thinks he has been misled by a very natural mistake; for the Aratta, who were the dominant people of the Eastern Punjab, are never mentioned in the Mahabharata without being called robbers.—Lassen, Pentapot Indica.—"Aratti profecto latrones," and "Bahici latrones." The Sanscrit name is Arashtra, the 'kingless,' which is preserved in the Adraistæ of Arrian, who places them on the Ravi. They were the republican defenders of Sangala, or Sakala, a fact which points to their Sanskrit name of Arashtra, or 'kingless.' But though their power was then confined to the eastern Punjab, the people themselves had once spread over the whole country—"Ubi fluvii illi quini * * * ibi sedes sunt Arattorum."—(Lassen, Pentapot Indica, from the Mahabharat.) They were known by the several names of Bahika, Jarttika, and Takka; of which the last would appear to have been their true appellation; for their old capital of Taxila or Takka-sila was known to the Greeks of Alexander; and the people themselves still exist in considerable numbers in the Punjab hills. The ancient extent of their power is proved by the present prevalence of their alphabetical characters, which under the name of Takri, or Takni, are now used by all the hindus of Kashmir and the northern mountains, from Simla and Sabathu to Kabul and Bamian. On these grounds, Major Cunningham identifies the banditti of Justin, with the Takka, or original inhabitants of the Punjab, and assigns to them the honour of delivering their native land from the thraldom of a foreign yoke. This event occurred most probably about 316 B. C., or shortly after the march of Eudemos to the assistance of Eumenes. Chevalier Bunsen also mentions (iii. 543-4) that Chandragupta was present when Porus was murdered: that he dethroned and murdered the younger brother of Nanda king of Palibothra, or Patalipura, B. C. 312, and founded the Maurya dynasty, whose reigns gave a lustre to the East. Chandragupta's kingdom extended over the Persians, *i. e.*, the easterns, also the Peninsula of Guzerat, and north to the Indus, and south to the mouths of the Ganges and Telingana, the whole of Aryavarta. His forces consisted of 600,000 infantry, 30,000 cavalry, and 900 elephants. Towards the close of the fourth century before our era, when Alexander's successors were at peace with each other, the great Seleucus turned his arms towards the East, with the intention of recovering the Indian provinces of Alexander. Chandraguptra formed an alliance with Seleucus, whose daughter he received in marriage. He also received at his court of Palibothra, Megasthenes, as an ambassador, and in return, Chandragupta sent presents with an ambassador to Seleucus to Babylon. The hindu drama of Mudra Rakshasha records the memorable political event of his usurpation of Palibothra. His name occurs in an inscription at Sanchi, also on one at Oojein. Tod also says he was of the Takshak race.—*Bhilsa Topes*, p. 141. *Indische Alterthumskunde*, Vol. I, Appendix, p. xxx., and Vol. II, pp. 1161 and 1162. *Journal of the Asiatic Society of Bengal*, p. 146. *Thomas, Prinsep's Essays on Indian Antiquities*, Vol. I, p. 276. See Inscriptions, pp. 373, to 379.

GUPTAVADHUTA. An ascetic of a particular hindu order, one who does not avow his profession of mendicancy, or who observes its practices in secret.—*Wilson.*

GUR. See Kirkook.

GUR. Hind. Duk. Unclarified sugar, raw sugar, treacle, or molasses, whether the product of the sugar cane or of any of the palms, written Goor, also called Jaggree.

GURA. See Vara, or Vasara.

GURACHA. Hind. Rubus flavus, and R. lasiocarpus.

GURÆNDA. Singh. A tree in Ceylon, the wood of which emits an offensive stench. Thunberg stated that it is neither the Sterculia fætida nor the Anagyris fætida.—*Tennant.*

GOOR-AKOO, or Goodakoo, Hind. the tobacco for the hukka, from Gur, unclarified sugar and aku a leaf.

GU-RAKHI. MAR. A cow-keeper, a cow-herd, from Go, a cow, and rakhna to keep.

GURAL. HIND. The Chamois of Kangra.

GURAL HARRA — ? See Har.

GURANYO ALOO. Dioscorea rubella. Red Sweet Yam This is an oblong and red skinned root, tuberous, deeply tinged with red under the skin, but the colour does not penetrate deep; in a rich light soil they are sometimes as much as three feet long.

Guranyo Aloo, Lal. Dioscorea purpurea. Purple Yam. Root oblong; throughout of a lighter or dark purple, but always considerably deep in tinge. This colour is permanent.

Another species is the Zemmykund the Dioscorea purpurea. Tubers subrotund, purple throughout, very large, of an irregular, smooth, roundish shape, and growing near the surface, so as to appear in dry weather through the cracks they make by raising the soil over them.—*Riddell.*

GURAPPA SAKA TUNGA. TEL. Scirpus maritimus.—*Linn.*

GURAO. MAR. According to Wilson a mixed caste usually employed as the servant of the village temple, sweeping it, and decking the village idol, he is also the village trumpeter. In the Dekhan, the Gurao is supposed to be the illegitimate offspring of a brahman with a woman of another caste. They are now in every varied employ.—*Wilson.* See Baluta.

GURBHADHANU. SANS. from garbha, the womb, and adhana, to hold.

GUR-BATAS. Root of a climber brought to Ajmeer from Delhi: has a bad smell, is considered astringent and cooling; much used in horse mesalih: four seers for one rupee.—*Gen. Med. Top.*, p. 135.

GURBIANI. HIND. Thalictrum foliolosum.

GURCH, also Gurcha. HIND. Menispermum cordifolium. syn of Coculus cordifolius —*D. C.* Tinosporea cordifolia.

GURCHAM. See Kelat, p. 493.

GURD ALU. HIND. Prunus armeniaca.

GURDASPUR, a district in a fertile pleasant strip under the Himalaya hills.

GURDEZ, a country between Ghazni and India.

GURJAN, also in the Arabic form Juzjanan, must not be confounded with the country of Gurjan or Gurgan, on the eastern shores of the Caspian. Yakut says the names Guzjan or Guzjanan both designate a large district of the province of Balkh, between that city and Merv. The chief town was Yahudiya, and Ibn Haukal mentions Shaburkan, Andkhod, and Ambar among its principal places, adding that Ambar was the largest town.—*Elliot.* See Gurgan.

GURDEZEE, properly Gardezi a class of Syuds in Jowlee of Moozuffernugur. They claim connection with the Barah Sadat.—*Elliot.*

GURDONEE, a silver neck-ring

GURG. HIND. PERS. a wolf.

GURGAN, the modern Vehrcan or Hyrcania.

GURGANNA. HIND. Verbascum thapsus, Eremostachys vicaryi, Salvia lanata.

GURGBANSEE, properly Gargbansi, a class of Rajpoots in Sugree and Mahool of Azimgurh; and in Amorha, Ruttunpoor, Bansee, and Rusoolpoor, Ghous of Goruckpoor.—*Elliot.* See Chunumea.

GURGHEE, a river running in the Hazaribagh district.

GURGI. HIND. Dress. Trowsers

GURGU. HIND. Pistacia integerrima.

GURGULI. HIND. Leptopus cordifolius.

GURGU ARU. MALEAL. Syn. of Bryonia laciniosa.

GURGUR. BENG. Job's tears grass, Coix barbata.

GURGUR. See Kirkook.

GURGURA. HIND. Reptonia buxifolia.

GURGURI. HIND. a kind of hukka.

GURHEEBUND properly Garhiband, a description of maafee tenure in Bundlecund, by which lands are held on paying a stipulated yearly tribute, but not one-fifth the amount which ought to be paid. When the power of the Mahrattas became consolidated, they soon perceived that the Gurheebund holders were difficult to deal with in every way, slow and irregular in the payment of revenue.—*Elliot Supp. Gloss.*

GURHEE HUBEEBOOLLAH. See Khyber, p. 517.

GURHWAL, a non-regulation district under the N. W Provinces of India. It is a country of very great extent, though of small comparative value. Many of the larger rivers of Upper India, and all those which form the origin of the Ganges, have their rise in its mountains, and hold their course through its territory. Sreenuggur, the chief town is on the south bank of the Alacnanda about twenty miles above its junction with the Bhagiruttee at Deo Prague, where a strip of level ground stretches along for three or four miles, forming the valley known by the same name as the town. On the termination of the Nepal war in 1815, rajah Soodursun Sah, who had been deprived of his country by the Goorkha dynasty, was found in great poverty at Dehra. That portion of his hereditary possessions which

lay to the west of the Alikananda river was restored to him by sunnud, the lands to the east, and the Dehra Doon and the pergunnah of Ramgurh being retained by the British Government. During the rebellion of 1857, the rajah rendered valuable assistance to the British. He died in June 1859, and in consideration of his services, his eldest illegitimate son, Bhowan Sing, was allowed to succeed and since received a sunnud guaranteeing the right of adoption. The revenue of the country is about rupees 80,000, and the population 200,000. The rajah has no troops of any kind, and pays no tribute. The people of Gurhwal are Bhot, dwelling in the passes and their neighbourhoods at heights above 6,000 feet. The passmen state that ridges which within the memory of man were clothed with forest and pasture lands are now covered with snow, showing the extension of the snow zone. The Niti pass on the Duli, a feeder of the Ganges, is the best, and the Juwar on the Gauri pass, a feeder of the Sarda or Gogra, is the worst. The number of well-built houses in the Bhot districts are in

Villages.	Houses.		Villages.	Houses.
Mana on the Saraswati	3	Darma on the Dhouli,	24	342
Niti,	10	Byanse Pass on the Kali,	9	184
Juwar on the Gauri,	13			

The Bhot, here, as elsewhere, is an agriculturist, and is assisted by slaves who live under the roofs of their masters. The people in the Mana, Niti, Juwar and Byanse passes are supposed to be immigrants from Tibet who drove out an earlier body of hindus, and many of the chief families trace their origin to a Tibetan locality. The inhabitants of the Darma pass are said to be a body of Mogol left in Kumaon by Timur and if so they are not true Bhot. The Darma inter their dead for a time, and in the month Kirtik exhume and burn them, but the other pass-men burn their dead on their demise. The Darma practice divination, taking their omens from the warm livers of sheep sacrificed for the purpose The women of the Darma and Byanse pass dress alike, and these two clans eat the Yak and would eat the cow, while those of Mana, Niti and Juwar abstain from beef of all kinds and look down, as on an inferior caste, on the Darma and Byanse. The Juwar nearest India, have the largest trade, and resort to an annual fair in September at Gaitogh, the residence of the Lahsa viceroy. These passes are the roads from India to Nari or Gauri, Tibetan provinces of the Chinese empire. The Gurhwal people have a passionate love of country and home. The celebrated temples of Kedarnath and Budrinath are both in Nagpore, and also the Panch Kedar, or five intermediate holy spots along the edges of the snowy range. The concourse of pilgrims during the season of resort from May to October, enables the zemindars to sell their rice, wheat, ghee, &c., with advantage, along the different points of the pilgrim road nearest to their homes. They also breed large flocks of sheep and goats on the excellent pasture tracts which lie at the base of the snowy peaks. In regard to temperature, the climate of some parts of Nagpore is quite European, and the scenery of the whole tract is highly beautiful, while the vicinity of the eternal snows is characterized by the grandest sublimity. Nagpore will never be forgotten by those who have pursued the torrents of the Mundagnee to their source, who have wandered among the magnificent forests of the Toongnath range, or who have spent a day on the banks of the Deoree Thal. In this pergunnah are the copper mines of Pokhree, &c., which, in the time of the Gurhwal rajahs, are said to have yielded a large revenue. Since the British occupation of the province they have never been very profitable, and the produce had become so scanty, owing to the difficulty of working the ground, rather than to the absence of ores, that in 1837, the farmer could not even pay one hundred Rupees per annum. About 400,000 acres of Gurhwal and Kumaon are covered by the Pinus longifolia, bearing about fifteen trees to the acre.—*Fraser's Himalaya Mountains*, p. 369. *Cunningham's Ladak. Latham's Ethnology. Aitcheson's Treaties*, p. 58. *Mr. J. H. Batten on British Gurwhal in* 1842.

GURITI CHETTU. Tel. Dæmia extensa.—*R. Brown.*

GURJAN BALSAM. Anglo. Beng Wood oil, or Gurjan oil from species of Dipterocarpus. See Gurjun.

GURI-SHIORA. Beng. Ficus rubescens. *Vahl.*

GURI GENZA CHETTU. Tel. Canna Indica.—*Linn.*

GURINDA. Hind. Prinsepia utilis.

GURJARA the ancient name of the tract between Jambuka or Jambusir on the Nerbudda to the Tapti river, p. 321. See Gujar; India.

GURJA-RASHTRA. also Gurjara or Gujarathi, a name of Guzerat. See Gujar; India p. 321 Mahratta.

GURJI a Georgian: to say that a Persian lady resembles a Gurji or Georgian, is one of the highest compliments to her

beauty. The harams of Persia, contain many lovely Circassians. *Ouseley's Travels*, Vol. II. p. 51.

GURJI-MARA Can. Gamboge Tree.

GURJUN OIL. Gurjun ka tel.—An oleo-resinous liquid afforded by several species of Dipterocarpus: deep brown, transparent, of nauseous odour; sometimes thick and white. See Dipterocarpus.

GURJUR. See Chittagong.

GURKE ELLE LANGE? Cucumis utillissimus.

GURMAIA. Guz, Cassia fistula.

GUR KATS, also Gur Shagal. Hind. Desmodium tiliæfolium.

GURKEH. Umber was a sovereign of high rank among the princes of the Deccan, who governed his dominions with wisdom. He built the city of Gurkeh, now called Aurungabad, five kos from Dowlatabad, and died two years before the expedition of shah Jehan, at eighty years of age, leaving his dominions the best cultivated and the happiest region in India. *Briggs, The Nizam.*

GURKHA, a rising race in Nepal. In feature and figure the true Goorkha are always singular and remarkable, from their broad Chinese or Tartar-like physiognomy, the small eyes, flat nose, and meagre whiskers, as well as his stout square make and sturdy limbs. The Gurkha, in every description of costume, and in all degree of raggedness, are to be seen mingled with inhabitants of Kumaon, Sirmore, and Gurhwal. In 1792, the Goorkha race mastered the whole of the valley of Nepal, and the hill country from Sikhim to the Gogra and a party of them crossed the Himalaya, and appeared suddenly before Teeshoo Loomboo. The Llama and priests hastily evacuated their convents, and fled to Lhassa, and the place was plundered by the Goorkha, who retired immediately with their booty. The Tibetans applied to China for aid, and an army was collected for the punishment of this act of unprovoked outrage. The Goorkha submitted unconditionally to the Chinese commander, who imposed a tribute and triennial mission to Pekin, besides restitution of all the booty taken at Teeshoo Loomboo, and he took hostages for the performance of these stipulations. The rajah of Sikhim was at the same time taken under Chinese protection. Checked towards the east by these events, the Goorkha extended their dominion westward, subjugating Kumaon, Sirinugur, and all the hill country to the Sutlej. When Lord Hastings commenced his administration, their dominion extended as far as the river Teesta to the East, and westward to the Sutlej, thus occupying the whole of the strong country in the mountainous tract which stretches on the northern borders of India, between that and the highlands of Tartary. They had acquired these territories during the preceding 50 years, from many disunited hill chiefs whom they dispossessed, exterminating the families as each raja fell before them. *H. T. Prinsep. Egerton's Journal of a Winter's Tour in India*, Vol. I, p. 177. *Prinsep's Tibet, Tartary and Mongolia*, p. 18. *Fraser's Himalaya Mountains*, p. 223.

GURKHALI. See Nepal.

GURMA. A river of Rewah.

GURMALA. Guz. Hind. Mahr. Cathartocarpus fistula. Pers.

GURM MUSSALA. Guz, Garm masala. Hind. Spices.

GURMUI. A river near Chogong in the Bauleah district.

GURNARD. One species is known as the Flying gurnard: species of Exocœtus are the flying fish, and a species of Pegasus is the flying horse.

GUROH. A band or troop, of fakeers, thus there is the Chistiah, Ba-nawa, the Calendar, &c., guroh.

GUROH SAR. Leader of a band.

GUROOAN. A river near Koomarpootah in Goalparah.

GUROORA or Garura, also Garootmut Sans. From garoot, a wing.

GURRA. A river of Phillibeet.

GURRAH MANDLA. in the middle of the 16th century was 300 miles long and 100 broad. Gurrah town is five miles below Jubbulpur.

GURRAPU BADAM CHETTU. Tel. Sterculia fœtida.—*Linn.*

GURRAPU DIKKA CHETTU. Tel. Sagittaria obtusifolia,—*Linn.* Lit. "Horses hoof-tree," from the shape of the leaves.

GURRAPU GATTE AKU. Tel. also Manduka brambi, Tel. Clerodendron viscosum.—*Vent.*

GURRAS, a Nepaul tree that affects the highest situations; its flowers are large and of a deep red, and yield by decoction a purplish colour, which is converted by acids into a tolerable pink. The Jumno-mundroo tree, the Gurras, the Puddiem or Payah, the Chootraphul, the Mahul and the Puhuttoli tree, all grow in Nepaul. *Smith's Nepaul.*

GURROY. A river near Kushtee in Pubna district.

GUR-SOONDUR. Beng. Acacia arabica.

GURU or Gooroo, amongst jains, hindus and the sikh, a religious teacher. Among the Sikh religionists Govind Sing was the last of the padshah. The ten padshah or Guru of

the Sikh were 1, Nanak; 2, Angad; 3, Amaradas; 4, Ramadas; 5, Arjun; 6, Hargovind; 7, Har-kishan; 8, Tegh-bahadur; 9, Harah; 10 Govind Sing. In the hindu religion the guru corresponds to an ecclesiastical bishop and each of the hindu sects has a superintending guru. They have large incomes, reside in a temple, but make extensive ecclesiastical visitations or tours, accompanied by a band of disciples who occasionally act as the assistant guru. In popular belief, the guru can work miracles and forgive sins. He can excommunicate and again restore to communion. In his tours he levies contributions from the people of his sect. The Jains have their own guru.—*Wheeler's History of India.* See Gayatri Jain. Jogi. Kanta Bhaja.

GURU CHANDAN. Hind. Bezoar.

GURUGA. Tel. Celosia argentea.—*Linn.*

GURUGINJA. Tel. Abrus precatorius.

GURUGUDU or Gilugudu. Tel. Casearia tomentosa, *R.* ii. 421.

GURUGU KURA. Tel. Allmannia nodiflora.—*R. Brown.*

GURUGU PULA TIGE. Tel. Cryptolepis reticulata.—*Wild.*

GURUKATTA. Sans. Bole Armenian.

GURU GOVIND, the last of the Sikh Guru. See Guru; Sikh.

GURUKKAL. The head priest amongst the saiva sect of the south of India.—*Wilson.*

GURUGU. Tel. Celosia argentea. *L.*

GURUGU CHETTU. Tel. Crozophora plicata, *Ad. Juss.*—C. tinctorium, *Burm. Ind.* This is the Indian turnsol—*Royle Ill. i.* 329. Misled by the English name, some have imagined the plant to be the sun-flower, and still farther to increase the confusion, they have turned the old Greek name of Croz. tinctorium *L.* ("ηλιοτρόπιον μικρόν) into the modern Heliotrope and explained the various Indian names of Croz. plicata by Heliotropium (Tiaridum) Indicum *Lindl. Elliot Fl. Andh.*

GURUGUDU. Tel. Cascaria tomentosa.—*Roxb.*

GURUMANDL. Hind. Sphoeranthus mollis.

GURUMATA. Panjabi, a convention of the chiefs of the Sikh tribes, formerly held at Amritsar, on all occasions of importance. *Wilson.*

GURUMUKHI. A modification of the Devanagari alphabet devised by the Sikhs: it does not differ in shape, but the forms of many of the letters are interchanged.

GURUNG, a pastoral tribe living west of the Magar race on the slopes of the mountains in Nepal. They breed sheep, which they use for carriage. Their language is peculiar, but little known, and used by the buddhist priests to propagate their religion. They eat beef, but do not use milk. Their paganism is not yet extinguished.

They form a tribe or clan or race in Nepaul, and, along with the Krat and Magar, also of Nepaul, form the principal part of the Nepaul army. These three tribes are said to differ only in their religion, according as it combines a greater or less degree of the hindu opinions with those of buddhism. The Jarya are a tribe of Nepaul, south of the Gurung, with whom they are intermixed and intermarry. They are hindu in creed and manners. They may pertain to the Gurung, Magar or Newar tribes. The Newar were, however, the prior holders of Nepaul and their divisions are the Gurkha, Nepaul, Makwarpur and Morung.—*Latham.* See Krat, India.

GURU PADASRAYA, in the hindu religion, the servile veneration of the spiritual teacher.

GURU SICHER, a peak on Mt. Aboo 5,700 feet above the sea.

GURYAL. Guz. Hind. a watch, a gong, a clock; properly Ghurial.

GURZ, an iron club pointed at one end, and having a knob at the other covered with spikes. Gurz-Mar, is an order or guroh of faqeers. The members of it carry a gurz with which they wound themselves to extort alms. The order is said to have originated with a Pir named Sayid Ahmad Kabir.—*Wilson's Glossary.*

GUSHARATHA MARA. Can.? also Tumi. Tel. Embryopteris glutinifera.

GUSHTASP, a Persian king of the Kaianian dynasty, the Hystaspes of Grecian history. He was son of Lohrasb, and the son of Gushtasp was Isfandiar, the Apanda or Astyages of the Greek historians. See Persian Kings.

GUSHURA. Hind. Root of Barleria longifolia.

GUSRAH. Hind. of Cis Sutlej, sandy, unculturable soil.

GUSRU, a river of Jabbalpur.

GUSSALAH. Hind. Moorda-sho. Pers. persons whose office it is, in the mahomedan towns, to wash the bodies of the dead.

GUTCH'KA.? Duk. Syn of Guilandina bonduc.—*Linn.*

GUT-HA, properly Gat'ha, a measure of length. The twentieth part of a jareeb. Each Gut-ha contains three Ilahi Gaz. The word is derived from Gut-hna to join, or unite by knots.—*Elliot, Supp. Gloss.*

GUTHLI. Hind. Kernel, Gutli-khajur kernel of Phœnix dactylifera.

GUTI, in 15° 6' 9", 77° 38' 18". Hill station 2,171 feet above the sea, and the base of the Guti rock is 1,180 feet. It is in the Bellary collectorate.—*Schl. Ad.*

GUTIA. BENG. or Shuk-China. BENG. Smilax glabra.

GUTI-SUNA. HIND. Panax fragrans.

GUTTA. MALAY, a gum, any gum or concrete juice of a tree.

GUTTA PERCHA. MALAY, is the concrete juice of the Isonandra gutta. It is a forest tree of Penang, of the Malay Peninsula from Penang to Singapore, of Sumatra and of Borneo. It is called the Taban tree, by the Malays of the Malacca and, in Borneo, it is known by the name of 'Niato.' but Gutta percha seems to be the Malay name in the Straits. The ch is not pronounced hard like a k, but like the ch in the English word perch. The tree grows slowly to from sixty to seventy feet high, and three or four feet in diameter. Its foliage is of a pale green on the upper side, and covered with reddish-brown hairs beneath: it flourishes luxuriantly in alluvial tracts, at the foot of hills, and in such situations in many places, forms the principal part of the jungle. The natives had discovered its valuable properties before it became known to Europeans. They constructed from it whips, shoes, traces, buckets, jugs, basins, 'timba' or draw-buckets, and vessels of various kinds and thus attracted attention to the substance which has since been applied, in Europe, to a vast variety of domestic and scientific purposes. Their method of collecting the gum, however, has been of the most destructive kind, especially since the demand of a European market for this substance has had to be met. Instead of economising their treasure, as is done in the case of the caoutchouc tree, by tapping the tree and allowing its juice to ooze gradually from the incision, they fell the trees at once, and, removing strips of bark at intervals, collect indeed a large quantity of sap at one time, but destroy all future supplies from that source. The tree was formerly very abundant, but all the large timber was soon felled, and few and but very small plants are to be found. The wholesale destruction of the gutta tree, necessarily involves destruction of the traffic. To check it, is said, to be extremely difficult; because each set of explorers, is anxious for present profit. A very small quantity, comparatively speaking, is to be obtained by tapping, and the first comers get a full supply of sap for themselves, without considering those who come after, and who might very probably cut down the trees if they had been spared previously. When 20 to 30 years old, it was cut down and the smaller branches cleared away; round the bark of the trunk and the larger branches, circular incisions are made at a distance from one another of a foot or a foot and a half, and in a few days all the sap dribbles and falls into a cocoanut shell or other vessel placed below. The portions of juice are then collected into bamboo pitchers and carried by the collectors to boil it, at their huts, in large cauldrons, in order to steam off the water which has mixed with the juice and to clear it of impurities. After boiling, it assumes its marketable consistency and is brought for sale. (*Cameron.*) Pure gutta percha is greyish white, but it is generally brought to market of a reddish-brown hue. This is ascribed to chips of the bark, which fall into the sap and give it their colour, but in addition to this there are frequently other matters, such as sawdust, purposely introduced as adulterants. Dr. Montgomerie, of Bengal, appears to have first noticed the native use of this substance, in 1842. In 1843, Dr. d'Almeida presented a specimen of the inspissated juice to the Royal Society of Arts, and described some of the advantages which would accrue from its use. This communication led to no results; but another, made shortly after by Dr. Montgomerie, was more successful, so that by the united efforts of these gentlemen gutta percha was introduced to public notice, and by the year 1858, about 2,000 tons were annually exported from Singapore. The gutta percha from Borneo is not so much esteemed as that from the Malay Peninsula, and doubts exist as to the identity of the trees. It seems to be a practice with the people who collect the gutta percha of the Malayan Peninsula, to mix the juices of several other species of Isonandra with that of the true Isonandra gutta. And though this mixture confessedly depreciates the value of the gum, as the products of the several species have, to some extent, similar properties, the adulteration allows the commercial article to be applied to many purposes in the arts, from which the higher price and the scarcity of the true gum gutta would exclude it. There are said to be five or six species of Isonandra on the Koondahs of the Western ghats of India, I. wightiana, I. perottetiana, I. candolleana, and I. lanceolata, and in Ceylon is I. grandis and five other species. Some of these, however, may be referred to other genera, or are

synonyms. One in the peninsula, the Isonandra acuminata, *Wight*, is now referred to Bassia elliptica and yields the Pauchontee or ponchontee Dr. Oxley says that gutta ought not to require an elaborate process: the simple boiling in water, and rolling out into sheets, from which all foreign matter can be easily picked off, is the only process he employs, and this he thinks would be generally sufficient, if manufacturers in giving their orders would take the precaution of requiring that the article should be strained through a cloth at the time of its collection, and if they would encourage the natives to do this, by offering a somewhat higher price for gutta percha so prepared. A vast deal of trouble and expense might, in his opinion, be thereby saved. The great peculiarity which makes gutta percha convenient and valuable for a variety of purposes is, that when plunged into boiling water, it becomes so soft and plastic as to be easily moulded into any desired form, and this form it permanently retains on cooling. It was the discovery of this quality which first led the Malays to fabricate it into useful articles, Mr. Tomlinson tells us (Dictionary) that surgeons employ it for fractures, bougies and capsules; tubes for syringes are made of it, and water conduits have been manufactured from it for water service. For stereotype plates a mould is taken, by pressure, of a page with woodcuts, in gutta percha; from this mould a cast is obtained on a cylinder of gutta percha, and from this last the printing is carried on. An hour, it is said, suffices to make both mould and cylinder. It is made into speaking tubes for the conveyance of messages in mines, railway stations, prisons, workhouses, hotels, and other large establishments. For partially deaf persons, the distribution has been devised of gutta percha tubing over a church or other large building, so that, by seating themselves where the tubes terminate, they are able to hear distinctly the sermons or speeches delivered therein. Gutta percha also appears to be admirably adapted for cornices and centres for ceilings, also for picture frames, and many other uses to which plaster and papier machie have hitherto been applied. It has likewise been employed for door handles, and plates, knife handles, vases, baskets, &c., for the stopping of decayed teeth and for printing in relief. The clear, sharp impression it receives, and the toughness of the substance, have made it very useful in books for the blind, and in maps embossed for their benefit. In solution, this substance is employed in waterproof clothing; mixed with caoutchouc and other substances it is made into a light, porous, spongy material, suited for stuffing or forming the seats of chairs, cushions, and mattresses. Springs of clocks clasps, belts, garters and string, are prepared from the modification of the above mixture, while moulds and balls of gutta percha are produced of a hardness sufficient to bear turning in the lathe, like wood or ivory. A varnish may also be made in which gutta percha, being the principal ingredient, may be used to give a water-proof covering to other substances. Gutta percha dissolves at ordinary temperatures, and still better at a higher heat in sulphuret of carbon. The solution leaves behind on a glass plate a thin coating, possessing all the properties of gutta percha, unaltered. Paste-board boxes coated over with this may be made to hold water. Gutta percha was found by Dr. Faraday to possess high insulating power. Being flexible, impervious to water, and possessing insulating power, it is the most efficient of all substances as a coating or tubing for the copper wire of submarine telegraphs. The juices of various trees have been brought to notice, under the impression that they might prove substitutes for Gutta percha; but none of them have been found to answer, not even the sap of Euphorbia cattemundoo from the Coromandel Coast, which, at one time, was considered a likely substitute. General Cullen brought to notice the Pachontee tree of Malabar, the Isonandra latifolia, of *Wight*, since included in the genus Bassia, but it was not found of much commercial value. The Dutch Government while taking measures to transplant and cultivate the Isonandra gutta in Guiana, have discovered, at Surinam, a juice-yielding tree possessed of analogous properties, in the Sapota Mulleri, believed to be the same as the bullet tree of the English. It is a tall tree, yielding, in the hot season, a large quantity of milky juice. The tree grows abundantly on slightly elevated situations. The trunk is surrounded with a ring of clay, with elevated edges, and then an incision is made in the bark as far as the liber; the milky juice flows out immediately, and is collected in the clay reservoir. The juice resembles, in some respects, the milk of the cow: it forms a pellicle on its surface, which is renewed after removal. By the evaporation of the juice, 13 to 14 parts in 100 of pure Gutta percha is obtained. Six volumes of absolute alcohol added to ten of the juice, separates at once

all the Gutta percha which it contains. Sulphuric ether acts more rapidly than alcohol. The juice is not coagulated by acetic acid. This Surinam gutta product is sold at Amsterdam at the same price as the best Gutta percha of commerce, a good proof of the esteem in which it is held, The coagulated juice of a large climber found by Mr. Sandeman, of Munneepore, in his grant, has been pronounced inferior, inasmuch as it is sticky, and becomes brittle when exposed to cold and it would be unsaleable in England. A Cachar kind of gutta percha is also brittle, and when dissolved in chloroform or benzole, does not dry so quickly as the commercial article. On heating this in water it becomes most ductile and plastic, rather more so than common gutta percha: it is dissolved by the same agents as the latter. *Low's Sarawak*, p. 19. *Singapore Cat. London Ex.* 1862. *Indian Field Calcutta June* 12, 1858. *Tomlinson's Dictionary.* See Isonandra, Pachontee.

GUTTA PODAH of Billiton, vegetable wax.

GUTTA TRAP of Singapore the inspissated sap or juice of an Artocarpus, used for making bird-lime.

GUTTEAH of Chittagong, a tanning substance obtained from a bush that grows on the sides of creeks and rivers, in low ground, which is inundated with the spring tide. It is cut for firewood, and the fishermen and shoemakers purchase it, and take the bark off to tan their fishing nets and leather, and afterwards sell the wood posts for firewood. It is very abundant at Chittagong.

GUTTE GUM. Dut. Gamboge

GUTTI. Sans. Tel. A cluster of flowers.

GUTTI BIRA. Tel. Luffa racemosa. *R. Brown.* Perhaps only a variety of L. fætida. The peponidæ are smooth and generally 3-4 on the same stalk; cultivated about Masulipatam.

GUTTIFERÆ are generally regarded as the Indian Garcinaceæ: all of them abound in a viscid yellow, acrid and purgative gum resinous juice resembling Gamboge. See Clusiaceæ, Garcinaceæ.

GUTTI GUNNERU. Tel. Calpicarpum Roxburghii.—*G. Don.*

GUTTI NEMALADUGU MANU. Tel. A species of Vitex.

GUTWARA, properly gatwara, but more correctly, Gant'hwara, a tribe of the Jat race who hold villages in Gohana (where they are called Aolanea, after their chief town), in Soneeput Bangur, and in the Doab on the opposite side of the Jumna. They trace their origin from Ghuzni, from which place they were accompanied by the bhat Bajwaen, and the blacksmith Budea—of whom descendants are now living and are engaged in the occupation of their fathers in the villages of the Gunt'hwara fraternity.—*Elliot, Supp. Gloss.*

GUTZLAFF, Reverend Charles, a missionary in China, acquainted with several Chinese dialects. He endeavoured to spread christianity amongst them. He was afterwards an interpreter in China, and consul of Britain. He died about the year 1868. He greatly encouraged the Tae-ping movement.—*Bennett's Wanderings.*

GUVARPHALLI. Guz. Dolichos fabaeformis.

GUVI MANU. Tel. Ficus virens.

GUVVADADA. Tel. Grewia abutilifolia.—*Juss.*

GUVVA GUTTI. Tel. Trichodesma Indica.—*R. Brown.*

GUYA-BABULA. Beng. Hind. Acacia farnesiana. syn. of Vachellia farnesiana.

GUYAN. Hind. Ghwiyan, the edible Arum, A. colocasia.

GUZ also Gaz, a measure of length, a yard 3 Guz = 1 Gut'ha, and 60 Guz = 1 Jareeb, The Ilahi guz, is the standard guz, or yard measure of forty-one fingers, instituted by Akber. After much controversy respecting its length, it was authoritatively declared by the British Government to be 33 inches long, and the declaration has been attended with considerable convenience to revenue officers, as a Beegha measured by this yard constitutes exactly five-eighths of an acre. Since the middle of the 19th century the word guz is generally regarded as the British standard yard of 36 inches.—*Elliot.*

GUZBUR. See Kelat, p. 492.

GUZANJABIN, abounds in the province of Kermanshah; it is a kind of manna; caused by a green fly on the back of the leaf of the dwarf oak. It is very accurately described by Diodorus Siculus. The Persians mix it with flour and sugar, and make it into little cakes, which they consider great dainties, and export to all parts of Asia.—*Ed. Ferrier Journ.*, p. 26. See Gazanjabin, Manna.

GUZERAT, a peninsula in the N. W of the Peninsula of India, with the Gulph of Cutch on its north-west, and the Gulf of Cambay on its south-east. The area of the whole province is stated by Capt. Nasmyth to be 31,752 square miles of which only 10,736 belong to the British Government, the remainder appertaining to tributary chiefs. The low land of Guzerat resembles that of the Concan, Canara, the Carnatic and Orissa, but the interior of that province is mountainous. The alluvial tract, is a soil emi-

nently productive, and is occupied by Rajput tribes, Gujur, Katti, Koli and Kunbi, all claiming a distinct origin. The Koli of Guzerat are descendants of aboriginal tribes who occupied the country before the Aryan conquests. They have long since adopted some parts of hinduism. In the beginning of the nineteenth century they were a restless turbulent race, despising agriculture and living by plunder. Before the middle of the century they had settled down to be peaceful husbandmen, and the state of some of their villages vied with those of the Kunbi.

The Guzerat Koonbi are a remarkably sturdy independent race, and will often wrangle, for days, over a slight increase made in their rent.

The district of Diu is Portuguese, and the town of Diu has been repeatedly besieged by rulers of Guzerat and the Dekhan but it has continued in the power of thePortuguese.

Guzerat was overrun in A. D. 718, by Mahomed-bin-Kasim, Walid's general, but when advancing on Chittore he was met by Bappa and totally defeated.

The city of Nehrwalla says Rennell, the ancient capital of Guzerat, together with the whole of that peninsula, fell into the hands of Mahmood, who died four years afterwards (1028), possessed of the eastern, and by much the largest part of Persia ; as well as, nominally, of all the Indian provinces from the western part of the Ganges, to the peninsula of Guzerat.

Anhilwarra, was the dynastic name of three races that ruled in Guzerat from A. D. 696 till A. D. 1309, when Guzerat was annexed to Delhi by Ala-ud-din Mahomed shah. The name of these dynasties was taken from the town of Anhilpoor, which rose to great distinction as a commercial site, and with Cambay as its sea-port, was the Tyre of India. At its height, Anhulpoor was twelve coss (or fifteen miles) in circuit, within which were many temples and colleges; eighty-four chaok, or squares; eighty-four bazaars, or market places, with a mint for gold and silver coin. Col. Tod thinks it not unlikely that the Chaora, the tribe of the first dynasty of Anhulwarra, is a mere corruption of Saura; as the ch and s are perpetually interchanging. The Mahratta cannot pronounce the ch ; with them Cheeto is Seeto, &c., he thinks the Saura princes of Deo and Somnath, in all likelihood, gave their name to the peninsula of Guzerat. The language spoken is one of the Hindi tongues.—*Rennell's Memoir*, p. 47. *Sir H. Elliott's History of India, Annals of Indian Administration. Histoire de l' Inde*, p. 29. *Tod's Travels*, pp. 147, 152, 156. *Tod's Rajasthan*, Vol. I, p. 31. See Hindu, India, Infanticide, Jain, Kalmuk, Kathi, Kattywar, Koli, Krishna, Kutub Minar, Marco Polo, Rajput, RudraSampradaya, Veddah.

GUJERATI. In the Dekkan this term is applied to any native of Guzerat, but more especially to the traders and dealers from that country. In Bengal and Bahar, one subdivision of the Kurmi or agricultural tribe, is called Gujarati, having perhaps come originally from thence or, possibly from being of Gujar origin.—*Wilson.*

GUZERATI ILACHI. HIND. Elettaria cardamomum.

GUZ-GIAH. PERS. also Bunjdashti. PERS. Thorn apple.

GUZNI. See Ghazni ; Kandahar.

GUZZELHUTTI, a pass running up a valley in which the Moyar flows to the Bhawany, between Colligal and the Neilgherry hills. The Anamallay hills are in the S. W. border of Coimbatore and are richly clothed with valuable forests, with many elephants and some of the lower hill ranges from the Neilgherries, between which is the valley and gap or pass of Palghaut leading to the western coast. The Guzzlehutty pass leads up the deep valley separating the Neilgherry hills from Colligal.

GWA. HIND. Tetranthera monopetala.

GWALAGARH, 31° 53' ; 76° 20', in Chamba, near the well known temple of Jwala Mukhi, about 10 miles N. of Nadaun Fort is 3,281 feet above the sea.—*Mulherran.*

GWALDAKH. HIND. of Kaghan, Ribes rubicola, glacialis and grossularia, currant and gooseberry; also Ribes leptostachyum.

GWALIOR, town in 26° 13' 2" ; 78° 9' a large place 65 miles S. of Agra. The Entrance to the fort on the hill is 1,111 feet above the sea. Gwalior is the capital of a Mahratta prince, maharajah Scindia. Gwalior Fort built on a rock was taken on the 3rd August 1780, by Major Popham. It was regarded as so powerful a fortress that its capture was heard of by the chiefs of India with great astonishment. During the rebellion a massacre at Gwalior occurred on the 14th June 1857. But the town was re-captured by Sir Hugh Rose on the 28th June 1858. The British Indian Government keep a Political Agent at the Court of Gwalior, by whom, also, Amjherra, Nurwar, Bhadowra, Khaltoun, Sirsee, Ragogurh, Baroda or Sheopore and Burra are superintended. See India, Mahratta Governments.

GWEY-TOUNG. See Karenp., p. 469.

GWALIDAR. HIND. Diospyros lotus.

GWAL KAKRI. Hind. Bryonia umbellata.

GWANDISH. Hind. Sambucus ebulus.

GWIAN. Hind. Arum colocasia

GWAI. Burm. Urtica nivea.—*Linn.*

GWYNE, with the Moulmein and Salwen rivers enter the Bay of Bengal.

GYAL. See Bos; Bibos.

GYAL, or Gayal. The land of a deceased Biswadar, lying unclaimed; land coming under the management of the Malgoozar after an "asami" deserts his village.—*Elliot Supp. Gloss.*

GYAM. Tibet, Cedrus deodara, deodar or Himalayan cedar.

GYAMI, a Chinese military tribe.

GYAMI, a population, whose language Mr. Hodgson treats as Sifan.—*Latham.*

GYARUNG or Gyarung-bo, a powerful nation consisting of eighteen banners, at present acknowleding the supremacy of China Each tribe has its special denomination. The name seems the same as that of Gurung, a population in Nepal,—*Latham.*

GYEN BAING. Burm. Bassella alba.—*Linn.*

GYEW. Burm.? A tree, maximum girth 2 cubits, maximum length 15 feet. Found abundant in the jungles round Moulmein and all over the provinces. When seasoned it floats in water. Stated by the Burmese to be equal to chisel handle tree, Dalbergia, species, but if so, Captain Dance had not seen a favorable specimen.—*Captain Dance.*

rGYLFO, the title of the ruler of Iskardo, or little Tibet, derived from two Balti words rGgyl, powerful, and Fo, a man. The queen is styled rGgyl-mo. Mr. Vigne points to this as the original of the title of Guelph belonging to the royal family of Britain, and of the term Gylfe-koniger, still used to designate the old kings of Denmark. See Gylfo.

GYLLUPKA. See Bhot.

GYLONG. See Bhot.

GYMNEMA. A genus of plants belonging to the Natural Order Asclepiaceæ, of which fourteen species occur in the East Indies: the best known are

C. acuminatum	C. nepalensis.
C. decaisneanum.	C. sylvestre.
C elegans.	C. tingens *var.* cordifolia.
C. hirsutum.	C. „ *var.* ovalifolia.
C. lactiferum.	

A green dye of an excellent quality has been obtained from the leaves of G. (Asclepias) tingens a twining plant. It is a native of Pegu but grown in Burmah.

GYMNEMA LACTIFERUM var. of G. sylvestre *R. Br. W. Contr.*

Milk-Bearing Gymnema.

Ch'hoto-doodhi-luta Beng.	Kiri hangula, Pali.
Ceylon Cowtree, Eng.	Kiri anguna, Singh.
Cow Plant, „	

It is a form of G. sylvestre. The appellation Kiri is given because of the resemblance of the juice in colour and consistency to milk. It is never used as food, though Loudon, Lindley and Charles Knight say so, nor as a vaccine virus as stated by Loudon.

It has an erect stem, or rather is twining; the leaves are on short petioles.ovate,bluntly acuminated,usuallyunequal-sided; theumbels many-flowered, shorter than the petioles; the throat of the corolla crowned by five fleshy tubercles; the tube furnished with double pilose lines running from the tubercles. It is a native of Ceylon.

GYMNEMA TENACISSIMA. Syn. of Marsdenia tenacissima.—(*W. and A.*)

GYMNEMA SYLVESTRE, Spr. *R. Br.* ii, 45.

Asclepias geminata *Roxb.*	Periplocasylvestris *Wildle*
Ch'hoto-doodhi loota, Beng.	Poda patra, Tel.
	Putla podara, Tel.

This grows in the Peninsula of India, Bengal, Nepaul, Assam and Canton. *Roxb.* ii, 53. *Voigt*, p. 538.

GYMNEMA TINGENS, Spr.

Asclepias tingens, *Roxb.*	Asclepias montana *Roxb*

Grows in Sukha Nuggur, Kamroop, Burmah and Java. Its leaves yield a green dye, or sort of indigo. *Roxb.* ii, 49. *Voigt.* 538. *Simmonds.*

GYMNOCLADUS CANADENSIS Lam. Coffee-tree wood. A tree of the forests of Canada and N. America, introduced into India

GYMNOPUS. A genus of reptiles, the river turtles or trionyx, of which there occur in India, G. duvaucelli, *Dum.* and *Bibr.* river turtle or trionyx. G. euphraticus, of Babylonia. G. Javanicus. G. lineatus. G. ocellatus. G. subplanus of Babylonia. See Reptiles.

GYMNOSOPHI. These arespoken of by the writers of the time of Alexander's invasion, and this was the term by which the Greeks and Romans designated Gymnosophist, people of India who practiced austerities for religion to quell the flesh and its desires. They are yet daily to be seen in every part of India, sometimes without any covering, or with only a narrow strip of cloth, their bodies covered with ashes, exposed to the elements and continuing to live as anchorites through a long life under the most painful circumstances. Manu(Inst.6,22.)says, "let the devotee push himself backward and

forward on the ground, or stand on his toes the whole day, or continually sit down and rise again; let him go into the water at sunrise, noon, and sunset and bathe; in the hottest season of the year, surround himself with five fires; and in the winter stand constantly in a wet garment, and so let him proceed ever, continuing his penances in severity." Their present representatives are the byragi and sanyasi. In the Ramayana they are represented as lying in winter in cold water, living on dried leaves and water. Colonel Wade and Captain Osborne were witnesses to the interment, alive, and disinterment, of a devotee, at Lahore in 1837, who was buried, for six weeks in a closed chest. It was suspended in a vault to avoid the attacks of white ants. The seal of Ranjit Sing was on the tomb. The systems of hinduism and bud'dhism encourage austerities and the reformers Sakhya Sinha, Kabir, Ramanand, and Chand all favoured it. The idea seems to be connected with the prevailing belief as to transmigration, leading to the infliction of self torture, as penance, for the sins of the former or present existence, in the hope of absorption after the present term of life. The austerities are practiced in the most varied form, from simple abstaining from marriage, to temporary or life long tortures and voluntary suicide by drowning, burning, or placing themselves beneath the great wheels of idol cars. The tortures at the Holi festival, the deaths in the Ganges and at the Jagarnath car, the prostrations for a pilgrimage and around the hill of Goverdhun are of this kind, and in 1866, a hindu ascetic was sitting in a cave at the editor's visit to Ellora, where he had sat for five years. See Byragi, Crow, Hindu, Holi, Karshagni, Sanyasi.

GYNANDROPIS AFFINIS. BLUME. Syn. of Gynandropsis pentaphylla.—*D. C.*

GYNANDROPSIS PENTAPHYLLA. —*D. C. W. & A.*

G. affinis. *Blume.*		Cleome pentaphylla *Linn.*	
Shada hurburija;	BENG.	Valle kire,	TAM.
Kamala,	„	Nai kaduga;	„
Kat koduku;		Nai vella,	„
Kara vella,	MALEAD.	Vaminta,	TEL.

An annual plant of the Order Capparidaceæ, grows in the E. and W. Indies, and America. Leaves of the wild plant are eaten in curries; bruised and applied to the skin, they act as a rubefacient and produce a very abundant serous exudation, affording the relief derived from a blister without its inconveniences. It is grown as a flowering plant and both this and other species are cultivated easily from seed, are very pretty and grow well in a light rich soil, the colors of the flowers are white, red, purple and yellow, at Lahore, the seeds are used by the hakims, in convulsions, those of Cleome viscida are said to be anthelmintic.—*Honigberger*, p. 258. *Roxb.*, iii, 126. *Voigt*, p. 73. *Riddell. Jaffrey. Wight's Ill.*. I, p. 35.

GYNOCARDIA ODORATA.—*Lindley.*

Chaulmoogra odorata.—*Roxb.*

Talien-noe,	BURM.	Petar kura,	HIND.
Chaulmoogra,	HIND. PERS.		

This is a native of Sylhet, about Rangoon, and is met with on the banks of streams in the Tounghoo forests, but must be considered scarce. The plant is referred by Lindley to the Natural order Pangiaceæ which by some is considered a section of Papayaceæ. The seeds are sold in the bazaars in India at about 13s. 4d. per cwt.: they yield by expression about ten per cent. of a thick bland fixed oil having a peculiar smell and taste. The seeds are employed extensively in the treatment of various cutaneous diseases in the form of ointment, especially in herpes and tinea and have been recommended in tape worm. The seeds are various in shape, nearly oval, smooth, grey, hard. Embryo white. For external application they are beaten up with ghee or clarified butter and applied to the diseased cutaneous surfaces three times daily. The expressed oil is prized in the treatment of leprosy in India. The surfaces of the ulcers are dressed with the oil while a six grain pill of the seed is given three times a day. The dose of the latter is gradually increased to twice the original quantity. One drachm given to a dog caused violent vomiting in 15 minutes. The expresssed oil is sometimes given internally in doses of 5 or 6 minims. Too large doses are apt to produce nausea and vomiting. The Chaulmoogra is prized by the Chinese.—*Notes on the Chaulmoogra seeds of India by Charles Murchison, M. D., M. R. C. P., L. in Edin. New Phi. Mag.*, No. 6, of April 1856, p. 363. *Roxb. Fl. Ind.* iii. 836. *O'Shaughnessy. Beng. Pharm.*, p. 382. *Honigberger*, p. 255. *McClelland.*

GYNDES. See Fars.

GYO, Schleichera trijuga.—*Willde.*

GYPAETOS HEMACHALANUS. HUTTON, the Lammergeyer, inhabits the high mountains of Europe, Asia, and Africa, from the Altai even to the Cape colony. Authorities differ with respect to the value to be attached to certain differences observed in specimens from different regions. The prince of Canino identifies the Himalayan with G. barbatus of Gebler from the Altai, and G. nudipes of Brehm (meridionalis of Keyser and Blasius) from S. Africa. M. Malherbe remarks that specimens from the Pyrenees and Sardinia are of inferior size to those

from the Swiss Alps; and this smaller race is the G. barbatus occidentalis of Schlegel. Even the Himalayan, the G. hemachalanus of Captain Hutton, is said to differ from that of eastern Europe by having a pictorial dark band not observed in the other. The constancy of the alleged distinctions seems to need confirmation, preparatory to an estimation of their value. The Himalayan bird is commonly miscalled 'Golden Eagle' by English residents,—*Blyth.*

GYPS. A genus of birds belonging to the sub-family Gypinæ and Family Vulturidæ, of which there are three species in India, G. fulvus, G. Bengalensis and G. Indica, and other species occur in Africa and America.

Gyps Fulvus or Vultur fulvus, is the Great White Vulture, or Griffon Vulture, and inhabits the high mountains of Europe and Asia, inclusive of the Himalaya and its vicinity, is common in Dalmatia, Greece, and the islands of the Mediterranean; less so on the Alps, and exceedingly rare and accidental in the British islands and northern provinces of France. It is re-placed in the Pyrenees, Sardinia, and Barbary, by the nearly affined G. occidentalis: in E. Africa by G. Ruppellii: and in S. Africa by G. Kolbii; also generally over India and the Malay countries by G. indicus, a much smaller bird. All the birds are remarkable for possessing fourteen tail-feathers, whereas other birds of prey have twelve only, even their congener, G. bengalensis, which is the commonest Indian vulture about and near towns, and is also met with in E. Africa. As Mr. Yarrell does not appear to discrimainate the G. occidentalis, it is just possible that the bird which he notices appertains to that particular race, rather than to the genuine G. fulvus of the Himalaya. The 'great black Vulture' of the Himalaya, Vultur monachus, may yet be found to stray so far west as Britain; since it has several times been shot in Schleswig and Holstein, also in Provence, Languedoc, Dauphine, &c. It is not rare in the Pyrenees, Sardinia, Sicily, and mountainous regions of the S. E. of Europe.

The great African vulture, V. auricularis, has been observed in Greece, and has once been killed in Provence, in France, this resembles V. ponticerianus, the so called 'King Vulture' common over the plains of India, but is much larger, equalling V. monachus in size; while the latter has also an analogous diminutive in Africa, in the V. occipitalis.

In a fine adult of G. occidentalis, from Algeria, the closed wing measured about 27 inches. The clothing feathers are much less acuminate than in G. fulvus, and resemble those of G, Ruppellii in form; but their colour is throughout dull, pale isabelline, slightly tinged with ashy excepting round the margins; and the hue of those covering the craw is much darker. In the adult G. Ruppellii, the whole plumage is fuscus, with strongly contrasting whitish margins more or less broad, imparting a handsome variegated appearance, especially to the scapularies and coverts of the wings and tail: feathers covering the craw blackish; and those forming the white ruff shorter and more dense than in either of the preceding. Length of wing 24 inches. In G. Indicus the feathers are not more or less accuminate according to age, and in the young of this species and of G. fulvus and doubtless of the others also, the feathers of the upper parts have a medial pale streak but not the broad whitish margins which distinguish the adults of G. Ruppellii. In G. Ruppellii the beak is somewhat broader in proportion to its length than in G. fulvus and G. occidentalis, resembling that of G. Bengalensis except in having its ceral portion more prolonged backwards, while G. Indicus has a comparatively slender bill especially as viewed laterally with its cera portion remarkably elongated. In a particularly fine adult of G. Indicus the closed wing measures 24½ inches.—*Mr. Blyth's Report.*

GYPSOPHILA ELEGANS. This is a genus of small creeping plants, flowers of various colours, and will grow in any common soil.—*Riddell.*

GYPSUM, A native sulphate of lime, occurs in several forms, which are known as Selenite, Plaster of Paris, Alabaster or Snowy gypsum, Radiated gypsum, Satin spar or Fibrous gypsum. Extensive beds of crystalline and fibrous Gypsum and Selenite occur near Ennore, the Red Hills, Ootatoor, Tiagur, Madura, Bangalore, Masulipatam, Hyderabad, and other localities, but are not put to any use except in the vicinity of Madras. The substance can be purchased in most bazaars in India under the name of kulnar and kurpoora silasit, and is used in small doses as a medicine, but the Natives do not appear to be acquainted with the uses of this mineral in taking casts, plastering and house decoration, or in manufacturing Keene's cement. The best qualities are from Ootatoor near Trichinopoly, the Chingleput District, Sadras, Ennore, the Red

Hills, Nellore, Masulipatam and Bangalore. The only new localities for this mineral are Sadras, the Red Hills, and Nellore. It occurs very abundantly in the Madras Presidency in the form of fibrous and crystalline gypsums, both free from carbonate of lime, and well suited for the manufacture of plaster of Paris, for moulds, busts, statues or ornaments. The fibrous gypsum of Bangalore, Tiagur and Nellore are the thickest and best, A fine transparent crystal of selenite in the shape of a parallelopiped was brought to Mr. Mason by a Burman, who said it was found in Amherst Province. Granular gypsum is found near the banks of the Tenasserim in about latitude 13° 40' N. It is granular and friable, is a sulphate of lime. A fine variety of fibrous gypsum, sulphate of lime, (Shakoung, Chinese,) is brought, to Burmah from China. They use it in medicine, and say "it is very cooling!" Gypsum, is brought to Canton in abundance, from the North West of the province, and is ground into powder, in mills. It is not used as manure by the Chinese, but mixed with oil to form a cement for paying boats after they have been caulked. The powder is employed as a dentifrice, a cosmetic, and a medicine, and sometimes, also, is boiled to make a gruel in fevers, under the idea that it is cooling. The bakers who supplied the English troops at Amoy, in 1843, occasionally put it into the bread to make it heavier, they do not think it noxious; its employment in colouring tea, and adulterating the ping fa, or powder sugar, is also attributable to other motives than a wish to injure the consumers.

Gypsum is named from γῆ earth, and ἕψειν, to concoct, i. e. formed or concocted in the earth. It is widely distributed throughout the world, and was well known to the ancients, who applied it to many of the same uses for which it is valued at the present day; it abounds in the London and other clays, but its great repository is in the rock commonly called new red sandstone. Numerous quarries exist in that formation, and those of Derbyshire, South Yorkshire and Nottinghamshire are in high repute. The better sorts of Derbyshire gypsum are employed in the Staffordshire potteries, as an ingredient in certain kinds of earthenware and porcelain, and also in making moulds for such articles of pottery as cannot be shaped on the common wheel. The finest pieces of this gypsum are reserved for ornamental purposes, such as vases, small statues, &c., of which a considerable manufacture exists in Derby. Gypsum in this form generally bears the name of alabaster, Gypsum, when calcined and reduced to powder, can be brought to a pulpy mass by admixture with water, and is the well known Plaster of Paris. This mass very soon sets, or returns to the solid form, giving out, while in the act of doing so, a considerable degree of heat. Advantage is taken of this fact in the use of gypsum as a material for casting and taking impressions.

A white granular gypsum suited for sculpture occurs in the Jammu territory, and an alabaster, from Spiti, is a hard white granular gypsum. Gypsum occurs in the marl beds of the Devonian or primary strata of the Salt Range. In the gypsum of Mari, Kalabagh and Sardi, beautiful regular quartz crystals occur called Kalabah and Mari diamonds. They are transparent, milky, or red. The 'Bohemian topaz' of the Jhilam consist of small crystals of this quartz, in the form of dodecahedra, or double six sided pyramids, but there is not the six sided prism so characteristic of quartz. The Kalabagh diamonds are quartz in six-sided prisms, terminated by six-sided pyramids.

Sang-i-Jarahat of Lahore and the Punjab, is a sulphate of lime. An inferior alabaster, occurs at Sardi and on the Karuli mountain, erroneously called 'marble,' Lahore gypsum is called saug-i-jarahat; also godanti; that of the Jhilam and Rawul Pindi is called 'Surma safed,' a name usually applied to the carbonate of lime 'makol.' *Powell's Handbook*, p. 14. *Madras Exhibition of* 1857, *Juries Reports Simmonds. Tomlinson. Masons Tenasserim*, *Williams' Middle Kingdom*, p. 242.

GYPSY. Eng.

Zigeuner,	Ger.	Gitano,	Spain.
Cygani,	Hung.	Tschengene,	Turk.

Their number amount to five millions, half a million being in Europe. See Karachi: Zigano.

GYRINI and Hydrometræ, are aquatic insects of which several occur in S. E. Asia — *Colld.*

GYR-MAHDEE, a sect of mahomedans who believe that Mahdi was the prophet Elias, and that Elias has come and gone. They call themselves Mahdawi. Vide Mahdee.

GYROCARPUS ASIATICUS.—*Willde.*

Tanuku,	Tam.	Tanuku manu,	
Kummara ponuku,	Tel.	Tanuka,	Tel.
		Ponnuku,	,,

A tree of the Coromandel mountains; grows on the banks of the Kistnah at Nilatwar and not uncommon in the hot and drier parts of Ceylon. Wood whitish coloured and very light: when procurable, it is used for catamarans, in preference to all others.—*Thwaites*, p. 258. *Voigt. Roxb. Cor. Pl.*, p. 258.

GYROPHORA. Tripe de roche.

H. This letter, in the English language, as an aspirate, shows that the vowel following it must be pronounced with a strong guttural emission of voice, as in hammer, house, humidity, helm, history, hyson; but, in a few English words it is quiescent, as in hour, honour. The Tamil has no letter h, but this English letter is represented in the Arabic, Persian, Urdu, Sanskrit, Hindi, Marathi, Bengali, Uriya, Telugu, Karnatica, and Malayalam, but the sounds are mere modifications of the simple breathing. Two of the sounds derived from the Arabic are not very nicely distinguished in Indian pronunciation. One may be something harsher than the other, and so far it agrees with the strong Sanskrit aspirate, whilst the softer breathing of the Nagari alphabet, the Visarga, or sign of the nominative case, may be regarded as peculiar. Sir William Jones distinguishes the harsher forms by an accent, as Ah'med. Gilchrist and Shakespear distinguish it by a dot underneath it; Professor Wilson places the dot beneath the softer Arabic aspirate. In a suggested Missionary alphabet it has been proposed to indicate the unmodified flatus by an apostrophe as ve'ement for vehement. With the people on the line of the Indus river, the letters 'S' and 'H,' and 'Z' are permutable. Hind becomes Sind: Zalim Sing becomes Halim Hing. The difficulties, however, as to the letter 'H,' are not greater than in the Italian, where the initial 'H' is quiescent before a vowel and modifies the sounds of consonants. Colonel Tod says S and H are permutable letters in the Bhakka, and he supposes that Sam or Sham, the god of the Yamuna, may be the Ham or Hammon of Egypt. He also thinks it not unlikely that the *Chaora*, the tribe of the first dynasty of Anhulwarra, is a mere corruption of *Saura*; as the *ch* and *s* are perpetually interchanging. The Mahrattas cannot pronounce the *ch*; with them *Cheeto* is *Seeto*.

HAARE. Ger. Hair.

HAB. See Kelat, p. 491.

HABAC. Arabic. Ocymum pilosum.

HABAKUK. This sacred writer says "They sacrifice unto their net, and burn incense unto their drag; because by them their portion is fat, and their meat plenteous," from which it would seem that the Jewish idolaters had a custom like that of the Hindu, who annually worship the implements of their trades. See Kush or Cush.

HABARUM, a mount close to the Dead Sea, on which Moses died in the fortieth year of the Exodus. In this interval, the whole land of the Emorites had been taken, the Midianites overthrown and the country of the king of Basan conquered, crossed the river Jabbok and taken the western country on the Jordan (Batanæa and Aulonites) eastward and north-ward as far as Hermon. —*Bunsen*, iii, 252.

HABAS. Span. Beans.

HAB. Ar. Hind. Pers. A seed or fruit; hence

Hab-ul-as. Berries of Myrtus communis.
Hab-ul-ban. Seeds of Moringa pterygosperma, also of Melia azedarach?
Hab-ul-jarab. Strychnos nux vomica.
Hab-ul-Kal Kal. Hind. Cardiospermum halicacabum.
Hab i-kaknaj. Hind. Physalis Indica.

HAB SAUDE. Egypt. Nigella seed.

HABSHI. Hind. An African or Abyssinian, Habsh being the Arabic reading of Abyssinia.

HABENARIA, a genus of plants belonging to the natural order Orchidaceæ. This genus has a ringent hooded perianth, a 3-lobed entire spurred lip. Dr. Wight, in Icones, gives the following species of Southern Asia: affinis, cephalotes, crinifera, decipiens, digitata, eliptica, fimbriata, foliosa, Heyneana, Jerdoniana, Lindleyana, longicalcarata, montana, ovalifolia, peristyloides, plantaginea, platyphylla, rariflora, Richardiana, salaccensis, trinervia, viridiflora. Habenaria acuifera, is an elegant species found in the Tavoy forests; and several other species of the same genus are scattered over the Tenasserim Provinces. *Mason W. Ic.*

HACKERY. ANGLO-BENGALI. A cart or carriage. a country cart.

HAC-MINSAU. COCHIN-CHIN. Emblic myrobalan.

HADA. A blight, drying up of leaves.

HA-DA. See Japan, p. 410.

HADAD. The Phœnician Sun-god. and their king of the gods. *Bunsen*, iv. 269.

HADAH. Wife of Lamech and of Esau *Bunsen*, iv, 253.

HADAKONKALEE. URIA. A useful timber of Ganjam and Gumsur, extreme height 12 feet. Circumference 2 feet. Height from the ground to the intersection of the first branch, 4 feet. *Capt. MacDonald*

HADAPIGA. KAR. A barber.

HADAR. HIND. Ribes leptostachyum, Ribes rubrum.

HADDU. PANJ. Cornus macrophylla. *Wall.*

HADES. See Karen.

HADHJORA. HIND. Nyctanthes arbor tristis.

HADI, a helot race, spread over all Bengal, who take their name from the original Santali word for man, 'had,' and who have supplied such terms as 'hadd,' base, low-born; 'hadduk' a sweeper; 'hunda,' hog, blockhead, imp; hudduka, a drunken sot, &c., also, 'Hadi,'-in low Bengali, 'Hadikath,' is the name of a rude fetter or stock, by which the landholder used to confine his serfs until they agreed to his terms. It means literally the helots log; it was also used for fastening the head of the victim in the bloody oblations which the Aryan religion adopted from the aboriginal races, especially in the human sacrifices to Kali, to which the low castes even now resort in times of special need. In an account of the last human offerings to Kali, during the famine of 1866, it was mentioned that the bleeding head was found fixed on the 'harcat,' *i. e.* helot's log.—*Dr. W. W. Hunter*, p. 30.

HADIAH. ARAB. A maiden of good family and courage, who precedes in battle, the Bedouin Arab, mounted on a camel, in the fore ranks, she has to shame the timid and excite the brave by taunts or praise.—*Palgrave.*

HADISAH. See Mesopotamia.

HADIWICKE. A moderately hard, fine, close-grained, rather heavy Ceylon wood.

HADRAMAUT. See Arabs. Inscriptions, p. 371.

HÆMADIPSA CEYLANICA *Blain*, the land leech of Ceylon, another is the Hæmadipsa Boscii. See Leeches.

HÆMATIN. A colouring substance obtained from the Cæsalpinia sappan tree.

HÆMATITE, a name given to certain forms of native peroxide of iron. When of a red colour it is called red hæmatite; and when brown, brown hæmatite.—*Eng. Cyc.*

HÆMATOXYLON CAMPECHIANUM. Logwood. This useful timber tree has been introduced into India. It grows readily and seeds abundantly, but it remains to be seen whether it will attain a large size in this country. It is used only as a dye, and the bark is astringent in a considerable degree. It is a promising tree and deserves attention. It is a low spreading tree, seldom thicker than a man's thigh.—*Eng. Cyc., Dr. Cleghorn in Madras E. J. R.*

HÆMOPSIS PALUDUM. One of leeches. See Leeches.

HÆMATOPUS OSTRALEGUS. A genus of birds of the family Chionidæ and order Grallatores. See Birds, p. 518.

HÆMATORNIS CAFER, is one of the bulbuls of Southern India, is not a song bird and is called the Bulbul-i-gul-dum, or bulbul with the rose tail. Hæmatornis cafer is a common cage bird and like quails and cocks is trained to fight, and when pitted against an antagonist, it will sink from exhaustion rather than release its hold.

HÆNKE. The 'Reliquiæ Hænkianæ, of Presl, is a folio volume with plates, devoted to the materials collected by Hænke, who was employed in the Spanish service, and collected in America and Manilla. The Indian plants described are few, and the descriptions and identifications far from satisfactory.—*Hooker f. et Thomson.*

HAE-NUN, called by Europeans Amoy, an island on the S. E. of China about 22 miles in circumference. The town of Amoy is situated on the S. W. part of the island, opposite the small island of Ku-lung-su, which affords protection to the town anchorage or inner harbour. On the Western side of the island is that of Woo-seu-shan, also that of Woo-an. Amoy was delivered over to the British, after the first Chinese war of 1841-2, and forms one of the consulates thereof, Shanghai and Hong-Kong being others.—*Horsburgh.*

HAE-TAN. A large and irregularly shaped island on the East coast of China, near the mainland, between lat. 25° 24' and 25° 40' N. Its northern part, Hae-tan Peak, is in lat. 25° 36' N. and rises to an elevation of 1,420 feet, but its eastern and western shores are low and indented with deep sandy bays. *Horsburgh.*

HÆTERORNIS CRISTATELLA, the myna bird of Ceylon.

HÆTUMAT, A land mentioned in the Vendidad of the Zoroastrians, as the eleventh of which the Aryans took possession. It is the valley of the Helmund to the west of Arachosia. *Bunsen*, iii, 485.

HAFAR CANAL. See Khuzistan.

HAFES. Ger. Oats.

HAFIZ. Arab. Hind. Pers., from the Arabic Hifz, he did remember, is a literary title given to a mahomedan who can recite the whole of the Koran from memory. It is generally earned by lads, sometimes of very tender years, and in large towns there are always several of the Hafiz. Where so many are actual Hafiz, thousands have almost attained thereto, and remember vast portions of their religious book, and every mahomedan with any education can indicate almost any passage under discussion. The Koran is not perhaps a third the size of the Old and New Testaments, and the feat of committing it to memory is comparatively easy, which may explain why we so seldom hear of a Bible hafiz. Recently, however in 1860, a religious gentleman in Massachusetts having offered several prizes of Bibles to those, old or young, who should commit to memory and repeat the largest portion of the Bible, Mrs. Betsy Conant who had been residing in Melrose, a lady sixty eight years of age, committed to memory the entire Bible, Old and New Testament, reciting each day in the week. This was certified by her daughter, and also by the Superintendent of the Sabbath School. An Irish servant girl repeated nearly 10,000 verses; three other females repeated above that number, and a list was appended of some 20 more who were able to repeat from 3,000 to 9,000 verses. It is noticeable that more than two-thirds of the successful competitors were women, showing how strong the faculty of memory is among the sex as a general rule.

HAFIZ. A lyric poet, native of Shiraz, author of the Dewan-i-Hafiz. Many of his poems have been translated: one by Sir William Jones, and which perhaps surpasses the original, commences with

> Sweet maid, if thou would'st charm my sight,
> And bid these arms thy neck unfold;
> That rosy cheek, that lily hand,
> Would give thy lover more delight
> Than all Bokhara's vaunted gold:
> Than all the gems of Samarkand.

Hafiz is the "takhallus" or poetical appellation. His own name was Khaja Shams-ud-Din. Very little is known of his life; and it appears to have been in no degree remarkable for incident. He was born at Shiraz in the beginning of the 14th century, and died and was buried there in A. D. 1338. He is regarded as a holy man and oblations are offered at his shrine. The tomb is a gloomy and ugly building, but the transcript of one of the poems of that poet, which is cut on it in the most exquisite Persian character, renders it an object of great curiosity. It is said that the best and oldest copy of his works extant, is kept within the tomb. The white material with which the tomb is formed, has become from exposure to the weather, very much discoloured, and adds to the sombre effect produced by the cypress trees that surround it. Four well known distiches of Hafiz, inculcate the return of good for evil

> "Learn from yon orient shell to love thy foe,
> And store with pearls the hand that brings thee woe:
> Free, like yon rock, from base vindictive pride,
> Emblaze with gems the wrist that rends thy side:
> Mark where yon tree rewards the stony shower
> With fruit nectareous, or the balmy flower:
> All Nature calls aloud—Shall man do less
> Than heal the smiter, and the railer bless?"

—*As. Res.* Vol. IV. *Pottinger's Travels, Beloochistan and Sind*, p. 241-2. *Sir William Jones.*

HAFIZ. See Kosti, Kurdistan.

HAFREK. See Naksh-i-Rustoom.

HAFT AKLIM, Amin Ahmad, Razi, author of a history of the Persian poets, entitled Haft Aklim or the 'Seven Climates,' has illustrated his with much geographical matter. Amin graphical and biographical work. Ahmed was surnamed Razi being a native of Rai. Five hundred years ago, Amin Ahmad said the cuneiform character was unintelligible to the learned of all religions.—*Ouseley's Travels*, Vol. II, p. 402, III, p. 10. See Heft. Aklim.

HADROSPHERUM. Hadrospherum, mesospherum, and microspherum are applied by Pliny to varieties of Nard; perhaps a mistake of his, as Dioscorides observes that some people made the mistake of regarding malabathrum as the leaf of Indian Nard. *Yule Cathay*, I. p. cxlv.

HAFT. Hindu, the seven rivers of the Punjab. See Bharata Bharata Versha.

HAFT KHANEH, or Satgurh group of caves is one of the Behar caves in the neighbourhood of Rajagriha, the most ancient caves in India, about 200 B. C. The others are the milk maids' cave, the Brahman girls' cave, the Nagarjun cave and in the neighbourhood are the Karnachapara and Lomas Rishi caves.

HAFT LANG. A tribe of the Bakhtiari.

HAFT TAN. Pers. Lit. seven persons, who in the early days of mahomedanism,

were worshipped in Kurdistan by the Ali Ilahi sect as the incarnate deity. Baba Yadgar was one of the seven persons. His tomb is in the pass of Zardah, and is the holy place of the Ali Allahi sectarians, who believe in upwards of a thousand incarnations of the godhead. At the time of the Arab invasion of Persia, the Zardah pass was regarded as the abode of Elias. See Ali Allahi.

HAGGIS. Sultan Baber compares the Jack fruit to a haggis. "You would say," quoth he, (p. 325), that the tree was hung all round with haggises," *Yule, Cathay*, II, p. 362.

HAGAI. HIND PASHTU. Fraxinus xanthoxyloides, Crab-ash.

HAGIN MARA, CAN. Nauclea ? *sp.*

HAGRIA VOSMAERII. *Gray*, a reptile of Bengal of the family Scincidæ.

HANSA, the vahan of the hindu god Brahma. See Vahan.

HAHULAI. EGYPT. Aloes wood.

HAI or Ai, the royal city of the Canaanites.

HAIDAR, or Hyder Ali, an officer of the Mysore sovereigns whom he set aside. He was an active intelligent soldier. On the 17th Augt. 1764, he routed the rear of a British convoy. He carried war into the Carnatic and his advanced posts reached St. Thomas' Mount, eight miles from Madras. He left at his death, a compact kingdom and was succeeded by his son Tepu known as Tippoo sultan.

HAIGA. A clan of brahmans, in Canara.

HAIFA. A name of Caifa in Palestine.

HAIQ. The populations to whom the term Armenian is now applied, call themselves Haiq. Their chief occupancies are the Turkish province of Erzerum, and the Russian district of Erivan, and the patriarch resides in Erivan. They are now under the sway of Russia, Persia and Turkey, but they are found in all eastern countries; 37,676 are in European Russia alone, and one important settlement of them is in Venice, that of the Mechitarist monks, on the island of St. Lazarus. In figure, the Armenians have been likened to the Jew, the Turk and the Afghan. They evince great commercial aptitude, and are bankers and merchants. In Armenia, however, they cultivate the soil. Before their conversion they were fire worshippers. Many of them now are Nestorian christians, some are Romanists. The language of the present day has affinities with the Iron, and Persian, Arabic, Syrian and Turk. General tradition and the formation of language point alike to the mountains of Armenia as the birth place of the Arab and Cananitish races, and there is especial native evidence to the same effect as regards Edom, consequently the Phœnicians.

HAIL. HIND. of Jhilam district, manured land.

HAIL occasionally falls in India southwards, almost, to the equator. Occasionally the fall assumes the form of lumps of ice, so large and heavy as to break through the roofs of houses and kill, or injure, the larger quadrupeds such as sheep. In Ceylon, it has fallen at Kornegalle, at Badulla, Kaduganawa and Jaffna. On the 24th September 1857, during a thunder storm, hail fell near Matelle in Ceylon in such quantity that in places it formed drifts upwards of a foot in depth.

Violent hailstorms are frequent in the hot seasons of Central and Eastern India. The following are amongst the most marked of the meteorological phenomena which occurred in the first fortnight of March in one year. On the 3rd, a violent hailstorm occurred at Bolarum, which dashed right through the roofs of the houses, and stripped the trees of their leaves and branches —it was experienced at Secunderabad, but did not extend to Hyderabad itself. A hailstorm occurred at Cawnpoor on the 8th, and two violent hailstorms happened at the same time near Meerut. Many of the fragments being the size of ostrich eggs. A violent squall with hail occurred at Hurryhur on the 12th; two hundred and seventy birds, which had been killed by it, were picked up in a single garden, and the river was found covered with dead fish, which seemed to have been attracted to the surface and fell victims to the gratification of their curiosity. The following abstract of the proportion of hail-storms, due in India at the different months of the year, may be found of interest to many inquirers. It is taken from a hundred and twenty-seven storms, which we find on record during the last forty years:—

January ... 5	May ...17	September 2	
February...20	June ... 4	October 3	
March ...31	July ... 2	November. 4	
April ...34	August ... 0	December. 5	

One year a heavy fall of hailstones took place near Ashteh, (the village where Bapoo Gokla fell,) which caused severe injuries to people working in the fields, and the death of a girl about ten years of age. Many of the hailstones were larger than a good sized wood apple, they fell in an oblique direction, and so accumulated at the foot of walls that it took two days in some places for them to melt away. One stone was larger than a man's head and took two days to dissolve, the wheat crops which were

then nearly ripe for taking down, were quite destroyed by it. In Hyderabad in the Dekhan, hail-storms usually occur in the very hot period of the year, in April or May, and the hail doubtless falls from a great height. In Berar and in the parts of the Mahratta country there is a caste of hail-conjurors, the Garpagori, who pretend to have the power of preventing hail falling on fields.

HAILEYBURY. A college in England where the civil servants of the East India Company were formerly educated.

HAI-LING-SHAN, or Hin-ling-san, is a high island, on the south coast of China, extending about 12 miles. Two small islands form it into a harbour. *Horsburgh.*

HAINAN ISLAND, bounding the Gulf of Tonquin to the Eastward, extends 165 miles in a N. E. and S. W. direction, and is about 75 miles in breadth. Viewed from the sea, it presents many high and uneven appearances, but inland, there are many level districts, cultivated with rice, sugar-cane, tobacco, and betel-nut trees. These level tracts are separated by lofty mountains and impenetrable forests, through which paths are opened. The island is subject to the Chinese, whose officers fill all the public offices. The fishing boats are built of a hard, heavy wood, and sail fast. Their fishing voyages, commencing in March, last for two months, and they navigate to 700 or 800 miles from home, collecting beche de mer, dry turtle and sharks' fins, amongst the numerous shoals and sand banks in the S. E. of the China Sea. *Horsburgh.* See Tonking.

HAINES, Capt., an officer of the Indian Navy.

HAIR. Eng. Dut.

Poil,	Fr	Ruma, Bula Ranbut, Tailhan,	Malay.
Haare, Huhaare,	Ger.	Kesa,	Sans.
Bal,	Guz. Hind.	Mairu,	Tam.
Pelo,	It. Sp.	Ventrukulu,	Tel.
Pelles,	Lat.		

The hair of animals is a considerable article of traffic. Goats hair is largely exported from Bombay to England. The hair of the elephant's tail and the bristles of the wild boar are utilized in India. The value of the exports of hair from India amounts to about £2,000 annually.

Human hair.

Cheveux,	Fr.	Capelli umani,	It.
Haar,	Ger.	Capilli,	Lat.
Menschen Haar,	,,	Cabellos,	Span.
Bal,	Hind.		

The women of all the oriental races wear long hair, differently braided. The men of Beluchistan and Afghanistan shave the front but wear hair long on the back and sides of the head. Mahomedans of India as a rule shave their heads and hindoo men also shave, leaving only a scaup-lock on the crown. Brahman women, on the demise of their husbands have their heads shaved. The ancient Greeks, in laying out their dead, placed an obolus or Greek coin in the mouth, to pay Charon's fare across the rivers Styx and Acheron, and a cake made of flour and honey to appease Cerberus. Greek men cut off their hair, when they obtained the age of puberty and dedicated it to some deity. Theseus is said to have repaired to Delphi to perform this ceremony and to have consecrated his shorn locks to Apollo. After this, it was again allowed to grow long and only cut off as a sign of mourning. Thus, at the funeral of Patroclus (Iliad xxiii) the friends of Achilles cut off their hair and

"On the corse their scattered locks they throw."

In some parts of Greece, however, it was customary to wear the hair short and to allow it (*Cassandr.* 973) to grow long when in mourning

Neglected hair shall now luxurious grow,
And by its length their bitter passion show,—

In Luristan, at present, the women on the death of their men relatives, cut off their hair, and hang the locks around the tomb. The practice of the young women and young men of the Island of Delos, was something similar; they cut off a lock of hair before marriage and placed it near the tomb of the virgins from the hyperboreans.

The hair of hindoo women, and often also that of men, is frequently made a votive offering to their gods. Crowds of hindoo pilgrims are to be seen moving towards Triputty and other holy places but the men and women return with heads shaved. Mahomedans of India have black hair, which they occasionally dye red with henna or mehndi. The Somali of the East of Africa, change their hair into red by mixing it with lime. Amongst the Romans, blonde auburn tresses were most admired and to obtain these, men steeped their hair in a powerful alkali, as the Somali now do.—*De Bode*, II, 218-19.

HAIRI KAIRI. Japan. or the happy despatch—the ripping up of the belly by a Japanese. See Hari Kari.

HAIR POWDER.

Poudre a poudrer,	Fr	Polvere di cipri,	It.
Puder,	Ger.	Polvos de peluca,	Sp.

—*McCulloch.*

HAIRY BREAD-FRUIT TREE. Artocarpus hirsuta.—*Lam.*

HAIRY LETSOMIA. Letsomia setosa.

HAI-TSAI. Chin. Gracillaria tenax.

HAI-YANG, is the Neptune of the Chinese. In Hi-ching-mian, is a temple of the sea god, at Ta-coo, in one hand he holds a magnet as emblematic of security, and a dolphin in the other, to show his sovereignty over the inhabitants of the sea; his head, beard, and hair, are evidently intended as a personification of water.—*Baron Macartney's Embassy*, Vol. I, p. xxxi.

HAIYU, Chepang, and Kusundu are three uncivilized Bhot tribes who dwell amid the dense forests of the central region of Nepal, to the westward of the great valley; they dwell in scanty numbers and nearly in a state of nature. They have no apparent affinity with the civilized races of that country, but live in huts made of the branches of trees, on wild fruits and the produce of the chase. The Chepang are slight, but not actually deformed though with large bellies. Mr. Hodgson says they are of Mongol descent. Their language is akin to that of the Lhopa. The Chepang, Haiyu, and Kusunda, seem to belong to the Rawat group of frontier populations. They are named by Mr. Hodgson as Durre, Denwer and Bramho, which Mr. Latham believes to be the same as Tharu, Dhangur, and possibly Brahman. They occupy the districts where the soil is moist, the air hot and the effluvia miasmatic.—*Latham.*

HAIZA. Ar. Hind. Cholera, Haiza-kapatta.

Hind. Kalanchoe varians.

HAJ. Ar. A pilgrimage, by a mahomedan, to Mecca, Medina, Jerusalem, &c., hence the word Haji a pilgrim. The day of the ceremony is the 10th Zu ul Haj, on the Kurban or Bakr 'Eed festival. The setting forth of the pilgrims from the distant parts of the world, is generally attended with great show. The Persian shiah sect resort in pilgrimage to three places; the town of Meshid is reckoned the least in the scale of sanctity; and those who have been there to the tomb of Imam-Raza, obtain the name of Meshidi. The next, after them, are the Karbalai, who stand a degree higher in estimation, while those only who have visited the Kaaba at Mecca and the tomb of Mahomed at Medina, can lay claim to the title of Haji. A Persian will feel offended if you call him Meshidi, when he has a right to the superior degree of Kerbelai, or the still higher and more pompous appellation of Haji. Thus Meshedi, Kerbelai, and Haji, become titles of distinction.—*Baron C. A. De Bode's Travels in Luristan and Arabistan*, p. 25.

HAJ DARWAZAH, the Pilgrim gate of the city from which the pilgrims issue when proceeding on pilgrimage.

HAJAM. A barbar, who shaves, bleeds, cups, cleans the ears, pares the nails &c., usually included among the village establishment.—*Wilson.*

HAJAR Ar. A stone, any stone.

HAJAR-UL-AKAB. Eagle stones of the ancients, one of them was probably the bonduc nut of the Guilandina bonduc: the Greeks believed that the Eagle stone or Aetiles were only found in the nests of eagles and the Arabs describe them as resembling tamarind stones, but hollow, and found in Eagles' nests, and they believe that the eagles bring them from India.—*King.* See Ætiles.

HAJAR UL MUSA. Arab. Asphalte.

HAJAR-US-SIAH. A celebrated black stone which stands within the kaaba at Mecca, an object of the greatest veneration. This stone is set in silver, and fixed in the south-east corner of the temple. It is deemed by mahomedans one of the precious stones of paradise that fell to the earth with Adam, and, being preserved at the deluge, the angel Gabriel brought it to Abraham when he was building the Kaaba. It was, they say, at first white, but its surface has become black from coming in contact with those who are impure and sinful. These and many other fables are told of this relic of idolatrous worship, for such it undoubtedly may be considered.—*Malcolm's History of Persia*, Vol. II, p. 336.

HAFERO. Sindi. Mimosa tubucaulis. *Lam.*

HAJI. Ar. A mahomedan pilgrim, one who has visited a holy place of pilgrimage, Mecca, Medina, Karbela, Jerusalem, Sinai, Meshid, &c. They are little esteemed in the peninsula of India or in Hindustan, but are much revered in central Asia, and in the Mahomedan parts of the Eastern Archipelago Amongst the tombs in India to which mahomedans resort is that of Haji Rahmat oollah and oblations are offered at his shrine..

HAJI AHMUQ and Haji Bay-wuqoof, are mahorum fakeers.

HAJIGAK. A pass in the Hindu Kush 12,400 feet above the sea.

HAJIN. According to General Briggs, one of the aboriginal tribes of India.

HAJONG. A section of the Bodo tribe who dwell in the plains of Cachar. See Bodo.

HAJRAH. The Arabic name of Hagar, the kept woman of Abraham, the mother of Ismael generally called the Bibi Hajirah.

HAJUR MUNI. Beng. Phyllanthus urinaria.

HAKIM. A mahomedan physician; a

learned man, pronounced hakeem. General Ferrier says that the influence which the Hakeem Sahib has generally exercised in the British embassy at Teheran, and the employment of such men as Jukes, Campbell, McNeill, Riach, Bell, Lord, and others, in various important duties in those countries, has naturally led the chiefs of Herat to suppose that physicians occupy a higher place in the councils of the British than is accorded to them, and they attribute much of the prosperity of the British nation to their hikmut.—*L. Ferrier Journal*, p. 149.

HAKIK. HIND. Canna indica.

HAKKU. HEB. Akka or Ptolemais, their inhabitants were called Gaik-Krui.

HAKODADI was a small fishing town; but the number of inhabitants increased 60 per cent., within twelve months, and business considerably more. See Japan.

HAKOOCH-KANTA, BENG. Dilivaria ilicifolia.

HAKOOI. BENG. Hakoon. HIND. Croton polyandrum.

HAKOORK. BENG. HIND. Psoralea corylifolia.

HAKRA. A name of the river Caggar.

HAKRI. ANGLO-HIND, from "akra" a cart.

HAKSHA. HIND. Portulaca quadrifida.

HAKUCH. BENG, Psoralea corylifolia. *Linn.*

HAKUN. HIND. Croton polyandrum. *Roxb.*

HAL. ARAB. HIND. Present, present state, condition, current, as Ibrahim Khan-i-hal, the present Ibrahim Khan; Hal-ki-waste, for the occasion. It occurs frequently in combination and is used in revenue accounts to represent the existing state of collections.—*Elliot Supp. Gloss.*

HAL. SINGH. Vateria indica, *Linn.*

HAL. The Tamil name of a Ceylon tree which grows to about 2 feet in diameter, and 12 feet high. It is used in native vessels, palanquins, &c. and produces a fruit which the natives eat.—*Edye on the Timber of Ceylon.*

HAL. HIND. A plough: it has been suggested that as the Arians were originally and essentially an agricultural and therefore a peasant race, they may have derived their name from their plough, and words of a similar sound relating to agriculture are found in several tongues. In Latin, it is aratrum, from aro, I plough. In Egyptian (in Nefruari) Ar is said to mean a plough. In Tamil it is Er, ಏರ್ in Telugu, Araka, ಅರಕ್ in Sanscrit, along with Nagala or Nagara, it is also called Hala or Hara ಹರ and possibly the Arian race may have obtained their name from this implement of husbandry.

HALA, also Halla Kandi, a ruined city on the Indus, thirty miles above Hyderabad.

HALA, or Salt Range of mountains, stretch from the E. base of the Sulimun mountains to the Jhelum river, N. E. to S. W., in lon. 32° 30' to 33° 30.' Their highest elevation is 2,500 feet. Vegetation scanty; the bold and bare precipices present a forbidding aspect. About 32° 50', 71° 40,' the Indus makes its way down a narrow rocky channel, 350 yards broad; and the mountains have an abrupt descent to the river. The Hala mountains on the west of the Lower Indus, separate Sind from Beluchistan. Shawl and Pisheen are between the Hala and Amran ranges, on the N. frontier of Beloochistan. Khojuck. Pass, Amran Mts, 30° 45', 66° 30', 7,449 feet, Pisheen, from 5,000 to 6,000 feet. Shawl exceeds 5,000 feet Sir-i-ab, 30° 3' 66° 53', 5,793 feet. The wildest parts of the enclosing mountains, are haunts of wild sheep and goats; the more accessible tracts yield pasture for herds and flocks. Orchards numerous. The Dasht-i-be-dowlat (wretched plain) is destitute of water.

HALU BRAHUIK, or Bolan Range of mountains, length about 400 miles, from Tukatoo to Arabian Gulf, forming the E. wall of Beloochistan table land. Average height, 5,000 to 6,000 feet. Kurklekee mountains, is that part which borders on the Bolan Pass, from 29°, 20' to 30° 10' and 67° to 67° 30', where the crest of the Bolan Pass intersects them is 5,793 feet. The range is crossed by the Bolan Pass, through which the route lies from Shikarpore to Kandahar and Ghuznee, and though important in a military point of view, is inferior in commercial interest to the Goolairee farther North.

HALAF. AR. HIND. PERS. An oath.

HALA HALAI. HIND. Rhus succedanea,

HALAILI. A cotton stuff, with long stripes of white silk, a favourite material amongst the city Arabs. At Constantinople, where the best is made, the piece, which will cut into two shirts, costs about thirty shillings.

HALAL. HIND. Lawful food for mahomedans, as opposed to haram, unlaw-ful.

HALAL KHOR. HIND. PERS. A sweeper, a house scavenger. The words are Arabo-Persic, and mean a lawful eater, i. e. one to whom everything is lawful. Scavengers are usually mahomedans and are often called Mahtar, Bhangi, Toti.

HALAMAHERA. A group of islands in the S. E of the Archipelago.

HALAMBA-GASS. SINGH., Nauclea cadamba.

HALAPORPHYRUS. A genus of fishes

of the Family Gadidæ, which may be thus represented.

FAM. 3 —Gadidæ.

Gen 18 Gadus, 2 Gadiculus, 1 Mora, 1 Halargyreus, 1 Strinsia, 3 Merluccius, 4 Lotella, 1 Physiculus, 1 Uraleptus, 1 Pseudophycis, 6 Phycis, 2 Læmonema, 1 Halaporphyrus, 1 Lota, 3 Molva, 1 Hypsiptera, 2 Couchia, 5 Motella, 1 Raniceps, 1 Bregmaceros, 2 Brosmius.

HALAR, see Rajpoots.

HALAS, a branch of the Sakai population of the Malay peninsula. They tattoo their face and breast, pierce their ears and nose and insert porcupine quills. See Kedah.

HALBEH. ARAB. Seeds of Trigonella fœnum-græcum.

HALAYA PAIKA, or old pack, a race in Mysore. Wilson says, Halepaik, KAR., is a term applied in Mysore to the drawers of tari who speak the Tuluva language.

HALBAMBAR. HIND. Hedera helix.

HALCYONIDÆ, a family of birds, containing 5 gen, 23 sp viz., 2 Dacelo : 8 Halcyon: 2 Todirhamphus : 2 Ceryle : 9 Alcedo : 2 Ceyx, See Birds, p. 469.

HALCYON SAUROPHAGA. A very fine kingfisher with white head, neck, and lower parts, green scapulars, and blue wings and tail, previously known by a single specimen from New Guinea in the British Museum. It is a very shy bird, frequenting the margin of the island, usually seen perched on some detached or solitary branch, as if sunning itself, and darting off into the dense bush upon being approached. *Macgillivray Voyage* Vol. I p. 245.

HALDAR. H. or Holdar, a name borne by some Bengal families of the trading castes. *Wilson.*

HALDI. HIND. Turmeric, Curcuma longa, ban haldi, Hind. Hedychium spicatum and Roscoea purpurea.

HALDIA MOORA and Singia moora are roots brought to Ajmere mixed with haldi; they are acrid and poisonous, and are carefully separated.—*Genl. Med Top. p.* 151.

HALDU. HIND. Also Kaddam, Nauclea cordifolia.

HALEE DASUL. CAN. Lagerstrœmia reginæ, *Roxb.*

HALELA. HIND. Terminalia chebula ; T. citrina.

HALEO. HIND. Cornus macrophylla, dog wood.

HALENIA. See Chiretta.

HALES; Cornus macrophylla also called Harin ; Hadu ; Harrin, Nang Punjabi. *Wall.*

HARGAM BAAL. See Aerolites.

HAL-GASS. SINGH. Hal gaha, SINGH. Vateria indica.—*Linn.*

HALHAL-KA-BIJ. HIND. Cleome pentaphylla.

HALHED, Nathaniel Brassy Halhed, in 1776, published a code of Gentoo laws or ordinations of the pandits, from a Persian translation made from the original, written in the Sanscrit language.

HALIAETINÆ, a Sub-Family of birds containing 6 gen. 7 sp. viz., 1 Pandion; 2 Pontoaetus ; 1 Blagrus ; 4 Haliætus ; 1 Haliastur ; 1 Milvus.

Haliætus fulviventer. *Viell.* The Ringtailed Sea Eagle.

Falco Macei, TEMM.	Haliætus unicolor, GRAY.
Haliætus ,, BLYTH.	,, lanceolatus, HODGS.
,, albipes, HODGS.	
Mach-arang, BENG.	Bala, BENG.
,, manga, ,,	Kokna of the KOL.
,, korol, koral, ,,	Ugus, ,, ,,

The Ringtailed Sea Eagle is found throughout the N. of India, along the Ganges and Indus up to Kashmir. It lives on fish, turtle and snakes.

Haliætus leucogaster. *Gmel.* The Grey Backed. Sea Eagle.

Blagrus leucogaster, BLYTH.	Falco blagrus. DAUD.
Ichthyaetus cultrungus, ,,	,, dimidiatus, RAFFLES.
	,, maritimus, GMEL.

This Sea Eagle is found throughout India in Burmah, Mayläyana and Australia, chiefly on the coast and near the mouths of rivers. It lives on sea snakes, crabs, rats, and on fish which it picks up on the beach.

Haliætus leucocephalus is a bird of N. America and N. E. Asia.—*Jerdon, Birds of India*, pp. 57 to 86.

H. albipes.—*Hodgs.* and lanceolatus.—*Hodgs.* H. macei *Blyth*, and H. unicolor *Gray* are Syns. of Haliætus fulviventer.—*Viell.*

Haliætus leucogaster.—*Gmel.* Syn. of Blagrus leucogaster.—*Blyth.*

Haliætus plumbeus.—*Hodgsen.* Syn of Polioætus ichthyætus.—*Horsf.*

Haliætus pondicherianus. See Garuda, Serpent. See Vahan, Vishnu.

HALIASTUR INDUS is the Sunkar cheel or Siva's kite, and is known to Europeans as the brahmany kite. In Bengal, the kites and brahmany kites breed chiefly in January and February, and disappear during the rains. Europeans have given the name of the Brahmany Kite to the Haliastur Indus, probably from observing the superstitous feelings of the natives regarding it, who revere it as Garuda, the eagle vahan of Vishnu, and believe that when two armies are about to engage, its appearance prognosticates victory to the party over whom it hovers. Bartholomew says, that

the vehicle of Vishnu is called "paranda" in the language of Malabar, where it is held in great veneration, particularly by women; and if one of these birds snatch a fish from their hand, they consider it as a most fortunate omen. The friar must have seen this bird pouncing on the fish-baskets borne by the Makati women of the Makwa or fishing tribe, on the coast of Malabar. The Brahmany kite is very useful in the populous sea-port towns of India in removing carrion and refuse and is never killed. Its usefulness was, perhaps, originally the cause of its obtaining, like the cow, a protecting legend in the popular superstition of the hindus, as with the Ibis, and Ichneumon in Egypt, where filth and noxious animals abound. Major Moor mentions as an instance of this bird's boldness of which he was a witness, viz., its stooping, and taking a chop off a gridiron standing over the fire that cooked it. The religious hindoo feeds these birds on holidays, by flinging up little portions of flesh, to which they are attracted by the call Hari! Hari! meaning Vishnu, Vishnu.—*Tennent's Sketches of the Natural History of Ceylon*, p. 246. *Moor*, p. 447. *Cole. Myth. Hind.*, p. 374. *Tod's Travels. Taylor Mackenzie's M. S. S.*, p. 57. *Cole. Myth. Hind. Inscriptions*, pp. 369 to 383. *Krishna*, p. 545. See Arians, Birds, Garuda, Nandi, Ravana, Serpent, Siva, Surya, Vahan, Veda, Vishnu, Vrishala.

HALICACABUM of Pliny, supposed to have been Physalis somnifera, *var.* flexuosa.

HALICHONDRIA. See Halispongia.

HALICORE DUGONG.—*Cuv.*

Trichechus dugong. *Gmel.*	Dugungus Indicus *Ham.*
Indian Dugong. ENG.	Le Dugong des Indes FR.
Dugong: Lamantin. ENG.	Duyung. MALAY.

The Dugong is an inhabitant of the narrow seas of the Eastern Archipelago, and professor Owen denominated it Halicore indicus, in distinction from that of the northern coast of Australia, at a time when the former had not been ascertained to frequent (as a Dugong of some kind is now known to do) the Malabar coast and Gulf of Calpentyn in Ceylon; but it still remains to be proved that this is the true Malayan Dugong, however little reason there may seem to doubt it,—as there might equally have seemed little cause to suspect the distinctness of the other Halicore species.

The Halicore dugong inhabits the shallows of the Indian Ocean and about Ceylon, where the water is not more than two or three fathoms deep. It does not appear to frequent the land or the fresh water. Its flesh is delicate. The dugong was noticed as occurring in Ceylon by the early Arab sailors, by Megasthenes (*Fragm.* lix) and Ælian, and subsequently by the Portuguese. It is this creature which has given rise to the tales about mermaids which have till the present day occupied the world, and doubtless had their origin in the tales of the Arab-sailors. They are phytophagous or plant eaters.

Halicore Indicus, Owen. The Malay dugong, an inhabitant of the narrow seas of the Eastern Archipelago.

Halicore Tabernaculi, Ruppell. The dugong of the Red Sea, has a feeble voice, and feeds on algæ. It is about ten feet long. In February and March, bloody battles occur between the males. Its flesh, teeth and skins are utilized.

Halicore Australis, the Manate of Dampier, and white tailed manate of Pennant, is a native of the West Coast of Australia.

Halicore Indicus.	*F. Cuvier.*
Trichechus dugong ERXLEBEN.	Halicore tabernaculum. RUPPELL.
Halicore cetacea ILLEGER.	Dugungus marinus, TIEDEMANN apud SCHINZ.
Halicore dugong, CUVIER apud RAFFLES.	
Dugong of BUFFON.	Parampuan laut, MALAY.
Dugong MALAY.	

Under these synonyms, Dr. Theodore Cantor unites all the above, which he says inhabits the Red Sea, the seas of the Malay Peninsula, Singapore, Sumatra, the Philippine islands, Moluccas, Sunda islands, and New Holland.—*English Cyclopædia, p.* 913. *Mr. Blyth in Beng. As. Soc. Journ. Tennent's Ceylon, Dr. Theodore Cantor in Beng. As Soc. Journal, No.* CLXXII of 11th December 1846.

HALIFAX, Lord, better known as Sir Charles Wood, Secretary of State for India, in the middle of the 19th century and during the time of the revolt and mutiny. He did not support Lord Canning in his administration.

HALIM BENG. DUK. HIND. Lepidum sativum. Garden cress.

HALI MARAM. CAN. Chrysophyllum roxburgii.—*G. Don.*

HALI-MOONG. BENG. Green gram, Phaseolus mungo.

HALIOTIDÆ, a family of recent and fossil shells, belonging to the class Gasteropoda, of the Mollusca, the genera of which may be thus shown—

Gen. Haliotis, Ear-shell, Sea-ears, *recent* 75 sp. *fossil* 4 sp

Sub-Genus, Deridobranchus.

Gen. Stomatia, *rec.* 12 sp. *fossil* 18 sp.

„ Scissurella, *rec.* 5 sp. *fossil* 4 sp.

„ Pleurotomaria, *fossil* 400 sp.

Sub-Genus, Scalites, *fossil* 8 sp.

Gen. Murchisonia, *fossil* 50 sp.
„ Trochotoma, *fossil* 10 sp.
„ Cirrus, *fossil* 2 sp.
„ Janthina, violet snail, *rec* 6 sp.

One species the Haliotis or sea-ear mollusc or ear shell is largely used as food by the people on the coast of Manchuria. They are also dried and exported to China, and sell at 300 for a dollar.—*Adams.*

HALISPONGIA, DE BLAINE, a genus of sponges, the genus Halichondria of Fleming.

HALIUN. HIND. Asparagus racemosus.

HALJA. HIND. Curcuma longa.

HALL. A very soft, coarse, open-grained, light, Ceylon wood, adapted only for very inferior work, and where durability is not required.

HALLAR. See India, p. 335. Kattiyawar.

HALLIKAR. A tribe of the agricultural sudra in Mysore.—*Wilson.*

HAL MENDORA. SINGH. Cynometra.—*Linn.* A hard, fine, close-grained, heavy, Ceylon wood, used for bridges and in buildings.

HAL MILILA. SINGH. Berrya ammonilla. A rather soft, though fine, but not very close-grained, heavy, Ceylon wood.

HALU. HIND. Impatiens *sp.* also Salvia lanata.

HALUKOO, the Mogul conqueror of Persia, grandson of Chengis Khan, was the prince whose victorious arms, almost repaid to his new dominions, the devastations of his conquest.—*Porter's Trav.* Vol. I, p. 288.

HALUN. HIND. PANJ. Seeds of Asparagus, also Solanum gracilipes.

HALWA, a hill race, not Gond, pretty numerous in Bastar, Bandara and Raepore, who covet the distinction of wearing the sacred thread, which right those in Bastar purchase from the raja.

HALWA. HIND. A kind of sweetmeat, specially that made of honey and camel's milk, and brought from the Persian Gulf, via Bombay, in saucers. Halwai is a sweetmeat seller. Halwa-Rang means color of sweetmeat, pale drab, first dyed with naspal, pomegranate rind, then with catechu.

HALWAKKAL. A tribe of the agricultural sudra in Mysore —*Wilson.*

HALWA KADDU. HIND. Cucurbita maxima.

HALWA PASHMAK. HIND. A sweetmeat made in threads; also Juniperus communis.

HALYS. A genus of reptiles of the family Crotalidæ, H. Himalayanus occurs in Gurhwal and H. Elliotti in the Neilgherries.

HAM. See Kush or Cush.

HAMA SYRIA. See Abul Feda.

HAMADAN. A town in Persia, the ancient Ecbatana. Among the antiquities of Hamadan, the tomb of Mordecai and Esther is pre-eminent. It is impossible to conceive a more charming situation, a country better suited to live happily in, than Hamadan and its neighbourhood. The country is undulating, the soil rich, the water good, the climate singularly clear, healthy, and bracing, with picturesque mountains at hand for retirement during the heats of summer. *Ferrier Journ. p.* 35. *J. B. Fraser p.* 221. *Porter's Travels Vol. II. p.* 91. See Khuzistan or Arabistan, Kizzel Ozan, Rawlinson.

HAMAL. AR. A porter or bearer, palankin bearers in Western India. *Yule Cathay* II. p. 366.

HAMAM. AR. HIND. PERS. A bath, Hamam lena to take a bath. Public baths, usual in Persia and Kabul, are unknown in India.

HAMAM DASTAH. HIND. A mortar, from the Persian Hawan.

HAMAMELIS CHINENSIS. One of the Hamamelidaceæ, or Witch hazels, a plant hitherto only known as a native of China though it grows on the Jyntia Hills; this, the Bowringia, and the little Nymphœa, are three out of many remarkable instances of an approach to the eastern Asiatic flora.—*Hooker, Him. Jour. Vol.* II. *p.* 318.

HAMA RAJA? A very small Penang tree, little used.

HAMANIEL. SINGH. Berrya ammonilla, *Roxb.*

HAMAYUN, emperor of India, son of the emperor Baber, succeeded Baber A. D. 1530. After a series of reverses, he retreated in 1540 to Amerkot, where his wife gave birth to his son, Akbar, who has been the most distinguished of the emperors of India. Hamayun continued to meet with misfortunes and successively sought refuge in Candahar and Persia, but with the aid of 14,000 soldiers from the Persian king, he recovered Candahar and Cabul, crossed the Indus in 1555, defeated the emperor Secunder Soor and reconquered Delhi which he entered in triumph. In 1556, he accidently fell over the terrace of his library and was killed, and his son Akbar succeeded, as emperor.

Akbar was then but twelve years of age, the same period of life at which his grandfather, Baber, maintained himself on the throne of Ferghana. In the vicinity of Delhi is the well preserved mookabrah or tomb of Hamayun; though old, all that seems to wear features of decay is the external coating of cement.—*French's Tour, p.* 14.

HAMBUKH. Hind. Myricaria germanica.

HAMD-ALLAH. Ar. An abbreviation of the ejaculation-ul-hamd-ul-illah, the praise be to God, as commonly used by mahomedans as the thank God of the English.

HAMDE PADARA of Ravi, Coriaria nepalensis.

HAMECOUS. Fr. Fish hooks.

HAMEIR. See Kulzum.

HAMILTON. Dr Francis, formerly Buchanan, a Bengal medical officer who published papers in the Linnæan Society's Transactions, Author of a journey through Mysore. An account of Nepaul. Edin. 1819. Description of Hindoosran—Lond. 1820, 2 vols. 1822 4to. Account of the Fishes found in the River Ganges and its branches with a volume of Plates. Dr. Buchanan Hamilton was the first after Rheede to explore the botany of Malabar. In the extreme south of Malabar the rainfall at Quilon is 77 inches, and at Trivandrum 65 inches, probably from the narrowing of the land and the lower elevation of the mountains. The humidity, however, continues excessive. At Cape Comorin the amount of rain is only 30 inches. Hamilton tells us that it resembles Bengal in verdure, but has loftier trees and more palms, the shores are skirted with cocoanuts, and the villages surrounded with groves of betel-nut, palms and talipots. Vateria Indica, a noble Dipterocarpus tree is abundantly planted in many parts; cassia, pepper, and cardamoms flourish wild in the jungles, and form staple products for export. The mass of the Flora is Malayan, and identical with that of Ceylon, and many of the species are further common to the Khasia and the base of the Himalaya. Teak is found abundantly in the forests, but the sandalwood occurs only on the east and dry flanks of the chain. Oaks and coniferæ are wholly unknown in Malabar, but the common Bengal willow, Salix tetrasperma, grows on the hills. Gnetum and Cycas both occur, the former abundantly. The mountain-chain which forms the eastern boundary of Malabar, separating it from Mysore and the Carnatic, has, except on the eastern slopes of the most lofty parts, a very humid climate, and is therefore most appropriately noticed here.—*H. f. et Th. Dr. Buist's Cat.*

HAMILTON, Captain, visited Cambay in A. D. 1681 and gave an account of its quartzose minerals.

HAMILTON, Sir Robert N., a member of the Bengal Civil Service, who served from 1819 till about the year 1860.

HAMILTON, Walter. Author of East India Gazetteer 1815.—*Dr. Buist.*

HAMILTON TEAK. Tectona Hamiltonia.

HAMILTONIA SUAVEOLENS. Roxb.

Muskei, Kantalu, fi-sanni of Chenab,	Niggi, tulenni, phul, golunla of Ravi
Pudari of Sutlej.	Kanera, pudari of Beas

A common shrub in the Punjab Himalaya, up to near the Indus at from 2,500 to 6,000 feet. Its wood is very small, but in Chumba it is said to be used for making gunpowder charcoal.—*Dr J. L. Stewart, M.D.*

HAMIR. The Balla race were of sufficient consequence in the thirteenth century to make incursions on Mewar, and the first exploit of the celebrated rana Hamir was his killing the Balla chieftain of Choteela.

HAMIRPUR A district west of Banda.

HAMITES. See Arians.

HAMITIC CUSHITES. See Kush or Cush.

HAMKAT-JHOOLI. Beng. Phyllanthus reticulatus.

HAMMA-I-JOUR. Literally "joining of hands," a Parsee ceremony practised in Pappati, similar to the English greeting of a "Happy New Year."—*Pursees*, p. 61.

HAMMAZ. Hind. Sidi cordifolia.

HAMMEN. Dut. Hams.

HAMMER. The native sledge hammer of Bombay, employed in breaking trap, granite, limestone, and other rocks is a most efficient tool. Its handle is generally of male bamboo about two feet long: its head is something like that of an ill-shapen axe—thick all along. It weighs about eighteen pounds. In the face or striking portion is a bluntish wedge of steel, fastened in with a piece of leather. With this the native quarryman will break up the most obdurate trap into slabs or blocks of almost any size or form, from a pavement flag three inches thick and two feet square, to a block two feet cube. He looks narrowly at the grain of the stone, and then with a series of blows, of no great force apparently, literally cleaves the stone, which falls in pieces seemingly without effort. Similar varieties of this, of exactly the same pattern, are used as hand-hammers —they are called Sootki. The blasting, or rather the boring tool, or jumper, is a plain round rod of iron, about three feet, long, pointed at both ends with steel. No hammer is ever employed in boring: the jumper is raised and struck in with both hands, and a man will penetrate some inch or two in an hour. The native punch is a short dumpy lancet pointed tool—it is sharpened by being turned point up, and struck with a piece of flint. When used in stone-dressing, it is held in the left hand, and struck with a hollow-faced iron hammer, the cavity being

about an inch in depth and as much in diameter.—*Dr. Buist. Bombay Times.*

HAMMER HEADED SHARK, Squalus zygæna.

HAMOON. See Ab-i-istadah; Hamun

HAMP. Dan. Hampa. Sw. Hemp.

HAMP. See India. p. 322.

HAMUN a name for the lake of Seistan. Hamun is an old Persian word signifying expanse.—*Ed. Ferrier Journ. p.* 429.

HAMYAR was the first of the descendants of Kahtan who reigned over the whole of Yemen. The devotions of the Hamyarites, were addressed to a multitude of deities, of which the principal were the sun, the moon and the planets.—*Wright's Christianity in Arabia.* See Abdus Shams; Himyar Joktan, Kulzum, Shammar.

HAMZA. Uncle of Mahomed, slain by Wahsha, a negro slave. See Masailma El Aswad.

HAN the 5th dynasty of China began B. C. 206, and lasted to A. D. 264, a total of 469 years. Most of the Han princes were munificent patrons of literature. During the reign of Ming-ti, the 15th of the Han dynasty, considerable intercourse was carried on between the princes of India and China. This had obtained from the earliest period, but particularly during the dynasties of Sum, Leam and Tam, from the fourth to the seventh centuries, when the princes from Bengal, Malabar and the Punjab sent embassies to the Chinese monarchs.

The Han dynasty of China reformed the Chinese calendar. The Chinese, like all the natives of the north-east of Asia, reckon their time by cycles of 60 years, and give a different name to each year of the cycle. The Chinese cycle of sixty years is called Hwa-kea-tsze. The year commences from the conjunction of the sun and moon, or from the nearest new moon, to the fifteenth degree of Aquarius. It has twelve lunar months, some of twenty-nine, some of thirty days. To adjust the lunations with the course of the sun, they insert, when necessary, an intercalary month. Day and night are divided into twelve periods, each of two hours. The Chinese division of the day is therefore, as simple as the English and not much unlike it. The Chinese begin the day an hour before midnight, and divide the twenty-four hours into twelve parts of two hours each. Instead of numbering their hours they give a different name to each period of two hours; the names and corresponding times, according to the English mode, are as follow:

Tsze	11 to 1	Morning	Woo,	11 to 1	Afternoon.
Chow	1 to 3	„	We	1 to 3	„
Yiu	3 to 5	„	Shin	3 to 5	„
Maou	5 to 7	„	Yew	5 to 7	„
Shin	7 to 9	„	Seo	7 to 9	„
Sze	9 to 11	„	Hae	9 to 11	„

The word Keaou is added when the hour of each period is intended, and Ching for the last. Thus, Keaou tsze is 11 at night, and Ching tsze 12 at night; Keaou chow 1 in the morning, Ching chow, &c. &c. The word K'hih, "quarter," is used after the hour with the numerals yih 1, urh 2, or sau 3, to subdivide the hours into quarters, which is the smallest division commonly employed: example, ching maou yih k'hih, a quarter past 6; keaou woo urh k'hih, half past 11. This division still maintains itself in legal and official language, though the practical value of the European clocks, and watches, now largely used in China, is gradually substituting for it the occidental division of twice twelve hours.—*T. T. Meadows' Chinese and their Rebellions, p.* 326-330. *Tod's Rajasthan, Vol. I. p.* 218. *Gutzlaff's Chinese History, Vol. I. p.* 73). See Cycle; China.

HANAFIYAH, a large vessel of copper, sometimes tinned, with a cock in the lower part and generally, a ewer, or a basin, to receive the water.—*Burton's Pilgrimage to Meccah,* Vol. II, p. 43.

HANAN. See Abraham.

HANASA. Hind. A goose, a swan in hindu mythology, the vahan of Brama. See Brama, Hansa, Henza; Hiranya-Gharba, Nando, Vrishala, Vahan.

HANCHOOTI. Beng. Myriogyne lanuginosa.

HANCHU. Panjabi. Euonymus fimbriata.—*Wall.*

HAND. HIND. Cichorium intybus.

HAND. A slave to whom you make a present, a servant to whom you do a kindness, will rush to your hand and press it to his lips. To seize a man's hand is to crave his protection to profess yourself his servant, hence the act is one of obedience and devotion almost of servility. The person advancing to seize the hand always does so in a stooping posture in an attitude of humility. The giving the hand amongst all nations has been considered as a pledge for the performance or ratification of some act of importance, and it was the custom amongst the Scythic or Tartar nations, of transmitting its impress as a substitute. The hand being immersed in a compost of sandalwood, is applied to the paper, and the palm and five fingers (panja) is the signature. In Carne's letters from the East, is given an anecdote of Mahomed, who, unable to sign his name to a convention, dipped his hand in ink, and made an impression therewith. It is evident, however, that Mahomed only followed an ancient solemnity, or custom, for all mahommedans occasionally stamped or sealed their epistolatory communications with the print of their hand. It was considered a solemn form of signature the panjah, or palm and five digit form hand of the mahomedans, is used at the mahuram in erect panjah flags or alam, in the name of Hussain and other martyrs.—*Tod's Rajasthan*, Vol. I, p 362.

HANDKERCHIEF pieces form a considerable article of manufacture and traffic in Southern India. At the Madras Exhibition of 1857, handkerchiefs, colored, Madras; red, from Sydapet, and Ventapollem, were much admired for the harmony and richness of the colors, and the superiority of texture. Putcha Ramalinga Chetty sent from Nellore *pocket* handkerchiefs, jean, cambric, muslins, watered, (Rajabundas) and what is called unbleached drill, but it was good jean. These manufactures deserved unqualified approbation, especially the watered cambric, which was exceedingly well done. The cotton fabrics of Nellore were most interesting, excellent in quality and of great variety from the coarsest material to that which is very superior, and received from the Jury a marked notice.

The silk handkerchiefs manufactured chiefly in Bengal are known in the market as "Bandanah," "Korah," and "Chapah." They are generally figured and of different colours. They are exported chiefly to the Burmese territories and sold at from 1½ to 5 Rupees each. Those of Madras manufacture of cotton are ordinary, always red in colour and chiefly used by the inhabitants. The coloured cotton handkerchiefs manufactured at Ventapollem on the coast, which are well known in foreign markets, were formerly highly prized for their superior qualities and colours, but they have been driven from the markets by the Madras and Pulicat manufactures, which the community prefer for their superior qualities and colours. Madras handkerchiefs of superior kinds are sold at 1¾ rupee each, and inferior sorts at 4 annas to 12 annas; the colour of the last description is very perishable. The ordinary colour of the Madras handkerchiefs is red. Almost all the natives, mahomedan and hindoo, prefer them to those of other countries. The principal site of the manufacture of Silk handkerchiefs for the head, is Seringapatam in Mysore; they are of superior quality and of red and pink colours, they are in squares of 6 cubits, and are, in consequence of their gold lace borders, sold at 35 to 100 Rs. each. *Mad. Ex. J. Rep.*

HANDRO. HIND.? A tree of Chota Nagpore, with hard red timber.—*Cal. Cat. Ex.* 1862.

HANDSCHUH. GER. a glove.

HANE. Of Kangra, Pavia indica, *Royls.*

HANE. CYNGH. Crotalaria juncea

HANEE MARA. CAN. Pterocarpus dalbergioides, *Roxb.*

HANF. GER. Cannabis sativa. Hemp.

HANGLU. CASH. The stag of Kashmir.

HANGO. See Kunawer.

HANGRANG PASS, 31° 47' 7"; 78° 30' 6, in Kanawar, W. of the Sutlej, leads over to Spiti. The top of the pass, is 14,530 ft. above the sea, according to the G. T. S.—14,710 ft. Herb & Hodg. 14,837 ft. Gerard.

HANG TUAH. This celebrated champion of Java, called "the Laksamana," must not be confounded with the Laksamana of the Portuguese writers, as the latter lived several generations after the first who accompanied king Mansur to Majapahit.

HANGU. See Kohat.

HANIA. AR. An Arabic salutation, meaning may it be good to you.

HANIF. An expression employed in the Koran by Mahomed, to signify that he followed the pure and catholic faith of Abraham. One mahomedan theological sect is called Hanifi. The Hanifi theology, chiefly holds by the religion of Abraham. See Masailma and El Aswad.

HANJA, PUSHTU. Acacia farnesiana.—*Willd.*

HANJIKA. TEL., also Chiri teku. TEL. a species of Clerodendron: a medicinal root.

HAN JIN, AND TAN JIN, men of Han or of Tang, from the dynasties of those

names. *Gutzluff's Chinese History*, Vol I, p. 20.

HANKA, the Elephant drivers spear-gaod.

HANKHOW. See Yang-tze-kiang.

HANLE TSO. A fresh water lake in Ladak, in Lat. 32 ° 48', 78 ° 54', at the monastery of Hanle, 14,600 feet above the sea. This is the largest sheet of fresh water in Ladak. *Cunningham's Ladak*, p. 142. *Schlagentweit.* See India, p. 337. Maryul or Low land.

HAN-LIN. The famous Imperial academy of Han-Lin is composed of literary graduates; it furnishes orators for the public festivals, and literary examiners for the province, and is supposed to promote the cause of learning and science generally. But the people of Europe, where the press is teeming with new publications, may be astonished to learn that amongst 400 millions of men, there is not in China one original writer, nor has there been any for many centuries. The essays of successful literary candidates are almost the only new publications which see the light, and these contain nothing but what many millions before them have written under similar circumstances —*Huc Chinese Empire*, Vol. I. pp. 19, 95.)

HANNA. Ar. Hind. Lawsonia inermis.

HANOCH. Hind. of Hazara, Fraxinus xanthoxyloides, the Crab-ash.

HANQMOREY, betel-box bearers, of Oovah in Ceylon, a race or caste held to be more degraded than the Rodiya.—*Tennant.*

Ansar,	Sp.		

When the followers of the first crusade issued from England, France and Flanders, they adored a goat and a goose which they believed to be filled with the Holy Ghost.

Salu, translated quails in Numbers xi and 31, are supposed to be red geese. See Paramahansa. Hanza; Goose; Swan.

HANSA VRIKSHA. Can. Artocarpus integrifolia.

HANSI retains its name as the chief town of a zillah. It was the capital of George Thomas, who raised himself from being a sailor before the mast to be ruler of a small Indian principality. *Yule Cathay*, II, p. 406

HANSRAJ. Species of Adiantum, A. caudatum, A. capillus veneris, A. venustum, the pari-soosa or fairy hair ferns, the leaves of which are deemed by the natives of India heating and febrifuge. *Gen. Med. Top.* p 127.

HANTU. Malay. A spirit, a ghost.

HANUDAN of Kangra, Chenab, Ravi, Pavia indica.—*Royle, Ill. Him. Bot.*

HANUMAN a hindu deity, extensively worshipped; his images are set up in temples, sometimes alone, and sometimes in the society of the former companions of his glory, Rama and Sita. He is supplicated by the hindus on their birth-days to obtain longevity, which he is supposed to have the power to bestow. As the god of enterprise, offerings are made at his shrine by night. Hanuman is called Maruti, from Pavana being chief of the Marut, or genii of the winds. He is also called Muhabar. As the monkey general, who assisted Rama in his war with Ravana, he is regarded and worshipped as a demi-god. Both Hanumanjee and Boosundi are said to have their lives protracted through the four yuga of hindoo chronology. Boosund was a crow, who had more blood than he could drink in the wars of Sambhu and Nesambhu. He just quenched his thirst with blood in the wars of Rama. But in the wars of the Mahabharat he broke his beak by striking it against the hard dry earth which had soaked in the little blood shed on the occasion.

In 1868, Bala, potail of Assaye, who was five years old when Sir Arthur Wellesley fought the battle, was the pujari of the temple, in which the Editor put up. He walked in and poured water on the lingam (Abisheegan) and on Hanuman and on the bull (Basava) then put rice on these, then walked around five times, then put rice on the tulsi. *Tr. Hind*, Vol. II, p. 207. *Col. Myth. Hind*, p. 59. See Avatar.

HANUMAN-GHUR. See Khaki.

HANUMANTA BIRA. Tel. also Beri. Tel. Leonotis nepetæfolia.—*R. Brown.*

HANUZ. Panjab. Fraxinus xanthoxylloides.

HANZA, sacred goose. The figure on Buddhist monuments is the Casarca rutila or Brahminy goose. The goose is emblazoned on the national standard of Burmah.

HANZA. Hind. Acacia jacquemonti.

HANZAL. Hind. Acer cultratum, also root of Cucumis colocynthis or Citrullus colocynthus.

HAOURAN. In May, the whole of this plain is covered with swarms of Bedouin wanderers from the desert, who come for water and pasturage during the summer months, and to obtain a provision of corn for the winter: they remain till after September. If they are at peace with the pasha, they encamp generally amongst the villages near the springs or wells; if at war with him, confine themselves to the district to the south of Boazra, towards Om-e-jamal

and Jadheins, extending as far as Zerka. "The Arabs of the jabal Haouran (called the Ahl-ul-jabal), and those of the Ledja, seldom encamp beyond their usual limits; they are kept in more strict dependence on the pasha than the other tribes. The Ahl-ul-jabl are the shepherds of the people of the plains, who entrust them with their flocks during the winter to pasture amongst the rocks and mountains. In spring the Arabs restore the flocks to their proprietors receiving for their trouble one-fourth of the lambs and kids, and a like proportion of the butter, made from the milk during the spring months. Those which are to be sold are taken to Damascus." The soil of the Houran consists of a fine black earth, of great depth, but apparently, at the present day, very little cultivated. —*Burckhardt. Robinson's Travels*, Vol. II, pp. 128 to 161.

HAOU? TSING! TSING! The Chinese salutations on meeting, meaning literally, are you well? hail! hail!

HAPIUM. Bali. Opium.

HAPLOCHITONIDÆ family has 2 Haplochiton, 1 Prototroctes.

HAPLODACTYLUS, a genus of fishes of the family Sparidæ.

HAPSUM, See Tin.

HAPTA HINDU, of the Vendidad is the modern Punjab, the Hapta Sin or Hapta Hin or the seven rivers, called in the Vedas, the Sapta sindhava. These consist of the Sindhu or Indus, with its eastern confluents, viz.

Vitasta or Hydaspes.	Vipas or Hyphasis.
Asikni or Ascesenes.	Satadru or Hesydrus.
Parushni or Hydraotes.	Kubha or Kophen.

In the journeying of the Aryan race, their fourteenth settlement was in Haptu Hindu (Punjab vi. verse 19.) the Land of the seven hindus, that is, the country between the Indus and Sutlej. In the Vedas the country of the Five Rivers is also called the Land of the Seven rivers. The traditional Greek names also are seven. The Indus and the Sutlej are each formed by the junction of two arms, which, in their earlier course were independent. According to this view it stands thus

1. Kophen (Kubhà)	I. Indus.
2. Indus, Upper	
3. Hydaspes (Bidaspes)	II. Hydaspes.
4. Akesines (Asikni)	III. Akesines.
5. Hyarotis (Hydraotis, Iravati-Parusni.	IV. Hydraotes.
6. Hyphasis (Vipasa)	V. Hyphasis.
7. Saranges (Upper Satadru, Sutlej, Ghara)	

Ritter supposes that the country extended as far as the Sarasvati, but such a supposition is at variance with history. It is now ascertained from the Vedas that the Arians passed the Sutlej, at a very late period, and settled in what is now India. It was not till their fourteenth settlement after the migration from the primitive country in the north, that they passed the Hindu-Kush and the Indus. The previous resting places form an unbroken chain of the primitive abodes of the Arians (the Free or the Land owners). The last link in those earlier settlements is the land of the Afghans, on the western slope of the Hindu-Kush. Lower down to the westward there is but one settlement necessary to secure their previous possessions, namely, the two districts of Ghilan and Masandaran, with the passes of the Caspian. This settlement more to the north-west (Ghilan and Masandaran) forms therefore also a connected group. Putting these two groups together, we shall find that there is no one single fertile district in the whole of Eastern Central Asia of which our Arian ancestors did not possess themselves, except Southern Media and all Farsistan or Persis. Now as history exhibits the Arian race spread throughout the whole of Media, but as dominant only in Persia, it follows that Ghilan and Masandaran formed the nucleus of these ancient possessions which afterwards became so important and celebrated. There cannot therefore be a more unfortunate theory than the one which makes Persia the original seat of Zoroaster and his doctrine. History as well as personal observations at the present time, supply unequivocal evidence of the Iranian having been the popular language in all these districts. The names in the Vendidad moreover, when compared with Sanskrit, turn out to be regular ancient formations.—*Bunsen iii.* 465, 487.

HAPURMALEE. Beng. Vallaris dichotomus.

HAR, or harchara. Beng. Cissus quadrangularis.

HAR. Hind. A necklace.

HAR. The Rajpoot god of war is Kumara. In the hindu mythology he is represented with seven heads: the Saxon god of war has six. The six headed Mars of the Cimbri Chersonese, to whom was raised the Irmanseul on the Weser, was worshipped by the Sacasenæ, the Catti, the Siebi or Suevi, the Jetæ or Gete, and the Cimbri, evincing in name as in religious rites, a common origin with the martial warriors of Hindustan. Har of India, is the Thor of Scandinavia. The religion of the martial Rajpoot, and the rites of Har,

the god of battle, are little analogous to those of the meek hindu, the follower of the pastoral divinity, the worshipper of kine, and feeder on fruits, herbs, and water. The Rajpoot delights in blood: his offerings to the god of battle are sanguinary, blood and wine. The cup (cupra) of libation is the human skull. He loves them because they are emblematic of the deity he worships; and he is taught to believe that Har loves them, who in war is represented with the skull to drink the foeman's blood, and in peace is the patron of wine and women. With Parbutti on his knee, his eyes rolling from the juice of the p'fool and opium, such is this Bacchanalian divinity of war: this is not hinduism, acquired on the burning plains of India, but is a perfect analogue of the manners of the Scandinavian heroes? The Rajpoot slays buffaloes, hunts and eats the boar and deer, and shoots ducks and wild fowl (*cookru*); he worships his horse, his sword, and the sun, and attends more to the martial song of the bard than to the litany of the brahmin. In the martial mythology and warlike poetry of the Scandinavians a wide field exists for assimilation, and a comparison of the poetical remains of the Asi of the east and west would alone suffice to suggest a common origin. The cupra of Har, a human skull, the Calvarium, in the dialects pronounced cupar, is the cup. in Saxon. The cup of the Scandinavian worshippers of Thor, the god of battle, was a human skull, that of the foe, in which they showed their thirst of blood; and was similar to that of the chief of the hindoo triad, Har, the god of battle, who leads his heroes in the "red field of slaughter" with the cupra, in his hand, with which he gorges on the blood of the slain. The Gosain are the peculiar priests of Har or Bal, they seem all to indulge in intoxicating drugs, herbs and drinks.—*Tod's Kajasthan, Vol. I, p.* 67. See Bal; Gosain.

HAR, Terminalia chebula, and other three species, furnish all the discarded myrobalans of old pharmacopœias. The whole are much used in dyeing. The myrobalan from Delhi and Harowtee, Hindostan and the Dekhan, are of four kinds namely; *Gural harra.* Astringent and purgative: used in mesalihs: given in medicine to children: four seers for one rupee. *Juwal harra.* Used in the same way: eight seers for one rupee. *Chaipel harra*, used only in dyeing, ten seers for one rupee. According to the size of the myrobalan, its value augments, so that a very large one may be worth one hundred rupees or more, the natives believing that the very large ones have the virtue of causing purging by being merely retained in the hands, and is esteemed to possess wonderful general deobstruent and purgative qualities, &c. &c but is in reality worthless. —*Genl. Med Top.*, p. 136, 153.

HAR. HIND. A plough, enters with the composition of many compound words.

HARA. A name of Siva or Mahadeo. See Basanth, Inscriptions, p. 390. Iswara.

HARA. A Mountain range.

HARA. A branch of the Chouhon Rajpoots. There are a few of this distinguished tribe in Ruttunpoor, Bansee of Goruckpoor, but they are very rarely met with elsewhere in the North Western Provinces.—*Elliot.*

HARADUL. GUZ. Curcuma longa.

HARAKAT. AR. Trouble; inconvenience. Under British rule in India, harakat na hui, barakat hui, trouble there has been none, blessing hath there been. *Burton's Pilgrimage to Meccah*, Vol. I, p. 11.

HARA KIRI, is from Hara, *Japanese*, the belly and Kiri, root form of Kiru, to cut, self immolation by disembowelling, a mode of self execution adopted in Japan. In 1869, when Taki Zenza buro was permitted by the Mikado so to die, because he had ordered the Europeans to be fired upon at Kohe, he wore a dress of ceremony, and a Zimbaori coat. He advanced to the high altar and prostrated himself twice, with his pupil on his left to act as the Kaishaku or beheading friend. He was presented with the Waki-zashi-short sword or dirk, 9½ inches long, which the victim raised to his head and placed in front of himself. He then confessed aloud "I and I lone, unwarrantably gave the order to fire on the foreigners at Kohe and again as they tried to escape. For this crime I disembowel myself and I beg you who are present to do me the honor of witnessing the act." Bowing again, he let his clothes fall to the waist, then took the dagger and stabbing himself below the waist on the left side he drew it slowly across to the right side and turning the dirk in the wound, he gave it a slight upward turn. He then drew out the dirk, leant forward and stretched out his neck. At that moment the Kaishaku sprang to his feet, and with one blow severed the head from the body, made a low bow, wiped his sword and retired. The stained dagger was then solemnly borne away as proof of the execution. The Samurai or gentlemen of the military class, are trained from infancy to regard this self execution as an honourable form of expiation. In some parts of Japan as the victim criminal stretches out his hand to take the wooden dagger, the Kaishaku strikes off his head. Or a daimio disembowels himself and cuts his own throat

Mr. Oliphant says the knife used, under the old system is about 10 inches long, sharp as a razor, and made of steel of the highest temper. It is only used to make a slight incision, significant of the intention of the victim to put an end to himself. His intimate friend stands over him with a drawn sword and when he commences to make the aforesaid incision, the sword descends and the head rolls at the feet of his disconsolate family. *Mr. Mitford in Cornh. Mag. Nov.* 1869. *Oliphant II* p. 147. *Manners and Customs of the Japanese* p. 193.

HARALU. HIND. See Hurala.

HARAM. In Arabia, Egypt and Turkey, the haram means the female part of the family of a Turk, and the word is used to avoid the indecorum, in the eyes of a mahomedan, of mentioning his wives or daughters. It is likewise the name for that part of the house where the females dwell. Mahomedans are so scrupulous to avoid speaking personally of their female relations, that when obliged to refer to them, they say "my house is sick," or "my house sends compliments to your house." The haram in India means a purchased woman associating with her maker. In Arabia, the haram woman would be a slave woman taken in war.—*Rich's Residence in Koordistan*, Vol I, p 2.

HARAM. HIND., according to the Mahomedan law, unlawful food such as pork, wine, mushrooms, &c., hence Harami, and Haramzadah a vicious, wicked, man or beast.

HARA-MUK or Gunga bul, TIB. means literally place of the Ganges, and is a sacred lake on the mountain of Haramuk in Kashmir. It lies under the wildest and most lofty peaks of the mountain; is 1½ mile long and 200 or 300 yards wide, and is about 12,000 feet above the level of the sea.—*Vigne.*

HARAN, the present Karra, a day's journey south of Edessa, to which Abraham went from Ur of the Chaldees.—*Bunsen*, III, 464.

HARAN. See Mesopotamia,

HARAND, a district in Eastern Beluchistan bordering on the Indus. It is one of the three eastern sections of Beluchistan. See Kelat.

HARANG of Pangi, Juniperus squamosa, the creeping Juniper.

HARAQUAITA is the Arachosia of the classics, the country of the Rachos, with whom the immigrant Arians came in conflict, and who have been turned to the fearful Rakshasa of popular hindu belief. According to General Ferrier, Arachosia can be distinctly shown, by the Greek measurements, to have been at the ruins of Shahr-Zohak or Olan Robat, between Kilat-i-Ghilji and Mokoor. According to Ch. Bunsen, Haraquati, denominated the fortunate, is south of Kabul, and is the Haraiwati of the cuneiform inscriptions, the Arachosia of the classics. It was the ninth settlement made by the Arians (verse 13) in a country which the Arians conquered and it was here that they commenced to inter their dead, which the Zind-avesta strictly prohibits as being the greatest desecration of the sacred earth, another apostacy therefore from the true faith. Arachotia, mentioned on the coins of the Indo-Greek rulers, was Candahar.—*Bunsen*, III, pp. 464 to 485. *Ed. Ferrier's Journ.*, p. 323. See Arians, Greeks of Asia, Cabul, pp 434 to 438. Sudra

HARAOATI or Haraiti, the Hara, a branch of the Chohan dynasty, are descended from Anuraja, a son of Visaldeva, or more properly of Manakya rai (Tod, Vol. II, p. 454) who in A. D. 695, founded Sambhur hence his title of Sambri rao. In A. D. 1024 Anuraja took possession of Asi or Hansi in Hariana. The Bundi branch of this family reckon from rao Ratan, who built Ratanpoor, the name of the chief town in 1578 to 1821 in which year was Ram Sinh. The Kotah branch reckon from Madhu Sinh, son of rao Ratan in A. D. 1579 to Kiswar Sinh, Madhu Sinh regent in A. D. 1819.—*Thomas' Prinsep*, p. 249.

HARB, an Arab tribe who warred with Mahomed. Mahomed is fabled to have resuscitated those killed in the war by the application of Balsam of Mecca.

HARB-SIR, a hamlet at Poonah.

HARBURENNI and other places in Ceylon, have numerous rock inscriptions in the Pali language from 104 B. C. to twelfth century in the Lat to the modern Tamil character. Religion mentioned is buddhist. Sir Wilmot Horton says, there are thousands of these inscriptions in Ceylon, and they exhibit the Deva Nagari in all its transitions The inscriptions would appear to be much defaced, and little is yet made of them.—*Vol.*, V, p. 554.

HARSCHARA, BENG. Vitis quadrangularis.

HAR-CUCHILA, Strychnos colubrina.

HARDAUL-LALA, a chief of Bundelcund, whose spirit, according to the natives of northern India, visited the camp of Lord Hastings with cholera in consequence of the slaughter of cows in the grove where the chief's ashes were interred. Hardaur is the name given to the earth mounds, on which a flag is placed, raised to avert

epidemic disease from the villages of northern India.—*Wilson.*

HARDWAR, in L. 29° 57' 5"; N. and L 78° 9' 5" E., is a town in Gárhwal on the right bank of the Ganges, east of Saharanpur. The level of the Ganges at Hurdwar is 1,024 ft. The Ganges falls rapidly to Hurdwar, which is 1,300 miles from the mouth. It is a great place of pilgrimage, the pilgrims often occupying the valley of the Ganges to a length of nine, and a depth of two, miles from the village of Doodea past Hurdwar and Myapore to Kunkul and Jooalapore. Its celebrity is owing to the proximity of the Rikikase gorge, from which the Ganges escapes from the Sevalik hills of the Himalaya mountains, thirteen miles above Hurdwar. The greatest assemblies, are called Koombh, and occur every 12th year, but there are others every sixth and at certain periods of the year when pilgrims come to drink the waters and bathe in the stream. In 1867, it was estimated that 2,855,966 people were present at the fair but the numbers range from 100,000 to 3,000,000. Koombh, also koombharie are the names of the great pilgrim fairs held at Hurdwar every 12th and 6th year. From Hurdwar, to Rikakasi, a distance of thirteen miles, the valley of the Ganges is covered with dense brushwood, and at night the Dadoo, or cold wind from the mountains, blows down the valley with great violence It blows from the Himalayas nightly down the gorge at Hurdwar, and in April typhoons are very frequent. Pilgrims come to Hurdwar from all parts of Hindoostan and Bengal, from the Deccan, the Punjab, from Cashmere, Affghanistan, Tartary, Thibet and China, some as religious devotees, some as worldly tradesmen. For miles around the place it is one immense encampment. Colonel Yule has seen buddhist pilgrims at Hurdwar who had crossed the Himalaya, from Maha-china, as they said, to visit the holy flame of Jawalamukhi in the Punjab. In 1829 Gosaeens fought their way to the Ganges, and many were killed.

A great attack of epidemic cholera occurred at Hurdwar in 1783, when 20,000 people died in eight days.—*Yule's Cathay*, p. 411.—*Taylor's Visit, p.* 177.

HARDWARE.

In commerce, goods of every kind made from metal. *McCulloch's Comm. Dict.* p. 627.

HARDWARI PEORI, or Indian Yellow, is the dried deposit precipitated from the urine of cows that have been fed on the leaves of the mango (Mangifera indica). It consists principally of magnesia and "purreic acid," as it has been called by Sir R. Kane. On treating a solution with weak muriatic acid, after evaporation, yellow scaly crystals of purreic acid are obtained. Hardwari peori is usually met with in the bazaars in lumps, "Wilayiti peori" is chrome yellow, in lumps (chromate of lead). Hardwari indicates the locality where it is obtained. A dye made of the Harsinggar is sold under the same name.—*Powell. Hand Book, Econ. Prod Punjab* p. 195.

HARDWICKIA BINATA, *Roxb*; *W. & A.*

Caratchu.	CAN	Epe	TEL
Anjun.	MAHR.	Nara epe.	,,
Acha or Atrimaram	TAM	Nar yepa.	,,

This large leguminous tree grows in the forests of the Godavery; in the Nalla Mallai, on the mountains of the Coromandel coast, in some parts of Khandeish, and in the Padshapoor jungles, in the Guzelhutty pass, common in Lulling pass between Malligaum and Dhoolea and on the hills of the Sone valley. It is a most elegant tree, tall and erect, with an elongated coma and the branches pendulous. On the Godavery, it is often hollow in the centre. Yields a timber of an excellent quality for beams and a variety of uses. The wood is red or dark coloured, very hard, very strong and heavy. As the shoots grow up very straight, it is also valuable for rafters The bark yields a strong fibre and the people of the island of Siva Samudram use it without further preparation. *Roxb. Voigt, Mr. Rohde's MSS., Hooker's Him. Journ. Vol. I. p* 50, *W. and A. Mr. Latham, Captain Beddome, Dr. Gibson.*

HARDWICK, general, an officer who served in India, a distinguished naturalist, whose labours were of great value.

HARE.

Arneb,	ARAB.	Rzhong,	TIBET.
Arnebeth,	HEB.		

See Lepus. Mammalia.

HAREEM ARAB. A sacred or forbidden place where no one should intrude. It often denotes the ladies' apartments. It also means the harm, a captured slave in Arabia, in India, a purchased woman. From ancient times, leading the females captive appears to have been the sign of complete victory. Rajpoot inscriptions often allude to "a conqueror beloved by the wives of his conquered foe," and in the early parts of Scripture the same notion is referred to, the mother of Sisera, (Judges verse 31.) asks, "Have they not divided the prey; to every man a damsel or two?" *Tod's Rajasthan, Vol. I. p.* 312.

HAREIN. Hind. Tetranthera monopetala.

HARENGS. Fr. Herrings.

HAR-FARURI, Hind. Cicca disticha. —*Linn*

HAR GOVIND. A Sikh guru. See Govind, Guru, Sikh.

HARHAR. Hind. Terminalia chebula.

HAR,—HAR. A sub-division, or part of an estate. In Saugor it means the cultivated space immediately round a village which is quite opposed to the meaning it generally bears in the North West, where it is applied to the land most distant from the site of the village, i. e., beyond the Mungha. In Bundlecund and some other places, it signifies a tract of land, but the term in no way indicates separate possession of the tract designated. *Elliot, Supp. Gloss*

HAR-HAR. Hind. Cleome viscosa.

HAR HARA, also Umbed'her. Hind Terminalia chebula.

HARI, also Ishwari. Sans. Aristolochia indica.

HARA, semi-aboriginal tribes of Bengal; a servant of the lowest class, a sweeper.—*Wilson, Dr W. W. Hunter.* See Hadi.

HARI, Hind. Casuarina muricata *Roxb.* Armeniaca vulgaris or apricot; Aristolochia indica; also Terminalia citrina.

HARI. A name of Krishna, as an avatar of Vishnu.

HARI The great harvests are called in hindi Rabi and Khurif, or by the villagers "Hari" and "Sawani," from the names of the months in which the crops are ripe. Rabi is the spring harvest, kharif the autumn, but it is not all land that bears two harvests. Land that does so, is called "dofasli," and land that only bears once, "ekfasli," but there are certain tracts of country where two or even three harvests are taken off the soil. The principal crops of the Rabi are the cold weather crops of wheat, barley gram. "mattar" (Vicia), lentils, tobacco, linseed, "sarshaf" or "sarson," "rai," &c. The kharif sowings are "Jawar," bajra (millet), maize, rice, "moth," "mung," "mash," and other pulses, sugar-cane, and cotton.—*Powell Hand Book.*

HARIALI GRASS. Cynodon dactylon. Pers. Was introduced into the Persian provinces of Fars and Khuzistan, during the British expeditions of 1856-57.

HARIANA, in L., 31° 38' L. 75° 49' 5 δ, in the Hoshearpur district, Punjaub, about 10 miles N. N. W. of Hoshiarpur. 1,063 feet G. T. T. Dr. Royle mentions that the grasses of Hariana (Sirsa and Rohtak) —and indeed it is true of the Rakhs generally, consist of species of Panicum, Pennisetum, Cenchrus, Chætaria, Vilfa, Dactylolenium, Chloris, Eleusine, Achrachne, Poa, Eragrostis and Andropogon, species of Saccharum, and Rottbollia. Besides various grasses, other fodders are employed: in one place a clover or lucerne, "Shotal," is grown; also Sinji, but this principally by Europeans for their horses and other cattle. Cattle are usually fed (besides grass) on bhusa, or as it is called in Punjabi "turi," the chopped straws of wheat and barley, besides which they get "Karbi," the dried stalks of jawar (H. sorghum); this latter when green and fresh is called "Charri." Chopped leaves of the ber both Z. vulgaris and Z nummularia, called "mulla," are much used, and are said to be fattening. Dr. Henderson mentions that in Shahpur and one or two other districts, turnips are grown very extensively for feeding cattle during the cold weather and they often attain a larger size than in Europe. A few of these are used in times of famine for food, as the "markan" grass, the wild Sawank, "Phog," the seed of Calligonum polygonum, is used as human food in the Punjab in times of famine. Dhaman or anjan (Pennisetum cenchroides) is considered the best grass for cattle, rapidly improving their condition and increasing their produce in milk. Jhang is a scented grass and probably Andropogon schænanthus and the root of A. muricatum forms the Khaskhas used in matting tatties and screens for cooling the atmosphere.—*Powell Hand Book Econ. Prod. Punjab*, pp. 244 and 245. *Royle Ill. Him. Botany*, p. 421. *Mason's Tenasserim. William's Middle Kingdom*, p. 277. *Hooker's Himalayan Journal*, Vol. II, p. 289. See, Food, Graminaceæ: Grasses: Rushes.

HARIANA. Edrisi speaks of the people of the towns of Banjhir and Hariana, on the Banjhir (Panjshir river) as employed in mining silver, and those of the latter as notorious "for the violence and wickedness of their character." The position of this town of Panjshir does not seem to be known now, though mahomedan coins exist struck at that place in the ninth century but the valley has retained its character to this day. "This fair scene," says Wood, "is chiefly peopled by robbers, whose lawless lives and never ending feuds render it an unfit abode for honest men." Hariana is perhaps Paryan, at which there are silver mines marked in Wood's survey, Edrisi also speaks of Andarab as a town surrounded by gardens, orchards, and vineyards, where they stored the silver from Panjshir and Hariana town. i. 476, seq.—*Yule Cathay* II, p. 595.

HARI CHANDANAM. Sans. Tel. Santalum album.—*Linn.*

HARI CHANDRA. See Harischandra.

HARIDAS, the reader or reciter of the Ramayana and preacher of the Kirtan during the Ram Naomi. See Yug byasa.

HARIDRA. Sans. Curcuma longa. Turmeric.

HARIDWAR. See Naga.

HARI, HARIAN. Hind. Prunus Armeniaca.

HARI HOLKAR, See Holkar, Mahratta Government.

HARI-KARAPUTRA. See Hindu.

HARI-HARA, or Hari-Hara putra, a name of the hindoo deity Ayenar.

HARISCHANDRA, a celebrated king of great uprightness of the Chandra Vansa, or Indo-vansa, or lunar race, that reigned in Antarveda and Kasi, but afterwards in Magadha (Behar) and Indraprashtha (Delhi). In this dynasty are included the kings of Kasi (Benares), the line of Puru and the line of Yadu.

Atri.....Muni.
Soma.....Lunus, the Moon.
Buddh.....Mercury, married Ila, daughter of Ikshwaku, the sun.
Alias or Pururavas.
Ayu.....kings of Kasi, descended from him.
Nahusha...Devanahusha, Dionysos, Bacchus (*Wd.*)
Yayati.....Father of Puru and Yadu.

According to Tod, the following are synchronisms of the Solar and Lunar Races:

Buddha of the Lunar Race married Ila, the sister of Ikshwaku.

Harischandra, contemporary of Parasurama of lunar line.

Sagara, cot. of Taljanga, of Parasurama.

Ambarisha, cot. of Gadhi, founded Kanouj.

In the line of Pura occurs Hastin, who built Hastinapur, and Vichitravirya. In the hindu mythology, Indu, Som, Chandra, in Sanscrit, mean the moon: hence the lunar race is termed the Chandra-vansa, or Induvansa, or Soma-vansa. Harischandra is fabled to get a son from Varuna, but is required to offer him to the god, which he would not do.—*Thomas' Prinsep's Indian Antiquities. Tod.* See Magadha, Mysore, Rama, Pandu, Surya.

HARI MANDHAKAMU. Tel. Cicer arietinum.—*Linn.*

HARI MUNG. Beng. Hind. Green-gram, Phaseolus mungo.

HARIN. Panj. Cornus macrophylla, *Wall.*

HARIND. Ricinus communis, the castor oil plant. See Arind.

HARINGE. Ger. also Haringen. Dut. Herrings.

HARINPADI. Convolvulus arvensis.

HARIPORE, about 12 miles from the Ravi on the eastern bank, is supposed to be the Sangala of Alexander. It is west of Pakpatan.

HARIR. Hind. Terminalia citrina.

HARITHA, Sapindus detergens; Sacuminatus.

HARISCHANDI, a Vaishnava sect of hindus, amongst the Dom or sweeper race of the western provinces of India See Hindu.

HARI SENA, See Inscriptions, p. 384.

HARISWAMINI, See Inscriptions, p. 380.

HARITA. Sans. Phaseolus radiatus.

HARITAKA. Sans. Terminalia chebula. Myrobalan.

HARITALAKA. Sans. sulphuret of Arsenic.

HARITA MANJARI. Tel. Acalypha indica.—*Linn.*

HARIVARNA. See Inscriptions, p. 392. Hari-Vishnu.

HARIWA, this country, so named in the cuneiform inscriptions, is the Aria of the Greeks, the Haroyu of the Vendidad, the modern Herat.—*Bunsen*, III. 481.

HARJANGI. Hind. Terminalia citrina or T. chebula.

HARJORA, Hind. Cissus quadrangularis.

HARKA. Can. Harmala ruta.

HARKADI. Hind. a dye stuff.

HARKARA Hind. Pers., a messenger. See Inscriptions, p 388.

HARKUCH KANTA. Hind also Harkut. Hind. Syn. of Dilivaria ilicifolia. *Juss.*

HAR-KAT, Harkooch Kanta. Hind. Dilivaria ilicifolia.

HARM. Arab. Literally he did honor, hence it means sacred. It is applied to the women's apartments, also to the women captives and purchased women The words haram, unlawful, hurmat, chastity, harami and haramzadah a wicked person or animal, moharram the first month of the mahomedan year, come from this word. See Haram, Hareem.

HARM. Tam. Wood or timber.

HARMAL. Hind. Peganum harmala.

HARMALA RUTA.

Peganum harmala.		Ruta sylvestris.	
Harka,	Can.	Viragu,	Tam.
Kodar,	Hind.	Arkalu,	Tel.

Grows plentifully at Lahore, the ruins of the old city are covered with this weed and Asclepias gigantea. Harmal, in Lahore, is looked upon as the plant devoted to the pariahs the inferior caste, yet though a Sikh or hindoo, would not touch Harmal, the seeds are in common use among the natives to fumigate the rooms of the wounded. The natives fancy that a person suffering

from any discharge, as hæmorrhoids, the monthly unwellness, &c., is unclean, and that the exhalation proceeding from such person may be prejudicial to the wound, therefore it is customary on the entrance of every stranger to strew a few grains of harmal upon a charcoal fire The natives, with the exception of Sikhs and hindoos, use these seeds internally against weakness of sight and retention of urine.—*Dr. Honigberger*, p 284.

HARMANDUR, a celebrated Sikh temple at Amratsar. It was destroyed, in 1762, by Ahmud Khan.

HARMOZIA, this ancient town in a bay of the Gulf of Ormuz was subsequently called Gambroon but now Bandar Abbas, a sea-port town in the province of Kirman in a barren country. It is fortified with double walls. Bassorah did not long benefit by the fall of Hormuz; but appears to have been nearly ruined during the reign of Nadir Shah whose tyranny extended its baneful influence even to this extremity of the Persian empire; so that in 1750 Mr. Plaisted found there nine houses out of ten deserted. In the year 1639, there seems to have been an English factory at Bassorah, subordinate to that at Gambroon and protected by firmans.—*Ousley's Travels*, Vol. I, p. 155. *A Journal from Calcutta to Aleppo, &c.*, p. 11. *Lond.* 1758. *Kinnier's Geographical Memoir*, p. 201. See Kirman.

HARMOZONTE. See Kirman.

HARMUZI. Hind. a deep red earth.

HARN, Mahr. Antilope cervicapra.—*Pallas.* See Antelope.

HARNAULI. Hind, Solanum xanthocarpum, Ricinus communis, the castor oil plant and seed.

HARNESS, Aba-aba. Malay.

HARO-BEREZAITI. See Arians.

HAROON-UR RASHID, a kalif of Baghdad, the fifth of the Abbassi Khalifa. He came to the throne of Bagdad in A. H. 170 = A. D. 786. At that time the empire of the Khalifa was one of the most powerful that ever existed; and extended from the confines of India and Tartary to the Mediterranean, including also all northern Africa The reign of Haroon-ur Rashid was prosperous and splendid. He has been famed for liberality and justice, but his bloody cruelties throw an eternal stain on his memory. He died at Taos in Khorassan after a reign of 22 years. The Daoodputra, the reigning family at Bahawalpur, claim to be descended from Haroon-ur-Rashid.

HAROYU. The fifth settlement of the Arians was in Haroyu, the Hariva of the cuneiform inscriptions. Its name has no connexion with the Arians, but comes from the river now called "Heri," abounding in water. The Greek district Aria comprises the larger portion of Segestan, and forms part of southern Khorassan. In the Record (vi. verse 9,) is mentioned that the fifth best land was Haroyu, the pourer out of water, here Ahriman created hail and poverty. See Arians.

HARPAETOS A genus of birds of which several species occur in India. H. erythrocephalus is common in the Himalaya from 3,000 feet upwards. Below that, it is replaced by H. oreskios. It flies in small troops, and is active and vociferous in the morning, solitary and quiet during the heat of the day, sitting in the shade. It appears larger and brighter than in Nepal and Sikim, Darjiling, Sylhet, &c.—*Mr. Blyth's Report*, See Ornithology. Spizaetus nipalensis.

HARPALIDA. One of the Coleoptera of Hong Kong.

HARPAR Polanisia icosandra.

HARPEGNATHOS *Jerd.* A new genus of ants. Jaws scythe-shaped, pointed and finely serrated; head oblong. H. saltator, worker, 1-6th of an inch long; head long, head and abdomen blackish brown, thorax and legs rufous.—Length 3-4th of an inch. Seen at Tellicherry and in other parts of Malabar, also found in the Mysore country, the specific name Saltator is from its power of making most surprising jumps which it does when alarmed or disturbed. It is very pugnacious, and bites, and stings very severely. It makes its nest under ground, generally about the roots of some plant. Its society does not consist of many individuals. It appears to feed on insects, which it often seizes alive.

HARRA also Harva. Guz. ,Hind.? Myrobalan.

HARRI. Hind. Nyctanthes arbor-tristis. *Linn.*

HARRU. Panj. Cornus macrophylla, *Wall.*

HARAN. Is the capital of a Turkish pashalik which extends in a north-west direction from the mouth of the Shat-ul-Arab to the rocks of Mardin, the Baghdad frontier towards Constantinople. In an east and west line, it stretches from the confines of Persia to the banks of the Khabour, which separates it from the pashalik of Orfa; the Osrhoene of the Romans, and that part of Mesopotamia which contained the Haran of Abraham, and the famous Edessa of the crusades.

HARRAR. Hind. Terminalia chebula

HARRI MUNG. Hind. Phaseolus radiatus.

HARRIN-HARA. Hind. Amoora rohituka. *W. & A.*

HARRIS, General, Lord, who commanded at the siege and fall of Seringapatam in A. D. 1799.

HARRIS, Lord, son of the first Lord Harris, was Governor of Trinidad, then Governor of Madras from 1854 to 1859. He caused to be made a revaluation of the lands in North and South Arcot, from which great advantages resulted to the people and to the State. He sent to Northern India, all the Madras soldiers and enabled Lord Clyde and Lord Canning to reconquer northern India, by dismantling his own presidency of both men and guns, *Thurlow Company and the Crown*, p. 32, 33.

HARRIS. Sir William Cornwallis, an officer of the Bombay Engineers, author of a work on the Wild Sports of the Cape, and of a Mission to Shoa.

HARRU. Hind. Chenab. Cornus macrophylla, dog wood.

HARSHA. See Inscriptions p. 376, 379, 380, 386.

HARSHANA. See Yoga.

HARSHUF. Arab. Artichoke.

HARSINGHAR. Hind. Nyctanthes arbor tristis.

HAR-SULA. Sacrificial pillars are termed Sura or Sula in Sanscrit; which, conjoined with Har, the Indian god of war, would be Har-sula. The Rajpoot warrior invokes Har with his trident (tri-sula) to help him in battle, while his battle-shout is mar! mar! *Tod.*

HARPOCRATES, the ancient Egyptian god Aurora or Day-Spring, is often represented, seated on the lotus

HARPODON a genus of fishes of the

Fam. 5.—Scopelidæ.

First Group.—Saurina.

Gen. 9 Saurus, 5 Saurida, 1 Harpodon, 2 Aulopus, 1 Chlorophthalmus, 22 Scopelus, 1 Scopelosaurus, 1 Odontostomus.

Second Group.—Paralepidina.

Gen. 3 Paralepis, 1 Sudis.

Third Group.—Alepidosaurina.

Gen. 3 Alepidosaurus

HART. In Cairo, a quarter of the town, each occupied by separate races, as Hart-ul-Kopt, the Coptic quarter, Hart-ul Yahood the Jewish quarter, Hart-ul-Suggion the Water Carriers' quarter.

HARTAL. Hind. Yellow sulphuret of arsenic, orpiment. Two varieties occur; the "hartal-i-wilayiti" and "hartal-warki," the last so called from its beautiful glittering lamellar texture; varieties of hartal-i-warki are called hartal pili and gulabi.—*Powell's Handbook Econ. Prod. Punjab*, p. 63.

HARTIGHSEA, *sp.* in Java yields a fruit used as garlic. The Cedar of New Zealand is Hartighsea spectabilis the "Kohekohe" or New Zealand cedar, and is a good timber tree.

HARTH. Hind. a Persian wheel.

HART'S EAR.

Lisan-us-saur,	Ar.	Cacalia kleinia,	Lat.
Oleander leaved cacalia,	Eng.	Gowzaban,	Pers.
Gowzaban,	Guz. Hind.	Yerrimai naku,	Tam.
		Yennapa nalika,	Tel.

These leaves resemble the tongue of the cow (hence its Asiatic name), the stalks are prickly, and covered with white spots. While fresh, the leaves have a strong smell like hemlock, and are given by native practitioners in the form of decoction in rheumatism, syphilis, leprosy, and in all other cases in which sarsaparilla is usually employed by European physicians. It is brought to Bombay from the Persian Gulf, and is procurable throughout India in most native druggist's shops.—*Faulkner.*

HARUKEE. Beng. Echites macrophylla.

HARUNTUTIA. Hind. Agathotes, *sp.* Colchicum *sp.*

HARUT and Marut, in mahomedan belief, are two angels, imprisoned, till the day of judgment, in a well in Babylon for having, when in the flesh, committed sins which they denounced in mankind.

HARVEST. In Persia, there are two harvests in a year. The seifee or summer crop, sown in summer and reaped in the end of autumn, consists of rice, cotton, zoorat-i-bellall, maize and zoorat-i-danareeza, great millet, Holcus sorgum; aryen or allum, small millet, paunicum italicum; nokhood, cicer arietinum, known in India as channa or Bengal gram—adas (lentils)—mashok, a small vetch, phascolus radiatus; beanjeer or renatoo the castor oil plant, palma christi—roonjed (sesamum) and some garden vegetables.

HARWAN. Hind. Tamarix dioica.

HARWUN. Hind. a pulse, equal to rawan and raonjgi.

HASA. See Kooch.

HASALBAN ACHSIR. Arab. Rosmarinus officinalis.

HASALE. Hussulleeru, Karn one of the supposed aboriginal tribes of Mysore, found in the hill districts of Nagar, properly woodmen, but serving as agricultural labourers.

HASAN and Husain, sons of Ali, by his wife Fatimah, daughter of Mahomed. After Ali's murder by the contrivance of Yezid son of Moawiah, Hasan and Hussain left Shawn and went to reside at Medina. Ha-

san was poisoned there by an emissary of the kaliph, and several years afterwards on the 10th of the moharrara A. H. 46, Husain was murdered at Kirbila, his eldest son Zain-ul-abidin alone escaping, and it is these events that are commemorated by the ceremonies of the first ten days of the moharram. See Allawa, Barak, Khalifa Moharram, Marsiah, Tabut.

HASANIYUSUF. Hind. Diatomaceæ.

HASARU. Can. Phaseolus radiatus. Asarum Europæum.—*Linn.*

HASELKRAUT. Ger. Asarabacca.

HASELNUSS. Ger. Hazel nut.

HASHA. Hind. Tamarix dioica.

HASHIM-BIN-HAKIM, born at Gaza near Merv, is known as Mokanna or the veiled prophet of Khorassan, because he was one-eyed, deformed in feature and bald, and concealed his features. He claimed to be the deity; his most numerous converts were near Samarcand and Bokhara. He was joined by hordes from Turkestan. He had a hundred of the loveliest women of Transoxiana. About the year 163 Hijera he destroyed himself.

HASHISH. Ar. tender tops of Cannabis sativa after flowering, the bhang, of India and Persia, and Fasukh of Barbary. The Hottentots use it, and even the Siberians, we are told, intoxicate themselves by the vapour of the seed thrown upon red-hot stones as the Scythians of old did. Egypt surpasses all other nations in the variety of compounds into which this fascinating drug enters.—*Burton's Pilgrimage to Meccah*, Vol. I, p. 64.

HASHMEE maund equal to sixteen Tabreez maunds of 7¼ lbs. each, or about 116 lbs. English.

HASHU. See Karen, p. 466.

HASI-LUBAN. Beng. Benjamin.

HASJORA. Beng. Vitis quadrangularis. —*Wall.*

HASORA, a district, town, and river, in Central Asia, the town is 7,198 feet above the sea and is on the banks of the river which runs northwards to the Indus. Latham says, Hasora or Dsungari, a country west of Deotsu, and lying to the south of Rongdo. The people speak the Tibetan language and Moorcroft gives it the name of Dsungari. It is partially a Bhot district.—According to Ad. Schlagentwat Hasora, or Astor, or Tsunger, in 35° 12'; 74° 53', a fort in the valley of Astor, or Hasora. Level of the Hasora, is 7,198 feet abovethe sea, *Ad. Schl., Latham.* See Maryul.

HASORA. Hind. Mica.

HASSA. See Koh-i-nokreh.

HASSAN. A mountain forming part of Taurus and Zagros, between Diarbeker, Palo, and Moosh. It is no thoroughfare, and the people are entirely independent. The Koord race who inhabit all that part are called Zaza, which means stuttering, mouthing, or speaking unintelligibly and seems to be a nickname, *Rich's Residence in Koordistan*, Vol. I, p. 376.

HASSANDHUP, A hard white clay supposed to be a deposit, containing sulphur, from a mineral spring. But it is also a medicinal compound.

HASSAN KEIF. See Kufra.

HASSAR. Dr. Hartwig mentions that, in several fish, the gills communicate with a cellular labyrinth containing water, which keeps the gills moist, and by this means the hassar of Guiana, the frog fish of Ceylon and the climbing perch of India are able to remain out of the water. The Hassar throws itself forward by the spring of its tail, and can move in this way, nearly as fast as a man can actually walk: the pectoral fins of the frog fish supported by the bones of its carpus perform the office of feet. The climbing perch moves itself up trees by means of its ventral fins. Sir R. Schomburgh also tells us that certain species of Dora called by the people the Hassar, in Guiana are occasionally met with in such numbers in their travels that the negroes fill baskets with them. If they fail in finding water, they are said to burrow in the soft mud, and pass the dry season in torpidity like the lepidosiren.—*Hartwig. Fishes of Guiana*, 1103. *Gosse* 122.

HASSAINI SYED, descendants of Hussain son of Ali.

HASSELTIA ARBOREA, a handsome tree near Jampiam, in Java, with flowers large, yellowish-white, in axillary fascicles, the milk obtained from the trunk by incision, mixed with honey and reduced with boiling water, is employed as a powerful drastic for destroying the tape-worm; it is however apt to produce inflammation of the intestines, and in some cases has proved fatal.—*Lindley, Flora Medica* quoted in *Eng. Cyc.*

HASSKARL, author of the 'Hortus Bogoriensis' catalogue, with occasional notes and descriptions of new species of the plants cultivated in the Government Botanical Garden of Buitenzorg, near Batavia, published in Batavia in 1844, also author of an octavo volume of descriptions, entitled Plantæ Javanicæ rariores.—*Hooker f. et Thompson.*

HASTHI. Sans. Elephant.

HASTI, sent forth three grand branches, Ujamida, Deomida, and Poormida. Ujamida's progeny spread over all the northern parts of India, in the Punjab and across the Indus. The period, probably one thousand

six hundred years before Christ. From Ujamida, in the fourth generation, was Bujaswa, who obtained possessions towards the Indus, and whose five sons gave their name, Panchalica, to the Punjab, or space watered by the five rivers. The capital founded by the younger brother, Kampila, was named Kampilnagara. The descendants of Ujamida by his second wife Kesunee, founded the Kusika kingdom and dynasty, celebrated in the heroic history of northern India. *Tod.*

HASTI KASAKA. TEL. Elephantopus scaber. *Linn.* Elephant gourd.

HASTIA, son of Bharata, founder of Hastinapura.

HASTINAPURA, an ancient city built by Hastia, a prince of the Lunar dynasty of Puru. It was finally ruined by the encroachment of the Ganges, but, till an early part of the nineteenth century vestiges were to be traced along the river, nearly in a line with Delhi, but about sixty miles to the east and forty miles south of Hardwar. It was washed away in the reign of Nichakra-Nemi, one of the Pandu dynasty. Another account describes it as overwhelmed by a cataclasm of the Ganges. This mighty stream, rolling its masses of waters from the glaciers of the Himalaya, and joined by many auxiliary streams, frequently carries destruction before it. In one night a column thirty feet in perpendicular height has been known to bear away all within its sweep, and to such an occurrence the capital of Hasti is said to have owed its ruin, as this city was only forty miles south of Hardwar, where the Ganges breaks through the Sewalik mountains and enters the plains of India. It was the chief city of the Panchyala, who aided the Kuru in the combat of the five races. The modern Delhi (Indraprestha) is on the Jumna.—*Thomas' Prinsep*, II, p. 257. *Tod's Rajasthan*, Vol I, p. 40. *Bunsen* iii, 554. *Wheeler Hist. of India.* See Hindu; Inscriptions, p 374: Kusambu; Krishna.

HASTINGS ISLAND, about 2 miles in extent, in lat. 6° 56' S. long. 116° 24' E.—*Horsburgh.*

HASTINGS. Francis, second Earl of Moira, afterwards created Marquess of Hastings, was appointed to the Government of British India in the early part of 1813, which post, he held for nine years. He was constituted both Governor General and Commander-in-Chief by his own solicitation. The East India Company afterwards acknowledged their sense of his services, bestowing on his family two grants of money, in sums of 60.000l. and 20.000l. respectively. He took the field against the Pindari on the 18th October 1817 his Government of India continued to January 1823. *Hasting's Private Journal*, Vol. I, p. viii.

HASTINGS, WARREN, an eminent ruler of British India, he landed in Calcutta in 1750 as a clerk. He attained to the office of the E. I. Company's agent at the council of Murshedabad, and then became a member of the Calcutta council. He returned to Britain but was sent to Madras as a member of council and in April 1772 was nominated president of the Calcutta council. In 1773, he entered into a treaty with the vizier of Oude; in 1774, in alliance with the vizier, he entered Rohilcund, defeated the enemy and the whole country was then laid waste and its inhabitants driven across the Ganges. In 1774, the new members of his council colonel Monson, general Clavering and Mr. Francis, arrived, and opposed and changed all Hastings' measures. In 1780, he established a court of justice, called the Sadr Adalat, of which he made sir Elijah Impey president. For this Sir E Impey was recalled and Hastings impeached. He erred gravely in his conduct of Cheyt Singh, rajah of Benares, in 1781, in his treatment of the begums of Oudh, which the Court of Directors rectified and Hastings shortly after resigned his appointment after holding it 13 years. On his arrival in England, in 1785, he was well received by the king, queen, and Court of Directors, and was about to be made a peer, when Mr. Pitt opposed this and only seven days after his arrival, he was impeached by Messrs Burke, Fox and Sheridan. His trial commenced on the 13th or 15th February 1788, in the presence of the king and queen. It proceeded for seven years, and at length, after an honorable defence, on the 23 April 1795 Hastings was acquitted and lived till 1818 in which year also Sir Phillip Francis, his opponent, died.

HASTIRETH, see Hastoreth Astarte.

HASTI SUNDI. TEL. literally elephant's trunk, Tiaridium Indicum.—*Lam.*

HAT. HIND. A periodical market day.

HATAJORA. BENG. Club moss, Lycopodium imbricatum.

HATAPING. PALI. Amygdalus communis.

HATCHING CHICKENS IN OVENS. The method of hatching chickens in ovens may be reckoned among the peculiar arts. Pocoke tells us that in Egypt, the season for it is when the weather is temperate, about February and March. In one apartment, they keep a smothering fire of horse-dung and chopped straw, to be disposed of in the apartments where the chickens are hatched; on each side of a gallery are five rooms, about ten feet square, and four high, with

holes at top. They put the eggs in heaps in the lower cells for eight days, laying the burning dung and chopped straw along in the channel, in the gallery, and turn them by moving the heaps three times a day: they then carry them into the upper apartments, and, spreading them, so as only to cover the floor, and turning them in like manner, they put the fire in the channels and within the apartments, and open or shut the holes at top as they find occasion. In two and twenty days they begin to hatch. They leave them in the ovens till they are perfectly dry, and then put them in the gallery, and the people come and buy them. If it thunder, great number of the eggs miscarry and the chickens hatching, thus, often want a claw or a rump, or are some way or other imperfect. In Chusan an immense quantity of ducks are hatched by steam. The hatching house is a shed, the roof thickly and compactly thatched with paddy, the walls plastered over with mud. There are a number of straw baskets, thickly besmeared with mud, to prevent them from igniting, a tile is so placed, as to form the bottom of the basket, and a lid fits closely over the top, a small earthen fire pot being placed under each basket, the eggs belonging to different folks are put into the baskets as soon as they arrive. The baskets are kept closely shut for five days, a uniform heat being maintained under the basket by means of the before named earthen fire-pot; and at the expiration of that period they are taken out and carefully examined, to see if they are good or bad; if the former they are placed in holes, which have been cut in a board for their reception; if the latter they are laid aside to be returned to their owners. Before the eggs have become cold, they are replaced in the baskets and kept there for nine or ten days; that is, the eggs remain altogether in the baskets about a fortnight or fifteen days, the heat of the hatching-house ranging from 93° to 100°: in the middle of the shed, broad shelves are placed, on which the eggs are laid when taken finally from the baskets, being carefully covered over with a thickly wadded coverlet, and the little birds issue from their fragile domicile in about a fortnight or three weeks: the whole process of hatching an egg occupying one month or five weeks. In the Phillipines, incubation is performed by placing warm paddy husks under and over the eggs, which are deposited in frames. A canvass covering is spread over the husks; the art is to keep up the needful temperature, and one man is sufficient to the care of a large number of frames from which he releases the ducklings as they are hatched and conveys them in little flocks to the water side.—*Pococke's Description of the East.* Vol. I. p. 260. *Bowring's Philippines*, p. 104. *Sirr's Chinese Vol.* I p. 249.

HATEE-SHOORO. Beng. Triandrium Indicum.

HATH'H. Hind. A hand, a lineal measure, a cubit, an Ell.

HATHAJORI. Hind. Martynia diandra. Lycopodium imbricatum.

HATH-BURTANA. A matrimonial ceremony.

HATHI. Hind. Elephant. Hat'hi Khana, an elephant shed; an elephant battery.

HATHI-KI-DUM KA BAL. Duk. Hair of elephant's tail.

HATHI-SHURU. Beng. Tiaridium Indicum, *Schm.*

HAT'H-KUTORAY-WALA. A mohurrum fakeer.

HATIAN. Hind. Eriodendron anfractuosm, *D. C.* Hatian ka Gond sum Gum of Eriodendrou anfractuosum, var. Africanum.

HATICHUK Anglo-Hind. Cynara scolymus. Artichoke.

HATIF. Ar. A mystic voice.

HATI-KANA. Beng. Clerodendron hastatum.

HATIM TAI. A generous monarch of Arabia who lived about a century before Mahomed. In all mahomedan countries he is quoted as a model of generosity.—*Palgrave.*

HATMUL. Hind. Agathotes *sp.*

HATTIAH. An island at the mouth of the Megna.

HATTI SHURA. Beng. Heliotropium indicum.

HAUBER. Hind. Fruits of Cupressus sempervirens also of Juniperus communis.

HAUD and Ud of Garcias, Eagle wood.

HAUDIGA. Can? A Mysore wood used for furniture; polishes and turns well.

HAUG. Dr Martin, a learned Sanscrit and Zend scholar who devoted many years to the study of the Vendidad or Code of the Fire worshippers of Iran, author of Essays on the Sacred language, writings and religion of the Parsees. *Bombay* 1862.

HAULBER. Hind. Juniperus communis.

HAUT-BRION. A district producing Claret.

HAUTE. Ger. Hides.

HAVANGA. Malbal. Cassia lignea.

HAVELOCK, Henry, K. C. B, born at Bishop Wearmouth, a suburb of Sunderland in 1795, and at the age of twenty was posted to a second Lieutenancy in the 95th Foot or Rifle Brigade. He exchanged shortly afterwards to the 13th Foot, and embarked in the 'General Kyd' in January 1823, for India, whither his two brothers one in the 4th Dragoons and the other in the 16th Lancers were serving. He was diminutive in stature but well built, with a noble expanse of forehead, an eagle eye, a countenance remarkably comely, which exhibited that union of intellect and energy which never fails to command deference. Such in physique was the future saviour of India, in morals he was a blameless gentleman. Shortly after he reached India the first Burmese war broke out, and thither Havelock proceeded as Deputy Assistant Adjutant General. He had, whilst in Calcutta and stationed in the fort, been accustomed to have prayer meetings among the so disposed of his regiment. He subsequently published his Burmese experiences in a book called 'Campaigns in Ava.' On the 9th of February 1829, he was married to Hannah Shepherd the youngest daughter of the Rev. Dr. Marshman: when a bachelor he had determined to devote a tenth of his income to objects of piety and benevolence, and on his marriage he resolved to, and did adhere to the same rule. He obtained his Company in 1838. Havelock formed one of the 'Garrison' shut up in Jallalabad, which witnessed the arrival of Dr. Brydon the only man who escaped that passage of fire and slaughter; the daring attack on Akbar Khan in which he took a prominent part is attributed to Havelock's suggestion. Associated with him was Capt. Broadfoot of the Madras Army, whom Havelock justly looked upon as one of the greatest soldiers of his time. Havelock was in his forty-eighth year and twenty-eighth of his service, when he obtained his regimental majority; and the Command-in-Chief having been bestowed on Lord Gough, Havelock became Persian Interpreter on the Staff. In the short Gwalior campaign and the battles of Punniar and Maharajpore, he was present. Just after the Gwalior campaign the first spirit of mutiny amongst the Bengal sepoys showed itself. The 64th became unruly.

'It is believed' writes Havelock 'that thirty-nine of the 64th mutineers are capitally sentenced: at least the course of their trials justified this expectation. They ought all to be executed.' They were not, and thus so far back, commenced that contempt for Government in the sepoy mind which ended in so much bloodshed in 1857. In the first Sikh war, Havelock took part on H. E. the Commander-in-Chief's staff, and at its conclusion, was appointed Deputy Adjutant General of the Bombay Army. During the tenure of this office the second Sikh war broke out. The fatal charge of Ramnuggur proved fatal to his brother William who was much blamed by some for the hasty and it was supposed rash, order which led to it: Havelock wrote.

"I may well grieve for the loss of the brother who was brought up with me in the nursery and was nine years my schoolfellow; but though it be decided in Bengal that the same acts which would be lauded as heroism in Anglesea, or Joachim Murat or Augusti Caulmeorut, are mere rashness in William Havelock, I cannot quite think so; nay strange old man that I am, my grief is more than half absorbed in admiration, and I proudly parody the saying of the English nobleman and would scarcely give my dead brother for any living soldier at the three Presidencies."

At the commencement of 1857, the Persian war broke out, and for the first time after forty-two years of service and in the sixty-second of his age he was brought into a position which afforded scope for his great military talents. Lord Elphinstone dispatched a telegram to General Anson requesting Havelock might be nominated to the command of a division. Havelock accepted the appointment with alacrity. At Havelock's recommendation, Outram the Bayard of India, was nominated Commander-in-Chief — while Havelock was giving his opinion that Outram was the fittest man to command the expedition, Outram was pressing Lord Elphinstone to apply for Havelock's services, and this mutually unknown to each other. When the mutiny and rebellion of 1857 occurred, Havelock suggested the formation of a moveable column at Allahabad which was immediately formed, and among the troops were Neill's Madras Fusiliers, or as they were afterwards so well called 'The Blue Caps.' From this time, he commanded in many battles, on the 11th July 1857, at Futtehpore, on the 12th he fought at Aong, on the 16th he fought and took Cawnpore. His last great effort was the first relief of Lucknow, on the 25th

September 1857. The second relief of Lucknow was effected by Sir Colin Campbell on the 17th November 1857. Sir C. Campbell had arrived in India, and the Government had superseded Havelock putting Outram in command of the force in Oudh, but that noble soldier refused to supplant his brave comrade, preferring rather to act under him than deprive him of his well earned right to relieve Lucknow, the two together advancing in spite of an almost fatal opposition, effected the relief, the 'Blue Caps' charged the Char Bagh bridge, but as it became every moment more apparent that Maude's two guns would not be able to silence the superior Artillery of the enemy in their front. Almost everyman at them was either killed, or wounded when General Neill who commanded the 1st brigade in Sir James Outram's absence allowed a charge, and the 1st Madras Fusiliers were ordered to advance. Lieutenant Arnold a young officer ever conspicuous even among the daring spirits of that noble regiment had been impatiently watching for the signal. At the first word and without waiting for the regiment to rise and form, he dashed on to the bridge with some ten of his men. Arnold himself fell, shot through both legs and his devoted followers were swept down almost to a man. Lieut. Havelock the Deputy Assistant Adjutant General alone remained on the bridge, the mark for a hundred bullets, the Fusiliers animated and nobly led by their regimental officers, dashed forward with a cheer, without giving the enemy time to reload, advanced over the prostrate bodies of their comrades and rushing on the guns amidst a storm of bullets wrested them from the enemy and bayonetted the gunners. It was a second Lodi!! Poor Arnold died "At length" writes the General "we found ourselves at the gates of the Residency and entered in the dark in triumph."

The moment he entered, his command ceased and Sir James Outram became the chief. Havelock's career was finished, he had not yet heard what his country thought of him, and what rewards she had in store for her faithful son; he himself was satisfied in the consciousness of duty performed to his God and nation. He had succeeded in enrolling his name in the imperishable scroll of Britain's heroes

Havelock fell sick and from the first seems to have had a presentiment that it was his last illness. He died in perfect peace and hope, a sublime picture! attended by his well loved Aide-de-Camp Hargood of the Fusiliers, and his heroic son. Calling the latter to him he said 'I die happy and contented.' 'See how a christian can die.' And when Outram came to visit his dying comrade he said—'I have forty years so ruled my life, that when death came I might face it without fear.' Thus passed away, pure and spotless as a knight of old, a soldier, a christian and a hero.

HAVER. Dut. Havre. Dan. Oats.

HAVILDAR, in the Indian armies of Britain, a non-commissioned officer of native soldiers equal to a sergeant.

HAVUN. A yellow colored and strong wood of the Santhal jungles for about forty miles from Rancebehal to Hasdiha, but scarce. It is used for building purposes by the natives and also for cart wheels.—*Cal. Engineers' Journal, July* 1860.

HAVVAH or Hawa, of the Arabs, the mother of life, the Eve of the Bible, the mother of all living, the mother of the human race, and recognised under different names in all cosmogonies. The Eve of Mosaic history, is the Astarte of the Assyrians; Isis nursing Horus of the Egyptians; the Demeter and the Aphrodyte of the Greeks and the Scythian Freya. The Eve of Genesis, the Hawa or Havvah of the Arab and mahomedan generally, Baltis, in Byblius called Beuth or Behuth. i. e. void of Genesis, is identical with space and means the mother's womb, the primeval mother,—the fundamental idea being the mother or source of life, which is the meaning of Havvah the Eve of Genesis. The tomb of Eve is pointed out in several places. Mecca is bounded on the east, by a hill called Abu-Kubays, and according to many mahomedans, Adam with his wife and son Seth lie buried there. Also at less than a mile from the Medina gate of Jeddah, is a tomb said to be of our common mother Eve, is surmounted by a cupola and surrounded by walls, inclosing a pretty cemetery, in which many of her children lie around her. *Bunsen's Egypt. Hamilton Sinai, Hedjaz and Soudan p.* 66. See Abu Kubays; Adam; Baltis, Mount Ararat.

HAWAZAD. Hind. Pers. Wind lodged, of corn literally, struck by the wind.

HAWAR, Hind. of Kubat, completed, from hamwar, level land.

HAWELI or Hawili, the tract of country adjacent to a capital town and originally annexed to it.

HINDOO HAWKERS. Yailm wanloo. These people follow any occupation not involving manual labor, writers, painters.

HAWKS and kites are very numerous in the East Indies. Astur trivirgatus, *Temm.* the Goshawk inhabits the hilly parts of Nepaul, India and the Malay countries.

Another Indian species, A. palumbarius is a native of Europe and Asia, but in India is confined to the Sub-Himalaya. Among the hawks, the Kestrel will occasionally be observed in extraordinary abundance; and Harriers (Circus) are often seen beating over the open ground. In Lower Bengal, kites quit Calcutta and neighbourhood during the rains and return in the cold weather. It is supposed that they go to to the N. East. The kestrel, baza and Indian hobby are most frequent in Bengal during the rains, and in the rains, the Adjutant bird visits Calcutta and leaves in the cold weather. Dr. G. Buist has given a highly graphic sketch of a curious ornithological incident observed annually in the island of Bombay On the approach of the monsoon, nearly all the kites, hawks, vultures, and other carrion-birds disappear from the seacoast, while the crows begin to build their nests and hatch their young just at the season that seems most unsuitable for incubation, when the eggs are often shaken out, or the nests themselves are destroyed by the storm, and the poor birds are exposed, in the performance of their parental duties, to all the violence and inclemency of rain and tempest. At the instigation of a sure and unerring instinct, the carnivorous birds, as the rains approach, withdraw themselves from a climate unsuitable to the habits of their young, betaking themselves to the comparatively dry air of the Dukhun, where they nestle and bring forth in comfort, and find food and shelter for their little ones. The scenes connected with this, which follow the conclusion of the rains, are curious enough. While the mahomedans bury, and the hindus burn their dead, the Parsee race expose their dead in large cylindrical roofless structures, called Towers of Silence, where birds of prey at all times find an abundant repast. Their family cares and anxieties over for the season, the carrion-birds, which had left in May for the Dukhun, return in October to Bombay, and make at once for the usual scenes of their festivities, now stored with a three month's supply of untasted food. As they appear in clouds approaching from the mainland, the crows, unwilling that their dominions should be invaded, hasten in flocks to meet them, and a battle ensues in the air, loud, fierce, and noisy; the fluttering of the wings, the screaming and cawing of the combatants resounding over the island, till the larger birds succeed, and having gained the victory are suffered hence-forth to live in peace. In Bengal, the pitas and braminy kites breed chiefly in January and February, and disappear during the rains. The adult 'Adjutants' make their appearance as soon as the rains set in, and becoming in fine plumage towards the close of the rains, depart at that time to breed in the eastern portion of the Sundarbuns upon lofty trees, and along the eastern coast of the Bay of Bengal upon trees and rocks. Vultures are permanently resident. In Ceylon the beautiful Peregrine falcon, Falco peregrinus, *Linn*, is rare, but the Kestrel Tinnunculus alaudarius, *Briss* is found almost universally; and the bold and daring Goshawk, Astur trivirgatus *Temm.* is seen wherever wild crags and precipices afford safe breeding places. In the district of Anarajapoora, where it is trained for hawking, it is usual, in lieu of a hood, to darken its eyes by means of a silken thread passed through holes in the eyelids. The ignoble birds of prey, the Kites, Milvus Govinda, *Sykes*, keep close by the shore, and hover round the returning boats of the fishermen to feast on the fry rejected from their nets. Accipiter trinotatus is a beautiful hawk of Celebes with elegant rows of large round white spots on the tail *Tennents Sketches of the Natural History of Ceylon* p. 246. *Dr Buist in Bombay Times, Mr. Blyth "Z" in India Field.* See Eagles. Heroury.

HAWKING is a Tartar pastime, and Asiatics, are generally addicted to it. In India the employment of trained hawks may be traced to an exceedingly remote antiquity; and Mr. Layard found a bas-relief at Khorsabad, in which there appeared to be a falconer bearing a hawk on his wrist. The bedouins of Mesopotamia are attached to the sport, and especially so with reference to their larder; and the Arab race may possibly have introduced it, together with the creed of Mahomed, among the Malays of the Archipelago. We are not aware that traces of the practice of falconry have been remarked amongst the monuments of the old Egyptians; and in Africa this kind of sport is still confined to a few of the mahomedans of the north: nor does it appear to have been practised among the aboriginal tribes of the New World. In Europe the custom seems to have been first distinctly mentioned by authors about the fifth century:—but the garniture of the trained hawks would appear to have been unknown prior to the crusades; in the famous Bayeux tapestry for instance, falcons are represented as carried upon the wrist unhooded. Moreover, it seems likely that trained Ospreys were formerly employed in Europe for fishing: witness, as cited by Colonel Montague, an Act passed in the reign of William and Mary, by which persons were prohibited at a certain period of the

year from taking any Salmon, Salmon peal, or Salmon kind, by hawks, racks, guns, &c. Analagous to "hawking" is the Asiatic custom of hunting with the leopard. In Hyderabad in the Dekhan, in Hyderabad in Sindh, hawking is largely followed, the hawks commonly used are the

1. The Shahbaz, or hawk-king, a large grey goshawk with yellow eyes, caught in the hills of Affghanistan and its surrounding regions, brought down to the plains and sold, when well reclaimed, trained, and in good condition, for 5l. or 6l The tiercelet or male, is, as usual, much smaller than the female, and is called Jurrah, in Persian, "the active." Both are uncommonly strong and ferocious. They are accounted the noblest birds; the Sherbaz ("lion-hawk") or peregrine of Bokhara and the snowy regions, being all but unknown in Sindh.

2. The Bahri Bhairi) or Falco calidus, so celebrated amongst Indian falconers for her boldness and power, and her tiercel, in Sindh, commonly called the Shahin, are found in some parts of Sind'h. They fly at partridges, hares, bustards, curlews, herons and the saras; being long-winged hawks or birds "of the lure," they are taught to fly high, to "wait on" the falconer, and to "make the point."

3. The Bashah, a kind of sparrow-hawk, and her mate the Bashin, a small, short-winged, low-flying bird with yellow eyes and dark plumage in her first year, which afterwards changes to a light ash colour, marked with large grey bars, are very much valued on account of the rapid way in which they fill the pot, especially with partridges. As they remain in Sind during the cold weather, and retire in summer to the hills around, those trained are "passage hawks," or "birds of the year;" their low price, 8s. or 10s., makes it scarcely worth while to mew them, so they are let loose when the moulting season commences.

4. The Shikrah and her tiercel the Chipak are the common English sparrow-hawks. They are flown at partridges, and by their swiftness and agility afford tolerable sport. At the same time they are opprobriously called "dog-birds" by the falconer on account of their ignoble qualities, their want of staunchness and their habit of carrying the game, carrying being the technical word for flying away with the wounded bird. They may be bought ready trained, in most parts of Sind, for a shilling or two.

5. The Laghar, or hobby and her mate the Jaghar. This is the only long-winged hawk generally used in Sindh; she is large, and black-eyed with yellow legs, black claws and a tail of a cinereous white colour. She is a native of Sind, moults during the hot months from April to October, and builds in ruined walls and old mimosa trees. The Laghar is flown at quail, partridge, curlew, bastard-bustard and hares; the best sport is undoubtedly afforded by crows, only she is addicted to carrying the quarry, and is very likely to be killed by her angry enemies.

Luggur (Laghar) female. Juggur (Jaghar) male.	Native of Scinde, a large sparrow hawk, with dark eye, trained for the season, and then let loose.
Baz (Shahbaz) female. Zorru (Jurrah) male.	Native of Khorasan, goolab (yellow) eye; a noble bird.
Churgh, female. Churghela (Charghlo) male.	Native of Cuthee, black-eyed; fastens on the antelope, and kills the "tuloor" a kind of florikin.
Bashu (Bashah) female. Bisheen Bashin) male.	Native of Khorasan, goolab eye, small.
Bahree (Bahri) female. Bahree-buchee (Shahin) male.	Natives of Scinde, found near the Indus, and not prized
Kohe, female. Koheela, male.	Also called Shaheen, natives of Scinde, black-eyed.
Tooruratee, female. Chatway (Chatua) male.	Natives of Scinde, black-eyes; let loose after the season.
Shikrah, female. Chipak, male.	Natives of Scinde; goolab eye.

"Bashin" is a feminine form of Bashah, and yet popularly applied to the tiercel, or male bird.

The Bahri is a noble bird, as every Indian falconer knows. Some erroneously consider it a variety of the jer-falcon.

In Sind, the word Shahin is improperly applied to the tiercel of the Bahri. The best authorities believe it to be synonymous with Kohi (Kohee), a kind of jer, or Barbary falcon. The old falconers of Britain like the Orientals, had different names for the birds of the different sexes.

The Scindian, like the English sparrow-hawk, preys entirely upon birds. She flies exactly like the goshawk,—low, and frequently takes advantage of a shelter to fall unexpectedly upon her quarry.—*Burton's Falconry, Valley of the Indus.* p. from 13 to 16.

The Deer numerous on the banks of the Oxus, near Said, of which "a splendid pair of antlers" were procured by Lieut. Wood, are probably of the Maral species. Moorcroft also notices them, and enumerates lions and tigers among the animals of that neighbourhood; the lion being similar to

that of Guzerat. According to Burnes the tigers of Bokhara are small. *Z. in Indian Field, Burton's Falconry Valley of the Indus*, p. 16 to 20. See Falconry.

HAWLOOL, in lat. 25 ° 40' N. long. 52 ° 27' E , a small island on the south side of the Persian Gulf.—*Horsburgh.*

HAWIZA. See Khuzistan, Kerkha.

HAWULBAGH, is 3,976 feet above the sea.

HAYCOCK, NORTH and SOUTH. Islands in the China Sea, in lat. 3° 17' N., long. 107 ° 31' E. off great Natuna island.—*Horsburgh.*

HAY SAFFRON. Crocus sativus.

HAYWARD, George W. a scientific explorer who was endeavouring to explore the Pamir steppes and the country north of Peshawur, in the interest of the Royal Geographical Society of London. He was murdered in A. D. 1870, in Chitral, by Mir Wali, the nephew (sister's son) of Aman Malik, chief of Chitral, the valley North of Swat and Bajour and West of Gilghit. The Kashmir authorities urged him repeatedly to abandon the expedition in which his life would not be safe. Mr. Hayward resolved to persevere, although he was aware that beyond the Gilghit frontier the maharaja of Kashmir would be absolutely unable to protect him. *Indian Public Opinion.*

HAZAI also Hojai. See Bodo.

HAZAR. Ar. Present, Hence also Huzur, the presence; an address of royalty, also Hazrat. Hind. Pers. from a mahomedan a respectful address

HAZAR. Ar. Hind. Per. present; hence Hazari, breakfast.

HAZAR, Pers one thousand.

HAZARA, Shia Affghans who live principally in houses. They are said to lend their wives to their guests, their numbers are given at 1,56,000 souls. Monsr. Ferrier, in his "Caravan Journeys," (pp. 194, 237) mentions that he fell among the Aimak Hazara on the Murgab river, and other tribes about Dev-Hissar, more to the north and east. Their women take part in every war, manage the horse, the sword, and the firelock. Their courage amounts to rashness, and they are more dreaded than the men for cruelty and fierceness. He himself saw them under fire in the foremost rank, and it is, and so far as they know, has always been, a national custom. Here we have an intelligible explanation of the Amazons of Alexander, and the "female hosts" of Namuchi. Except Kangra and Hoshiarpur, the Hazara part of the Punjab, is the only well wooded district of Punjab proper.

The Hazara districts between Kabal and Bamian are collectively called Bisut, and mallia or tribute is enforced from them by the authorities of Kabul. This fluctuates in actual receipt, but the registered amount is 40,000 rupees.

The Hazara, or Hazarajat, are so called from the innumerable taifah, or tribes, into which they are divided—Hazar signifying in Persian a thousand. The Hazara occupy the whole range of the Parapamisus, or the mountains extending between the Hindu Koosh, or Caucasus and the city of Herat, to within a few days' march of Kandahar. In appearance, they very much resemble the Ghurka; they have the same high cheek-bones, the same small eyes, very little beard, and no doubt are of Tartar origin. The Ghurka, however, are Hindus; whilst the Hazara are shiah mahomedans.

The following are the Independent tribes dwelling along the outer face of the north-west Punjab frontier and inhabiting hills, adjoining the frontier of the Hazara District.

Hazara District.—Turnoulee, Gukkar, Dohnd and Suttee, Kaghan Syud and other tribes of Hazara.

In an attack by the Feroz Kohi on a Hazarah tribe near Singlah, in which M. Ferrier was engaged, he says it was a remarkable sight to see brave and energetic Tartar women under fire amongst, and as forward as, the men; they fight also on horse-back, and ride or act under any circumstances as well as the other sex. More than one of them would, I have no doubt, meet any European horseman on more than equal terms: the dexterity with which they manage their horse is extraordinary, and their courage is not less great—they take part in every war, and the vanquished dread their cruelty more than that of the men. The wild Hazara tribes, descend from the snowy range of the Narawah mountains, for the purpose of traffic. The Hazara mountaineers derive their subsistence chiefly from

their flocks. Their games are manly and athletic; they ride, wrestle, and shoot at a mark. The Hazara have a yodelu like the Swiss. Ferrier frequently heard it in passing through the country. Hazara are easily distinguished from their Afghan neighbours by their Tatar physiognomy, their diminished stature and their habiliments, especially their close-fitting skull-cap. The chief of the Bubak tribe, resides at Karabagh. Amongst the Hazara there is a tribe called Berber, like the inhabitants of Algeria. Between Herat and Kabool, lies the mountainous country of the Hazara. The journey between the cities has been performed in 12 days by shah Zuman, with a body of horse, and is said to be passable for artillery of small calibre. Caravans also travel it in summer, but the ascents and descents of innumerable hills are such that it is very fatiguing to the cattle, and the roads from Kabool, by Maimuna or Candahar, are always preferred. Towards Herat, the Hazara are soonee mahomedans, while those near Kabool are shiahs, which is a singular reversal, since the people of Kabool are of the former, and those of Persia of the latter persuasion. About Khujir Chist, east of Obe and Herat, the Teimuri are partially submissive to Herat In Sir A. Burnes time, those near Maimuna, and the adjoining states, were plundered by them, while the chief of Koondooz "chupao'd" the country to Yakonbung, over three of the passes of Hindoo Koosh, and near Bamian. The eastern portion about Bamian, and west of the road between Ghuzni and Candahar, are subject to Kabool, and pay a regular tribute. They are the Hazara of Besoot, Dihzungee (in part), Kara Bagh and Jughoree. The Kuzzilbash of Cabool have orders given on the greater part of this tract for their allowances, the people being shiahs, but the revenues of Besoot were generally collected by one of the Ameer's sons. The Hazara of Faloda, Hoojuristan, which is west of Jughoree, as well as those of Dih Koondi, secure independence from their remote possessions. The whole race is without a head, or it might prove very formidable; at present they are driven off in every direction, and sold like sheep. At no period did the kings of Kabool derive so much revenue from them as procured by Dost Mahomed Khan. The eastern Hazara are bigoted shiah and devotedly attached to the Persian party in Afghanistan.

The Hazara are of Tartar descent, and one of their tribes is called Tatar Huzara; they live at an elevation of 10,000 feet but in their square faces and small eyes they resemble Chinese; they are a simple-hearted people, but Burnes denies that they give their wives to their guest, though he states that their wives have great influence and go unveiled, and are not chaste.

Immediately on the north of Herat lies the country of the soonee Huzara, and a portion of the tribe ruled from Killa-i Nou, the chief of which is an adherent of the chief of Herat. This country includes Obe, and extends to the Moorghab. On the last invasion of Herat 4,000 Tajik families were removed from their seats nearer Herat to the more fertile lands east of Punjdeh, on the bank of that river.

At present the Hazara, according to Wood (p. 199), do not extend further east than the valley of Ghorbund; but Leech's report on the Passes shows that they are found on the passes immediately above Parwan, and that they formerly extended to the mountains adjoining the Khawak Pass, the most easterly of all.

The Hazara are not, according to Ferrier, the descendants of the old inhabitants of the Parapamisus, but are Tartar tribes, first settled in the country by Chengis Khan, they have entirely lost their original language, and have adopted an old dialect of the Persian. Their Tartar physiognomy remains, however, unchanged, so that it is impossible to mistake them. The Hazara mountains are on the S. W. of Balkh. The Hazarah are of a pure Mongolian type, indicative of their Turanian origin. The Hazarah are shiah mahomedans they derive their chief subsistence from their flocks. They are good marksmen and also ride and wrestle.—*Cal. Review, No.* 64, *p.* 433. *Masson's Journeys* Vol. II, p. 295. *Vigne's Personal Narrative*, p. 167-169. *Ferrier's Journ. p.* 223, 237. *Vigne's A personal Narrative* p. 113 to 171. *Masson's Journeys*, Vol. ii. p. 217. *Papers. East India (Cabul and Affghanistan* p. from 135 to 136.) *Yule Cathay*, II *p.* 540. *Ed. Ferrier Journ. p.* 222. See India, Kafir, Kavir, Kalmuk, Kazzalbash, Jews, Kabul, Inscriptions, Khyber, Koli, Mongal, Punjab.

HAZARA river is the Aras, the modern name of the ancient Araxes and is the Awerna of the Purans. This ancient river is now called Kum Feroz. It laves the foot of the rock Istakhr. The snowy Ardekan mountains are the same with those which presented so formidable a barrier to Alexander's progress, and by whose slopes he descended into Persia, in his advance on Persepolis. Towards the north of Armenia, runs the Araxes with its numerous tributaries. This river which at its commencement, owing to its many affluents, bears the Persian appellation of Hazara, springs from the side of the Bin Gol, or

"mountain of thousand Lakes," about 30 miles south of Erzerum, and nearly in the centre of the space between the eastern and western branches of the Euphrates. Its course, from its first spring near Jebel Seihan, is almost N. E. for about 145 miles through Armenia; when it turns eastward, being then near the frontier of Kars: this proximity continues for 110 miles. The sources of the Aras and those of the north branch of the Euphrates are about 10 miles from one another. According to Pliny (lib. VI. c. 9). those sources are in the same mountain, and 600 paces asunder. In modern times, the north-eastern districts, along the banks of the Araxes, intervening between Aderbijan and Georgia, had been in general subject to the sovereigns of Persia. —*Malcolm's History of Persia* Vol. II. p. 212. *Journal of the Royal Geographical Society Vol. VI. Part II. p.* 200.

HAZARA CAP, see Kush or Cush.

HAZARDANA, Hind. Euphorbia hypericifolia, E. thymifolia.

HAZAREA MOGRA. Jasminum sambac.

HAZAREE, a mahomedan ceremony.

HAZAREEBAGH, a small station in L. 24° L. 85° 54', 1750 feet above the sea and about 220 miles from Calcutta, in a district of the same name. It is a healthy spot; the earth sandy and rocky, presenting a strong contrast to the loomy and alluvial soil of Southern Bengal. The country slopes to the South, towards Sumbulpore. The North and East parts of the district are very mountainous, but level, and even depressed towards the Mahanudy. Between Hazareebagh and Palemow on the East and Jubbulpore on the west and thence southwards to Nagpore and Chandah. Central India has, in the East, five well marked sub-divisions of sedimentary rocks with coal bearing strata, the Talchir, Barakur, Ironstone shales, Raniguuj and the Panchet, but at a short distance to the west, there are only a threefold series, the Talchir, Barakur, and the Panchet. All these successive beds (possibly with the exception of the Talchir) representing an enormous lapse of time, agree in one respect that they seem to be purely fresh-water (fluviatile or fluvio-lacustrine) deposits. The Damoodah, the Barakur, the Adjai and the More, rivers seem at an early period to have formed one general estuary,—the basins of the Sone, and the Nerbudda. But the Mahanuddy and the Godavery, in all of which extensive deposits of coal have been found, as yet seem to have not been connected.—*Mundy's Sketches in India, Vol.* I. *p.* 4.

HAZAR KINIAN, here are no trees to be seen, but the ground is very verdant from the quantity of water. This spot is called Hazar Kinian, or the thousand springs. It is in Kurdustan, in the district of Aalan, an alpine spot where innumerable springs start from the ground.—*Rich's Residence in Koordistan Vol.*I *p.* 262.

HAZEL NUT.

Bindik,	Beng.	Corylus colurna,	
Noisettes Aveilenes,	Fr.	Avellane,	Lat.
Haselnusse,	Ger.	Fenduk,	Pers.
Finduk,	Guz. Hind.	Avellaas,	Port.
Naccinole, aveline,	It.	Avellanas,	Sp.

The fruit of different species of the Coryli or hazel trees. The kernels have a mild, farinaceous oily taste, agreeable to most palates. A kind of chocolate has been prepared from them; and they have been sometimes made into bread. They are grown in England, France, and Portugal, but chiefly Spain. They are also produced abundantly in the Himalayas. Hazel nuts are imported into Bombay from the Persian Gulf. According to the English Cyclopædia, the hazel-nut is the fruit of the wild bush of Corylus avellana, unchanged and unimproved by cultivation. It differs from the domesticated varieties only in being smaller and rather more hardy.—*McCulloch, Faulkner, Eng. Cyc vol.* III. *page* 31.

HAZIRAT, in mahomedan divination, in India, the flame of a charm-wick.

HAZIR ZAMIN, Hind. Pers. a personal bail.

HAZIZ. Ar. Hind. Berberis lycium.

HAZRAT. Ar. Hind. Pers. An honorific appellation, equivalent to lord, reverence, Mr. worship; Lord Jesus, Hazrat Isa; Hazrat Ali, the lord Ali.

HAZRAT IMAM a town on the south bank of the Oxus producing good silk. See Baljawar.

HAZREE. Breakfast, literally, the assembly.

HEAD CLOTHS, COTTON, or Roomals, are manufactured in the Madras districts they are always in squares of $5\frac{1}{2}$ and 6 cubits: with lace borders and are always red coloured, printed with white spots. These are worn by hindoos as turbands and are valued at from 8 Rupees to Rs. 250.

HEAD DRESS. The Turks of Turkey and of Egypt wear the turban and the red Fez cap. The Jews of Syria, Egypt and Persia, wear the turban. Many Persians in Persia, wear caps. The mahomedans and many hindus of India, use turbans. The Chinese story ascribes wing-like appendages to the emperor's cap. But the wings attached to the cap are rather an ancient

hindu feature, and are remarkably preserved in the state costume of the kings of Burma and the sultans of Java. *Yule Cathay.* I. p. lix.

HEADIE, the Malayala name of a tree in the forests of Canara. It grows from eighteen inches to two feet in diameter, and from thirty to fifty feet high. It yields a close grained wood, and is said to be durable; but it is rather scarce.—*Edye, Forests of Malabar and Canara.*

HEADLESS TESTACEA. See Chamacea. Chamidæ.

HEÆ-NUN, or Amoy, is an island in the Province of Foo-keen, and the city is of the third class, situate in Lat. 24° 32 N. Lon. 118° 6 East, and has a remarkably fine harbour and bay, capable of affording safe anchorage to one hundred sail, the entrance to which is through a narrow passage, fortified on either side. The population of Amoy exceeds 200,000, the greater portion of whom are occupied in the coasting trade. The city of Amoy is about eight miles in circumference, including the outer town or city, and north-eastern environs, the outer town is separated from the city by a chain of rocks, with a paved pass to a covered gateway, on the summit, and is skirted by the outer harbour; Amoy is well fortified, as the citadel, which is more than a mile in circumference commands the inner town, *Sirr's China and the Chinese. Vol.* I. p. 132-133.

HEARI, Mahr-, Terminalia chebula, *Retz.*

HEART-LEAVED COCCULUS. Eng. Cocculus cordifolius. *D. C.*

HEART LEAVED-FIG. Ficus cordifolia.

HEART-LEAVED MENISPERMUM. Menispermum cordifolium.

HEART-PEA. Cardiospermum halicacabum.

HEARTS-EASE. Viola tricolor, Pansy.

In gardens oft a beauteous flower there grows,
By vulgar eyes unnoticed and unseen;
In sweet security it humbly blows,
And rears its purple head to deck the green.
This flower, as Nature's poet sweetly sings,
Was once milk white, and Heart's-ease was its name,
Till wanton Cupid poised his roseate wings,
A vestal's sacred bosom to inflame.
With treacherous aim the god his arrow drew,
Which she with icy coldness did repel,
Rebounding thence with feathery speed it flew,
Till on this lonely flower, at last, it fell.
Hearts-ease no more the wandering shepherd found
No more the nymphs its snowy form possess,
Its white now changed to purple by Love's wound,
Hearts-ease no more,—'Tis Love in idleness.

Mrs. Sheridan. p. 47.

HEAVY OAK, Eng. Quercus incana.

HEAT. Poo hgying, Burm. The heat in India is sometimes very high. Major Sander's thermometer, on the Furrah-rood, in 1840, rose to 175° in the sun, a heat which enabled him to poach eggs in the burning sand. The mean heat at Bombay is 84° at Madras 83°, Calcutta 79°. Delhi 72°. *Ferrier Journ.* p. 269. See Gunpowder.

HEATHER, HIMALAYAN. Andromeda fastigiata.

HEAVEN. See Swarga Moksha.

HEAVENS, the seven.

HEAVY SPAR or Sulphate of baryta, sulfate de baryte, French; schwefelsaures Baryt German, is more abundant as a mineral than the Carbonate. The finest specimens have been obtained from Dufton in Cumberland: Dr. Royle found it on the Himalaya, near the convalescent depot at Landour.—*Illustr. Himal. Bot. p.* xxxiii. *Prop.*

HEBALSU. Can. The Wild Jack-wood.

HEBEL, the vanishing, the Abel of the Bible.

HEBENSTREITA a genus of undershrubs grown in common garden ground, the flowers white.

HEBER. The passage, a historical term connected with the race of Arphaxad,—indicating their passage near the Upper Tigris, in a south-western direction.—*Bunsen.* See Joktan.

HEBER a bishop and metropolitan of India, an eminent writer, was found dead in his bath, at Trichinopoly, on the 4th October 1833. In his time, he visited many parts of India and consecrated most of the church yards and churches, which led to after regulations.

HEBHARUVARU. Karn. A class of brahmans in Mysore.

Assara Rewand,	Ar Hind. Pers.	Rong,	Malay.
Gamboge tree,	Eng.	Go-katu,	Singh.
Rewand Chini,	Guz.	Katu,	,,
Sirah,	,,	Kana goraka,	,,
		Mukki,	Tam.

A moderate sized tree of Ceylon from the bark of which the gamboge of commerce oozes. The genus belongs to the natural order Clusiaceæ, and was established by Professor Graham of Edinburgh, for the gamboge-tree of Ceylon. The gamboge of commerce is known by the names of Ceylon and Siam gamboge. The gamboge of Siam is in cylinders, either solid or hollow, usually called pipes: it is supposed to have this form

from being so rolled, or from being poured into the hollow of bamboos. According to Lieutenant White, in his 'Visit to Cochin China,' in this form it is usually of the best quality, but Mr. Pereira has shown that some very impure is occasionally in the form of pipes. As this pipe-gamboge is usually exported from Singapore, it has been doubted whether it was actually the produce of Siam; but specimens from Mr. G. Swinton, which were sent to him direct from Siam, when he was Chief Secretary to the Indian Government, as the produce of that country, are identical with the best pipe-gamboge of commerce. The only information respecting its preparation is that given to Kœnig by a Catholic priest, who officiated as such to his co-religionists of Cochin China, and who stated that the inspissated juice obtained from breaking the leaves and young shrubs, as well as the fragrant lignum aloes, are given as a tribute to the king of Siam by the christians residing there. The tree must therefore be common, and probably near inhabited places, and therefore very likely to be Oxycarpus Cochinchinensis of Loureiro (now referred to the genus Garcinia) who names it from its acid fruit, and describes it as cultivated in Cochin China. Specimens of a plant, something similar to this in the form of its leaves, given by Mr. Malcolmson, were collected by him in Rangoon, which he thought might be the gamboge plants, as it contained a yellow purgative juice in the rind of its fruit. Dr. Graham thinks that the Siam plant may be a nearly allied species of the same genus as the Ceylon plant. The Ceylon gamboge is usually considered inferior; that which forms an article of commerce no doubt is so; and we have been informed by one of the principal merchants of Ceylon that, finding the gamboge there very cheap, he had been induced to purchase and send it to England, but had not been able to sell it from its inferior quality. No doubt, however, some of very excellent quality is produced in Ceylon by the tree which has been called Hebradendron cambogioides, and Mrs. Colonel Walker describes it as "brilliant and excellent," and "as good for water-colour drawings as any she ever used." Dr. Graham ascribes its inferiority to want of care in preparing the article for market; though it is yet doubtful whether the Ceylon gamboge of commerce is all yielded by this tree; but Mrs. Walker on one occasion, in passing through a forest of these trees, saw all of them with the bark cut off in various places. Dr. Christison has shown that there is all but an identity of composition with that of Siam; and its medicinal effects are precisely the same, as proved in Ceylon by Dr. Pitcairn, and by Drs. Graham and Christison in Edinburgh. The plant, though new named, is far from being new. Dr. Graham considers it to be identical with the Carcapuli of Herman, the Cambogia gutta of Linnæus, the Garcinia morella of late authors, and the Stalagmitis cambogioides of Moon's 'Catalogue of Ceylon Plants.' The last name might have been retained, as it was originally intended for it, had it not been discovered by Mr. Brown that the specimens in the 'Banksian Herbarium' collected by Kœnig, and from which Murray's character of the genus and species was established, consist not of one, but of two distinct plants, the flowers of Xanthochymus ovalifolia being stuck by sealing-wax upon a branch of what appears to be this Ceylon plant. The genera Stalagmitis and Xanthochymus are therefore one genus, as was previously inferred by Cambessodes, who has retained for it the former, as the prior name. The genus Hebradendron has dioecious flowers, the male having the calyx membranaceous, 4-sepalled, persistent; corolla 4-petalled; stamens monadelphous; column 4-sided; anthers terminal, opening by the circumcision of a flat and umbilicate terminal lid. The inflorescence of the female tree is similar to that of the male, the flower white and a little larger, with a germin precisely in miniature of the fruit, and surrounded like it with several (ten ?) abortive stamens. The berry is many (4) celled cells 1-seeded, surrounded at the base with some free abortive stamens, crowned by a lobed and muricated sessile stigma; cotyledons fleshy, united; radicle central, filiform; trees with entire leaves.—*Dr. Christison.*

See Clusiaceae, Dyes, Gamboge.

HEBRADENDRON PICTORIUM *Christison.*

Garcinia Pictoria.—*Roxb.*

A tall tree of the Malabar coast 60 feet high, of a conical shape, and very full of branches. The bark is pretty thick, scabrous and ramous on the outside, of a dark ferruginous colour, intermixed with many yellow specks, and through its substance, particularly on the inside, considerable masses of gamboge are found. The young shoots are somewhat angular, smooth polished, of a deep green colour. The leaves are opposite, short petioled, oblong, ventricose, rather acute, entire, smooth on both sides, and of a firm texture, from 3 to 4 inches long, by $1\frac{1}{2}$ or 2 inches broad. The calyx consists of two unequal pairs of concave obtuse leaflets, permanent. Petals 4,

oval, longer than the calyx. Anthers from 10 to 15, oblong, 2-lobed, and seemingly fertile. Ovary superior, round, 4-celled, with one ovule in each, attached to the axis a little above its middle. The berry is the size of a large cherry, oval, smooth, very slightly marked with four lobes, crowned with the sessile 4-lobed verrucose permanent stigma. Roxburgh says he received frequent samples of the gamboge of this tree from a correspondent at Tellicherry, and uniformly found it, even in its crude unrefined state, superior in colour while recent, but not so permanent as that from China. The tree grows on the highest parts of Wynaad in the peninsula of India.—Lindley *Flora Medica*, quoted in *Royle's Materia Medica*.

HEBREW is the language of the sacred books of the Old Testament and does not contain at most above 1,200 roots, the auxiliary forms included. Like all Aramaic languages it contains a great number of forms, for flexion or composition, thus an "x" signifies to live, life, alive, a living being. The language of Tyre and Sidon, was pure old Hebrew. Abram was a Hebrew, who spoke Aramaic as his mother tongue, but migrated from the Trans-Euphrates country and adopted the language of Kanaan, whose first born son was Sidon. 1,400 years after Joseph, Kanaan was occupied by the Israelite, Edomite and Canaanite, as separate nations. In the Old Testament, (Isaiah xix. 18,) the language of the Bible is called the language of Kanaan, in no instance Hebrew. This language is used by the small colony of Jews residing in Cochin and its neighbourhood, and is their means of acquiring a knowledge of their religion. Dr. Pritchard makes his fourth family of tongues, the Syro-Arabian languages, which, he says, appear to have been spoken from the very earliest times by the various nations who inhabited that part of Asia lying to the westward of the Tigris. Chevalier Bunsen names these the Semitic stock of languages, amongst which he includes those of the Hebrews and other tribes of Kanaan or Palestine inclusive of the Phenicians:—the Aramaic tribes of Aram, Syria, Mesopotamia, and Babylonia, speaking Syrian in the west and the so-called Chaldaic in the east; and thirdly, the Arabians, whose language is connected, through the Himyaritic, with the Ethiopic, the ancient, now the sacred, language of Abyssinia. The Semitic of Eichom, from Shem, is the Syro-Arabian of Farrar and Arabic of Leibnitz.

The Hebrew race, speaking this family of languages, ignorant of science, and theocratic, has devoted itself to the expression of religious instincts and intuitions,—in one word to the establishment of monotheism. The Semitic has, according to Mr. Farrar, three main branches:—

Aramaic, divided into two dialects, Syriac and Chaldee.

Hebrew, with which is connected the Carthaginian, Phœnician and Arabic.

Besides these, Egyptian, Babylonian, Assyrian and the Berber dialects are now considered to have a Semitic character, by Champollion, Bunsen (Egyptian) Lassen, Eugene Bornouf, Dr. Hincks, Sir H. Rawlinson (Assyrian) and Prof. F. Newman (Berber.) Essenians were a sect amongst the Hebrews who every day saluted the rising sun. The Hebrews, in Afghanistan and Bombay are called Ban-i-Israel.—*Bunsen*, i, 270-271. iv. 419. *Caldwell*, p. 3. See India. Inscriptions, p. 372. Iran, Jews, Kali, Sacrifice, Sanskrit, Serpent.

HEBRON in Judea was a refuge city, also, according to the Jews, the grave of our parents is there. See Bait.

HEBULHU. Mahr. Artocarpus hirsuta.

HECATE, See Kali.

HEDDE, Can., Nauclea cordifolia, *Roxb.*

HEDDE WOKE, Singh., Choecarpus pungens.

HEDERA, a genus of plants belonging to the natural other Araliaceæ, the Ivy family, generally trees or shrubs, several genera of which, Panax; Dimorphanthus; Aralia and Hedera, occur in India.

The following species are known in the Indies.

acuminata.	heterophylla.	rostrata.
exaltata.	jackiana.	trifoliata.
helix.	racemosa.	umbellifera.

Arbundul and Biridi, plants of Kaghan are species of Hedera, *Eng. Cyc. Wight's Icones.*

HEDERA EXALTATA, *Thw.* A large tree growing in the central province of Ceylon, at an elevation of 4,000 to 6,000 feet.—*Thw. En. Pl. Zeyl. p.* 132.

HEDERA HELIX, The Ivy; Common Ivy:

Lablab,	Ar.	Dakari	Beas.
Kussus,	„	Parwatti,	Trans Indus.
Harbambal of	Jhelum.	Kural of	Chenaub.
Arbambal	„	Kuril of	Ravi.
Karmora of	Kaghan.	Karur	„
Mandia	„	Karbaru of	Sutlej.
Brumbrum of	Beas.	Kaniuru	„

The ivy is a common plant all over Europe, clinging to trees and walls. It has a climbing stem with root-like fibres; leaves coriaceous, smooth, shining. It is found commonly wild in England, and is dispersed

through many distant parts of the Old World, lying between the Canaries and Europe on the west, and the northern parts of China on the east. In the Canaries it acquires its largest size, being what is called in English gardens, the Irish or Giant Ivy, which grows so much faster than the European form. In the north of India, and indeed occasionally in Italy, the berries, instead of being black as in Britain are bright yellow, and it is supposed that this is more particularly the Hedera of the Roman poets. The flowers are yellowish and appear late in the season, and, in consequence, are much resorted to by bees at seasons when little other food is to be had. It is common in the Punjab Himalaya, at places from 3,200 to 8,000 feet, occurs in the Salt Range and Trans-Indus; and Dr. Bellew got it at 9,000 feet near the Sufed Koh. It is stated to be a favourite food of goats, and in Kullu the leaves are said to be added to the beer of the country to make it strong.—*Dr. J. L. Stewart, M. D., Eng. Cyc.*

HEDERA UMBELLIFERA a native of Amboyna, where it is called "Sarura." It has a shrubby, unarmed, stem, and yields a blackish or dull-brown resin with a very powerful aromatic camphorated smell.—*Eng. Cyc.*

HEDGE HOG, the Erinaceus of the Mammalia, of which there are in India, at least, two species, E. collaris and E. mentalis. See mammalia.

HEDGES are not used for the cold weather crops of India. For the garden crops, sugar cane, betel, vine and others, the large species of saccharum are used. Quick-hedges are formed in Japan of the Lycium Japonicum, Citrus trifoliata, the Gardenia, species of Viburnum, Thuja, Spiræa; and arbours are made of the Dolichos polystachyos. Dr. Cleghorn gives the following as the hedge plants of India.

i. Plants adapted for Field-enclosures.

Opuntia dillenii, *Haw.*
Agave americana, *L.*
Euphorbia tirucalli, *L.*
„ antiquorum, *L.*
„ nivulia, *Buch.*
Cæsalpinia sepiaria, *Rox.*
„ sappan, *L.*
Pterolobium lacerans, *R. Br.*
Guilandina bonduc, *L.*
Parkinsonia aculeata, *L.*
Poinciana pulcherrima, *L.*
Mimosa rubicaulis, *Lam.*
Inga dulcis, *Willd.*
Acacia arabica, *Willd.*
„ concinna, *D. C.*
Vachellia farnesiana, *W. and A.*
Hemicyclia sepiaria, *W. and A.*
Epicarpurus orientalis, *Blume.*
Jatropha curcas, *L.*
Pisonea aculeata, *Rox.*
Capparis sepiaria, *L.*
„ aphylla, *Rox.*
Scutia indica, *Brong.*
Azima tetracantha, *Lam.*
Gmelina asiatica, *L.*
Balsamodendron berryi, *Arn.*
Toddalea aculeata, *Pers.*
Bambusa arundinacea, *Willd.*
Bambusa spinosa, *Rox.*
„ nana, *Rox*
Dendrocalamus tulda, *Nees.*
Pandanus odoratissimus, *L.*

ii. Ornamental Plants forming inner fences.

Lawsonia inermis, *L.*
Lonicera ligustrina, *Wall.*
Citrus limetta, *Riss.*
Morus indica, *L.*
Punica granatum, *L.*
Phyllanthus reticulata, *Poir.*
Hibiscus rosa sinensis, *L.*
Adhatoda vasica, *Nees.*
„ betonica, *Nees.*
Graptophyllum hortense, *Nees.*
Gendarussavulgaris, *Nees.*
Gardenia florida, *L.*
Allamanda cathartica, *L.*

iii. Plants used for edging garden walks.

Pedilanthus tithymaloides, *Poit.*
Vinca rosea, *Willd.*
Rosa indica, *L.*
„ semperflorens, *Curtis*
Heliotropium Curassavicum, L.

The Cacti, Agaveæ and Euphorbiæ are adapted to the arid districts, their structure enabling them to exist, when refreshed with only occasional showers; the Mimoseæ and Cæsalpineæ seem to enjoy the somewhat more cold and moist climate of the Balaghaut districts; while the Bambuseæ and Pandaneæ luxuriate in the rich loamy soil of the Mulnad (i. e. Rain country) Plants, for railway fences ought to differ as the line is continued through various districts, in accordance with the conditions under which particular plants thrive best between certain limits of temperature and moisture.—*Thamberg's Travels, Vol.* III. p. 8. *Dr. Cleghorn in Rep. Brit. Ass.* 1850, p. 311.

HEDGE QUINCE. Ægle sepiaria.

HEDJAZ. Arab. Goat.

HEDOO, Mahr. Can. Nauclea parvifolia, *Roxb.*

HEDUNG of Java the chopping knife of the Tenger mountaineers.

HED-YA-Mahr, a drover or cattle-dealer.

HEDYCHIUM, a genus of plants belonging to the natural order Zingiberaceæ, of which 28 species occur in the East Indies, some of them with sweet smelling flowers. A very fragrant species of hedychium with long narrow petals, and an epiphytic habit is often seen in Tavoy. Marsden gives Gandasuli, as the Hedychium coronarium of Linnæus, the doolal champa of India, and adds that its flowers are worn as ornaments in the hair, and in the enigmatical language of flowers stand for inconstancy.—*Mason. Jour. Ind. Arch., Vol.* V. *No.* 8, *August* 1851.

HEDYCHIUM CORONARIUM.

Doolal champa, Beng. | Khet-lan-thæ, Burm.

The garland flower, much cultivated; the flowers are fragrant, colours, orange, scarlet, yellow and white. The yellow and white varieties are both common. This is the most charming of all the plants of this natural order—the great length of time it continues to throw out a profusion of large, beautiful, fragrant blossoms, makes it parti-

cularly desirable." The plants are natives of India, and only require a light rich soil: they are increased by dividing the roots.—*Roxb. Voigt. Mason. Riddell.*

HEDYCHIUM SPICATUM.—*Royle; Bot. Mag.*

Bankela; Saki	of RAVI	*Bazaar roots.*	
Banhaldi; Shlui	„ BEAS.	Kapur Kachri,	HIND.
Sidhoul	HIND	Kachur.	„
Khor; Shalwi,	SUTLEJ.	Seer,	„
		Rutti	„

This grows throughout the East Indies and in the Punjab Himalaya up to near the Jhelam at least at from 3,500 to 7,500 feet and in China. Its large broad leaves are twisted and made into coarse mats for sleeping on, &c. The tuberous roots have, as "wild ginger," been tried by Europeans, as a preserve, but without success. The root is fragrant, warm, and aromatic, and Dr. Royle thinks it may probably be the "ritte," or lesser galangal of Ainslie. Capoor cutchery is the root of this plant, it is about half an inch in diameter, and, in China, is cut into small pieces and dried for exportation; has internally a whitish colour, but externally it is rough and of a reddish color; it has a pungent and bitterish taste, and a slightly aromatic smell. It is exported to Bombay, and from thence to Persia and Arabia; it is said to be used in perfumery and for medicinal purposes, and also to preserve clothes from insects. In Garhwal, they are used in washing the newly married, and Madden states that they are pounded with tobacco for the hookah.—*O'Shaughnessy, p.* 662. *Roxb.* i. 10; *Voigt. p.* 568; *Dr. J. L. Stewart, Punjab Plants, p.* 239.

HEDYOTIDEÆ a section of plants of the Nat. order Cinchonaceæ, containing 16 Wendlandi. 1 Lerchea; 2 Greenia; 3 Adenosace; 1 Xanthophytum; 26 Ophiorhiza; 8 Argostemma; 1 Spiradiclis; 2 Neurocalyx; 1 Dentella; 95 Hedyotis; 2 Kohautia; 10 Metabalos; 5 Axanthes; 2 Urophyllum.

HEDYOTES, a genus of the section Hedyotideæ, Nat. order Cinchonaceæ; some of the species are pretty flowering plants, otherwise mostly unimportant. *W. Ic. Voigt. Roxb.*

HEDYOTES UMBELLATA LAM. R. BR.

Hedyotes hispida, *Roth.* Hedyotes Indica *Rœm and Sch.*		Oldenlandia umbellata *Linn, Roxb.*	
Indian Madder.	ENG.	Saya.	TAM.

Camels thorn,	„	Badawart.	PERS.
Feve de loup,	FR	Shutur Khar,	„
Kamels dorn,	GER.	Dehveh samani,	TURU.
Susskle,	GUZ.		

A spiny shrub, from its branches exudes a sweet substance like manna; tatties are sometimes made of it, in Upper Hindoostan. Wellsted could not learn that manna is procured from this tree, in S. Arabia as in the vicinity of Mount Sinai.—*Wellsted's Travels Vol.* I. *p.* 139. *Ains. Mat. Med. p* 176.

HEDYSARUM GANGETICUM.

Salaporni. HIND.

This root is believed to be from the Hedysarum gangeticum, one of the Leguminosæ, a bitter tonic used in fever.—*Cat. Ex.*, 1862.

HEDYSARUM GYRANS. The wings of the ternate leaves of this leguminous plant are constantly oscillating upwards and downwards, as if invested with the power of voluntary motion, quite independently of any external stimulus.—*Hartwig.*

HEDYSARUM JUNCEUM, the Rush-stemmed Hedysarum, grows in vast quantities in Shekhawatti and elsewhere, near Jaepoor, the small branches are sweet and eaten by camels and other cattle. This becomes a considerable bush, and has no thorns.—*Gen. Med. Top*, p. 205.

HEDYSARUM LAGENARIUM. ROXB. Syn. of Æschynomene aspera.

HEDYSARUM LINEARE is used in Cochin China as a stomachic, and H alpinum is used in Siberia for the same purpose.

HEDYSARUM NALLA KASHINA. ROXB. Syn. of Ormocarpum sennoides. *D. C.*

HEDYSARUM PROSTRATUM. LINN. Syn. of Indigofera enneaphylla.—*Linn.*

HEDYSARUM SENNOIDES.

Ormocarpum sennoides.—*D. C.*

Jungli Munghi ki-jar,	DUK.	Katu murunga vayr,	TAM
Kanana, shiguru,	SANS.	Adivi munaga veru,	TEL.

The root possesses a considerable degree of warmth and is prescribed, as a tonic in certain cases of fever, also, in decoction, it is supposed to be a valuable remedy in rheumatic affections of long standing. With the bark of the root, ground small, and mixed with gingilie oil, a liniment is prepared which the Vyteans recommend as an external

application in paralytic complaints and in lumbago.—*Ain's Mat. Med.*, p. 74.

HEDYSARUM STIPULACEUM. Burm. and H. triflorum Linn. Willd. are Syns of Desmodium triflorum.

HEDYSARUM TUBEROSUM.

Pueraria tuberosa —*Bank's Ic. Kemp*, Tab. 25.

Kudsumi, Hind. | Daree goomodee—Tel.

A rare species, a native of the valleys far up amongst the mountains. It flowers during the hot season, at which time it is perfectly naked of leaves, being deciduous about the beginning of the cold season. The root peeled and bruised into a cataplasm is employed by the natives of the mountains where it grows to reduce swellings of the joints.—*Roxb. Fl. Ind.*, Vol. II, p. 863.

HEEL. This part of the body is often alluded to by oriental nations. The only vulnerable part of Krishna's body, was his heel, in which he was shot by a Bhil.

HEEMACHA, a bag made of the skin of a lamb, used by fakirs.

HEEN. Every Chinese province is divided into a certain number of districts, called 'Fu,' 'Ting,' 'Chow, or 'Heen.' A 'Fu' is a large portion or department of a province under the general control of a civil officer, immediately subordinate to the head of the provincial government.—*Sirr, Chinese.*

HEEN AMBILLA GASS. Singh. Antidesma zeylanicum.—*Lam.*

HEEN-KADOL. Singh. Ægiceras fragrans.—*Kon.*

HEERABOL. Hind. Sans. Balsamodendron myrrha. *Nees ab Esen.*

HEERADAKUN. Dragon's blood, from "Calamus draco."

HEERA-KASSEES, Dry per-sulphate of iron, used in dyeing, in making ink, blacking leather, used also in medicine, and made into "missi" to apply to the teeth :—to make.

Black missi.—Heera-kassees, chaipal harra, chooni-gond, lila tootiya, iron filings, kuth, equal parts, pounded and mixed: rubbed on the gums.

White missi.—Sufaid soorum (crystallized carbonate of lime, double refracting spar), and cinnamon pounded together: used as tooth powder.

Sada-kassees.—Impure sulphate of iron, the refuse from the manufactory of the sulphate of copper: four seers for one rupee.—*Gen. Med. Top. p* 137.

HEERAKHOND, in Assam, where diamonds occur. Tavernier tells us (Travels, p. 156), that gold, "comes from the kingdom of Tipra, but it is coarse, almost as bad as that of China." Gold dust is washed in the Dikerie river in the Tezpore district, but all the rivers in the north of Assam probably contain the auriferous metal, and on approaching the strata in the hills, the grains of metal found are of larger size. The value of the gold on the spot is rupees 16 for the quantity of a weight of a rupee. The Assamese use no cradle. A spot is selected and after digging down 4 or 5 feet, the sand is taken out and washed by passing water over it in any long leaf found at hand. The dust is then put into a small wooden or brass cup and a small quantity of quicksilver added, the mass is then gently moved together, the mercury taking up the gold and leaving the sand. The water is then drained off and the mercury with the gold placed in a piece of charcoal, the centre of which has been hollowed out; this is then put into the fire and the smelting takes place, the gold-finder using a piece of bamboo as a blow-pipe: when the whole mass is red hot, the charcoal containing the gold is taken out, dropped into water, and the shining metal appears. Gold also occurs in the Dirjmoh river Assam.—*Cat. Ex.* 1862.

HEERANA or Hirana in east Oud'h, manuring a field bypenning a herd of cattle or flock of sheep in it for several hours. K'hutana is used in a similar sense in Rohilcund. This practice is known in England under the name of 'fold-course' or 'foldage,' which formerly meant a privilege which several lords reserved to themselves of setting up folds within their manors for the better manurance of the same.—*Elliot, Supp. Gloss.*

HEERDA. Mahr. Terminalia chebula. —*Retz.*

HERRING, Pike, and Flat-fish tribes are represented on the Tenasserim Coast, by flat bellied herrings, thryssa-anchovies, Tenasserim-sardines, bristle-finned sprats, shads, chalæsi, fresh-water herrings, flying-fish, half-billed gar-fish, pikes, plagusia—soles, and brachirus—turbots.—*Mas.* 318.

HEFT, properly haft, Persian, seven.

HEFT-DHAT, literally seven metals, corresponding to the planets, each of which ruled a metal: hence Mohar, 'the sun,' for gold; Chandra, 'the moon,' for silver.—*Tod's Rajasthan*, Vol. I, p. 274.

HEFT-AKLIM, the seven climates, into which the mahomedan geographers divide the earth. The term is meant to include the whole world, and kings sometimes hyperbolically assume the title of king of the seven climates.

HEFT KISHWAR, has the same meaning and allusion as heft aklim; and the

sovereignty of the world is sometimes assumed under that title.—*Hindu Infanticide*, Vol. I, p. 141.

HEGGADE. KAR. The head-man of a town or village, but especially applied to one of the Jain religion. It is also used by certain castes as an affix to proper names to intimate respectability corresponding with sahib, or mian in Hindustan.—*Wilson's Glossary.*

HEGGULI of the Yerkali, Pandion haliætus.—*Linn.*

HEIBAH. See Kunduz.

HEIL. PERS. Cardamom. Eng.

HEJAZ, Burton says that the Arab of the Hejaz still uses heathenish oaths, and heathen names, few being mahomedan. Their ordeal of licking red hot iron, their practice of the salkh or scarification as a sign of manliness and their blood revenge, their eating creatures which have not been made lawful by the usual formula and their lending their wives to strangers, he indicates as showing how little mahomedanism has influenced the uncivilized parts of the country. *Burton's pilgrimage to Mecca vol.* iii *p.* 79. *See Bedouin.*

HEJR or Hajr. AR. also Tyn-Armeni? ARAB? Bole Armenian, perhaps Gil-i-Armeni.

HEJR-UL-BAHR. ARAB. Calculus cysticus.

HELA, a race of northern India, occupied as scavengers.

HELBETH. ARAB. also Helbh. ARAB. Trigonella fœnum Græcum. Fenugreek seed.

HELBULSOO. CAN. Artocarpus hirsuta.—*Lam.*

HELE. HIND. A subdivision of the Jat tribes.

HELEMBE. SINGH. Nauclea parvifolia.—*Roxb.*

HELENIUM MEXICANUM a flowering plant well adapted for borders, they are tallish growing plants, with yellow coloured flowers, and grow in any common soil, natives of North America chiefly.—*Riddell.*

HELFER, Dr., of the Bengal Medical Service and a celebrated botanist, was murdered by the natives of the Andamans in January 1839. See As. Jour. 1840, Vol. xxxiii. Author of Notice of the Mergui Archipelago. Ibid., Vol. xxxiii. Report on Tenasserim, and the surrounding nations Bl. As. Trans., Vol. viii. Along with Lieutenant Hutchinson, he reported on the new coal-field of Tenasserim in Bl. As. Trans. 1839, Vol. VIII, 385. Author of Researches on the Tenasserim Coast, in Friend of India, 165, 638.—*Dr. Buist.* Catalogue.

HELIANTHEMUM, a genus of plants, of the Cistaceæ or Rock-rose tribe, of which the following species may be enumerated,

egyptiacum, N. Africa Spain.	plantagineum, Europe, Persia.
breweri, Britain.	polyfolium, Britain.
canum, hoary sun rose.	punctatum, France.
denticulatum, France, Tibet.	salicifolium, Spain, Italy.
eriocaulon, Spain, France	sanguineum, Spain.
guttatum, S. Europe.	vulgare, common Rock-rose, Europe.
inconspicuum, Spain.

This plant has a singular looking contorted capsule, consisting of five fibres closely twisted in the shape of a screw, of various length, from one inch to two and a half. A liniment is prepared from the powder of it, which is supposed to be a valuable application in cases of offensive sores inside of the ears: the Teloogoo name means that the juice of the root is a powerful stomachic. The powder of the fruit has also been used in griping pains of the bowels, but solely because the twisted fibres of the capsule were considered to stamp it as a remedy, according to the ancient doctrine of signatures. The fibre of the bark makes good ropes.—*Powell, Drs. Stewart. Ain's. Mat. Med. page.* 118. *O'Shaughnessy, p.* 228.

HELICTIS, (Gray), a genus of the mammalia belonging to the order Carnivora. The species inhabit eastern Asia, and have the general appearance and colouring of Mydaus combined with a dentition resembling that of Gulo or Mustela, but differing from both the latter genera in the large internal lobe of the upper carnivorous tooth. The genus is thus characterised by Dr. Gray:—

Incisor (primores) $\frac{6}{9}$: canines (laniarii $\frac{1-1}{1-1}$; molars $\frac{5-9}{5-6}$

Head elongated, feet short; soles of the feet nearly naked to the heel; toes 5—5; claws strong, the anterior ones long and compressed. Tail cylindrical and moderate. There are two species, H. moschata from China, and H. Nepalensis from Nepaul. Their order may be thus shown;

Order Carnivora.

HELIOCLES, one of the Greek rulers in Bactria. See Bactria, Greeks of Asia, Kabul.

HELIOPHILA, of the Cruciferæ, a genus of pretty annuals, natives of the Cape of Good Hope, colours, purple, blue, violet and white, raised by seed, in pots, and may afterwards be placed out in borders.—*Riddell.*

HELIOPOLIS or Baalbec, the Balith of Scripture and Heliopolis or Temple of the Sun of the Greeks, is now a ruined town. It is built on the lower slopes of the Anti-Libanus, 43 miles N. W. of Damascus in lat. 34° 1' 30" N., and long. 36° 11' E. The date of its origin is unknown, but Antoninus Pius built a great temple there. It was sacked in A. D. 748 by the mahomedans and finally pillaged in A. D. 1400 by Timur; and now contains about a hundred Arab families, cultivators and herdsmen who reside in a quarter surrounded by a modern wall. The great temple of the sun and its buildings are at the western end, outside the modern walls. There were rows of pillars in the Corinthian order of architecture, almost all of which have now fallen, as also, have the roofs of great courts, one of them 144 feet square, and vaulted passages. On the east is a court 230 feet by 118 feet, which had arches on its western and northern sides. Human sacrifices were discontinued here in the time of—?

HELIOPSIS PLATYGLOSSA. Cass. Syn. of Guizotia oleifera.—*D. C.*

HELIOTROPE or Bloodstone, a quartzose mineral which occurs abundantly in the trap rocks of the Dekhan.

HELIOTROPE, flowering plants, should be grown in a soil more approaching to sand than clay, easily cultivated in pots, or the flower beds, propagated by cuttings in sand under glass; they require to be protected from the hot winds.

HELIOTROPIUM, a genus of plants of the Natural order, Boraginaceæ, of which several species are grown in India.

brevifolium.	malabaricum.	roxburghianum.
coromandelianum	marifolium.	scabrum.
curassavicum.	parviflorum.	supinum.
europæum.	peruvianum.	zeylanicum.
indicum.	ramossissimum.	
linifolium.	rottleri.

Under the native names, two kinds of hellebore which are commonly met with in the Indian bazaars are brought from Nepaul and the Red Sea. The roots of both plants are used in medicine, they are much used by carriers, and occasionally by native practitioners as a powerful cathartic in maniacal and dropsical cases. The roots of one kind occur in pieces of four to six inches, are black all through their substance, externally of a grayish colour, with numerous joints. The second variety is in similar pieces, but of a whiter colour internally. Black hellebore is indigenous to the Alps, Pyrenees, and Apennines, and is also cultivated in Great Britain. White helleboro grows in Switzerland, and the mountainous parts of Germany.—*Faulk. O'Shaughnessy, page* 168.

HELLUS, one of the Coleoptera of Hong Kong.

HELLWATER, a narcotic spirit distilled in Java from the fleshy part of the fruit of Arenga saccharifera,

HELMAND, the Etymander of the classics and Hætumat of the Vendidad, rises in the southern slopes of the Kouen-lun mountain near the Kalu Pass. It has, near it, the town of Bamian 10 000 and Cabul 6,400 feet above the sea; Koh-i-Baba peak 17,000 and its course is S. Westerly, receiving tributaries which rise near Candahar, the latter town being 3,480 feet. It is separated from the valley of the Indus by a meridional chain that runs from near the Koh-i-Baba peak, due south the Indian Ocean. The Helmand takes a S. W. direction and in its course receives the rivers that pass Candahar. The Helmund is very rapid, especially in winter after the floods. At Girishk it is from sixty to ninety yards wide. Its whole course is 650 miles. Rising in the Pughman range lat. 34° 40', lon. 68° 2'; at an elevation of 10,076 feet above the sea, it runs westerly to Pullaluk; and northwesterly into the Hamoon marshy lake, and that of Duk-i-Teer

by numerous channels. At 25 m. below Girishk it receives the Urgundab, 450 m.; At Girishk, 350 m. from source, its banks are about 1,000 yards apart but in spring it spreads beyond these limits; depth 10 or 12 feet, with a rapid current. At Pullaluk it was crossed by Christie, who found it, at the end of March, 400 yards wide, and very deep. The Persian authors generally write its name as Heirmund. It flows through Seistan, part of which arid province is fertilized by its streams, and empties itself into the lake of Zerah. Pottinger says, about two days journey for a horseman to the westward of Dooshak, it forms a lake, which, at some seasons overflows its banks, so as to extend eighty or ninety miles in length, and thirty or forty in breadth. The Etymander of the ancients is a fine river, and is the only one between the Tigris and the Indus to which these words can be applied. After the junction of several small streams coming from Koh-i-baba, situated at a short distance west of Kabul, it runs from north-east to south-west a length of two hundred parasangs; at first in a deep channel through scarped rocks, its bed obstructed by enormous blocks, through the mountainous country of the Parapamisus inhabited by Hazarah Pusht koh. At 10 or 12 parasangs above Ghirisk it begins to flow over a sandy and gravelly bed and through a flat country with a channel less confined. It is then turned to account, and irrigates by artificial means the meadows and arable land in its vicinity, until, nearly exhausted by the soil, it reaches at its extreme limit on the south the Meshila-Seistan, or lake of Seistan. Several inhabited islands, and some of them, like Kaleh-i-Bist, fortified, are in the middle of the stream, the aspect of which from one extremity to the other is picturesque and sometimes majestic.—*Malcolm' History of Persia Vol.* I p, 3 *Pottinger's travelsBeloochistan and Sinde* p. 316 *Ferrier Journ.* pp 428, 420. HEMIDACTYLUS TRIEDRUS, a pretty little white and spotted lizard of Labuan. It is one of the Geckotidæ, a natural family of Saurian Reptiles, belonging to Gray's sub-order Pachyglossa, and the Nyctisaura. The following is a list of the species of

Asiatic Geckotidæ, with the localities they inhabit.

Ædura marmorata, the Marbled Ædura. North Australia.
Æ. rhomhifer, the Lozenge-Spotted Ædura. West Australia.
Diplodactylus vittatus, the Yellow-Crowned Diplodactyle. Australia.
D. ornatus, the Beautiful Diplodactyle.
D. ocellatus, the Eyed Diplodactyle. West Australia.
D. marmoratus, the Marbled Diplodactyle. Australia.
D bilineatus, the Two Lined Diplodactyle.
D. lineatus, the Lined Diplodactyle. Cape of Good Hope.
D. Gerhopygus, the Naked Diplodactyle.
Phyllodactylus pulcher, the Phyllodactyle.
P. tuberculatus, the Large-Tubercled Phyllodactyle.
Ptyodactylus Gecko, the Fan-Foot. Egypt.
Uroplates fimbriatus, the Famocantrata. Madagascar.
U. lineatus, the Sharp-Tailed Famocantrata.
Caudiverbera Peruviana, the Caudiverbera. Peru.
Hemidactylus trihedrus, the Triangular-Tubercled Hemidactyle.
H. maculatus, the Spotted Hemidactyle.
H. Brookii, Brooke's Hemidactyle.
H. depressus, the Groove-Tailed Hemidactyle.
H. verruculatus, the Warty Hemidactyle. Shores of the Mediterranean; Egypt.
H. fasciatus, the Banded Hemidactyle
H. Mabouia, the Brazilian Hemidactyle. Brazil.
H. mercatorius, the Wandering Hemidactyle.
H. frenatus, the Streaked Hemidactyle. Ceylon.
H. Leschenaultii, Leschenault's Hemidactyle. Ceylon.
H. vittatus, the Streaked Cheeked Hemidactyle. Borneo.
H. Bellii, Bell's Hemidactyle.
D. Garnotii, Garnot's Doryure. South Sea Islands.
Platyurus Schneiderianus, the Platyure. Java.
Leiccrus ornaius, the Banded Leiurus. West Africa.
Crossurus caudiverbera, the Crossurus.
Boltalia sublævis, the Boltalia. India.
Peripia Peronii, Peron's Peripa. Mauritius.
Peropus mutilatus, the Peropus. Manilla.
Theconyx Seychellensis, the Seychelle Gecko. Islands of Seychelles.
Pentadactylus Duvaucelii, Duvaucel's Pendactyle. India: Calcutta.
P. Leachianus, Leach's Gecko.
Gecko verus, the Gecko, India.
G. Rcevesii, Reeve's Gecko Gecko. China.
G. Chinensis, the Japan. China and Japan.
G. Monarchus, the Amboyna Gecko. Borneo.
G. Smithii, Dr. A. Smith's Gecko. Prince of Wales, Island.
G. bivittatus, the Double Streaked Gecko.
Amydosaurus lugubris, the Sombre Gecko.
Gehyra oceanica, the Oceanic Gehyra. Islands in the Pacific.
G. Australis, the Swan River Gehyra. Swan River.
Ptychozoon homalocephala, the Fringed Treo-Gecko. Java.
Tarentola Mauriana, the Tarentola. Egypt.
T. Ægyptiaca, the Egyptian Tarentola. Egypt.
T. Delalandii, Laland's Tarentola. Madeira; West Coast of Africa.
T. Borneensis, the Bornean Tarentola. Borneo.
Phelsuma Cepedianus, Lacepede's Phelsuma. Mauritius.
Pachydactylus ocellatus, the Eyed Gecko. Cape of Good Hope.
P. maculatus, the Spotted Pachydactyle. South Africa.
P. elegans, the Elegant Pachydactyle. South Africa.
Sphœrodactylus sputator, the Banded Sphærodactyle. South America.
S. ponctatissimus, the Lined Sphærodactyle. Martinique.
S. fantasticus, the Black-Headed Sphærodactyle. South America.
S. nigropunctatus, the Black-Dotted Sphærodactyle South America
S. Richardsonii Richardson's Sphærodactyle. America.
Naultinus pacificus, the Pacific Naultinus. New Zealand.
N. elegans the Kakariki. New Zealand.
N. Grayii, the long-Toed Kakariki. New Zealand.
Eublepharis Hardwickii, Hardwick's Eublepharis. Penang, Chittagong.
Goniodactylus Timorensis, Boie's Augular-Toed Lizard. India.
G. alboangularis, the White-Throated Angular-Toed Lizard. South America.
G. ocellatus, the Eyed Angular-Toed Lizard. Tobago.
Cyrtodactylus, marmoratus, the Marbled Cyrtodactyle Java, Philippine Islands.
C. pulchellus, the Beautiful Cyrtodactyle. Singapore.
Heteronota Kendallii, the Bornean Heteronote. Borneo
Phyllurus platurus, White's Phyllure. Australia.
P. Milinsii the Thick-Tailed Phyllure.
P. inermis, the Spineless Phyllure. Australia.
Stenodactylus guttatus, Wilkinson's Stenodactyle. Egypt.

HEMIDESMUS INDICUS. *Rheede. R. Brown W. Ic. Contr.*

Smilax aspera	Asclepias pseudosara, *Roxb. var.* latifolia.
Periploca Indica, *Willde.*	
Ununtamul, BENG. HIND.	Irimusu, SINGH.
Kural, ,,	Nunnari, TAM.
Muckwy, DUK.	Gadi Sugandhi: Nalla Sugandhi; Pala-Sugandhi; Suganda-pala, Paia Chukhan-deru, Tella Sugan-dhipala TEL.
Indian, Sarsaparilla, ENG.	
Country Sarsaparilla, ,,	
Magraba, HIND.	
Naru nindi, MALEAL.	
Shadipa, SANS.	

This is a common plant, all over the Indian peninsula. The root is long and slender, with few ramifications, covered with rust-coloured very fragrant bark, the odour remaining after drying, and strongly resembling that of new mown hay. The roots have long been employed on the Madras coast as a substitute for sarsaparilla, and have been also used in England and very highly spoken of. Dr. O'Shaughnessy's trials were numerous and satisfactory. Its diuretic operation is very remarkable; two ounces infused in a pint of water and allowed to cool was the quantity usually employed daily, and by such doses the discharge of urine was generally trebled or quadrupled. It also acted as a diaphoretic and tonic, and so increased the appetite that it became a most popular remedy in his hospital, the patients themselves entreating its administration and continuance. The taste and smell of the infusion are balmy and sweet; he

used it with the most decided benefit in numerous cases of the description in which sarsaparilla is generally given; indeed he considers the activity of his medicine to be much more decided than that of sarsaparilla itself. The ununtamul can be purchased in Calcutta of good quality at from two to four annas the seer No good analysis has yet been made of this drug. A volatile acid is described by Mr. Garden of London as having been obtained from the Smilax aspera, under which name it is thought H. indicus became the subject of his experiments. This is however as yet doubtful. It occurs in bundles, about a foot and a half long; smell fragrant, enduring; fracture white; boiled in water, vapour very agreeable. It is a perfect substitute for sarsaparilla. But as much of its virtues depend on a volatile principle, ununtamul should not be employed in decoction, as long boiling dissipates the active ingredient. Dr. O'Shaughnessy says the infusion is a fragrant and highly effectual alterative and diuretic, of great service in secondary, venereal affections and chronic rheumatism. It is in every respect a perfect substitute for sarsaparilla.—*O'Shaughnessy Dispensary page* 456. *Beng. Pharm.* p. 279, 301.

HEMIGYMMA MACLEODII, *Griff?*

Cordia macleodii, *Hooker*

Botku. TEL. | Deyn gan. HIND.? of Jubbulpore.

This tree is abundant in the Godavery forests near Mahadeopore: it does not extend down to the Circars. It is found near Warungul. It is also indigenous to the Jubbulpore forests, where it is called "Deyngan." Dr. Griffith described "Hemigymna Macleodii." from dried specimens and thought that the leaves were opposite (instead of alternate) otherwise his description and native name agree. It yields a very beautiful wood which would answer as a substitute for maple for picture frames, &c.—*Captain Beddome.*

HEMIGYROSA TRICHOCARPA, *Thw.*, a moderate sized tree of which one variety grows in the Central Province of Ceylon up to an elevation of 3,000 feet; another variety grows in the hot, drier parts of the island.—*Thw. En. Pl. Zeyl.* i. p. 56.

HEMIONITIS CORDIFOLIA. In Tenasserim, near the sea shore, this species of mule fern with cordate fronds is sometimes seen.—*Dr. Mason.*

HEMIPODIUS DUSSUMIERI, a bird belonging to the family Perdicidæ. See Birds.

HEMIPTERA, of the Hemiptera, several genera occur in India. Amongst others, are Cantuo ocellatus, Leptoscelis marginalis, Callidea stockerius, &c., &c Of the aquatic species, the gigantic Belostoma Indicum attains a size of nearly three inches. Some of them are most attractive in color, a green one, often seen on leaves is quite inoffensive, if unmolested, but if irritated exhales an offensive odour.

Bugs belong to the Hemiptera and insects known as coffee bugs have in recent years attracted much attention from the anxiety and losses they have occasioned to the coffee planting interests, and from which planters are subjected to great losses, against which seemingly at present they have no means of protecting themselves.—*Tennent's Ceylon.* See Bugs · Insects.

HEMIRAMPHUS, a genus of fishes of the Family Scombresocidæ in which the genera are 46 Belone, 5 Scombresox, 40 Hemirhamphus, 1 Arrhamphus, 44 Exocœtus.

Hemiramphus macrorhynchos a native of the Bay of Bengal, near Pondichery, has an elongated body and proboscis like member proceeding from its mouth.

Hemiramphus Russelli, CUV. and VAL. Toda pendek (Pendek, short.) The Malays thus denominate all the species of Hemiramphus, to distinguish them from those of Belone (Toda) of the Malays. At Pinang this species is numerous at all seasons, but larger individuals occur at irregular intervals. They appear at European tables under the appellation of "Guard fish."—*Cantor. Hartwig.*

HEMITRAGUS JEMLAICUS a mammal of the goat tribe, See Capreæ: Mammalia.

HEMITRAGUS QUADRIMAMMIS. HODGS. Syn of Capra jemlaica.—*Ham. Smith.*

HEMLOCK. Conium maculatum.

Rosh, HEB. | Rash, HEB.

In the export commerce of India, hemp is a term applied to the fibres of several distinct plants, all of them valuable as cordage materials. The true hemp of Europe, is the fibre of the Cannabis sativa of botanists, which is chiefly grown in Russia and is sent to the other European countries for cordage, canvas and towelling. Hemp ap-

pears to be a plant of the Persian region, where it is subjected to great cold in winter, and to considerable heat in summer. It is however difficult to say of what country the plant is a native; Willdenow says Persia; Gmelin says Tartary; while Thunberg found it in Japan. It has thus been able to travel westerly into Europe, and easterly into Japan; so that the varieties produced by climate have by some been thought to be distinct species, the European being called C. sativa, and the Indian C. indica. It is believed to be originally a native of Asia and its Greek and Latin name Cannabis is supposed to be derived from the Arabic "Kinnub." Herodotus mentions it as a Scythian plant. Bieberstein met with it in Tauria and the Caucasian region. It is well known in Bokhara and Persia, and is abundant in the Himalaya. In Britain the prices of the cleaned fibre range from £15 to £45 the ton and in the years 1847 to 1851, the imports into Britain ranged between 40,578 to 53,063 tons annually. These quantities are stated from Poole's Statistics of commerce but Dr. Royle gives the following as the quantities of hemp imported into the United Kingdom:—

	1847	1848	1849	1850	1851
From Russia, Cwt	544,844	540,207	641,518	614,535	672,342
„ British territories in East Indies	185,788	258,239	360,362	399,345	590,923

Since the year 1855, in consequence of a war with Russia, true hemp has been more largely produced in other countries, and other fibres have been utilized, so that many fibres have come to be known in commerce under this name, and the value of all other fibres is estimated from their greater or lesser resemblance to hemp, and especially to Russian hemp. Though grown for the commercial purposes of Europe, principally in Russia, it is common in Egypt, Turkey and every part of Asia, but while in European countries it is cultivated only for its ligneous fibre, so extensively employed in the manufacture of the strongest ropes, and of coarse but strong kinds of cloth, in addition to its fibrous products, it is much cultivated in the oriental countries to obtain the intoxicating leaves, called 'Ganja,' from which 'Bhang' and "subjee" are produced, and the resinous substance, called 'churrus.' The mode of cultivating for each of its products is however different. The plant requires exposure to light and air, and is therefore sown thin or transplanted out when it is cultivated for its resinous and

intoxicating secretion, while the growth of fibre is promoted by shade and moisture, which are procured by thick sowing.

Hemp is an annual plant from 3 to 10 feet high, with the males and females on seperate stems. The finest quality of hemp and that which brings the highest price, being sold at 50s. per cwt., when the best Russia brings only 47 shillings, comes from Italy, though French, English and Irish hemps are much esteemed. The Russian hemp grows best in a friable soil of moderate richness. Hemp is grown everywhere throughout India, and in the Himalaya up to 10,000 feet, and with care in the selection of the soil and in its preparation, it might be made successfully to compete with the Russian, Polish and Italian hemps. Dr. Roxburgh's opinion is favorable as to its cultivation in the plains, and Dr. Royle recommends its cultivation both during the rainy and the cold weather season, the latter being so similar to that of the summer culture of European countries and points to Rohilcund and neighbouring hills as well suited for its extension.

It is from its possessing a remarkably tough kind of woody tissue capable of being manufactured into linen and cordage, that hemp is best known; and for its good qualities in this respect it is unrivalled among the many plants possessing similar properties. The hemp fibre of India is extensively used for the manufacture of twine and rope, coarse cloth, sacks and bags. In a Minute, published by the Madras Government (9th September, 1854 for the express purpose of directing attention to the fibrous productions of that presidency, the exports are given as valued at the following sums, in the respective years from 1847 to 1852, excluding Coir and Coir rope. The year selected above, in consequence of the published accounts of the three Presidencies being incomplete, is that in which the exports were the smallest.

	Hemp.
1847-48	....Rs. 19,819
1848-49	„ 23,242
1849-50	„ 23,076
1850-51	„ 10,577
1851-52	„ 46,683

The following are the values of the hemp, coir, and coir rope exported from Madras as shown by the Sea Custom Returns.

	Hemp. Rs.	Coir and Coir Rope. Rs.	Total. Rs.
1847—48	...19,819	27,937	47,756
1848—49	23,242	1,38,617	1,61,859
1849—50	23,076	2,08,704	2,31,780
1850—51	10,577	2,46,852	2,57,429
1851—52	46,683	2,42,019	2,88,702

Under the general title hemp including sunn and jute, from India, and that known as Manilla hemp, the quantities received in Britain were as under.

	From Russia Tons.	*All other parts* Tons.	*Total importation* Tons.
In 1851	33,229	31,442	64,671
1852	27,198	26,516	53,714
1853	41,819	21,323	63,142
Total	...102,246	79,281	181,527
Average	... 3,4082	26,427	60,509

Russia supplied considerably more than half the entire importation, realizing in one year, upon 42,000 tons at peace prices, averaging £35 per ton, a market value of nearly £1,500,000. In the Himalayas, the true hemp fibre is separated for economic purposes, and was exported from India to England during the last war. At the Madras Exhibition of 1855, the best and cleanest sample was sent from Nellore: this plant does not thrive in Southern India so well as in the North-West Provinces, and the colder parts of Bengal; it there produces a strong fibre suited for cordage and weaving, but in Southern India the fibre deteriorates, and has little strength, it grows best at altitudes of 3 to 7000 feet.

In China, hemp is cultivated in the provinces north of the Meiling, but the plant also grows in Fuhkien; the grass cloth made from it is not so much used for common dresses as cotton and silk. There are three plants which produce a fibre made into cloth known at Canton, under this commercial name, viz. the Cannabis sativa or hemp the Urtica nivea, a species of nettle grown about Suchan, and the Sida tiliæfolia near Tientsin-fu. A gigantic species of Cannabis hemp growing from ten to fifteen feet in height is in China a staple summer crop. This is chiefly used in making ropes and string of various sizes such articles being in great demand for tracking the boats up rivers and in the canals of the country.

Churrus.—In certain seasons and in warm countries a resinous juice exudes and concretes on the leaves, slender stems, and flowers. Separated and in masses, this juice constitutes the churrus of Nipal and Hindostan, called kirs in Bochara, and to this, the type or basis of all the hemp preparations, are the powers of these drugs attributable. In Central India, the Saugor territory and Nipal, churrus is collected during the hot season, men clad in leathern dresses run through the hemp-fields, brushing against the plant with all possible violence; the soft resin adheres to the leather, and is subsequently scraped off and kneaded into balls which sell at from five to six rupees the seer. A still finer kind, the Momeea or waxen churrus, is collected by the hand in Nipal, and sells for nearly double the price of the ordinary kind. In Nipal, the leathern attire is dispensed with, and the resin is gathered on the skins of naked coolies. In Persia, it is stated by Mirza Abdul Russac, that the Churrus is prepared by pressing the resinous plant on coarse cloths, and then scraping it from these and melting it in a pot with a little warm water. He considers the Churrus of Herat as the best and most powerful of all the varieties of the drug. It is said also that when the bhang leaves are picked off and the stalks remain, the little knots which occur wherever a leaf issues from the stem, are picked and collected as ganja and these contain much resin.

Ganjah.—The dried hemp plant which has flowered, and from which the resin has not been removed, is called Ganjah. It sells for twelve annas to one rupee the seer in the Calcutta bazaars. It yields to alcohol twenty per 100 of resinous extract, composed of the resin (churrus), and green colouring matter (chlorophylle.) Distilled with a large quantity of water, traces of essential oil pass over, and the distilled liquor has the powerful narcotic odour of the plant. The ganjah is sold for smoking chiefly. The bundles of ganjah are about two feet long and three inches in diameter, and contain twenty-four plants. The colour is dusky green—the odour agreeably narcotic—the whole plant resinous, and adhesive to the touch. According to Mr. McCann's notes, the Ganjah consumed in Bengal is chiefly brought from Mirzapur, and Ghazeepur being extensively cultivated near Gwalior and in Tirhoot. The natives cut the plant when in flower, allow it to dry for three days, and then lay it in bundles averaging one seer weight, which are distributed to the licensed dealers. The best kinds are brought from Gwalior and Bhurtpore, and it is also cultivated, of good quality in a few gardens round Calcutta. In Jessore, the drug is known to be produced of excellent quality, and to a very considerable extent of cultivation.

Bhang.—The larger leaves and capsules without stalks are called "Bang, Subzee, or Sidhee." They are used for making an intoxicating drink, for smoking, and in the conserve or confection termed Majoon. Bang is cheaper than ganjah, and though less powerful, is sold at such a low price that for one pice enough can be purchased to intoxicate a "habituated person." Sidhee, Subjee, and Bang (synonomous) are used

with water as a drink, which is thus prepared:—About three tola weight (540 troy grains) are well washed with cold water, then rubbed to powder, mixed with black pepper, cucumber, and melon seeds, sugar, half a pint of milk, and an equal quantity of water. This is considered sufficient to intoxicate a habituated person. Half the quantity is enough for a novice. This composition is chiefly used by the mahomedans of the better classes. The same quantity of Sidhee is washed and ground, mixed with black pepper, and a quart of cold water added. This is drank at one sitting. This is the favourite beverage of the hindus who practice this vice, especially the Brijobassi and many of the Rajpootana soldiery. (*Williams' Middle Kingdom, p.* 106. *Powell's Hand-book* 296. *O'Shaughnessy, p.* 582.)

Sunn In notices of Indian fibres we frequently meet with the word Sunn, as indicating a particular kind of Indian fibre. Sometimes we find it called Indian Hemp: and we may often see hemp enumerated as one of the exports from India. At other times the same or another fibre is mentioned by the name of brown hemp. These various names are sometimes applied to the fibre of one or of two different plants, or are employed to distinguish the fibre of three distinct plants all of which are grown for their fibres, and have been, and might be exported from India, though only two of them are now usually to be found among the exports. In the exports from the different Presidencies of India, it is very difficult to distinguish these different kinds of fibre, inasmuch as the same name, hemp, is applied to the exports from all the three Presidencies; but speaking generally, the Sunn (Crotalaria juncea) is chiefly exported from all the three Presidencies, and one kind of Brown hemp (Hibiscus cannabinus), along with the other kind, Taag, from Bombay.—(*Royle Fib. Pl. p.* 352.)

Jubbulpore hemp is being extensively cultivated and already established as an article of commerce in India and highly esteemed by good judges in Britain.

Sunn Hemp, (Crotalaria juncea), called also, Sunnub, Wuckoonar, Shanal or Jute gramee, is largely cultivated in the Madras Presidency for the manufacture of rope, string and gunny bags. This fibre is not so strong as many others, but it is well suited for the manufacture of gunny bags and paper, and is sometimes sold as Jute. The fibre of the Sunn or Taag (Crotalaria juncea) is often called Indian hemp, but incorrectly. It is the kind most generally cultivated all over India on account of its fibre,

and is that usually mentioned in the exports from Calcutta under the name of hemp, but also as Sunn. The plant may be distinguished by its flowers being of a bright yellow colour, and of the form of the pea and of the laburnum, while the leaves are entire and lanceolate.

The Ambaree.— (Hibiscus cannabinus) Mesta paat of Bengal, and Palungoo of Madras, is also very generally cultivated all over India, and exported of very good quality from the west side of that country. Its leaves are both entire and lobed, its flowers are large, and in shape resemble those of the mallow, the hollyhock, and the cotton plant, of a sulphur-yellow colour with a dark brown centre. The fibre of this plant is like that of Jute, sometimes called paat, and also Indian hemp. It is often confounded with that of the Sunn, as it is one of the kinds of Brown hemp of Bombay, though the two plants differ much from each other.

The strength of fibres is a point of very great consequence. The difference in strength between the best and ordinary Russian hemp is in the proportion of 5 to 4 and sometimes 6 to 4, and the strength of the best Russian hemp to the best Sunn bears a proportion of 6 to 4.

Dr. Royle had equal weights and equal lengths of several of Indian fibres taken, their ends tied and fixed in a vice, and then the number of pounds ascertained with which each broke. In these experiments St. Petersburgh clean Hemp, broke with 160 lb.

A fibre from Travancore, called Wuckoo... ...	„	175
Yercum fibre... ...	„	190
Jubbulpore Hemp... ...	„	190
China grass, from China,	„	250
Rheea fibre or China grass, from Assam, ...	„	320
Wild Rheea, also from Assam	„	343

Hemp from Kote Kangra, in the Himalayas, bore 400 lb. without breaking. Amongst thirteen samples of the 2-inch rope, the Deyrah hemp stood the fifth in strength and the twelfth in elasticity. But hemp of far greater strength is produced in the native hills of the plant. Mr. Williams, of Jubbulpore, gave to Dr. Royle, in the year 1853, a sample of hemp, which he stated had been forwarded to him by D. F. Macleod, Esq., as the produce of Kote Kangra, in the Sikh Himalaya. This, Dr. Royle has called Kote Kangra hemp, not breaking with a weight of 400lb., when China-grass from Assam broke with 320lb. and Petersburg hemp with only 160lb. It appeared to all the practical men who examined it, as the strongest

fibre with which they were acquainted. Dr. Jameson himself had brought Kote Kangra hemp to Mr. Macleod's notice, not produced in the Kangra district, but in Kooloo and Lahoul, which are a little farther in the interior.—*Royle, Fibrous plants, p.* 277. *Journ. Agri-Hortic. Soc.*, iii, pp. 224-227. *Drs. Roxb. Fl. Ind. HEMP, DEKHANI. Eng. also Hemp leaved hibiscus. Hibiscus cannabinus.

HEMP SEED, and oil.

Sunn-ki-bing, Hind. | Chenivi, Fr.

The seeds of the Cannabis sativa, var. C. Indica, are albuminous and oily, and entirely devoid of all narcotic properties. They are crushed for oil-the Gannja yennai, Tamil, in many parts of the country. In Russia. the oil is much used for burning in lamps, but it is unknown to the natives of India. At the Madras Exhibition of 1855, three specimens were exhibited, one of a deep green colour from Tanjore, another of an olive green, sent by Lieut. Hawkes, and the third in the Madras Tariff.

Henna tree, ,,	Goranta chettu, Tel.
Camphire of the Bible ,,	Iveni, ,,

This is the camphire of the English Bible, and the cypress shrub of the Greeks and Romans, is a fragrant plant when in flower. The cypress plant says Rosenmuller, "is held in particularly high esteem by the Greeks, the Arabs, and the Turks; and they think that they make an agreeable present when they offer a person a posy of its flowers. This plant, Sonini observes, is particularly agreeable to the eye and the olfactory organs, of which the coloring of the flowers, is soft, they spread fragrance to a great distance, in India hedges formed of it are common. The fresh leaves, beat up with catechu,

——"Imbue
The fingers' ends with a bright roseate hue,
So bright that in the mirror's depth they seem
Like tips of coral branches in the stream.

This use of the leaves is as old as the Egyptian mummies, and is still practiced by Southern Asiatics.

A reddish brown substantive dye, is procured from the leaves, the mahomedans in India, Persia, Arabia and other countries, use the shoots for dyeing the nails, tips of the fingers and toes, and palms of the hands red. It is employed in the East for dyeing ordinary stuffs; and the extract of the flowers, leaves, and shoots, is used by the hakeems in lepra, and in obstinate cutaneous diseases.—*Faulkner, Mason.*

HERA, a Babylonia goddess, the prototype of the Juno of the Romans and of the Egyptian Hora.

HERAR, Hind. Agaricus campestris.

HERABOL. Guz. Hind. Myrrh.

HERACLIDÆ. The first eleven kings, the Heraclidæ of Lacedæmon, commencing with Euristhenes (1078 before Christ), average thirty-two years, while in republican Athens, nearly contemporary, from the first perpetual archon until the office became decennial in the seventh Olympiad, the reigns of the twelve chief magistrates average twenty-eight years and a half. Colonel Tod surmises analogies between the Hercules of the east and west. Amidst the snows of Caucasus, Hindu legend abandons the Hercula race, under their leaders Yoodishtra and Buldeva: yet if Alexander established his altars in Panchalica, amongst the sons of Pooru and the Hericula Col. Tod thinks that no physical impossibility exists that a colony of them, under Yoodishtra and Buldeva, eight centuries anterior, should have penetrated to Greece? When Alexander attacked the "free cities" of Panchalica, the Pooru and Hericula who opposed him evinced the recollections of their ancestor, in carrying the figure of Hercules as their standard. Comparison proves a common origin to Hindu and Grecian Mythology; and Plato says the Greeks had theirs from Egypt and the East and Colonel Tod thinks that the Heraclidæ may be a colony of the Hericula, who penetrated into the Peleponnesus (according to Volney) 1078 years before Christ. The Heraclidæ claimed from Atreus: the Hericula claim from Atri. Euristhenes was the first king of the Heraclidæ: Yoodishtra has sufficient affinity in name to the first Spartan king, not to startle the etymologist, the *d*, and *r*, being always permutable in Sanscrit. The Greeks or Ionians are descended from Yavan, or Javan, the seventh from Japhet. The Hericula are also Yavan claiming from Javan or Yavan, the thirteenth in descent from Yayat, the third son of the primeval patriarch. The ancient Heraclidæ of Greece asserted they were as old as the sun, and older than the moon. This boast may conceal the fact, that the Heliadæ (or Surya vansa) of Greece had settled there anterior to the colony of the Indu (Lunar) race of Hericula? In all that relates to the mythological history of the Indian demi-gods, Buldeva (Hercules), Crishna or Kanya (Apollo), and Boodha (Mercury) a powerful and almost perfect resemblance can be traced between those of Hindu legend, Greece, and Egypt. (Buldeva the god of strength) Hericula, is still worshipped as in the days of Alexander; his shrine at Buldeo in Vrij, (the Suraseni of the Greeks), his club a ploughshare, and a lion's skin his covering.

A hindu intaglio represents Hercules exactly as described by Arrian, with a monogram consisting of two ancient characters now unknown, but which Colonel Tod found wherever tradition assigns a spot to the Hericula; especially in Saurashtra, where they were long concealed on their exile from Delhi. This he decides to be the exact figure of Hercules which Arrian describes his descendants to have carried as their standard, when Porus opposed Alexander. The twenty-eighth prince, Khemraj, was the last in lineal descent from Parikhita, the grand nephew of Yoodishtra. The first dynasty lasted 1864 years.—*Tod's Rajasthan*, Vol. I, p. 51-55.

HERACLEUM, a genus of plants of which several species grow in the Himalaya, one of these, the Padalli or Poral, is collected for the winter fodder of goats, and is supposed to increase the milk. Wight in Icones gives H. pedatum.

HERA-KASIS, also Hera-tutia. Guz. Hind. Sulphate of copper. Green vitriol. Copperas.

HERACULA, See Heraclidæ; Saraswati.

HERA KHOND, See Heera khand, Ousley.

HERAT. When the Dourani empire, created by Ahmed shah, Abdali, was lost by his

grandsons and parcelled out among the Barukzye brothers, shah Kamran managed to maintain a precarious footing at Herat. He was the son of Mahmood and, therefore, nephew of Zeman shah, shah Shuja-ool-moolk, and Feroz-ood-deen, and the last remaining representative of the Suddozye princes in Afghanistan. Herat was all that remained to him of the empire of his family. Kamran was cruel and dissipated and his minister, Yar Mohamed Khan, was even worse. Dost Mahomed Khan was ruling at Kabul, and his half brother Kohun-dil Khan ruled at Candahar. Dost Mohamed Khan was the son of Phound Khan, Barukzye. On 23rd November 1837, Mahomed shah, king of Persia, laid seige to Herat in pursuance of his ambitious policy for the reconquest of Afghanistan. It was on this occasion that Herat sustained a memorable ten months' siege, and all the efforts of the Persian king to capture it, aided by the advice and direction of Russian officers, were defeated principally by the efforts of a young British officer, Lieut. Pottinger of the Madras Artillery. Shah Khamran and his minister, however, continued his intrigues with Persia, and the envoy Major d'Arcy Todd withdrew. On the occurrence of the disasters in Cabool, Yar Mahomed was relieved of all apprehension of the interference of the British government, and in 1842 strangled his sovereign, shah Kamran, usurped the government of Herat, and professed himself a dependant of Persia. The policy of Yar Mahomed was to maintain himself in real independence, while soothing the shah of Persia by empty acknowledgments of allegiance. On his death in 1851, his son Syud Mahomed Khan succeeded him only to be deposed in 1855, and succeeded by Mahomed Yusoof, grandson of Feroze, grand nephew of shah Zeman. Mahomed Yusoof was afterwards deposed and Isa Khan succeeded but under him Herat fell to the Persians and he was murdered within a few weeks by a party of Persian soldiers. By the Treaty of Paris concluded between England and Persia on the 4th March 1857, the Persians were required to evacuate Herat. Before they withdrew, they installed sultan Ahmed Khan, better known by the name of Sultan Jan, as ruler of Herat, and the British Government did not refuse to recognise him as de facto ruler. Shortly after, sultan Jan attacked and took Furrah, but the ameer of Cabool immediately collected his forces to resent this aggression. He retook Furrah, on the 29th June, and on 28th of July, laid siege to Herat. After a siege of ten months, during which sultan Jan died, the ameer took Herat by storm on 27th May 1863. He died eleven days afterwards, and was succeeded in the government of Cabool by his son Sher Ali Khan, who placed his own son Mahomed Yakoob Khan in charge of the captured city. Herat has thus been again annexed to the Afghan dominions. Herat is also called Heri, and the river on which it stands is called Heri-rud. This river Heri is called by Ptolemy Αριοι, by other writers Arius; and Aria is the name given to the country between Parthia (Parthuwa) in the west, Margiana (Marghush) in the north, Bactria (Bakhtrish) and Arachosia (Harauwatish) in the east. It is supposed to be the same as the Haraiva (Hariva) of the cuneiform inscriptions, though this is doubtful. The importance of its situation is very great, and it has always exercised considerable influence over the affairs of Central Asia. It is the Haroya of the Vendidad, and has endured more than 40 sieges in ancient and modern times. The most polished court in the west of Europe could not at the close of the 10th century, vie in magnificence with that of Herat. *Treaties Engagements and Sunnuds*, Vol. VII, pp. 165, 168 and 169. *Prof. MaxMuller's Lectures*, pp. 234 and 235. HERBERTIANUM, *Wall.*

Pa-daing, Burm. | Ye pa daing, Burm.

HERCULES, according to Herodotus, was the father of Belus, the father of Ninus, and lived about 900 years before Herodotus. Herculus is supposed, by Tod, to be Baldeva, son of a prince of Mathura and nephew of Koonti the mother of the Pandua. Baldeva is still worshipped, as in the days of Alexander at Buldeo, in Vrij, his club a ploughshare, and a lion's skin his covering. Baldeva was cousin of Krishna who with Yudishtra, after Krishna's death, travelled to the north and reached Greece. Tod regards Hericula,—Hercules, as a generic term, for the sovereigns of the race of Heri, but used by Arrian as a proper name. A section of the Mahabharat is devoted to the history of the Hericula, of which race was Vyasa. Arrian notices the similarity of the Theban and the hindu Hercules, and cites, as authority, the ambassador of Seleucus, Megasthenes, who says: "he uses the same habit with the Theban; and is particularly worshipped by the Suraseni, who have two great cities belonging to them, namely, Methoras (Mathoora) and Clisoboras." Diodorus has the same legend, with some variety. He says: "Hercules was born amongst the Indians, and like the Greeks they furnish him with a club and lion's hide. In strength (bala) he excelled all men, and cleared the sea and land of monsters and wild beasts. He had many sons, but only one daughter. It is said that he built Palibothra, and divided his kingdon amongst his sons (the Balica-putra, sons of Bali.) They never colonized; but in time most of the cities assumed a democratical form of government (though some were monarchical) till Alexander's time. The combats of Hercules, to which Diodorus alludes, are considered by Tod to be those in the legendary haunts of the Hericula, during their twelve years exile from the seats of their forefathers. Bunsen, however, observes that, Hercules, according to Arrian, had a daughter when he was advanced in years; and, being unable to find a husband worthy of her, he married her himself, that he might supply the throne of India with monarchs. Her name was Pandea, and he caused the whole province in which she was born to receive its name from her." According to Bunsen, the Phœnician Hercules is fabled to have wrestled with Typhon, (the sun at the meridian) in the sand, as Jacob did with Elohim in the dust. Hercules, like Jacob, was wounded in the encounter in the thigh, and like the son of Isaac received the name of Palaimon or wrestler. Usov was a hunter like the rugged Esau, and wore skins of beasts; in both stories the elder brother separated from the younger. Acrisius, the Phrygian Saturn, wrestled with his twin brother Protæus, in his mother's womb, as Jacob did with Esau. Esau also was, in early times, interpreted by the Jews as Zamael, Satan, old serpent, wild boar. The brothers Osiris and Set Typhon, of the Egyptians, sons of Kronos, had a similar contest and in the Phœnician myth of Pygmalion and Sichæus. In the Egyptian legend, Hypsuranias and Usov, as wind and fire, is exactly like that of Set, Typhon, and Osiris.

Hercules is supposed by Bunsen (iv, 210) to be Israel, and his brother was Usov-Ares and the pillars under which they were worshipped were called after their names. The Phœnician pillars of Hercules were called Hamunim, Hamon in the Hebrew is a pillar. Hercules was worshipped in the island of Tyre, in the two pillars and the foundation of Tyre and discovery of the art of navigation are expressly attributed by the classics to Hercules and the legends regarding him are considered by Bunsen (iv. pp. 211-14) to be mixed up with the history of the Jewish patriarchs; Jacob, grandson of Abraham is, spiritually, the true wrestler with God (Yisrael.) The epithet of Edom was given to the wild indomitable Usov, and Set, Seth, the oldest mythological type of Western Asia, are met with in Egypt and in the same form. As a Grecian hero-deity, the legend regarding him is not historical. It is supposed to be of Egyptian origin, and to be the same as Gigon. The Egyptian Hercules was named Chensu or Khensu, written Sen, and the name of the twenty-sixth king of the 1st Egyptian dynasty was Herakles Harpokrates. One of the pillars in the temples of Hercules at Tyre was lighted by day, the other by night; upon an altar of Hercules—Buzygos at Rhodes, one of the two sacrificial oxen was offered up amidst imprecations, probably to Adonis the god of spring as the ass or dog was to Typhon. The Tyrian Hercules was the same as Moloch, the King, Baal-Moloch, Malakh-Bel as he is called in the coins. No statues were erected to him at Cadiz or in Tyre, but in Tyre, he was worshipped with eternal fire, which lighted up the temple by night from the reflection on the columns of Smaragdus, dogs were sacrificed to him as well as to Hecate and Melekhet-Artemis. In Babylonia, their neck or backbone (Isa. 66, 3.) as well as the first born of the ass, if they were not redeemed, was according to the law of Moses (Ex. xiii, 13; also xxxiv, 20), broken in honour of him. The principal sacrifices offered to Hercules-Usov, as well

as to his mythical companion Melekhet-Artemis were human beings. In Laodicea, they might be ransomed by a doe, as Diana accepted that animal instead of Iphigenia. The wild boar was also sacred to the same goddess. And, in like manner, in another myth, another Artemis caused the delicate vernal Adonis to be slain by a boar instead of by Mars as he is usually said to be. At Carthage, the practice of sacrificing their favourite children, and those of the highest rank continued down to their latest wars. Hercules of the Phœnicians was called Melkarth. The Grecian Hercules, is described as becoming insane, and burning his own children as well as those of his twin brother Iphicles, and murdering his guest Iphitus. But, in Asia, the ruthless god sometimes also required this atroceous sacrifice. In Amathus, Malika (Moloch), 'the inhospitable Zeus,' sarcastically called Jupiter Hospes, had his bloody altar before the temple of Adonis (Lord) and Baaltis (Queen). So had Saturn in Arabia whom Nonnus compares with the Syrian god. These sacrifices were offered on occasions of great misfortune but as a matter of course when there was excessive heat.

Bunsen quoting Megasthenes, (III, 525—531) mentions the Indian tradition, of Hercules, as reigning in India fifteen generations after Dyonysus. He built Palibrotha and other cities, had numerous sons, to each of whom he left an Indian kingdom, and a daughter Pandæa to whom he likewise bequeathed a realm. Bunsen, following Lassen says he was chiefly worshipped in the Suras-Sen country and identifying him with Krishna, says he founded Mathura.—*Tod's Rajasthan, Vol.* I. p. 30. *Bunsen*, IV, 20-214. *Bunsen*, III, 525, 531. IV. 210-214. See Kabul, Polyandry, Saraswati, Yavana.

HERCULES BELUS of Cicero is supposed to be the Osiris who invaded India, but his progress extended only up to the Indus.

HEREAR DU, a deity of the Korambar.

HERENSO. Sans. Pisum sativum.

HERI a tribe of mahomedan rajpoots chiefly found in Juspoor a pergunah of Moradābad. See Burwae.

HERI a name of Krishna. According to a hindu legend, related by Colonel Tod, he accompanied Ramesa to Lunka, as did the Egyptian Apollo, Rameses-Sesostris, on his expedition to India: both were attended in their expedition by an army of satyrs, or tribes bearing the names of different animals: and as we have the Aswa, the Takshac, and the Sassu of the Yadu tribes, typified under the horse, the serpent, and the hare, so the followers of Surya, of which Rama was the head, may have been designated Rishi and Hanuman, or bears and monkeys. The distance of the Nile from the Indian shore forms no objection; the sail spread for Ceylon could waft the vessel to the Red Sea, which the fleets of Tyre, of Solomon, and Hiram covered about this very time. That the hindus navigated the ocean from the earliest ages, the traces of their religion in the Indian Archipelago sufficiently attest. The coincidence between the most common epithets of the Apollos of Greece and India, as applied to the sun, are peculiarly striking. Heri, as Bhan-nath, the lord of beams, is Phæbus, and his heaven is Heripur (Heliopolis), or city of Heri. Helios was a title of Apollo, whence the Greeks had their Elysium, and the Heripur or Bhan-t'han (the abode of the sun), is the highest of the heavens or abodes of bliss of the martial Rajpoot. Hence the eagle (the emblem of Heri as the sun) was adopted by the western warrior as the symbol of victory. Heri, Crishna, familiary Kaniya, was of the celebrated tribe of Yadu, the founder of the fifty-six tribes who obtained the universal sovereignty of India, and descended from Yayat, the third son of Swayambhuma Manu, or "The Man, Lord of the earth," whose daughter Ella (Terra) was espoused by Budha (Mercury), son of Chandra (the Moon), whence the Yadu are styled Chandravansi, or "children of the moon."—*Tod's Rajasthan Vol.* i. p. 532-545. See Krishna, Lakshmi, Pandu.

HERI RUD, or Hury river, has a course of about 600 miles. It rises in the Hazareh Mountains, lat. 34° 50, lon. 66° 20, 9,500 ft. above the sea. Its course is generally westerly to Herat, where it turns northwesterly, forming a junction with the Moorghab; the united stream is ultimately lost in the desert of Khorasan. At Herat, it was formerly crossed by a brick bridge, but three out of thirty-three arches being swept away, communication is intercepted in time of inundation. It is remarkable for the purity of its water.

HERITIERA, Species.

Pinlay kanazoc. Burm.

Common in the delta of the Irawady, in British Burmah, wood used for house posts, and rafters, and for firewood for the manufacture of salt. The tree is nearly related to the "Soondree" of Bengal. A cubic foot weighs lbs. 66. In a full grown tree on good soil the average length of the trunk to the first branch is 30 feet and average girth measured at 6 feet from the ground, is 6 feet.—*Dr. Brandis, Cal. Cat. Ex.* 1862.

HERITIERA.

Ka-na-zo, BURM. | Soondree Tree, Anglo, BENG.

This, in Burmah, is a much larger tree than in Bengal, chiefly found on the tide waters. Fruit hangs in loose bunches, size of grapes, very pleasant, one seed. Leaves large, alternate, smooth, green on the upper side, and silvery white beneath. Timber, hard, straight-grained, elastic, and durable; used for millwork, spokes, shafts, oars, &c. There are several species of this valuable genus of trees.—*Malcom's Travels in South Eastern Y Asia, I. p.* 282.

HERITIERA ALLUGHAS, *Linn.* Syn, of Alpinia allughas, *Roscoe.*

HERITIERA ATTENUATA furnishes one of the best and most plentiful of the jungle fruits of Burmah. It grows in bunches resembling large grapes, is agreeably sub-acid, and when ripe, of a yellowish hue. The tree is small, and when arrayed with these long golden bunches it is very beautiful. It would be quite an acquisition to gardens both for ornament and utility.—*Mason.*

HERITIERA FOMES Syn of Heritiera minor.

HERITIERA LITTORALIS, *Ait.*; *D. C.*; *Roxb.*

Balanopteris tothila, *Gærtn.*

Sundri. BENG. | Kon-zo-za-loo. BURM.
Ka-na-zo. RURM. |

Grows in the Mauritius, the peninsula of India, in the Sunderbuns ?, common in the Rangoon district, and along the sea-shore in Amherst, and Tavoy, found very abundant on Pannat Island and all the Mergui Archipelago, also all along the coast of Amherst province. When seasoned, it floats in water. Maximum girth four cubits, maximum length thirty feet. It is used for boats, boxes, planks of houses, &c., is a very light wood, scented, durable and tough. And is recommended for fuzes beyond any other wood from Amherst, Tavoy or Mergui, also for helves, and for gun-stocks. Strongly recommended for packing cases of all descriptions.—*Voigt, Dr. McClelland, Captain Dance. Riddell.*

HERITIERA MACROPHYLLA.—*Wall.*

Looking Glass Plant. ENG.

Has small yellow flowers.

HERITIERA MINOR, *Lam; D. C.; Roxb.*

Heritiera fomes, *Willde, Buch., D. C.*
Balanopteris minor, *Gaertn*: D. C.

Soondree. BENG. | Kun-na-zoo. BURM.
Ka-na-za. BURM. | Kon-nay-zow.

A gloomy looking tree that may be distinguished from all others for many miles distant. It is remarkably characteristic of a peculiar soil. Wherever the tides occasionally rise and inundate the land, this tree is sure to be found throughout the whole Tenasserim coast, but it is never found at home, either on the high dry lands on the one hand, nor in the wet mangrove swamps on the other. It is the tree which was described by Dr. Buchanan Hamilton, who accompanied Symes' embassy, as Heritiera fomes. It grows in the Sunderbuns, and is used in Calcutta for firewood. Both the Heritiera minor and H littoralis are common in the Rangoon district, along the creeks, and H. minor furnishes the Soondree wood so well known in Bengal for its strength and durable qualities. Although so common on the Bengal coast, as to give name, as Captain Munro thinks, to the Sunderbuns, yet the tree grows much larger in the Tenasserim Provinces, and affords finer timber. It is indigenous in the Mayagee forests and on the choungs Kayoo, Thabyeed and Thunat, and in some sections is quite abundant. In Tavoy, it is a large tree furnishing very hard and durable wood. In Amherst, Tavoy and Mergui its maximum girth is 2 cubits and maximum length 15 feet. It is very abundant, but straggling; found in Martaban. and on both sides of the Moulmein river, and all along the sea coast; an unlimited supply of it is procurable. When seasoned, it floats in water, and is tough, light and durable. Indeed, it is the toughest wood that has been tested in India. When Rangoon teak broke with a weight of 870 lbs. Soondree sustained 1,312 lbs. It is not an equally durable wood, but stands without a rival in strength. It is used for boats, also piles of bridges, boxes ? and many other purposes. It is recommended for helves, but should be killed a twelvemonth before being cut down, or otherwise should be seasoned, by keeping, after it has been cut down. Dr. Wallich says it stands unrivalled for elasticity, hardness, and durability, and adds that "if not extensively employed for the construction of naves and felloes of gun carriages, it is solely because pieces of adequate dimensions are not procurable." But Dr. McClelland's informants asserted, that immense quantities, sufficient for such purposes, are obtainable here. Dr. Wallich adds that the charcoal made from it is better than any other sort for the manufacture of gunpowder.—*Dr. McClelland in Selec. Records Government of India, Foreign Dept. No. IX., p.* 43, *Dr. Mason, Captain Dance, Voigt.*

HERMÆUS. See Greeks, Kabul.

HERMELIN. GER. Ermine.

HERMINE. FR. Ermine. ENG.

HERMIPPUS. According to Pliny the Zendavesta seems to have been translated by

Hermippus into Greek about the same time as the Septuagint translation of the Bible. Hermippus is supposed to have been the peripatetic philosopher, the pupil of Callimachus, and one of the most learned scholars of Alexandria.

HERMIT-CRAB. The common English name for the well-known Pagurus crustaceans, that occupy the empty turbinated shells of testaceous molluscs. The fore part of the body, is armed with claws and covered with a shield, but it ends in a long soft tail provided with one or two small hooks.—*Hartwig.* See Crustacea.

HERMODACTYL. This medicinal plant of the later Greeks and Arabs, forms the sweet and bitter suranjan of the Arabs, and are supposed to be species of the genus Colchicum. The Persians name the sweet Surinjan, shirin and Surinjan tulk is the bitter. Irvine says it is the bulb or cormus of an uncertain species of Colchicum. In the medicine shops of India generally, there are sold soorinjan tulk, or bitter, and S. shirin or mild, both identical with the Hermodactyls of the ancient Arabian and Greek writers. Their origin is unascertained, but they are doubtless referable to some species of colchicum. The tasteless variety is about one inch long and the same in breadth, heart-shaped, rather flattened, grooved at one side, convex at the other. They are not wrinkled, are easily broken and form a white powder. The bitter kind is smaller, and has a striped appearance. Pereira describes one of Dr. Royle's specimens as yellowish, somewhat transparent, horny, and striped lengthwise. No satisfactory experiments, whether chemical or clinical, have been yet made with this article. In some trials which Dr. O'Shaughnessy made with an acetous tincture of the soorinjan tulk he was led to believe it possessed of all the virtues of the dried colchicum of Europe. It certainly deserves careful and extensive examination.—*O'Shaughnessy, page* 661. *Irvine.*

HERMON. Between Mounts Hermon and Tabor a valley runs towards the Jordan, *Skinner's Overland Journey Vol.* I, p. 277.

HERNANDIA GUIANENSIS. *Aub.*, syn. of H. sonora L.

HERNANDIA SONORA, *Linn.*

H. guianensis, Aub. | Bong-ko. Javan.

A tall, erect, tree of the West Indies, of Ceylon, the Moluccas and the Fiji islands, in the last, forming one of the sacred groves—a complete bower. The wood is so very light and takes fire so readily from a flint and steel, that it may be used as tinder. The bark, seed and young leaves are cathartic. The juice is an effectual depilatory, removing the hair without any pain.—*Ains., O'Shaughnessy, Voigt, Seeman's Fiji Islands, Eng. Cyc. W. Ic.—Thw. En. pl. Zeyl. p.* 258.

HERODIAS, a genus of birds of the order Grallatores ; as under

Sub-fam. Ardeinæ, 1 gen. 7 sub. gen. 19 sp. viz. 4 Ardea: 6 Herodias, 1 Butorides ; 1 Ardeola; 1 Nycticorax ; 1 Tigrisoma, 1 Botaurus; 4 Ardetta.

Herodias alba: the Ardea Alba ; or 'Great White Heron,' of Europe, Asia, N. Africa: very rare in Britain : very common in India, though the race is considered different by some.

Herodias bubulcus the Ardea russata ; or 'Buff-backed Heron.' of Europe, Asia, N. Africa, exceedingly rare in Britain : very common in India.

Herodias garzetta the Ardea garzetta ; or 'Little Egret.' of Europe, Asia, N. Africa: exceedingly rare in Britain : very common in India. Three specimens observed of an Egret in winter dress seemed to differ only from ordinary Herodias garzetta in having black toes.

HERODOTUS, a Greek historian who travelled in Egypt and Persia and visited Tyre B. C. 460. He never gives us to understand that he was able to converse in any but his own language. Herodotus, is called the Father of History. He relates that, after Cyrus had conquered a large portion of Asia, his third successor Darius Hystaspes, extended his conquests towards the Indian Peninsula.—*Bjornstjerna's British Empire in the East* p. 93. See Hindu. Khuzistan. Kooffa. Sakya muni. India.

HERONRY about fifty miles from Madras, and twelve miles from Chingleput, in a south easterly direction, is a small village called Vaden Thaugul, which means, literally, "Hunter's Rest," from vaden, "hunter," and thangul, "rest." To the south of the village lies one of those small tanks called Thaugul by the Tamil ryots, implying a water-rest or temporary reservoir, from which the village derives its name; but why Vaden was added to it is not known. It is possible that, from its being the resort of numbers of birds, the people connected it with the term vaden, or "hunter," a name given to a rude class of people in Southern India who are known as hunters and bird-catchers, but who have never been found residing here. The area comprised in the tank is about four acres and a half (thirty cawnies.) From the north-east to the centre of the bed of the tank there are some 500 or 600 trees of the Barringtonia racemosa, from about 10 to 15 feet in height, with circular,

regular, moderate-sized crowns ; and when the tank fills, which it does during the monsoons, the tops only of the trees are just visible above the level of the water. This place forms the breeding-resort of an immense number of water-fowl ; and herons, storks, cranes, ibises, water-crows or cormorants, darters, paddy-birds, &c., make it their rendezvous on these occasions. From about the middle of October to the middle of November small flocks of twenty or thirty of some of these birds are to be seen, coming from the north to settle here during the breeding-season. By the beginning of December they have all settled down ; each tribe knows its appointed time and arrives year after year with the utmost regularity within a fortnight, later or earlier, depending partly on the seasons. Some, from the lateness at which they arrive, appear to have come from great distances. They immediately commence building their nests or repairing the old ones, preparatory to depositing their eggs. When they have fully settled down, the scene becomes one of great interest and animation. During the day the majority are out feeding, and towards evening the various birds begin to arrive in parties of ten, fifteen, or more, and in a short time the trees are literally covered with bird-life; every part of the crown is hidden by its noisy occupants who fight and struggle with each other for perches : each tree appears like a moving mass of black, white, and grey ; the snowy white plumage of the egrets and curlews contrasting with, and relieved by the glossy black of the water-crows and darters and by the grey and black plumage of the storks. The nests lie side by side, touching each other; those of the different species arranged in groups of five or six, or even as many as ten or twenty, on each tree. The nests are shallow, and vary in inside diameter from 6 to 8 inches, according to the size of the bird. The curlews do not build separate nests, but raise a large mound of twigs and sticks, shelved into terraces as it were ; and each terrace forms a separate nest ; thus eight or ten run into each other. The storks sometimes adopt a similar plan. The whole of the nests are built of sticks and twigs, interwoven to the height of 8 or 10 inches; with an outside diameter of 18 to 24 inches, the inside is slightly hollowed out, in some more and in others less, and lined with grass ; reeds and quantities of leaves are laid on the nests. In January the callow young are to be seen in the nests. During this time the parent birds are constantly on the wing, moving backwards, and forwards, in search for food, now returning to their young loaded with the spoil, and again, as soon as they have satisfied their cravings, going off in search of a further supply. About the end of January or early in February the young are able to leave their nests and scramble into those of others. They begin to perch about the trees, and by the end of February or the beginning of March those that were hatched first are able to take wing and accompany their parents on foreign expeditions; and a week or two later, in consequence of the drying up of the tanks in the vicinity, they begin to emigrate towards the north with their parents and friends, except perhaps a few whose young are not as yet fledged, and who stay behind some time longer. Thus, in succession, the different birds leave the place, so that it is completely deserted by the middle of April, by which time the tank also becomes dry ; and the village cattle graze in its bed, or shelter themselves under the trees from the scorching heat of the midday sun, while the cow-boys find amusement in pulling down the deserted nests. The villagers, hold an agreement, from the nabob's ancient government, which continues in force by a renewal from the British government, that no one is to shoot over the tank, which is strictly enforced, and the birds continue in undisturbed possession of this place as a favourite breeding resort every winter or monsoon. The natives understand the value of the dung of the birds in enriching their rice-fields ; and when the tank becomes dry, the silt deposited in its bed is taken up to the depth of a foot, and spread over the rice-field ; consequently they are careful not to disturb the birds.

Dr. Shortt visited the trees on the 8th March 1864, on a raft pushed along by two fishermen swimming one on either side, their heads only visible above. As he approached the trees the birds at first remained quite unconcerned, but as he got nearer they began to look on with amazement at a scene which was evidently new to them ; then they rose en masse over head, and uttering piercing cries, some, with threatening gestures, rested a moment on the adjoining trees, and then took to their wings again : although so crowded, they performed their evolutions with the greatest nicety and dexterity, never interfering with each other's movements. Some ascended to a great height, and were hardly perceptible in the air, while others gyrated immediately above their heads; many crowded on adjoining trees, and witnessed the intrusion with dismay.

On a previous occasion, in January 1864, he was alone on the raft; most of the young of the Water-crows, Storks, Herons, and Darters were fully feathered, and were able to scramble to other nests, and some to the tops of trees: a few nests containing eggs, and some few callow young. The Water-crows and Darters, young as they were, immediately took to the water and dived out of sight. On the second occasion, in March, the young of the Ibises were fully feathered, as were also a few grey and purple Herons and Darters; two or three nests only contained eggs, and some few callow young. The following is a detailed account of the nests, and of the number of eggs, or young, found in each nest.

The small Grey and Black Stork, Leptoptilos Javanica ? ; Tamil name, Nutha cootee narai ; literally " Shell-fish-(Ampullaria) picking Crane" were the most numerous ; their nests were two feet in diameter, and contained three eggs or young. The eggs were of a dirty-white colour, of the same shape, but not quite so large, as those of the Turkey. The young when fully feathered were in prime condition The flesh is eaten by mahomedans and pariahs. The bird keeps entirely to marshy fields, edges of tanks, &c., it never approaches towns. Some half-dozen or more of these birds may often be seen in the morning sunning themselves with outstretched wings in the dry fields. They only differ from the Adjutant (or Leptoptilos argala)in size and colour. These nest early, and the young are firm on the wing in the month of February.

The Ibis or Curlew, Ibis falcinellus ; Tamil, Arroova mooken, literally " Sickle-nosed," which name they take from their long curved beaks. The nests of this bird contain from three to five eggs, and he found from three to four young in each nest. The eggs resemble in size and shape a medium-sized hen's egg, but are of a dirty-white colour. The birds are white, with black head, feet, and neck, and have a long curved black bill. The head and neck are naked, and the tail-feathers, of rather a rusty-brown colour ; the lower sides of the wings, from the axillæ to the extremities, are naked ; and the skin in the old birds is of a deep scarlet colour ; in the young this is absent, although the part is naked. The young are fully fledged in March, and take to the wing in April.

The Grey Heron, Ardea cinerea ; Tamil, Narai, sometimes Pamboo narai, or Snake Crane ; has a similar nest, built of twigs, containing sometimes two,sometimes three eggs. Dr. Shortt only found two young in the nests ; they are fledged from January to April, according to the time of depositing their eggs, which some do earlier than others. The eggs are of a light-green colour ; they are not so large in circumference as a large sized hen's egg, but are longer, with the small end sharp.

The Purple Heron, Ardea purpurea ; Tamil, Cumbly narai, or Blanket Crane. Nest the same ; deposits two to three eggs, of same size and colour as last ; seems to rear only two young. The young are fully fledged in April

Ardea nycticorax ; Tamil, Wukka. Nests are built after the same fashion, but smaller in size, and contain five eggs ; hatches four or five young ; eggs the size of a bantam's, and of the same shape. The young are fledged in April. This is the Nycticorax griseus, *Linn.*

The Cormorant, Graculus pygmæus ; Tamil, Neer cakai, or Water-Crow. Nest the same as the others, built of sticks ; deposits three or four eggs, and rears three or four young, which are fledged and on the wing in January ; eggs like those of a small-sized bantam's, rather sharp-pointed at small end, with a slight greenish tinge. This is the Graculus sinensis, *Shaw.*

The Large Cormorant, Graculus Sinensis ; Tamil, Peroon neer cakai, or Large Water-crow. Builds a very rude nest, chiefly formed of sticks ; lays four eggs, and rears two, three, or four young. The eggs are the size of a medium-sized domestic hen's egg, and have a slight greenish tinge ; the young are fledged sometimes in January, sometimes in March, according to the time of their nesting. These birds, as well as G. pygmæus are to be seen fishing in the tank itself ; and the rapidity with which they find their prey, by diving, is wonderful. This is the Graculus carbo, *Linn.*

The Darter, Plotus melanogaster ; Tamil, Pamboo thalai neer cakai, or Snake-headed Water-crow. Nest same as last ; three, sometimes four eggs of same size and colour ; young fledged and on the wing, some in January, others not till April.

Dr. Shortt captured the young of all the birds described. The villagers of Vaden Thangul, told him that the Pelican sometimes comes and breeds here, as also the Black Curlew. Occasionally different kinds of Teal, Widgeons, &c., are said to nest in the rushes that bound the inner surface of the tank bund.

The Egrets, or Herodias garzetta, bubulcus, and intermedia, were congregated in very large numbers, and roosted on the trees at night ; but they do not nest, which seems singular. The natives had observed this,

and he found it to be the case. Yet of all the birds that assemble here, these occur in the greatest number. Ardea alba, or Herodias alba, and H. intermedia are also found here; and the natives say that they breed.—*Dr. J Shortt M. D. F. S. S. in Linnean Society's Journal.*

HENLE. In 1844, there was issued at Berlin, the Systembung der Plagiostomen, by Dr. Henle, which included several of the genera and species of the fishes of the seas in the South and East of Asia.

HERMANN, Paul, a medical man in Ceylon, furnished the materials of the Thesaurus Zeylanicus of the elder Burmann, published in Holland and, afterward, of the Flora Zeylanica of Linnæus, *II. et Th.* p. 46.

The Herpestes is a genus of digitigrade carniverous mammalia and the Egyptia species, the H. ichneumon, has been noticed by writers from the earliest times, its combats with snakes and its alleged attacks on crocodiles, having been mentioned by Aristotle, Diodorus Siculus, Pliny, Strabo, Ælian and others. Like the mongoose of India, the Ichneumon of Egypt is frequently domesticated and their search for snakes, for food, is continuous. Some doubts exist as to the number of species in the East Indies, seemingly owing to the variation in the colouring of their furs, H. fasciatus and H. gambianus are noticed by Mr. Bennett.

There are said to be four species in Ceylon, H. vitticollis, H. griseus, H. flavidens and H. rubiginosus and the two latter are thus described:—

"H. flavidens, *Kelaart* Yellowish-brown. Hair annulated with brown and yellow rings, tips yellow. Tip of tail reddish. Muzzle blackish. Face brown, slightly ferruginous. Ears fulvous, thickly clothed with hair. Feet blackish, soles $\frac{3}{4}$ bald. A full grown specimen obtained at Kandy measured as follows: Length of head and body $16\frac{1}{2}$ in.; tail $12\frac{3}{4}$ in.; sole 3 in.; palm $1\frac{3}{4}$ in.; * * * The species was supposed hitherto to be only a variety of H. griseus, but there are strong characteristic differences between the two; the golden-yellow rings and tips of hair are very marked. Generally found in the higher parts of the island but one was obtained of a very deep brown and yellow colour from Newera Elia.

H rubiginosus, Kelaart, Decta, Cingh. Nearly as large as H. vitticollis, reddish and ferruginous brown. More of the red on the head and outer sides of legs. Hair annulated black and white and terminating in long reddish points. Muzzle flesh colored. Sides of nose and circle around the eyes of a light rusty colour. Feet black, tip and tail black. Whatever the former may be, that here described would seem to be identical with H. Elliot'. *Jerdon Mammalia, Eng. Cyc.*

HESPERIPHONA AFFINIS, Blyth, a bird nearly affined to H. icterioides (Coccothraustes icterioides, *Vigors*, from which the male is distinguished, — 1, by being smaller,) the closed wing measuring $4\frac{3}{4}$ inch instead of $3\frac{1}{4}$ inch and tail $3\frac{1}{4}$ inch, instead of $3\frac{3}{4}$ inch) ;—2, by the black portion of the plumage being of a deep and shining black, instead of being dull with a distinct ashy tinge ;—and 3, by having black axillaries and yellow tibial feathers, instead of yellow axillaries and black tibials, as in H. icterioides. The females are much more dissimilar: that of H. affinis having the upper parts olive-green, tinged with yellow on the collar and rump, and more brightly on the lower parts; wings and tail black, the coverts, secondaries and tertiaries broadly margined externally with yellowish olive-green, occupying the whole outer web of the last ; crown and ear-coverts ash-coloured, passing to pale grey on the throat. Young male like the adult, but the yellow much less intense. The adult male so nearly resembles that of H. icterioides, that its distinctness would scarcely have been suspected, had it not been for the great difference of the other sex, page 179.—*Report of Mr. Blyth, Curator Zoological Department.*

HESSARU. Can. Phaseolus mungo.

HESSONITE or Kaneel stone ; Cinnamon stone. See Garnet.

HESSING. Col. his tomb is a model of the Taj. He was a Dutchman in Scindia's service who rose from a common soldier to be the governor of Agra.—*Tr. of Hind.*, Vol. I, p. 436.

HESTIA JASONIA. The Sylph, Floater, Spectre or Silver paper butterfly, is found only in the deep shades of the damp forest of Ceylon, in the vicinity of pools of water and cascades.—*Sir J. E. Tennent*, Vol. I, p. 263.

HESUDRUS, the ancient name of the Sutledge river the Hesydrus of Alexander, and the Satadru of the Vendidad. In the oldest hymns of the Veda, about 1500 B. C., we find a war-song referring to a battle fought on the banks of this river.—*Bunsen.*

HETEROLEPIDINA, a group of fishes, of the Family Triglidæ. See Fishes : Triglidæ.

HETEROPHRAGMA ROXBURGHII, *D C.*, syn. Bignonia quadrilocularis, *Roxb.*

HETEROMEROUS GENERA, of Insects, See Coleoptera.

HETEROMORPHA, a genus of birds of the Sub-fam. Parinæ, with 8 gen. 20 sp. viz., 1 Conostoma; 1 Heteromorpha, 3 Suthora : 1 Falcunculus, 10 Parus, 1 Orites; 1 Sylviparus, 1 Ægithalus flammiceps.

HETEROPODA, a class of nucleobranch oceanic molluscs, of anomalous forms, with the foot variously modified for swimming. Amongst these, the Pterosoma plana *Less.* is a transparent, delicately tinted, winged animal, thick and gelatinous, and almost invisible in the water; it is found in the seas of the eastern Archipelago. The Firola, of the same class is a transparent creature, with a long proboscis, and swims by means of a fin below. The Sagitta, or Arrow fish, one of the same class, darts through the water by sudden instantaneous jerks, it resembles a minute arrow. Its body is so transparent that its whole organization may easily be observed. Atlanta, a pretty little curly shelled nucleobranch of this class, Heteropoda, has both its shell and body transparent—all these range through the Mediterranean, Atlantic and Indian Oceans.—*Collingwood.*

grows on the Panjab plains generally. *Dr. J. L. Stewart, Punjab Plants p.* 255.

HET-HER, a name of Aphrodite, called also Hather and Athyr, and Hathor, an Egyptian goddess, fabled to be the daughter of Ra or the sun.

HETKARI, Mahr. Signifying down; as applied to country, down the coast to the south, a native of the country southwards of the Savitri river; a native of the southern Konkan, serving in the Maratha infantry.—*Wils.*

HETOPADESA, and Panchitantra are books in use throughout India, in all its languages, read by every hindu. They contain the original fables which Bed-pai, a brahmin, wrote for the benefit of Dabishlim, his king. They were translated into Pehlevi, in the 6th century in the time of Nousherwan, from that into Arabic by Abdullah bin Makaffa, about the middle of the 8th century, then into Persian, by Rudaki, about the close of the 9th century, who received 80,000 dirhems for his labours. About the middle of the 12th century (A. D. 1150) in the time of Bahram shah, a Persian prose translation was made and a subsequent second translation was made by Kashifi, and named the Anwar-i-Soheili. A Greek version was made by Simeon Seth, at the command of Alexis Commenes, and they appeared in Hebrew and Aramaic, Italian, Spanish, and German. The first English edition was in the 16th century, then in French in 1644, and, again in 1709, and they are the foundation of Æsop's fables.

HETRUSCAN, See Indra. Kama p. 454.

HETTEE DU-AN, See Korumbar.

HETUMAT. The tenth settlement of the Arians was in Hetumat, a district of Helmand. (xi. verse 14.) "Hetumat, the wealthy, the splendid," is the valley of the present Helmand, the Etymander of the classics. The mischief inflicted here by Ahriman was the sin of sorcery.

HETWABHASU, Sans. from hetoo, a cause, and abhasu, an appearance, a semblance.

HENGONG, Bhot Neopus malaiensis, *Reinwardt.*

HEUDELOTIA AFRICANA, the African Bdellium tree.—*O'Sh. p.* 287.

HEUMA or Shendu. A tribe inhabiting the hills north of Arracan. They occupy the Yeoma toung hills, on the watershed between the Meeyk-young and the drainage of the Manipur rivers. Their chiefs are called Aben, and their villages have about fifty to 400 houses. They use the trap-bow for shooting the elephant, but fire-arms are superseding the ruder weapons. They regard the sun and moon as deities.—*Latham.* See India.

HEVEA GUIANENSIS. Caoutchouc plant.

Siphonia elastica.

Trunk 17 to 20 yards high, scaly like a pine apple, very straight, branched at the summit. Incisions in the bark cause the discharge of a juice which concretes into the well known and very valuable caoutchouc of commerce, a product however of many other trees in this and allied families, for example of Jatropha elastica, Ficus Indica, Artocarpus integrifolia, Urceola elastica, &c. The juice when first obtained is white and milky, spec. gr. 1·011; spread in thin layers it quickly dries into a colourless and often transparent solid substance. Pure caoutchouc is pale yellow, inodorous, tasteless. The ordinary black colour is attributed by some writers to its being smoke-dried, but specimens prepared by mere exposure to the air, have assumed the black colour. At 32 caoutchouc is hard, at 60 to 100 flexible like leather, and exceedingly elastic and adhesive. Sp. gr. 0·938. *Shaughnessy p.* 560.

HEWAR, Mahr. Acacia leucophlæa.—*Willde.*

HEWUL, a river near Byraghur in the Almorah district.

HEWUR. Mahr. syn. of Acacia leucophlœa, also of Mimosa tomentosa.

HEZEKIAH, king of Judah, in the later years of his reign was coeval with Sennacherib.—*Bunsen,* III, 435.

HEZM. Pers. Wood or timber.

H'HAVIRAPATI, i. e. resolute prince, also styled Shorapati lord of the oxen, was the ruler who opposed Semiramis and drove her back across the Indus. The whole country on the right bank of the Upper Indus, the site of the present Peshawar, opposite Attok (Taxila) and still higher up, was tributary to the Assyrians, as it afterwards was to the Medes and Persians. Pliny tells us that Semiramis capitulated, here, on the Cophen (the Cabul river, the Kubha of the Rigveda) and on the black obelisk from Nineveh in the British Museum which is at least of the 9th century B. C. the Bactrian camel, is found side by side with the Indian rhinoceros and Indian elephant. According to Deodorus (II 16-19) Semiramis fitted out an armament in Bactria, and between B. C.

1235 and 1225, she crossed the Indus with a vast force. At first she drove back the opposing maharajah from the strong position that he had taken up with a vast force, especially of archers; but rallying his retreating forces, he soon drove back the Assyrians in total disorder to the river, which they had great difficulty of crossing and only after immense loss. Semiramis concluded an armistice, made an exchange of prisoners and retreated into Bactria with a third of the army which she had brought against India. At that time there must have been a supreme ruler in India, a sami rajah, with a capital in the district to the south of the Sarasvati, in the Jamna and Ganges Doab.—*Bunsen* III, 549 *and* 550.

HIA, the first Chinese dynasty, descendents of Yu, from B. C. 1991 to 1559 ruled 432 years. Its first emperor was Yu, beginning B. C. 1991.

HIA-HI, Sandwich Islands, Santalum album, *Linn.*

HIATHELEH, See Greeks of Asia.

HIATICULA, a genus of birds of the Family Charadriadæ, Dr. T. C. Jerdon, obtained in Southern India a single example of a little Australian Plover, Hiaticula nigrifrons, which figures in his catalogue as a supposed new species by the synonym H. russata. The position of this genus may be thus shown: *Fam.* Charadriadæ

Sub-fam. Cursoriinæ, 2 gen. 2 sp, viz. 1 Cursorius Coromandelicus. 1 Macrotarsius bitorquatus.

Sub-fam. Esacinæ, 2 gen. 2 sp. viz. 1 Esacus; 1 Œdicnemus.

Sub-fam. Vanellinæ, 4 gen. 6 sp. viz 1 Hoplopterus: 1 Sarciophorus; 3 Lobivanellus.

Sub-fam. Charadrinæ, 2 gen. 2 sub-gen. 10 sp. 1 Squatarola; 2 Charadrius; 1 Eudromias, 6 Hiaticula. See Birds p. 517.

HIATILLA, or the white Huns. a tribe of Tartars who issued from the plains near the north wall of China, made themselves masters of the country of Transoxania and anticipated the irruption of those Turkish tribes, who some years afterwards expelled the Hiatilla, from the lands that they had taken from the Sacæ, or Scythians. There is every ground to conclude, that it was an army of the Hiatilla that invaded Persia in the reign of Bahram-Gor: and that it was to one of their kings that Firoz fled, *Malcolm's History of Persia Vol. I p.* 126.

HIBAVINIA OIL, CANARESE, under this name, there was exhibited at the Madras Exhibition of 1857, a solid oil from the Sampajey district of a clove brown colour, a small phial priced at Rupees 4½. Camujay tree oil: a small bottle, priced Rupees 6¼ from the same district, was a dark gelatinous mass, of the consistence of blancmange.

HIBBAH. AR. a gift; Hibbah namah, a deed of gift.

HIBBUK. ARAB. also Hibbuk nana. ARAB. Mint.

HIBISCUS, a genus of plants, belonging to the Nat. Order, Malvaceæ or Mallow tribe about 30 species of the genus being known in the East Indies: viz.

aculeatus.	lampas.	radiatus.
bifurcatus.	lindleyi.	rosa-sinensis.
cannabinus.	lunarifolius.	scandens.
collinus.	liliiflorus.	surattensis.
diversifolius.	micranthus.	syriacus.
furcatus.	mutabilis.	sabdariffa.
genevii.	palustris.	trionum.
heterophyllus.	panduriformis.	vesicarius.
hirtus.	patersonii.	vitifolius.

Several species furnish useful, commercial products viz. cannabinus; sabdariffa, vesicarius: Rosa-chinensis, vitifolia; lampas: esculentus; strictus, tiliaceus; furcatus; collinus; ficifolius. In the West Indies H. clypeatus and elatus are cultivated for fibres: H. manihot in Japan. H. heterophyllus in New Holland, and H. verucosus in Senegambia. Most of the Indian species might be employed for the same purposes as hemp, as the bark is tough, and may almost always be stripped off in long slips. Roxb. iii. *Voigt.* p. 116, *W. Icon.*—*Royle* (*Fib.*) *Pl. Riddell.* See Paper.

HIBISCUS ABELMOSCHUS *Roxb.* Syn. of Abelmoschus moschatus. *Mœnch.*

		Gongura	,,

This plant is grown all over India, for its acidulous leaves which are used as a spinach, also for the fibres of its bark which are used as cordage: the cultivators sow a small quantity along the edges of the usual crops for their own use. It is sown in the beginning of the rains, and when it commences to flower, it is cut and treated exactly as the

sunn hemp from Crotalaria juncea. The proportion of fibre is about half the weight of the plant. It is used for making rope, sackcloth, twine, paper, &c. The cost of the prepared fibre is from three to four rupees per maund, according to its strength, length and cleanliness. The fibre like that of Jute is sometimes called "Paut," also, in Bombay, Dekhanee hemp, to distinguish it from taag or Concanee hemp: also Indian "hemp." Also, it is one of the "brown hemps" of Bombay, and is often confounded with the fibre of "Sunn," though the two plants greatly differ, the sunn, 'Crotalaria juncea' being known in Bombay as Taag. The length of the fibres of carefully cultivated Ambaree, is from five to six feet: they are of a paler brown than ordinary Brown Hemp, harsher in feel and stick more together; but they are divisible into fine fibrils, possessed of considerable strength, well calculated for rope making, as also for coarse fabrics. Though esteemed by some of the natives of Western India, the hemp of the H. cannabinus, is not, either in strength or durability, so good as the true hemp, or as the Sunn or Brown Hemp of the Crotalaria juncea. Its price in the British market is probably the same as that of the Jute. Hibiscus cannabinus is an erect growing plant of the height of about four feet. It is slightly prickly over the stem. The leaves have an acid taste, and are much used as a pot herb. There is a dark purplish colored species, the leaves of which are used for a similar purpose; they are both grown all the year round, and sold in the Dekhan at five seers for one pice. The strength of this fibre was tested by several scientific men, and found to be

Experiments of	Ambaree, Hibiscus cannabinus, broke with	Sunn, Crotalaria juncea, broke with

HIBISCUS CHITLBENDA. Rox. Syn. of Pavonia odorata.—*Willde.*

HIBISCUS ELATUS. *D. C.* syn. of Paritium tiliaceum *St. Hil.*

HIBISCUS COLLINUS (Eriocarpus of *D. C.*), a native of the mountainous parts of the Northern Circars and of Peninsular India, where it is called kanda-gang, and where the natives use the bark as a substitute for hemp. Dr. Roxburgh states that there are three varieties of this plant, the double red; double yellow and double flesh red.

HIBISCUS FICIFOLIUS is a species which Dr. Roxburgh so named, and of which he received the seeds from the Moluccas. It was an annual, growing straight, very tall, often 12 to 14 feet high, with few branches. The fibres he describes as uncommonly beautiful, and rather stronger than the sunn fibre.

HIBISCUS FURCATUS.—*Roxb. W. & A.*

H. bifurcatus *Roxb* | H. aculeatus *Roxb. Wheele.*
Konda gongura. TEL.

A very prickly plant growing in India, to a height of from 6 to 8 feet. It yields abundance of strong white flaxy fibres, but from the prickliness of the plant it is very troublesome to handle. The stems are cut when in flower, and steeped immediately.

HIBISCUS LAMPAS, *Cav.* A small tree of India, yielding fibres.—*Voigt, M. E. J. R. Wights Ic.*

HIBISCUS MACROPHYLLA—? is very plentiful in the forests of the Pegu and Tounghoo districts, also in Tavoy: it yields a tall slender timber, of three or four feet girth, and would do for boards and house posts. Ropes are frequently made from its bark. Wood white colour and adapted for every purpose of house building.—*Drs. McClelland & Mason.*

HIBISCUS MUTABILIS.

Thal-padmo BENG. | Gul-i-ajaib. HIND

The changeable rose is a large shrub, native of China, remarkable for the changes which occur in the color of its flowers, bearing white flowers in the morning, but changing to red in the course of the day: easily propagated by cuttings. The fibres of the bark were found to be of a hard nature, and of a bad colour.—*Drs. Riddell, Mason, and Stewart, Mr. R. Brown.*

HIBISCUS ESCULENTUS, *Linn.* Syn. of Abelmoschus esculentus.—*W. & A.*

HIBISCUS LILIIFLORUS. *Cav.* Lily flowered Hibiscus. A variety has flowers of a buff sallow colour.—*Voigt.*

HIBISCUS LONGIFOLIUS. ROXB. Syn. of Abelmoschus esculentus.—*W. & A.*

HIBISCUS PATERSONII, *D C.*; *Prod. I. p.* 454, *Ait.*

Lagunæa patersonia, *B. M.*

HIBISCUS ROSA SINENSIS.

White oak of Norfolk Island, a shady tree forty feet high. Its leaves are a whitish green, sepals green and petals the size of a small wine glass, pink, fading to white. It is the largest of the mallow tribe, and attains sixteen feet in circumference. In an economic sense it is said to be valueless, except for firewood.—*Keppel's Ind. Arch. Vol. II, p.* 283, *Voigt.*

HIBISCUS POPULNEOIDES ?

Thespesia populnea ?

Parispipul,	Hind.	Muni ganga-ragi,	Tel.

Mr. Rohde names this as a species in a few gardens near Samalcottah: it flowers during the wet and cold seasons. He says that this species is immediately to be distinguished from populneus by the glands in the axils of the nerves of the leaves, their waved border and long points, and by the double integument of the capsule, the innermost of which requires force and a sharp knife to open it, whereas in populneus it is single; and can be easily broken by the pressure of the thumb and finger. This tree will answer better for avenues, parks, &c., than T. populneus, because it is much higher to the branches, consequently gives a free circulation to the air. When wounded the same yellow juice discharges as in populneus.—*Rohde M. S. S.*

HIBISCUS POPULNEUS, *Roxb.* syn. of Thespesia populnea, *Lam.*

HIBISCUS ROSA SINENSIS *Linn*

Uru; Joba, Jhva,	Beng.	Jaba,	Sans.
Jasun	Duk. Hind.	Sapata cherri	Tam.
Shoe flower, China Rose,	Egg.	Dasana Japa pushpamu Jovapushpamu	Tel.
Shem pariti, Kambang saptu,	Maleal.		

This plant is common in India; the leaves are used as emollients, anodyne and gentle aperients; the flowers are deep scarlet, and yield a very mucilaginous juice, which turns rapidly to a dark purple. Applied to soft, unsized white paper, this colour is nearly as sensitive a test for acid as the celebrated litmus. Shoe flowers are sometimes employed for dyeing lilac colour but it does not appear to be permanent, they are also occasionally rubbed on leather for the purpose of blackening and polishing. The natives make pickles of the flowers, and they are used for giving a red tinge to spirituous liquors; The petals are used in some cases to furnish a black liquid to dye the eyebrows. In Tenasserim, this bold, flaming flower is extensively cultivated.—*O'Shaughnessy*, p. 218. *Ainslie's Mat. Med.*, pp. 198 260. *Williams' Middle Kingdom*, p. 285. *Mason.*

Polichi,	Maleal.		

Cultivated in most gardens, for its calyxes which, as they ripen, become fleshy, are of a pleasantly acid taste, and are much employed for making palatable tarts, as well as an excellent jelly. The stem if cut when in flower and the bark stripped off, and steeped immediately, displays a mass of fibres of a fine silky nature. The leaves are used as greens, alone or mixed with others, the flowers are very pretty, often cultivated in flower beds. In the French West India islands a kind of cyder or wine is prepared from it termed Vin de Ozeille.—*Drs. Ainslie, Mat. Med.*, p. 256. *Roxb. O'Shaughnessy, Voigt. Stewart. Messrs. Brown and Jaffrey.*

HIBISCUS STRICTUS. Roxb. A native of the Rajmahl hills, with a straight stem of from 6 to 14 feet in height, and a very smooth bark. It is in blossom about the termination of the rains and the seed ripens in December and January, soon after which the plants perish, the bark abounds in flaxen fibres; beautiful, long, glossy, white, fine, and strong: sown in the beginning of the rains in beds; and when about six inches high, transplanted out in rows, about nine inches asunder, and about as much from each other in the rows. In 1801, forty square yards planted in this manner, yielded thirty-three pounds weight of very clean fibres. Dr. Roxburgh's original specimens, still in the India House, are 9 and 10 feet in length, a fibrous mass, apparently easily stript off, and composed of fine and easily divisible fibres.—*Roxb. Voigt. The exports of hides from India have greatly increased since 1851. In 1858 the total import into Britain was 2,379,256 hides against 3,056,071 hides in 1857, and 2,072,864 hides in 1856. At the Madras Exhibition of 1855, the tanned hides and skins exhibited were of excellent quality and could bear comparison satisfactorily with the same kinds of leather prepared in Europe. They had been thoroughly saturated with the tanning materials, were free from animal odour, and their sections did not shew the white line between the outer and inner surface, indicative in bad leathers of a hasty and imperfect inhibition of the tan liquor. The collection comprised the tanned hides of the Bison, Sambre, Bullock, Horse, Cow, Sheep, Goat, Kid, Dog and Iguana. Iguana skins which have been tanned and dyed black, or left of their natural color, are thin, even, soft, tough elastic and granular or sha-greenlike in external appearance. From the absence of gloss, the appearance of this leather is not much in its favour, but it bids fair to be a durable article for light slippers, and a good covering for the commoner kinds of instrument boxes, such as are still done over with shagreen.

Tanned and Colored Skins—for book-binding purposes and boot-linings, were generally even, soft, and pliant, and very suitable for their intended uses. Some of the colored leathers were very brilliant.

Sheep and kid skins tanned white—were exhibited in much perfection.—None of the specimens were fine enough for the better kinds of gloves, but they were all as well suited as European skins of the kind for the purpose of the apothecary.

Parchment skins.—The parchment skins take ink very well, but were not in every respect satisfactory, and their texture was uneven.

Wash Leather.—The skins prepared with oil, in imitation of chamois or wash leather, were all excellent specimens of the kind, so far as thickness, softness, pliancy and color, were concerned. In all these respects they will bear comparison with the European article. But as every one of these leathers was tainted with the odour of the Fish Oil employed in their preparation, they could not be recommended for household purposes, such as cleaning plate, though found very suitable for cleaning brasses and harness. As potass, soda, and dry pure deodorizing air are abundant in this country, a very little additional care would ensure the production of a perfectly inodorous chamois leather.

Buff leather.—The buff leathers for accoutrement were nearly all extremely good in quality; very economical leathers for manufacturing purposes.

The best tanned leather from Buffalo, Bullock, and Cow hides, were contributed by Colonel Sheriff and Lieut. and Qr. Mr. Grant from the Horse Artillery Tannery at Bangalore. They also exhibited specimens of leather prepared from the Hog, Calf, Goat, and Sheep skins, of unexceptionable quality. Boa-constrictor skin, when tanned, makes excellent boots, much prized in England for their strength, pliability, and great beauty, as they are handsomely marked. Boots made from this snake's skin are pliable and easy to fit; perhaps owing to the accommodating nature of the snakes skin when in his live state. Boots of Norwegian manufacture, are made from the skin of a salmon. In certain of the Southern States of America, the skins of young alligators are tanned, converted into leather, and the leather manufactured into boots.

The following are the values of the exports from India of hides and skins:

1851-2	303,089£.	1856-7	572,530£.
1852-3	337,849	1857-86	39,702
1853-4	402,365	1858-95	54,680
1854-5	402,386	1859-60	444,537
1855-6	431,729	1860-16	56,629

HIGGASS. Singh. Odina wodier, *Roxb.*

HIGH ASIA, a term applied by the brothers Schlagentweit to districts in Central Asia.

HIGH PLACES, Sacred edifices were often erected by the Greeks and Romans upon elevated sites. The custom is of very high antiquity. Hector, according to Homer, sacrificed upon the top of Ida; and Abraham was commanded to offer up Isaac on Moriah. Balak is represented as selecting three elevated stations, where he sacrificed with Balaam, and probably by some sacred erection.

First station, Num. xxii. 41. "And brought him up into the high places of Baal." And he led him to the high places of his god." (Chaldee and Samaritan). "And he made him ascend Bemoth Baal." (Syriac.) "He made him ascend to the pillar or mound of Baal." (Greek.) "And he led him up to some temples of his god." (Arabic.)

Second station.—Num. xxiii. 14. "And he brought him into the field of Zophium, to the top of Pisgah." "To the field of observation, to the top of the hill." (Chaldee.) "To the field of the watchers, to the top of the hill." (Syriac.) "To the field of the watchers, to the peak of observation." (Samaritan.) "To the field of observation, on the summit of a levelled place." (Greek.) "To an high place, on the top of a citadel." (Arabic.)

Third station—Num. xxiii. 28. "And Balak brought Balaam unto the top of Peor." Archæologia.

The temple, though superior to St. Paul's, was inferior to St. Peter's at Rome; the Ephesian temple being four hundred and twenty-five feet long, and the church of St. Peter eight hundred and forty Roman palms, each palm being about nine English inches.—*Milner's Seven Churches of Asia*, p. 100.

HIGH TOWNS, in Asia, along the sides of the Himalaya, are villages up to 10,000 and 16,000 feet. In America, the city of Quito 9,520 feet above the level of the sea; the city of Mexico, 7,400; the city of Miculpamha, 11,850; also the following places, situated between the two chains of Andes, in Upper Peru, at some 350 miles distance from the Pacific:—City of Puno, 12,830 feet above the sea; town of Potosi, 13,350; mines of Potosi, 16,000; Titiaca Lake, 12,760; house of Titiaca, 14,402.

HIJRA, the era of the Hijra dates from the flight of Mahomed to Medina, which took place on the night of Thursday the 15th July A. D. 622. The era commenced on the following day, viz. the 16th July. The corresponding years of the Christian and Hijra eras, may easily be calculated by the following formula: it being remembered that the Christian are solar and those of the Hijra lunar years, and that 521 solar are equal to 537 lunar years.

Ex.—What is the year of Christ 1734, according to the Hijra?

From 1734 A. D. subtract 621, the difference of the two eras,

Result 1113 of the Hijra in solar years.

Then, 521 : 537 : : 1113 : 1147 Hijra.—*Playfair's Yemen.*

HIJRE. Hind, a eunuch.

HILLAH, its ruins are called Babel by the Arabs. The pre-eminent mounds at the site of ancient Babylon, are three in num-

ber, 1st, the Amran Hill, so named by Mr. Rich in his 'Memoir on the Ruins of Babylon' and who designates it by that appellation, from its supporting a small tomb erected to the memory of some personage of that name, said to have been a son of the caliph Ali, who fell at the battle of Hillah. But there must be some mistake in this tradition. Ali having had only two sons Hassan and Hussein. The ruins near Hillah are still, by the Arabs, designated Babel, and all historical records, as well as traditions, agree in representing these as the remains of the first city of Nimrod, the Babylon of Herodotus, Diodorus Siculus, and other historians.

Hillah lies in latitude 32° 31' 18", in longitude 12' 36', west of Bagdad; and, according to Turkish authorities, it was built in the fifth century of the Hijira, in the district of the Euphrates, which the Arabs call El-arad Babel, lying on a spot of the vast site of Babylon. The author of the Majalis ul Momenin, under the article Hillah, states that it is a large city between Kufah and Bagdad, and that the site was originally named Jamiain.

The town of Hillah, is situated upon the banks of the Euphrates, and occupies a part of the site of ancient Babylon. The western side of the Euphrates, and stretching towards Felugia, is a tract pregnant with interest; for between the last named place, and the bitumen springs of Hit, the battle of Cunaxa was fought, in which the younger Cyrus lost his life, and whence Xenophon made a retreat more brilliant than victory.—*Mignan's Travels*, pp. 254, 326. *Porter's Travels*, Vol. II, p. 252. *Skinner's Overland Journey*, Vol. II, p. 185.

HILLOOYA. Beng. Asparagus officinalis.

HILL STATES. The early intercourse of the British Government with Nepaul was exclusively of a commercial nature. British political relations with it date from the invasion of the valley by the Goorkha race under rajah Pirthee Narain. In 1767 the Newar rajah of Katmandhoo, being hard pressed by the Goork'ha, applied for assistance to the British Government. Aid was granted, and Captain Kinloch was despatched with a small force in the middle of the rainy season. He was, however, compelled by the deadly climate of the Terai to retire. The Goorkha chief, meeting but a feeble resistance, overran Nepal, and extinguished the Newar dynasty, and was eventually recognized by the British Government as rajah of Nepal. For several years previous to 1792, the Goorkha power had been extending their conquests in the direction of Thibet. They had advanced as far as Digarchi, the Llama of which place was spiritual father to the emperor of China. Incensed by the plunder of the sacred temples of Digarchi, the emperor of China despatched a mighty army to punish the Nepal rajah, and the Goorkha concluded an ignominious treaty with the Chinese within a few miles of their capital. War between the Gorkha and the British was formally declared on 1st November 1814. An arduous campaign, in which the Goorkhas fought most bravely and with much success, left the British in possession of the hills west of the Kalee, and the Goorkhas disposed to treat for peace. Negociations were, however, twice broken off by the Goorkhas refusing to comply with the demand for the cession of the Terai, and Hostilities were therefore vigorously pushed by the British Government, till the 4th March 1816, when the Nepalese commissioners delivered to Sir David Ochterlony the treaty of Segowlee duly signed and executed. The hill lands east of the Nuchee, and part of the Terai between the Nuchee and Teesta rivers ceded under this treaty, were made over to Sikkim.

The murder of Guggun Sing, a favourite of the maharani and the massacre of thirty-one of the most influential chiefs in 1846, paved the way for the rise of Jung Bahadoor to the office of prime minister, and he was created a maharajah by the maharajah of Nepal, and invested with the perpetual sovereignty of two provinces. He effected the marriage of a son and two daughters into the royal family of Nepal. During the mutiny of 1857, and the subsequent campaigns Jung Bahadur rendered assistance to the British in the re-occupation of Goruckpore, the re-capture of Lucknow, and the subsequent capture of the rebels who infested the Terai. In consideration of these services he was created a Knight of the Grand Cross of the Bath, and under a treaty (No. LV) concluded on 1st November 1860, the tract of territory on the Oudh frontier, which had been ceded to the British Government in 1816, was restored to Nepal.

The Nepalese usually estimate the population of Nepal at 5,200,000 or 5,600,000,

but it is probably not more than 2,000,000. The city of Katmandhoo contains from 30,000 to 35,000 inhabitants. The area of the kingdom is about 54,000 square miles. Its revenue is unknown, but is supposed to be about 43 lakhs. The Goorkhas pay no tribute to the British Government, but every five years a mission is sent from Katmandhoo with presents to Pekin. Previous to the Nepal War in 1814 the Goorkhas had extended their conquests westwards as far as the Sutlej. By the 5th Article of the Treaty of 1815, the Nepalese renounced all claim to the countries west of the Kali, and the British were left in possession of the whole tract of hills from the Gogra to the Sutlej. Kumaon and the Dehra Doon were annexed to the British dominions, and the rest of the territory, with the exception of Subathoo, Raengurh, Sundoch, and a few other military posts, was restored to the Hill Rajahs from whom it had been conquered by the Nepalese. In 1847 transit duties were abolished throughout these states. A yearly sum of Rupees 13,735 is paid in compensation by Government. To all the hill chiefs, the rite of adoption has been granted.

Sirmoor or Nahun. In recognition of the services rendered by rajah Shumshere Purgass during the mutiny, he received a khillut of Rupees 5,000, and a salute of seven guns. The family is Rajpoot. The revenue of Sirmoor may be estimated at a lakh of rupees a year. The rajah maintains a small force of drilled sepoys, numbering 250 men. The population, according to the latest census, amounted to 75,595. The rajah pays no tribute, but is bound to render feudal service.

Kulloor or Belaspore The rajah of Kulloor had estates on both sides of the Sutlej. But the sunnud given to rajah Moober Chund, in 1815, confirmed to him the eastern portion only. The family is Rajpoot. In acknowledgement of his services during the mutinies of 1857, the rajah received a dress of honor of Rupees 5,000 value, and a salute of seven guns. The revenue of this state is not less than Rupees 70,000. The population amounts to 66,848.

Hindor or Nilagurh. The chief of Hindor belongs to a Rajpoot family. A sunnud was granted in 1815. The population at the last census was 49,678. The revenue amounts to Rupees 60,000.

Bussahir, a tributary state gave Rs. 3,945 as tribute. *Rawaun*, on the left bank of the Pabur, was transferred to Keonthul. The Thakoorai of Kotegurh and Koomharsein were declared independent of Bussahir.

The rajah is of a Rajpoot family, population of Bussahir, 45,025, revenue, Rupees 70,000.

Keonthul. After the Goorkha war a portion of the territory of Keonthul was sold to the maharajah of Puttiala. The chief claims a Rajput origin. He is bound to render feudal service. In 1858 the chief was created a Rajah, and received a dress of honor worth Rupees 1,000 for his services during the mutinies The revenue of the state is Rupees 30,000, and the population by census 18,053.

Baghul. The family is Rajpoot. Revenue, Rupees 35,000, population, 22,305.

Joobul. Originally this Rajpoot state was tributary to Sirmoor, but after the Goorkha war it was made independent, and the Rana received a sunnud from Lord Moira on 18th November 1815. The revenue is Rupees 18,000, and the population, 17,262 souls. The rana pays Rupees 2,520 tribute, and is bound to render feudal service.

Bhujee, pays tribute Rupees 1,440. Revenue, Rupees 15,000, population, 9,000.

Koomharsein. This state formerly a feudatory of Bussahir, was declared independent after the Nepal war, pays Rupees 1,440 as tribute. Revenue, Rupees 7,000, population, 7,829. The family is Rajpoot, of not very high pretensions.

Kothar. The sunnud bears date the 3rd September 1815, and confirms to rana Bhoop Singh and his heirs the hereditary possessions of his ancestors, subject to the performance of feudal service, and supplying a contingent of forty begar, but subsequently commuted to a tributary payment of Rupees 1,080. Revenue, Rupees 5,000; population 3,990. The family is Rajpoot.

Dhamee. This old Rajpoot state became independent of Kuhlor after the Goorkha war. The state was bound to supply forty begar, but this was commuted to a tribute of Rupees 720. Revenue, Rupees 4,000; population, 2,853.

Bughat a hill state, the chief of which acted unfriendly during the Nepal war. He died without issue on 11th July 1839. The state was treated as a lapse, and pensions to the extent of Rupees 1,282 were assigned to the family.

Bulsun. This state was originally a feudatory of Sirmoor, but a separate sunnud was granted to it in September 1815. Its tribute payment is Rupees 1,080. Its chief is of Rajpoot origin. Thakoor Jograj, was created a rana in 1858, for services rendered during the mutiny. The revenue of the state is Rupees 6,000, and the population 4,892.

Mylog. The sunnud of this Rajpoot state dated 4th September 1815, contains

the usual conditions and the tributary payment is Rupees 1,450. Revenue, Rupees 8,000, population, 7,358.

Beejah. This petty state pays a tribute of Rupees 180. Revenue, Rupees 2,000 population, 981.

Turoch. Revenue, Rupees 2,500, population, 3,082. It pays Rupees 280 in lieu of begar.

Koonhiar state pays Rupees 180 in lieu of begar, Revenue, Rupees 3,000 population 1,906.

Mungul was an ancient dependency of Kuhlor, but was declared independent on the expulsion of the Goorkha: its tribute payment is Rupees 72. The revenue, Rupees 1,000, population, 917.

Durkotee. This petty Chieftainship pays allegiance to the British Government, and is exempted from all pecuniary liability. Revenue, rupees 500, population 612. *Aitcheson, Treaties &c.* p. 323.

HILL TOON, Cedrela serrata *Royle.*

HILL TROUT, so called, although no trout, a bony monster of a silver grey, spotted with black, will eat everything he can swallow. Is often taken with an infant brother, while spinning for his high caste neighbours, with an artificial minnow of glass, with a piece of rag, or newspaper, with bees, and dragonflies, caught off the bushes by the river, with a morsel of cabbage leaves boiled, but in general with the orthodox spinning, the winnow, or the artificial fly, made very large and showy. In Cashmeer, five bags of these fish, have been caught some weighing 7 pounds each. One seen in the market, was 12 lbs. The "Wislur" Lake, the "Dhul Lake" and the "Ghelum" all swarm with them. about the mulberry trees the fallen fruits of which seem to afford them in legions a sweet and pleasant diet, if one may judge by the mighty rush ensuing on a shaking of the boughs. Boatmen avail themselves of this penchant, covering a bent pin with a plump mulberry, and dropping it incognito amid the shoal! This fish is widely distributed; abundant in the backwaters of the Ganges in the great rapids of that river far above Hurdwar and in Deyrah Dhoon; in 27°, 28' N. in the upper branches of the Burrampooter and in the Mishmee and Abor backwaters also in most of the small rivers of the Punjab, in which latter locality it does not seem to grow very large, though plentiful, owing perhaps to its being the common food of numerous fish of prey. Is abundant, though small in Central India, in Bundelcund and Jhansi Districts. Eatable, that is all that can be said, but giving good sport in its way, and yielding subsistence to the monsters of the deep, and useful in diverting their attention from mischief to their own breed. See Chiliva, Craw-fish.

HIL KILAN. Pers, bastard or wild Cardamoms.

HILO. Sp. Yarn. also Torzal. Sp. Thread.

HILSAH. A fish of the Irawadi and Ganges.

HILTITH. Arab. Asafætida.

HIMALAYA, a great mountain range, which includes the whole of the country betweenKashmir on the west and Kachar on the East: has the plains of India in the south, and on the north, those of Thibet, or Himachal, the country of snow. This tract possesses no table land, but is like a gigantic system of ravines, being throughout a series of steep acclivities, with narrow gorges and stream beds at the bottom of the ravines, and the hills ascend only to narrow ridge tops and again immediate descents. These hills have villages at every elevation, from 1,000 to 22,000 feet. The watershed of the Himalaya, on the north of the highest snow peaks, is the boundary between India and Tibet.

The Himalaya extend from the defile above Cashmere in Long, 73° 23' to the southern bend of the Tsan-po, in Long. 93-22. The range is usually divided into the Eastern Himalaya, from the banks of the Tsan-po to the course of the Kali, a river which forms the western boundary of Nepal: and the Western Himalaya, from the Kali river to the peaks of Dairmul on the Indus.

The entire length is computed at 1,500 miles and average breadth at 150 miles with a mean elevation of 18,000 feet, but there are solitary mountains and peaks rising higher.

Western Himalaya.

Imaus is a name by which part of the Himalaya was known to the Greeks and Romans. Pliny was fully aware of the signification of the name for he says (Hist. Nat. VI. 117) "Imaus in colarum lingua, nivorum significans." The great part of the mountains N. West from India was also called the Paropamisus or Hindoo Cush; and Imaus and Hindoo Cush seem to have been identical. The true Imaus, however, is the ridge which separates Kashmir from Little Tibet. It appears to incline, in its northern course, towards the continuation of the

Hindoo Koh and even to join it. The term Hindoo Koh or Hindoo Kush is not applied to this ridge in its whole extent, but seems confined to that part of it which forms the N. W. boundary of Kabul, and this is the Indian Caucasus of Alexander. There is, however, much confusion owing to the use of Tibetan, Chinese, and Persian names for that great mountain mass.

The Himalaya is a great mountain barrier and its name is from Hima snow, alaya abode. Natives call all the high snowy peaks of the Himalaya by the generic name Kailasa and a line of high snow peaks can be traced running nearly parallel to the plains of India, and extending from the places of passage of the Brahmaputra on the east and of the Indus on the west. But these snowy peaks are separated from each other by deep ravines along which flow large and rapid rivers.

This stupendous mass extends in an irregular curve over 22° of longitude from the defile above Cashmere, where the Indus penetrates into the plains of the Punjab, lon. 73°23'. Some of its heights are.

Average elevation, 18,000 to 20,000 ft. M. Everest, 29,002. Limit of perpetual snow, or congelation on S. slope. 15,000 ft. Deep narrow valleys, separated by ranges running either parallel or at right angles with the main ridge, contain the numerous sources of the rivers flowing into the Ganges, the Indus, and the Brahmapootra. The steep face is toward the plain, and to the N. the chain supports the lofty table-land of Tibet. The greater part of the giant peaks, which rise to an elevation of 25,000 or 28,000 ft., are situate not on the central axis, but to the south of it. Viewed from Patna, at a distance of about 150 miles, these mountains present a long line of snow-white pinnacles, which on a nearer approach, are seen towering above the dark line of lower but still lofty mountains. With the exception of a strip of land at the foot of the mountains, the whole of Bootan presents a succession of the most lofty and rugged mountains on the surface of the globe. It is a series of ridges, separated only by the narrow beds of roaring torrents. In the Western Himalaya, the average elevation of Cashmere valley is between 5,000 and 6,000 ft. above the sea. Huramuk Mt. 13,000. Pir-panjal, 15,000. Average of valley of Indus (N. of Cashmere vale), 6,000 to 7,000 ft. Slope from S. E. to N. W. Mountains on each side rising from 6,000 to 8,000 ft. higher. Mountains enclosing Cashmere vale are basaltic. Ranges on each side of Bultistan valley are rugged, bare, and nearly inaccessible; formation generally of gneiss; that of the valley, shingle and sand. The line of snow peaks in the western Himalay is the southern limit of the snowy range of the western Himalaya.

Western Tibet, is a highly mountainous region lying on both sides of the river Indus, with its longer axis directed like that river from south-east to north-west. It is bounded on the north-east by the Koenlun chain of mountains, by which it is separated from the basin of Yarkand. On the south-east its boundary is formed by the ridge which separates the waters of the Indus from those of the Sanpu. To the north-west and south-west its boundaries are somewhat arbitrary, unless the political division of the country be had recourse to, which, depending on accidental circumstances entirely unconnected with physical geography or natural productions, is so liable to change that its adoption would be extremely inconvenient. As limited by these boundaries, West Tibet includes the whole of the valley of the Indus and its tributaries, down to about 6,000 feet above the level of the sea, a considerable portion of the upper course of the Sutlej down to between 9,300 and 10,000 feet, and small portions of the upper course of the Chenab, of the Ganges (Jahnavi), and of the Gogra. Every part of Tibet is traversed by ranges of mountains which have their origin either in the Kouenlun on the north, or in the trans-Sutlej Himalaya on the south.

The mountain systems of East Tibet is an enormously elevated mountain mass, this is proved by the statements of many intelligent Tibetans, by the Chinese geographers, by the narrative of M. Huc, and the fact of so many of the large rivers of Asia flowing from it in several directions.

The two sections of the Himalaya furnish points of resemblance, in presenting almost insurmountable obstacles to communication between the countries which they divide, thereby separating the Boti or people of Tibet from the Hindoo family of India. Major Cunningham considers the distinction

of climate not less positively marked, both ranges forming the lines of demarcation between the cold and dry climate of Tibet with its dearth of trees, and the warm and humid climate of India, with its luxuriance of vegetable productions. Some analogy, moreover, may be traced between the drainage systems of the two sections; the one separating the waters of the Sampoo from those of the Ganges and its affluents; and the other intervening between the Indus, flowing at its northern base, and the subsequent tributaries of that river rising on its southern slope.

Any view of the Himalaya, especially at a sufficient distance for the snowy peaks to be seen overtopping the outer ridges, is very rare, from the constant deposition of vapours over the forest-clad ranges during a greater part of the year, and the haziness of the dry atmosphere of the plains in the winter months. At the end of the rains, when the south-east monsoon has ceased to blow with constancy, views are obtained, sometimes from a distance of nearly 200 miles.

The Bara Lacha range of mountains is regarded by Alexander Cunningham as the western continuation of the Himalaya. The Bara Lacha separates the Indus river from its first affluents as the Eastern Himalaya separates the Tshang-po from the Ganges.

The Western as well as the Eastern chain separate the great hindu family of India from the Bot of Tibet. Some mixed races are found to the south of each chain, as the Lahuli and Kanawari in the west and the Ghoorka and Bhutani in the east.

The inferior mountains of the Eastern chain run at right angles to its axis, whereas those of the Western chain are generally disposed in subordinate parallel ranges. There are, two distinct and independent ranges to the south of the Western Himalaya, both stretching in the same general direction from N. W. to S. E., which may be termed the Mid Himalaya and the Outer or Sub Himalaya; the term Siwalik being that applied to the lowermost sandstone ranges.

Eastward of the Subansiri river, there is probably only one range of any considerable elevation and the mountains by which the Himalaya terminate in that direction perhaps nowhere attain a greater height than eight or ten thousand feet while the valley of the Dihong or Brahmaputra is probably broad and open. These mountains are inhabited by wild and suspicious tribes.

The Siwalik is a Sub-Himalayan range of the later or tertiary formation. What is strictly called the Siwalik, extends in a north western direction from the right bank of the Ganges, and runs parallel to the Himalayan range, forming the boundary of the Doab between the Ganges and Jumna; beyond this, it skirts the Ambala and Ludhiana districts, and comes to its termination in the Hushyarpur district. Though this portion alone receives the name of Siwalik, Dr. Royle observes that hills of a precisely similar nature can be traced all along below the Himalaya from the Sutlej, as far as the foot of the Sikkim hills: and it is not difficult to conceive a continuation of them more or less continuous, and of greater or less elevation, along the whole southern frontier of the Himalayan system, a distance of nearly 800 miles. At Hardwar, the Siwalik hills form the gorge through which the Ganges issues into the plains of Hindustan. The breadth of this range is at its widest part about ten miles when it approaches the Sutlej river, and towards its termination beyond that river, the range assumes the form of little more than sandhills. The highest part of the range is about Hardwar, and to the south of Garhwal, beyond Sirmur, some of the peaks are as high as 3,000 or 3,500 feet above the sea level. The range is of tertiary formation, all alluvial, and in many places consisting of beds of gravel and rolled stones, fragments of the older formations of the Himalayan range above, consisting of granites, limestone, clay-slate, gneiss, mica-schists, &c. Besides these there are beds of loose grained sandstone, with much mica interposing, there are also beds of calcareous conglomerate and subordinate beds of clay.

The clay and sand beds of these ranges are fossiliferous: shells of the tertiary miocene period abound, but the chief characteristic fossils are the remains of gigantic mammalia, among which may be mentioned the Sivatherium, a huge creature somewhat similar to the "tapir" of modern days. The name Siwalik or Siwalik range, is derived from the hindu divinity Siva. Dr. Falconer, on his first visit to the Siwalik hills, inferred that they were of a tertiary age, and analogous to the Molasse of Switzerland. Thirty years of subsequent research by other geologists has not altered that determination, although the exact knowledge of the formation has been greatly extended. The researches thus begun were followed about the end of 1834, by the discovery, by Lieutenants Baker and Durand, of the great fossiliferous deposit of the Siwaliks near the valley of Markanda, westward of the Jumna, and below Nahun. Captain Cautley and Dr. Falconer were immediately in the field, and by the joint labors of these

four officers, a sub-tropical mammalian fossil fauna was brought to light, unexampled for richness and extent in any other region then known. It included the earliest discovered quadrumana, the Pliopithecus, and the Dryopithecus, an extraordinary number of Proboscidia, belonging to Mastodon, Stegodon, and Elephas; extinct species of Rhinoceros; Chalicotherium, Equus and Hipparion, Hexaprotodon, Hippopotamus, and Merycopotamus; Sus and Hippohyus; the colossal ruminant Sivatherium, together with species of camel, giraffe, and new types of Bovidæ; also species of Cervus, Antilope, and Capra; Carnivora belonging to the new genus Sivalarctos and Enhydriodon, Drepanodon (Machairodus), Hyæna, Canis, Lutra, &c. Among the Reptilia, monitors and crocodiles of living and extinct species, the enormous tortoise, Colossochelys Atlas, with numerous species of Emys and Trionyx; and, among fossil fish, Cyprinidæ and Siluridæ; no less than twenty five species of shells occurred, all of which but four are now extinct. The general facies of the extinct fauna exhibited a congregation of forms participating of European, African, and Asiatic types.

The Tarai is a great belt of gravel and sand, filling a trough from five to fifteen miles in length, parallel to the base of the Himalaya, to the depth of from 15 to 150 feet. It is so sickly as to be nearly without resident population; the houses of the cultivators are on the slopes of the hills. It is full of marshes. The belt of saul forest, which is waterless, is next to it towards the mountains, and is almost equally malarious: rivers disappear and pass under it re-appearing in the Tarai: it is surrounded by sandstone hills, which skirt the base of the mountains.

The Himalaya include the Simla hills, Kumaon and Nepal, but Mr. B. Hodgson applies the term sub-Himalayan to everything below the snowy range, including in this the most precipitous mountains and people dwelling in them, up to heights of 8,000 and 10,000 feet above the highest mountaineers in Europe. The low range of hills frequently separated from the Himalaya by diluvial valleys or doons, such as that of Deyra, seldom attains an elevation of more than 3,500 feet or 2,500 feet above the plains of northern India. The principal passes across this range were 2,339 and 2,935 feet before they were cut down. The second zone of mountains extending between these and the snowy range, vary in height from 5,000 to 8,000, or 9,000 feet. Within this tract is the military station of Sabathoo, elevated 4,200 feet; many hill-forts, and the summer residences of Simla 7,486, Mussooree 6,700, and Landour at 7,559 feet of elevation; of other heights, are the Peak of Kangchang 28,176. Ghat of Wallungchung 16,642, Ghat of Kanglachema 15,746, the former determined by Col. Waugh, the latter by Dr. Hooker. Peak of Dhavalagiri 27,000, (*Herbert.*) Of Chumalari, 24,000, (*Waugh.*) and Deodhung peak as well as Dhavalagiri are believed to rival Kangchang.

From the peak of Mono-mangli to the sources of the Gilgit and Kunar rivers, the distance is not less then 650 miles, and the chain is pierced in three places by rivers, by the Sutlej and Para, at the base of Porgyal and by the Indus, at the foot of Dyamur. The heights to the south of the Sutlej, range from 20,103 feet to 25,749, and the heights of the passes vary from 16,570 to 18,331 feet. In the western Himalaya, the snow limit ranges from 17,500 to 20,106 feet. The Himalaya, on the east, presents the lofty peaks of Kanchjinga and Dhawalagiri, which rise to more then 28,000 feet in height. The highest peak of the western Himalaya, are,

Nanda Devi, or Jawalur	25,749 ft	Mono mangli,	23,900 ft
Gyu peak	24,764 „	Porgyal,	22,700 „

The following table by Major Cunnigham, gives a summary of the information he collected regarding the great mountain chains, in the north of the Punjab.

NAME OF CHAIN.	Its length in miles.	Elevation highest peak, in feet.	Mean height of chain in feet.	Snow line. North	Snow line. South.
Kara Koram, or Trans Tibetan,...	450	24,000	20,000	18,000	18,500
Kailas, or Gangri; or Mid Tibetan	550	20,700	20,000	18,500	19,000
Trans Himalaya, or Tsho-moriri..	350	21,000	19,300	19,500	20,000
Western Himalaya, or Bara Lacha	650	25,749	20,000	19,000	18,000
Mid Himalaya, or Pir Punjal	407	21,786	17,000	17,000	16,000
Outer Himalaya, or Dacla Dhar. .	300	16,174	15,020	The snow disappeared annually.	

The following is a table of elevation above the sea level of places between Almorah and Gangri, from Lieut. H. Strachey's Journal and Map.

	Feet.
J. Strachey's hut on Binsar, near Almorah estimated to be nearly 600 feet below top of hill (7,969 feet T.)	7,400
Khazanchi's house, near St Mark's Tower, Almorah 50 feet below Tower (5,488 B.)	5,438
Dol Bungalow.	6,100
Dew Dhura (vulgo Dee) Bungalow	6,867
Pharka Bungalow	5,914
Lohughat Mr. Ramsay's house	5,649
Dhargara Bungalow	4,500
Iron bridge on the Sarju, 2 miles below confluence of Ramganga, estimated to be about the same height as (Rameswar, 1,587 B)	1,600
Kantaganu Bungalow	3,900
Petoragarh (Major Drummond's house) estimated 25 feet above fort (5,549 B)	5,574
Satgarh (Major Drummond's hut,) 100 feet below top of pass	5,900
Singhali Khan, (50 feet below pass)	5,600
Village of Askot, Camp 50 feet above	5,089
Garjia Ghat (estimated 35 feet below confluence of Gori and Kali, (3059 B)	2,094
Bank of Kali river under Balwakot	2,250
Dharchula, 100 feet above	2,850
Confluence of the Relagarh with Kali river.	3,794
Village of Kela	4,750
Bridge on the Dhauli under Keli	3,883
Confluence of Dhauli and Ali estimated 383 feet below, (No. 19)	3,500
(In Chaudans.)	
Village of Titila	8,000
Sosa village, (estimated 250 feet below Titila)	7,750
Rholing Dhura, top of pass, (estimated 2,000 feet above No. 21)	10,000
Bunbun Hamlet, (estimated to be about the same height as Gala)	7,500
Syankwag, crossing of the Garth, (estimated 25 feet above No. 26)	7,250
Gala Hamlet	7,500
Nirpania Dhura, top of pass, (estimated 3,000 feet above Gala)	10,500
(In Byans.)	
Golam, La, (at the great rock)	8,000
Thin Hamlet, left bank of Kali, (estimated 500 feet below Golam)	7,500
Crossing of the Najangarh, estimated 1,000 feet below Golam	7,000
Confluence of the Najangarh with Kali river, (estimated 1,500 feet below Golam).	6,500
Lamare, (on river bank)	8,000
Confluence of the Palangarh (with Kali river, (estimated 250 feet above Lamare).	8,250
Budhi village, 100 feet below	8,650
Cheto Biuaik, top of pass, (estimated 1,750 feet above No. 34)	10,500
Garbia village	10,272
Confluence of the Tinkar River with Kali (100 feet above)	9,900
Changrew village, (estimated 500 feet above No. 37)	10,500
Confluence of Kali with Kunti-Yankti, supposed to be the same as Webb's "Kalapem and Kali"	11,413
Mangdang, or Kunti river	11,750
Kunti village	13,000
Sangchungma encamping ground above the River.	14,000

	Feet.
Phia-mungba.	15,750
Lankpya Dhura, top of Pass, (estimated 2,000 feet above Lankpya and 1750 feet above Welshia.	17,750
(In Gnari, Gugi, Pruang.)	
Welshia.	16,000
Bhaweti, at the Darm-Sala	15,750
Lama-Choktan, (estimated 250 feet above Beaweti.)	16,000
S. E. end of Chujea Tol, (estimated same height as the Lakes)	15,250
Pass between Chujea Tol and Malang (estimated 1,750 feet above valley on either side)	17,000
Amlong, bottom of valley.	15,250
Jungbwa Tol, bottom of valley (estimated same height as Amlong.)	15,250
Bho Lagan (Rakas Tal,) level of Lake	15,250
Gangri Mountains, average height (estimated 4,250 feet above Lakes.)	19,500
Peak of Tise (Kailas), estimated 1,500 feet above the average of the Range and 5,750 above the Lakes.	21,000
Cho Mapan (Manasarowar,) [deducting* 175 feet height of station above the Lake.]	15,250
(In Pruang.)	
Mononangli (Gurla), estimated 8,260 feet above the Lakes, and 2,500 above Kailas.	23,500
Pass between the Lakes and N. head of Pruang valley (estimated 1,000 feet above lakes)	16,250
Baldak Dharmsala, (estimated about the same as lakes)	15,250
Kardam Karh, (estimated 250 feet below No. 58 and ditto above No 60.)	15,000
Camp in Ravine next above the great Ravine of Toiyon	14,750
Toiyon village, (estimated 250 feet below No. 60)	14,500
Bridge over Karnib, R. between Toiyon and Tauklakarh (estimated 250 feet below Toiyon)	14,300
Confluence of Sidya-Cha with Karnali, (estimated 50 feet below Bridge.)	14,250
Takla-karh, summit of hill, (estimated 500 feet above confluence).	14,750
Maghram village (estimated 250 feet above N. 63 and ditto below No. Tsklakarh.)	14,500
Pala-Dung, (estimated 500 feet above No. Maghram.)	15,000
Ningri, estimated 100 feet above Pala Dung and 4,744 feet below top of Pass.	15,100
Lipu Lekh, top of Pass [14th October 1828? Vide Calcutta Gleanings of Science, April 1829.]	16,844
Ravine entering left bank of Kali, supposed to be Webb's ["Mandarin's camp"]	14,506
Yirkha hamlet, above Kalapani (estimated 1500 feet below Bridge over Karnali.)	13,000
Kalapani Bridge, (site not identified as there are now three bridges over the Kali in this vicinity, but supposed to be not far below Yirkha	12,742

Eastern Dal-la, 27° 52' 1"; 92° 38' 6", in Bhutan, in the immediate vicinity of the Giant's peak top of the peak is 21,435 ft. according to *Herm. Schl.*, and 21,476 feet *Pemb.* The Giant's peak; and the Eastern Dal-la are the peaks occasionally called 'Gemini' by residents of Assam who have seen the Himalaya panorama from Nanklau

in the Khassia hills. The two 'monarchs' of the Himalaya are M. Everest, the 'King of the South,' reaching an altitude of 29,002 feet; and Nunga Purbut, the 'King of the North,' between two and three thousand feet lower. A dangerous glacier at a height of 18,000 feet is to be crossed at some distance from Ladak. A recent article on the Trigonometrical Survey in the Himalaya states that the whole mountain tract of Kashmir, including Thibet and Ladak, will soon be completely triangulated, and topographically surveyed. Altogether, the area already surveyed amounts to about 40,000 square miles, and 80,000 of triangulation. Some of the peaks on the Karakoram range along which runs the boundary between Ladak and Yarkand are very high, the highest being 28,278 feet above the sea. This mountain is called K2, and towers above all the surrounding ranges, being probably the second highest in the world.

Mount Everest—highest	...	29,002 feet.
K2	..	28,278 „
Kinchingunga ...	...	28,156 „
Dhwalaghiri (long thought the highest) ...	...	26,826 „

Some of the highest points 22,000 feet above the sea have been reached by surveyors who are East Indians, educated in Calcutta.

The following are the latitudes and longitudes and the heights of passes over the outer Himalaya range :—

Sugla,	31° 13'	78° 29'	16,000 feet.
Kimlia,	31° 15'	78° 25'	17,000 „
Siaga,	31° 16'	78° 20'	16,000 „
Marga,	31° 16'	78° 21'	16,000 „
Lumbia,	31° 16'	78° 20'	16,000 „
Barga,	31° 16'	78° 19'	15,000 „
Nulgun,	31° 19'	78° 13'	14,891 „
Rupin,	31° 2'	78° 10'	15,480 „
Ghusul,	31° 21'	78° 8'	15,851 „
Nibrung	31° 22'	78° 10'	16,035 „
Gunas,	31° 24'	78° 8'	16,026 „
Yusu,	31° 24'	78° 4'	15,877 „
Sundru,	31° 24'	78° 2'	16,000 „
Shatul,	31° 25'	77° 58'	15,555 „

Between Gil git and Chittagong, there are a hundred passes through these mountains. In Kunawur there are fifteen passes, at elevations varying from 15,000 to 17,000 ft.

Population. Bhot race. From Simla, for several hundred miles to the east all the passes through the snowy range are occupied by the Bhoti. They have a monopoly of the trade across the Himalaya, are carriers, loading the goods on the backs of sheep.

From Kashmir, eastwards, all the easily accessible portions of the Himalaya are occupied by Arian hindu as far as the eastern border of Kumaon and the Kali river separating Kumaon from Nepal—the Tibetans being here confined to the valleys about and beyond the snow. People of Thibetan blood have migrated into Nepaul, throughout its whole length, and have formed mixed tribes whose appearance and language is more Thibetan than Indian, but whose religion and manners are hindu. East of Nepaul, in Sikkim and Bhutan the hindu element almost disappears, and the Thibetans are altogether dominant.

Ghoorka. In Nepaul, in the west, are the Gurang and Magar tribes, small, with features of an extreme Mongolian type, full of martial ardour and energy. They are known as the Goorkha soldiers. They have considerable intellectual ability.

The Newar of the valley of Nepaul are the cultivating peasantry, have Thibetan features with a fair and ruddy complexion. The language of the Magar, Gurang and Newar is chiefly Thibetan. Further east are the Keranti, Murmi and others.

Valleys and Rivers.—It seems to be a constant rule that the depressions of the ridges are bare and open, while the more elevated portions are covered with forest. Probably the cause of this is the greater humidity of the higher slopes, which attract the rain-clouds, while the lower ranges are dry. The currents of air which sweep up the valleys may also in part be the cause of the bareness of the ridges opposite their summits.

The North West Himalaya, generally, include the great mountainous tract from the Kabul river on the west to Simla on the east, having the Indus river and its confluents, the Pangkong lake on the north and Kangra valley on the south, a region unsurpassed in the world for its rugged, defiant grandeur, its elevation, its extent of snow covered peaks, its glaciers, its impetuous torrents, its wild animals affording game to the sportsman, its flora, its mineral wealth and its soft serene valleys. The Cabul and Indian tributaries, the Indus, the Cabul river, the Jhelum, the Chenab, the Ravi, the Beas, and the Sutlej, form seven large rivers flowing through fertile valleys. The Jhelum runs in the valley of Cashmere. The course of the Ravee and Chenab is short and their valleys small. The Beas in its upper portion forms the Kulu valley, but lower down it becomes entangled amongst the lower ranges west of Mundee whence it opens on the plains of the Sutlej. The Sutlej has a tortuous entangled course, in its upper parts, but enters the valley west

of Simla, in Sukeyt and Balaspore within these regions to the west of the Beas valley in the valley of Kangra, and the valley of Dehra or Dehra Dhoon, to the east of the Sutlej almost out of the N. W. Himalayas.

The Dhera Dhoon is a winter valley. Its length is about 45 miles and its breadth about half that. It is shut on the north by the Sewalik range rising 3,000 feet high. On the east are numerous mountains rising 7,000 or 8,000 feet, amongst them Mussuri and Landour; the Asun and the Sooswa rivers drain it. It is clear of jungle and well cultivated. The tea plant thrives and the village of Dehra is large and thriving.

In the Kangra valley, some places like Bhagsoo (Dharmsala) and the road from Kangra town; Haurabagh and Fouta-Kal are beautiful, as also are the views of the Snowy Range. Kot Kangra or Kangra town was the capital of a powerful hill state which was conquered by the Sikhs. It is 2,500 feet above the level of the sea. Bhagsoo, above Dharmsala, is 7,000 feet above the sea. Haurabagh is 7,000 feet, and Foota-kal 9,000 feet above the sea. The Kangra people are sturdy, honest and independent.

The Sutlej vallsy commences a few miles above Mundee and continues up for about 40 miles almost to Simla and Subathoo and has the sanitaria of Simla, Kussowli, Nag-kunda and Chor. Mundee is the chief town of the Mundee state.

The Sutlej people are amiable and gentle, free of low cunning, having the appearance of a mixed race between the Tartar and the common hill men. They are fair, well made and strong, but are filthy and indigent. The women have a toga fastened round the waist.

Nag Kunda is estimated at 9,000 feet above the level of the sea. Chor is 12,000 feet.

The Beas vulley exceeds in beauty that of Kashmir. It runs from the Bajaora mountain on the north to the Snowy range on the south, a length of about 60 miles, and its heights range from 4,500 feet at the foot of the Bajaora pass to 9,000 feet at Ralha at the foot of the Rotang pass. Saltanpur is 4,584 feet. It is the only town in the valley, and trades with Ladak, Central Asia, Mundy and Kangra. Polyandry prevails in the Beas valley, but the general immorality is ascribed to the large numbers of Yarkundi traders.

Kulu.—The poorer Kulu people wear only a blanket, wound around the waist and one end flung across the shoulders and pinned across the chest, men and women often dress alike, but the long hair of the women is plaited in one tress.

Hot springs occur at Parbutty.

Vegetation.—In the Sikkim Himalaya, the giant peaks of Donkiah, Kinchinghow (22,756) and Kinchinjinga, the third greatest mountain of the world (28,178 feet,) only surpassed in altitude by the Korakarum (28,278 feet) and mount Everest (29,002 feet) form the culminating points in this magnificently wooded region. The truly temperate vegetation supersedes the subtropical above 4,000-6,000 feet, and the elevation at which this change takes place corresponds roughly with that at which the winter is marked by an annual fall of snow. This phenomenon varies extremely with the latitude, longitude, humidity, and many local circumstances. In Ceylon and the Madras Peninsula, whose mountains attain 9000 feet, and where considerable tracts are elevated above 6-8,000 feet, snow has never been known to fall. On the Khasia mountains, which attain 7000 feet, and where a great extent of surface is above 5000, snow seems to be unknown. In Sikkim, snow annually falls at about 6000 feet elevation, in Nipal at 5000 feet, in Kumaon and Garhwal at 4,000, and in the extreme West Himalaya lower still. Gaultheria nummularia, and several other plants, extend into the N. W. Himalaya and are also found in the Javanese mountains which are nearly 3,000 miles distant and some plants have been found in intermediate localities, as the Gaultheria, which occurs along the whole Himalayan range, and in the Khasia, and which will probably be found in the mountains of the Malay peninsula and of Sumatra; and there are many other Java plants which are more uniformly spread over the hilly districts of India and Ceylon, G. fragrantissima and G. trichophylla also occur in the Himalaya, and in the interior Himalaya, are represented by a few species in the plains of the Punjab, on the outer slopes of the western Himalaya, and even on the Khasia mountains. Spiræa Kamtchatica, chamædrifolia, and sorbifolia, and Paris polyphylla, are also Siberian forms which extend into the rainy Himalaya, and Corydalis sibirica and Nymphæa pumila are remarkable instances of specific identity between Khasia and Siberian plants.

The limits of certain European plants are well defined. Myrtus communis is not found further east than Afghanistan; Nymphæa alba, Marrubium vulgare, Nepeta cataria, Potentilla reptans, and Trifolium fragiferum. have not been observed beyond Kashmir, Cratægus oxyacantha stops in Kishtwar; Rubus fruticosus in the outer hills near Jamu; and Aquilegia vulgaris in Kumaon.

Many North African or Arabian forms such as Peganum harmala, Fagonia cretica, Balanites ægyptiaca, Acacia arabica, Alhagi, Grangea, Calotropis, Salvadora Persica, extend throughout all the drier parts of India. Oaks and Chesnuts prevail throughout the Himalaya, Khasia, and Malayan Peninsula, descending to the level of the sea in East Bengal, Malaya, Sumatra, Java, and Borneo, but throughout the Peninsula of Hindostan and Ceylon are wholly absent. Coniferæ not only inhabit high levels, (along with these oaks), but descend considerably below 4,000 feet; of these, Pinus, Podocarpus, Taxus, and Dacrydium, are all found in the Malay Peninsula and Khasia, but not one in the Hindustan Peninsula or Ceylon, though these present far more extensive and loftier mountain ranges. Cycadeæ, are absent in Ceylon, and palms and epiphytic Vacciniaceæ in that island and in the peninsula of Hindostan are comparatively rare.

In descending from Darjiling the zones of vegetation are well marked. At a little below 7,000 feet, or between 6,000 and 7,000 by

(1.) The oak, chesnut and magnolia, the main features of 7,000—10,000 feet.

(2.) Immediately below 6,500, appears the Tree-fern (Alsophila gigantea, *Wall.*) a widely distributed plant, common to the Himalaya from Nepal eastward to the Malayan Peninsula, Java and Ceylon. Dr. Hooker saw but one species in these mountains: a very similar, or possibly distinct species, grows at the foot of the outer range.

(3.) Palms, a species of Calamus, the "Renoul" of the Lepcha. The fruit of all the Calami are eaten by the Lepcha and the stems of larger species are applied to various economic purposes. This, though not a very large species, climbs lofty trees, and extends some 40 yards through the forest: 6,500 feet is the upper limit of palms in the Sikkim Himalaya, and one species alone attains so great an elevation. Four other Calami range between 1,000 and 6,000 feet on the outer hills, some of which are found 40 miles distant from the plains. Among the other palms of Sikkim is the "Simong"—a species of Caryota, which is rare, and ascends to nearly 6,000 feet.

Cultivation.—Firing the forest is so easy in the drier months of the year, that a good deal of cultivation is met with on the spurs, at and below 5,000 feet, the level most affected by the Lepcha, Limbo and Sikkim Bhothea. The term Sikkim Bhothea is applied to the more recent immigrants from Thibet, who have settled in Sikkim, and are an industrious, well conducted people. The Bhothea again, of Bhotan, to the eastward, rarely reside except at Darjiling, and bear the worst reputation (and most deservedly) of any of the numerous people who flock to Darjiling. These should not be confounded with any other Bhothean tribes of Thibet, Sikkim or Nepal. The mountain slopes are so steep, that these spurs, or little shelves, are the only sites for habitation between the very rare flats on the river banks, and the mountain ridges, above 6,000 feet, beyond which elevation, cultivation is rarely if ever carried by the natives of Sikkim. The varieties of grain are different, but as many as eight or ten kinds are grown without irrigation by the Lepcha, and the produce is described as very good (80 fold). Much of this success is due to the great dampness of the climate; were it not for this, the culture of the grain would probably be abandoned by the Lepcha, who never remain for more than three seasons on one spot. A large bamboo ("Pao," Lepcha) is the prevailing plant near the base of these valleys; it attains a height of 40 to 60 feet, and the culms average in thickness the human thigh; it is unarmed, deep green, or purplish and used as large water vessels. Besides this, there are nearly a dozen kinds of bamboo known to the Lepcha. A timber of the Himalaya, universally adopted for ploughshares and other purposes requiring a hard wood, is the "Sing-brang-kun" of the Lepcha, which ascends 4,000 feet on the mountains. In very dry soils it is replaced by "sal" (Vateria robusta), and more rarely the Pinus longifolia. Sterculiæ, of two species, are common, as Pæderia fœtida, which, as well as many Cucurbitaceæ, peppers, Gnetum, Porana, a few Convolvulaceæ and many Asclepioideæ, Hoya, &c., climb high. A troublesome dipterous insect swarms on the banks of the streams, it is very small, floating like a speck before the eye. The bite of this (the "Pipsa") leaves a small spot of extravasated blood under the cuticle, very irritating if not opened. A white flowered rue, Ruta albiflora, is sometimes cultivated, and very common; truly wild or at elevations of 3 to 7,000 feet; it is commonly used for all diseases of fowls, mixed with their food. Two species of bamboo, "Payong" and "Praong" of the Lepcha, here replace the "Pao" of the foot of the hills. The former flowered abundantly, the culms, 20 feet high, being wholly a diffuse panicle of inflorescence. The "Praong" bears a round head of flowers at the apex of the lofty branches.

A thousand feet above Punkabaree in the outer Himalaya, the prevalent timber is gigantic, and scaled by climbing Leguminosæ, as the Bauhinia and Robinia, which

sometimes sheath the trunks or span the forest with huge cables joining tree to tree. Their trunks are also clothed with parasitical orchids, and still more beautifully there, with Pothos (Scindapsus), Peppers, Gnetum, Vines, Convolvulus, and Bignoniæ. The beauty of the drapery of the Pothos leaves is pre-eminent, whether for the graceful folds the foliage assumes, or for the liveliness of its colour.

From one steppe, the ascent to Punkabaree is sudden and steep, and accompanied with a change in soil and vegetation. The mica slate and clay slate protrude everywhere, the former full of garnets. A giant forest replaces the stunted and bushy timber of the Terai Proper; of which the Duabanga and species of Terminalia form the prevailing trees, with Cedrela and the Gordonia Wallichii. Smaller timber and shrubs are innumerable; a succulent character pervades the bushes and herbs, occasioned by the prevalence of Urticaceæ. Large bamboos rather crest the hills than court the deeper shade, and of the latter there is abundance, for the torrents cut a straight, deep, and steep course down the hill flanks: the gulleys they traverse are choked with vegetation and bridged by fallen trees, whose trunks are richly clothed with Dendrobium Pierardi and other epiphytical orchids, with pendulous Lycopodia and many ferns, Hoya, Scitamineæ, and similar types of the hottest and dampest climates. The forest is truly magnificent along the steep mountain sides. The proportion of deciduous trees is considerable partly, probably, due to the abundance of the Dillenia, Cassia, and Sterculia, whose copious fruit is all the more conspicuous from the leafless condition of the plant. The white or lilac blossoms of the convolvulus like Thunbergia, and other Acanthaceæ were the predominant features of the shrubby vegetation, and very handsome. All around, the hills rise steeply five or six thousand feet, clothed in a dense deep green dripping forest. Torrents rush down the slopes, their position indicated by the dipping of the forest into their beds, or the occasional cloud of spray rising above some more boisterous part of their course.

Products and Commerce.—A range of hills, called the Garrow, the Khassia, the Jynteea, and the Naga, divides the valley of Assam from the valleys of Sylhet and Cachar, and there the tea plant thrives well, and planters and companies have established themselves, and are cultivating the plant successfully. Indeed, the tea soils of China and India are said to be almost exactly alike. At Darjiling and its neighbourhood, tea has been cultivated most successfully to a large extent, and its cultivation is rapidly increasing. Through Darjiling is the shortest mountain passage across the Himalaya into Thibet and Central Asia, and there is no doubt that a large commerce in British manufactures could be established for these countries. Mr. Moorcroft, who travelled in Thibet and Central Asia, gave it as his opinion that "it is at our option whether Central Asia shall be supplied with goods from Russia or England." The brothers Schlagintweit, corroborated that view. Mr. Bogle who was deputed by Warren Hastings to report upon the trade of Thibet, said, in 1775, that the trade must have been a very considerable one in broadcloths, and that the demand for it was still very great in his time. Dr. Hooker, in his evidence before the Colonization Committee, said there was nothing the Thibetans admired more than the cloth of his garments, and he believed, if they could obtain British woollens, they would gladly use them. The principal products of Thibet are gold, jewels, shawl-wool (the same as the Cashmere shawls are made of), ponies, immense quantities of borax, and salt. Almost all the salt consumed in the Himalaya is from Thibet, and it is brought with immense labour, upon the backs of men, women, children, and animals. When the communication is made easy and cheap from Calcutta to Darjiling, the salt of Europe will entirely supersede that of Thibet in the Himalaya, and the natives, too, much prefer it. Railroads are now in course of construction and the line between Calcutta and Darjiling may be completed in two or three years.—The plantations at present extend only as far as Debroghur, some days journey below Sudiya and from Debroghur as far as Gowhatee in Lower Assam there are immense tracts of waste land on both sides of the Berhampooter suitable for tea cultivation. The export of tea from Assam in 1856 amounted to 812,000 pounds, and from the then existing plantations it was estimated that the export in 1857 would be 1,000,000; in 1858, 1,250,000; in 1859, 1,600,000; and in 1860, 2,000,000. The brothers Schlagintweit and Dr. Hooker, stated unhesitatingly that tea of an excellent quality, could be grown all along the lower ranges of the Himalaya from the Indus to the Bramakund, a distance of more than 1,300 miles.

Languages.—No one of the nations or races of those who were occupying India and South Eastern Asia, prior to the mahomedan invasions, retain any strictly historical record of the routes by which they reached

their present localities or of the dates of their advents. Researches into the families of language to which the spoken dialects belong, and the existing physical peculiarities of the several rabes permit however, the belief that India and the island parts of South Eastern Asia were peopled long prior to historic times; that a succession of races, or of branches of the same human family, have entered India and in some instances become amalgamated with or been dispersed amongst the prior occupants, or have pushed them further on into less peopled or less fertile districts, or amid forest and mountain tracts. In India proper from the Himalaya to Cape Comorin, even yet, every village and every hamlet, have small bodies of predial slaves, who though possessing certain minor agricultural rights are not allowed to purchase lands; are compelled to reside outside the village walls, and are prevented quitting the locality, for they furnish the only free labour, available for the work of the field. The total number of the non-Aryan aborigines and outcastes is estimated at 12,250,000 people. On this point, Chevalier Bunsen, mentions that throughout Asia, the two great nations who once centred the one in the Altai and the pasture land towards the Himalaya, the other having its centre in the Ural mountains, appear in Asia as the subdued or primary element, as the subdued substratum of Iranian civilization, and that the aboriginal languages of India which attained their full development in the Dekhan dialects, belong to that stock.

Most of the traders of the snow valleys have some members of their families residing at Daba or Gyani on the Nuna khar lake. The great body of the hill men are Rajputs; there are a few villages of Brahmins, their residences are respectable, and occupy the more elevated portion of the village site, the huts of the Dom or Hali being on a low range. The Dom are hereditary bondsmen to the Rajputs. Basgi also dwell there, and are, both men and women, singers at the temples. The men of all castes in the hills are short and of poor physique; they look worn and get deep lined on the face at a comparatively early age. The young women are often extremely pretty, those living in the higher and colder villages, having, at 15 or 16, a complexion as fair as many Spaniards or Italians, and with very regular features. But they grow darker as they advance in years, and become very plain.

In the Himalaya, according to Mr. Aitcheson, the various dialects are mixed together in great confusion; on the northern Assam frontier are found, in the following order from east to west, the Aka, Abor, Doffla, Miri, and Mishmi; next to these is Bootea, which carries us as far east as the Teesta: Sikkim, or the country between the Teesta and the Singhaleela range, contains the Lepcha and Limbu dialects. The Sikkim Terai gives us the Dhimal, Bodo or Mechi and Koch which latter also occupy the plains of Koch Bahar, and the northern parts of Runjpoor, Dinajpoor and Purneah. In Nepal, according to Mr. Hodgson and Dr. Campbell's researches, we find a perfect maze of dialects. Beginning from the Singhaleela range we find Limbu or Kiranta which goes west as far as the Dudkoosi River in longitude 86° 44', Sherwill found the Gurung in the higher parts of Singhaleela, closely connected with whom are the Murmi. Along the lower hills are the Magar, who extend to the west as far as Palpa. Somewhere about here we should apparently place the Brahmu, Chepang, Hayu or Vayu, and Kusumbha. In Central Nepal are the Newar, Pahri, and Bhramo a dialect of Magar, also the Darahi or Dorhi, Danwar, and Paksya. The Tharu live in the Terai, between Chumparum and the Khatmandoo valley, as far west as the river Gandak. These last four are classed among Indo-Germanic languages. The rest are Turanian, with more or less infusion of Hindi. The Parbattia or Paharia, a dialect of Hindi, is spoken all over Nepal and is the court language. West of this again comes the Palpa, then the Thaksya, Sunwar, and Sarpa, the dialects of Kumaon and Gurhwal, which carry us on to the Milchan of Kunawar, the Hundisi, and Tibarskad north of it. West of this come the Dogra dialects of the Punjab hills. On the Southern Assam frontier we have the numerous Naga and Singpho dialects the Mikir and Angami, the languages of the Khassia and Jaintia hillmen the Boro in Cachar, and the Garo in the hills of that name. The Kooki occupy parts of Tipperah and Chittagong and the Mug race are in Arrakan and Chittagong.

Of the Geology of the Himalaya and its subsidiary mountain ranges certain parts have been studied, especially the lower formation of the Siwalik range. Other portions of the Himalaya, together with the hills beyond Peshawur, to the Safed Koh, Hindu Kush, and Sulaimani ranges, are almost unexplored, and the only published accounts of their structure are to be found in a few scattered and brief notices in the travels of Vigne, Jacquemont and others, and in several papers of the Asiatic Society.

The Hunia find numerous fossil bones in the table land just north of the Himalaya which they call Bijli Har. Aerolites are common about the passes and Mr. Dunlop picked up several. They are called Devi gola, bullets of the goddess "Devi." A great upheavement along the line of the Himalaya has elevated a narrow belt of the plains into the Sewalik Hills (determined to be of tertiary age) and added many thousand feet to the height of the Himalaya, and facts tend to the conclusion that India had one long term and one protracted fauna which lived through a period corresponding to several terms of the tertiary periods of Europe. The density of the strata of the earth's crust under, and in the vicinity of, the Himalayan mountains is less than that under the plains to the south, the deficiency increasing as the stations of observation approach the Himalayas and being a maximum when they are situated on the range itself.

Watershed.—The Himalayan watershed has invariably been found to lie at a very considerable distance to the north of the great Himalayan peaks which, from the side of Hindoostan, seem to form the watershed. This peculiarity has been confirmed by the routes of A. Zaskari. The Himalaya give forth four great rivers, the Brahmaputra, Indus, Sutlej and Kurnali or Gogra. These are called by the Thibetans, Tam-jan-khamba, or Horse's-mouth; Singh-gi khamba, or Lion's-mouth: Laugchan-khamba, or Bull's-mouth and Mabja-khamba, or Peacock's mouth. These four great rivers drain the Kailas group of mountains. They rise close to the great Kailas Purbut.

Belts of Vegetation.—The flora of the Himalaya mountains, including that of the most northern parts of China, shows an almost complete identity with the genera found covering the elevated belt of the Himalaya. If we commence with the bases of these mountains, and pass successively through the several belts, and (analogous to what takes place between the parallels of latitude of 40° and 45°), experience the rapid decrease of mean temperatures and the quick succession of vegetable productions, we first find a vegetation similar to that of the southern provinces of India; the agricultural products consist of rice, millet, amaranth, an esculent arum, ginger, turmeric, a little cotton, and sugar at the season, succeeded by wheat, barley and buck-wheat in the cold weather months. Along with plantains, oleander, and some of the orange tribe, we meet also with some species which werelong considered peculiar to China, as Marlea begonifolia and Houttuynia cordata, with species of Chloranthus, Incarvillea, and Hiptage. On ascending we pass through different gradations of vegetation until reaching the regions of the oaks and rhododendrons, which is immediately succeeded by that of pines, we meet another mild region, with a flora which must approximate to that of the mountains of the Central provinces of China, for here we find the Chinese genera, Abelia and Eurya, with Stauntonia, Kadsura, Hovenia, &c. and it is in the midst of similar vegetation that the tea plant is everywhere found. It cannot be a difficult task to transfer from one country to another, a plant which grows naturally and is cultivated extensively in one which possesses so many of the plants which are common to the two, and not found elsewhere. Dr. Royle notices at length, the similarity of products of the Chinese tea districts and the Himalaya: he says, as the camphor, varnish, wood oil, and tallow trees, constitute a part of the natural riches of China, so we have in the Himalaya and at their foot, Camphora glandulifera, containing solid grains of camphor in its wood; Melanorrhœa usitata (*Wall*) yieldsabundance of excellent varnish, besides Rhus vernicifera, the varnish tree of Japan, which is common in the Himalaya. Wood oil is yielded by several species of Dipterocarpus: oil is obtained from apricot seeds, and from Prinsepia utilis in China as it is in the Himalaya,and paper of the Daphne cannabina is also a product common to both as also the butter of Bassia butyracea, which abounds at Almorah.

Animal life.—Man dwells in villages up to 12,000 feet. The partridge has been observed 16,080 feet above the sea and crows and ravens 16,500. The Khaij pheasants never descend below 12,000 and high over the Kinchinghow (22,756) flocks of wild geese are seen to wing their flight.—*Powell, Hand Book Econ. Prod. HIMALAYAN ALDER, syn. of Alnus Nepalensis.

HIMALAYAN CHIRETTA. See Chiretta.

HIMALAYAM CEDAR, Cedrus deodara, *Loud.*

HIMALAYAN CHESNUT, Eng., Pavia indica, *Royle.*

HIMALAYAN FIR, Picea webbiana, *Lamb.*

HIMALAYAN GENTIAN. Gentiana kurroo. *Wall.*

HIMALAYAN HORNBEAM, Carpinus viminea.

HIMALAYAN IBEX. Capra; Ibex Himalayana. *Blyth.* See Capreæ. Mammalia.

HIMALAYAN OAK. Quercus incana. Q. incana.

HIMALAYAN RHUBARB. See Rhubarb.

HIMALAYAN SPRUCE, Abies smithiana. *Wall.*

HIMALEH. See Koh.

HIMANGSHOO. Sans. from Hima, cold, and angshoo, rays of light.

HIMANTOPUS CANDIDUS. Syn. of H. melanopterus; the black-winged stilt of. Europe, Asia, all Africa: and common in India.

HIMAUS, Rennell (p. 125-6) suspects Emodus and Imaus to be different readings of the same name; and Imaus or Himaus, to be of the same derivation as the compound Sanscrit word Himmaleh, signifying snowy region, the name at present used, and Pliny knew the meaning well. A chain anciently named Taurus, which rises in lesser Asia, and runs eastward through Armenia,—from thence deviating to the S. E., shuts up the south coast of the Caspian sea,—was continued by Ptolemy, under the names of Coronus, Sariphi, and Paropamisus, dividing Hyrcania and Tapuri, from Parthia; Margiana from Aria; and Bactria, from the province of Paropamisus: or, according to modern geography, dividing Mazanderan, or Taberistan from Cumis; the countries of Dahistan, Corcan, and Karasm, from Korasan; Balk and Gaur, from Segistan or Seistan, and finally was made to join that ridge, which, under the name of Indian Caucasus divided India from Bactria; and afterwards took the names of Imaus and Emodus, separating India from Scythia. The ridge that Mr. Forster crossed, near the Caspian sea, had a north and south direction and answers to the mountains Masdoramus of Ptolemy, which shut up the eastern side of Parthia proper, situated on the S. E. of the Caspian. The modern name of the ridge is Kana-hoody; and Mr. Forster remarks, that the elevation of it is far greater on the west, than on the east; so that the lands of Korasan, are, in general, more elevated than those towards Ispahan. The Kana-hoody mountains are those which M. D'Anville has extended to Herat and Cabul.—*Rennell's Memoir*, p. 125-6, 190.

HIMAVUT, Sans. from Hima, cold. See Inscriptions. p. 371.

HIMA VIMALA MUKTAGUNA "a string of pearls as pure as snow" is a comparison which occurs in the Mudra Rakshasha poem.—*Hind. Theat.* Vol. II, p. 182.

HIMBRO of Kanawar, Ulmus erosa, also Ulmus pumila, *Pall.* Small leaved-elm.

HIMIS, a buddhist monastry near Leh in Ladak, 12,324 feet above the sea.

HIMIS. Arab Cicer arietinum.

HIMSAGUR, Beng. Kalanchoë laciniata, Cut leaved navel-wort.

HIMYAR, one of the sons of Abid-us-Shams or Saba, who gave his name to the Himyaritic dynasty. The most powerful of this dynasty was Aboo Karib, commonly called Tobba, in A. D. 206, he covered the Kaaba with a tapestry of leather, and supplied its door with a lock of gold.

HIMYARITE. The term applied to the descendants of the Persian conquerors of Yemen. Himyar, was the fifth monarch from Kahtan, and gave his name to the Himayaritic dynasty, which ruled over Yemen for many centuries with varying fortune and different degrees of magnificence. This dynasty terminated on the conquest of Yemen by the Abyssinians in A. D. 525, with Dthoo Nawas the last of them, and the tyrant who destroyed the christians of Nejran by burning 20,000 in a pit, noticed in chapter 85 of the Koran, as the martyrs, the brethren of the pit. The dynasty had ruled in Yemen, for 2,000 years, and its down-fall was accelerated by the intolerance of the Jewish Tobbas. For a short time prior to A. D. 595, assisted by the Persian monarchs Nowsherwan and Kesra Parwez, the dynasty again ruled over Yemen, but were ultimately put aside by Persia declaring Yemen to be a satrapy. Himyaritic inscriptions were found by Mr. Cruttenden in the town of Senaa. They are, likewise, met with at Aden. The ancient people called Himyari by the modern Arabs were probably called Homeiri by their ancestors, as their territory corresponds with that of the Homeritæ of Ptolemy.—*Geog.* vi. 6. *Playfair's Yemen.* See Aboo Karib, Aden p. 29. India. Khadim. Samarcand.

HINAB. Ar. the hemp plant.

HIN-BIN-KOMBA. Singh. Andrographis paniculata. *Wall.*

HIND, the term India, by which this country as far as it was known, is distinguished in the earliest Grecian histories, appears

to be derived from Hind, the name given to it by the ancient Persians; through whom, doubtless, the knowledge both of the country, and its name, were transmitted to the Greeks. Mr. Wilkins says that no such word as Hindoo, or Hindostan, are to be found in the Sanscrit Dictionary. It appears that the people among whom the Sanscrit language was vernacular, styled their country Bharatan. *Rennell's Memoir*, p. xx.

HINDAULI. Pers. Syn. of Cleome viscosa.

HINDI, one of the tongues of India it abounds in Sanscrit words, and has many dialects. Speaking generally the tongues spoken in the whole of upper India, including the Panjab, from the Himalayan to the Vindhyan range, may be said to be Hindi. Also the languages of Kamaon, and Garhwal, all along the Sub Himalayan range as far as the Gogra river; the impure dialect of the Gorkha; the Brij-bhasha (or Baka as is pronounced on the Ganges,) the Panjabi, Multani, Sindi, Jataki, Haruti, Marwari and it is said Konkani. The Bengali is a form of Hindi but so highly polished as to be classed as a distinct tongue. See India. Hindoo.

HINDIKI. A name by which the hindoos in Astracan, are known; of whom there are about five hundred families. Mr. Mitchell says, that the reputation of these hindu colonists, stands very high, and that they bear a preference over all the merchants of other nations settled in this great commercial city.

HINDIYAN RIVER is navigable from the sea up to Zeitun, which latter town is only a day's journey to Beh-behan (five farsangs.) *Baron C. A De Bode's Travels in Luristan and Arabistan*, p 304.

HINDON. A river near Saharunpoor.

HINDOO. The recent labours of Professor Wilson, Major Cunningham, Mr. Hodgson, Chevalier Bunsen, Dr. Caldwell, Professor Muller, Professor Ballantyne, Dr. W. W. Hunter, and Mr. George Campbell and articles of deep learning and research in the Calcutta, North British, and Quarterly Reviews, all since the middle of this century added more to our knowledge of these people than had been acquired in preceding centuries, and it is from these writings that much of the present article has been gathered together. Hindoo, Native, and Native of India, are the ordinary names by which the idol worshipping people of British India are at present known, but the terms are all of very recent use. The peoples to whom they are applied are only now fusing, under the firm sway of the British rule, and never before had, nor could have had, one common designation. Bharata or Bharata vart'ha has been quoted as an ancient name, for part of the countries which Europeans include in the term India. Hindu for the people and Hindustan for the country, now so generally applied by natives as well as foreigners are possibly of Persian or Arian origin. And if the latter, the name may have some relation to the seven rivers of the Punjab, the Sabp'ta-Sindhu, which the Arians met with in their course to the south. Bharata was an ancient king of part of India and hence Mr. Wilkins derives one ancient name, rejecting of course, in so doing, the supposition that the river Indus, properly Sindhu, and commonly pronounced Sindh, either gave a name to the country or received one from it; also, of Indu, a name of the moon, being the origin of Hindu or Hindustan, the Sanskrit having no such words. (See *Hetopodesa*, *p.* 333.) The word may however be of some untraced foreign tongue, in which Ind or Hind or Hindu meant black, for it has long been so applied by the fairer races around to the dark coloured populations in the territories which are now comprised in British India. The Arab, the Persian, the Affghan and Sikh when speaking of the people of India, only call them "black men", and even in India the mahomedan descendents of the Arab, Persian, Moghul and Afghan conquerors use the same expressive designation, "Kala Admi," literally black man, being ever in their mouths. And hindus themselves, in their various tongues, likewise so distinguish themselves from all the fair foreigners amongst them. The African races who are brought to India, as the household slaves or guards of native princes invariably when alluding to such of their own people as are born in the country, style them Hindi. Now-a-days, too, though the idol worshipping people call themselves hindu, in this they are merely following the names given to them by their Arab, Persian, Tartar and British rulers. It is only of late, however, that even Europeans have habitually used this term, for at the beginning of the century, Gentoo was the every day name employed, though it has since gradually fallen into disuse. It, also, was derived from a foreign people, the Portuguese and was applied to the idol worshippers, like the "gens" of the Romans and gentile of the the scriptures. It never perhaps reached much beyond the sea-port towns and even there, if the better educated amongst the natives ever employed it, their doing so was merely in imitation of Europeans. And now,

too, similarly, brahmans and others when alluding to their own countrymen likewise style them hindus.

Hindoo is, however, entirely a conventional term, and does not represent a nation, a race or a religion. The great bulk of the people known by this appellation are the descendants of Scythian and Arian immigrants, who in bye-gone ages, as conquerors or in search of a milder clime, left the cold regions of the north, some offshoots moving westward and others to the south. Remnants of Scythian languages are found in Beluchistan, and the seat of the great Sanscrit speaking people was long in Kashmir, proving that one great highway to the south, had been along the valley of the Indus, through Kashmir, and the Punjab. But between the valley of the Indus and that of the Brahmaputra, there are twenty or thirty other passes in the Himalayas, through which the northern races could stream to the genial south. Amongst the first of these immigrants seemingly were the Tamil races, belonging to the Turanian or Tartar family of mankind, a body of whom seem to have followed the course of the Indus and spread themselves over the peninsula. As to the date of their advent, however, history is silent, but there seems no doubt that great branches of the Scythic stock were occupants of India, at the time that it was invaded and to a considerable extent conquered, by the Sanskrit speaking tribes of the Arian family. In the north, the subjugation or ousting of the Tamilians from all rank and power was so complete that Sanskrit forms of speech became the language of the country, and the Kashmiri, the Panjabi, the Sindi, the Guzerathi, the Mabrati, the Hindustani and the Bengali, all of them with a large admixture of Sanskrit, are sister tongues known as forms of Hindi. South of the Nerbudda, however, it is otherwise. Throughout the peninsula, the languages differ from the Sanskrit in grammar, and only admit Sanskrit words, in the same way that the Anglo-Saxon admitted terms of law and civilization from the Norman French. At the present day, the south of India more largely represents the Tartar, and the north, the Arian race. But the fair, yellow colored Arians are to be met with south even to Cape Comorin, and though mixing with the various Tamil nations, races and tribes, for at least two thousand years, in physical form, complexion, intellect and manners, the brahminical and other Arian families are as distinct as when their forefathers first came conquering from the north. The great Arian migration, however, which seems to have received its first check by the great Vindhyan range, took place between the fourteenth and eighth centuries before the christian era.

According to Chevalier Bunsen, Arya, in India, means Lord. It is not so, however, in any language now spoken, but is the Sanskrit term, Aria, a great man (plural Ariaha) which is brought into the Telugu as Aryudu, ఆర్యుడు sing. or Aryulu ఆర్యులు plural: and into the Tamil as Ariun ஆரியன் sing. and Aryar ஆரியர் or Aryargal ஆரியர்கள் plural, great man, singular, great men, plural. Brahmans use it amongst and for themselves and the inferior castes invariably apply it to the members of the brahminical order and to them alone. A slokam in the Sanskrit work, the Amarakosha,

Arya vartaha punia Bhumi hi.
Mad'hiam Vindhya Himava yoho,

i. e. "the Arian country, the sacred land (lies) between the Vindhya and Himalaya," while it indicates the race, also explains the utmost limits to the north and south to which the conquering Arians extended their territory in India. Major Cunningham in his learned work on the Bhilsa topes (p. 15) uses the term Arian in allusion to "the race of Aryya, whose emigrations are recorded in the Zendavesta, who starting from Ericene Vijo, gradually spread to the south-east, over Aryya vart'ha or Aryya-desa, the northern plains of India, and to the south west, over Iran or Persia: he adds that the Medes are called Αριοι by Herodotus. The original meaning of the word is also said to have been equivalent to Upper Noble. It has also, however, been suggested that as the Arians were originally and essentially an agricultural and therefore a peasant race, they may have derived their name from their plough. Word for word, the same term is found in several tongues. In Latin, it is aratrum, from aro, I plough. In Egyptian (in Nefruari) Ar is said to mean a plough. In Tamil it is Er ஏர், in Telugu, Araka అరక, in Sanskrit, along with Nangala or Nangara it is also called Hala or Hara ఆరం and possibly the Arian race may have obtained their name from this implement of husbandry.

The Vedas.—A recent writer in the Calcutta Review remarks that their history, whilst in the Punjab, is to be found in the Vedic hymns, which good scholars are of opinion were composed mostly about fifteen centuries before Christ, but not committed to writing, and therefore not collected, until the eighth century B. C. With all their difficulties, these hymns furnish much information regarding the origin and early state of a race who have exercised a great influence on the

peoples who, along with themselves, are now designated hindus. The geography of these hymns confirms the theory that the Arian race migrated from Central Asia about seventeen centuries before Christ, entered India by the North West, dwelt during the earliest Vedic portion in the Punjab, and migrated or rather fought their way into Central India during the five centuries that succeeded. From the frequent mention of the Saraswati and other rivers, we learn that the Punjab was at one time the locality of the Vedic Aryans. The Massagetæ occupied precisely that position to which the legends of Mount Meru and its rivers (amongst the rivers the Jaxartes and the Oxus may be clearly traced) point as the cradle of the Aryan race and the early mention of the Sacæ (Sakya) and Bactrians (Yavana) as the principal foreign nations, confirms the supposition that the Arian race travelled southwards from the high lands of Central Asia, before entering the Punjab. From the Rig-Veda it is evident that at the time of its composition, the cow was not reverenced though cow-stealing was a great crime. The Arians of the Vedic period were not barbarians or nomades. In the earliest period of their migration, they had no money. Their wealth consisted of cattle, horses, sheep, goats and buffaloes, and the cow was the medium of barter. But there is also mention in their hymns of cities, of commerce, merchants and sailors, of weapons of wood and iron, of chariots, of heralds, of travellers, and inns for their accommodation, and even of the vices of primitive civilization. These migrants into India, in the time of the Vedas, we are also told, were a cow-eating and spirit-drinking people. From their hymns also we learn that they had roads and ferries; bullock-carts and waggons; they had carriages and war chariots drawn by horses, and that the carriage was made of wood with brass wheels and iron rims and pillars. It had seats and awnings, was easy going and sometimes inlaid with gold. Iron and steel were, subsequently at least, in use, for there is mention of iron armour, of arrows tipped with steel, and Porus gave thirty pounds of steel to Alexander. They had a knowledge of the sea; had halls of justice and halls and chambers of sacrifice, but apparently no temples or images. Women held a high social position. The rishi and his wife, conversed on equal terms, went together to the sacrifice, and practised austerities together. Lovely maidens joined in processions, and grown up daughters remained without reproach in their fathers' house. But we read of drunkenness, polygamy, cheating, gambling, abandoning of children, thieves, courtezans and eunuchs. Kashivat, an illustrious rishi, married ten sisters at once, and polyandry also prevailed, for in an allegory, Kashivat says, "Aswins! your admirable (horses) bore the car, which you had harnessed, (first) to the goal, for the sake of honour; and the damsel, who was the prize, came through affection to you and acknowledged your husbandship) saying, you are my lords (*Vol. I*, p. 322.) *Calcutta Review*, 1859.

It is the commonly received opinion that south of the Himalaya, the Arians were first in the Punjab and Kashmir, and afterwards in Sind, Guzerat and Delhi, and that the seat of Vedic power, faith and learning was between the Jumna and the Indus. But Chevalier Bunsen, who does not accept the ordinary calculation as to the age of the world, and regards the stated years of the patriarchs to refer, not to the duration of their lives, but to certain cycles or eras then in use, gives B. C. 10,000 to 8,000 as the date of the Arian emigration from the north-east of the primitive land;—as the close of the great plutonic disturbances of the earth and its climatic changes; and of the formation of the stem of the Arian languages in its most general sense. From B. C. 8,000 to 5,000, he gives as the period of the gradual separation of the Arian races, German, Sclave, Palasgian: B. C 5,000 to 4,000 as the date of the gradual extension of the Irano-Arian race in Central Asia. B. C. 4,000 as that of the Arian immigration into the Indus country, and B. C. 3,500 as the age of Zoroaster's reform. According to this learned writer, their emigration from Sogd to Bactria and beyond it, after they separated from the rest of the Arian people, who shaped their course westward, took place prior to B. C. 5,000 consequently before the age of Menes. The same author is of opinion that it was about 3,000 B.C. that the schism took place amongst the Arians, when all India beyond the Sutlej adopted brahmanism, and the religious views, forms and habits of Bactria, were for ever abandoned. That they entered India as conquerors some centuries before Christ, and long swayed the fortunes of the northern part of it, is clear, but the greatly prior dates ascribed by Chevalier Bunsen, seem to require further investigation.

It is agreed that the Vedic immigrants, called themselves Arians: Indra, say the rishis, has given the land to the Arians.

Aria proper lay north-west from India, about the Arian lake latterly, but the Eastern

Medes and Parthians were its distinctive people. Latterly, Medes, Persians, and the tribes between the Medes and the Indus, were to a certain extent amalgamated under one rule, and Arians stretched loosely from the Indus to the Capsian sea. These races, in one part of their immigration, seem to have worshipped the elements but to have modified their tenets as they journeyed to the south, introducing amongst other matter, a large amount of hero-worship. It is however admitted that the Vedic Arians dwelt chiefly on the banks of the Indus and its confluence as high up as Kashmir, and as low down as Kutch and northern Guzerat. Aria-vart'ha, the Arians portion, as defined even in later times, was the country south of the Saraswati and north of the Drishadavati. (*Calcutta Review, No.* 64 *p.* 424.) Indeed it has been remarked, that in the first 500 hymns of the Vedas, we can discover the eastern and southern boundaries of the Arian races, at that time. Among the enemies whom they subdued by the help of Indra, we find the Arbuda, supposed by all scholars to be Mount Aboo, on the Aravali Hills. Also Kutsa, by the help of Indra, destroyed a robber chief, named Kaya (va) whose country near the Sipha was between the Anjasi, Kulisi and Verapatni rivers (*Vol. I p.* 268.) The Universal Knowledge Society's Maps mention a town still called Kaya , and its vicinity, the Sipu, Bunas or Anas and Kalindi rivers, thus identifying the locality of Kuya (va) as close to Arbuda or Abu. But the localities further south, viz., Oojein, Chittore or Udipore, and the river Chumbul and the Nerbudda seem not to have become known to them then. Of the north, however, notices occur of the Jumna, Sarju, Gumti and one allusion to the Ganga. There is fighting on the Sarju between Arian chiefs, but their silence as to the great Ganges, shows that it was as yet personally unknown to them, or that they had only encountered it in its northern course. They were occupants of Cashmir, the valley of the Punjab, Sind, Guzerat and even perhaps near to Delhi, but the kingdoms of Magadha and Mithila and Ayodhia, were not then known. The seat of Vedic power and learning when at its zenith, was between the Jumna and the Indus: and all to the east of Delhi or Indraprestha, or that lay north of the 28th parallel of latitude was unknown to them. Later, in the time of Seleucus, their territory had come down to Patna. But their discovery of the great Ganges, was later than the Vedas, which only allude to the Sindu, Saraswati and the Drishadavati (Kaggar.)

Much connected with the natives of India of those days will never be known. But the powerful branch of the Arian race who passed into India between the fourteenth and eighth centuries before Christ brought with them the language of the Vedas, and as, down to the present day, all brahmans profess alike to recognise the authority of these sacred books, we witness worshippers of Siva, Vishnu and the maintainers of the Sankhya or Nyaya doctrines, all considering themselves and even each other to be orthodox members of the hindu community. It is this common recognition of that one set of religious books, which is the sole bond of union amongst the descendants of the various races and tribes professing hinduism or brahminism, who now people India. The Arians seem to have brought with them a servile race, or to have had amongst them a social distinction between the noble and the common people which has ever continued. As they conquered southwards, amongst the Tartar races whom they found in the country, they also reduced them everywhere to a state of slavery. They named them in fierce contempt Dasa or slaves and these formed the true servile race of Menu and other writers. Where the races who had preceded them retained their independence these proud immigrants styled them M'hlechha, a term which even to the present day, is intended to comprise every thing that is hateful or vile. In Vedic times, along the western coast of Hindustan dwelt, also, other races, different alike from the Scythic tribes and from the Arians of the Vedas—earlier colonizers or emigrants, most probably from Assyria and the west,—who had a civilization of their own and "iron built cities," and with whom the Pharaohs and Solomon and Hiram and the Cushite Arabs of Yemen carried on a lucrative trade by sea. This people extended gradually down the coast to Cape Comorin, crossed over to Ceylon and crept up the Coromandel coast, till stopped by the Godaveri and Mahanadi. All the Bengal Presidency and Central India was at that time thinly inhabited by a Tartar, Sakyan, or Mongol race, coming down from Tibet, and Nepal. But so sparse was the population whom the Arians encountered that, in the Veda, Agni is represented as "the general" of *Nahusha*, the first settler, that is, they cleared the ground by burning the forests, and some fine descriptions are given of the grandeur and terror of the sight.

In the North-West were the Arians. For the earlier Arian India, one or two localities may be identified pretty nearly from the sakta or hymns of the Vedas. There is a rajah Mand-

hatri, or Mandhat; there is a city, Mandhati, still near Delhi. If the city was named from the king, it would go far to prove that in his time Hastinapur and Indraprestha were not yet founded, for which also there is Puranic authority. Again prince Bhujyu, or Bhoojyu the pirate, is plainly the name father of Bhooja in Cutch; a nest of pirates in all time. Among the many petty rajahs, (a confederacy of twenty is mentioned in the Veda, *Vol.* I, *p.* 147), one named Divodasa, called also Puru, is specially celebrated and we may gather that his kingdom coincided pretty nearly with that of Porus in the time of Alexander. He is at war with Susravas, a king whose name occurs in the Raja Taringini, as connected with Kashmir—perhaps an ancestor of the Abisares of Greek report. The Vedic name is Naja. In the Persepolitan inscription, Xerxes called himself Nagua or Nuka, the Greek Anax, and there can be no reasonable doubt, that this is the true meaning of the Naga dynasties of Cashmir and Magadha. These were kings, not snakes. The turning Naka into Naga, and then inventing a snake worship, which latterly may have become real, are quite Puranic.

It is supposed that the Vedas were composed about seventeen centuries before Christ but not reduced to writing till the eighth century. This would have admitted of much new matter being introduced when the traditions were first recorded. But a striking difference has been observed between the mythology of the Rig Veda, and that of the heroic poems and Puranas. Some of the divinities worshipped in Vedic times, are not unknown to later systems, but at first perform very subordinate parts, whilst those deities who are the principal objects of worship of the present day, are either wholly unnamed in the Veda, or are noticed in an inferior or different capacity. The names of Siva, of Mahadeva, of Durga, of Kali, of Rama, of Krishna, so far as research has gone, do not occur in the Vedas. The practice of the conquered races seems to have been to represent or regard their local deities as identical with or avatars or incarnations of the Vedic chiefs who had already become objects of worship. The Vedas mention Rudra, as the chief of the winds, collecting the clouds as a shepherd's dog does the sheep, and attending on his master Indra. The most that can be made of Rudra in the Vedas is as the father of the winds and seemingly a form either of Agni or Indra. Even in the Puranas he is of a very doubtful origin and identification; but in the present day, everywhere amongst the hindus he is identified with Siva. With the single exception of an epithet 'Kapardi,' with braided hair, of doubtful significance and applied also to another divinity, no other name applicable to Siva occurs, and there is not the slightest allusion to the form in which, for the last ten centuries at least, he seems to have been almost exclusively worshipped in India, that of the lingam or phallus: neither is there the slightest hint of another important feature of later hinduism, the trimurti, or triune combination of Brahma, Vishnu and Mah'eswara or Siva, as typified by the mystical syllable O M. (a-u-m.) although, according to high authority on the religions of antiquity (*Creuzer, Vol. I, pp.* 26 *&* 27,) the trimurti was the first element in the faith of the hindus and the second was the lingum. In this view, Creuzer must have intended the mixture of creeds now current in India, for the whole vedic faith had few of the elements of modern hinduism.

The gods whom the vedic hindus worshipped were Indra and Agni. Indra was the firmament, with all its phenomena. He alone held the thunderbolt, and was king over gods and men. Agni was the element of fire. All the other gods were but manifestations, or other forms, of these two. The relationship is evident between Agni and the Sun, the Surya, or Sura, or Savitri of the Vedas, and a female divinity. But Indra also is frequently identified with the Sun; indeed the twelve great deities or Aditya, are but other names of the same god as presiding over the twelve months of the year. It seems strange in the face of so significant an inference, that some of the best oriental scholars, including even the iconoclast Bently, agree in affirming that the division of the Zodiac into 12 signs was long posterior to the time of the Vedas, and that the rishi were familiar with the 27 nakshatra. The Aditya most frequently invoked are Mitra, Varuna, Aryaman, and in a lesser degree Pushan, Bhaga, Vishnu and Twashtri. There is some discrimination in these attributes: but on the whole they are pale and colourless. Pushan watches over roads and travellers, Twashtri is the Vulcan or 'smith' of the gods. Slight mention is made of Vishnu: but we have the germ of the legendary 'three steps,' being apparently simply the rise, culmination, and setting of the sun. Among the inferior deities, the Marut, or winds, hold the first place; and next to them, or nearly on the same level, the Aswini. These two,

are apparently twins or brothers, and sons of the sea (Sindhu). Sometimes, as Dr. Wilson notices, they seem to be the 'precursive rays of the sun,' at other times, perhaps the sun and moon as rising out of the sea; so that the vedic hindus evidently had settlements on the sea-coast or on some water, which they called a sea. The Aswini are almost invariably represented as having a triangular car with three wheels, drawn by asses—while their name appears to be derived from "*aswa*," a horse which would seem to identify them with the two horses of the sun. Altogether they are a perplexing pair: and the sakta or hymns addressed to them are richest of all in legend. Their connection with Indra (Jupiter,) their patronage of mariners, their twin brotherhood, the two horses and stars found on their coins, identify them with the Grecian Dioscuri, and add much strength to the theory that the Greeks were an Arian or Persian tribe originally, as their language indisputably proves. The legend of Perseus is another link in the chain. It is singular to find an exceptional and eccentric worship prevailing in countries so remote as India and Greece, while it had died out (if it ever existed) among the parent stock in the vast regions between. It can scarcely be doubted that the Aswini are connected with the primitive hindu astronomy. In the Vedas, Heaven, Earth, (Aditi and Prithivi) and ocean, are rarely invoked, and the sun has comparatively few saktas. Occasional laudations are given to rivers, especially to Saraswati; and this nature-worship extends so largely as to embrace the cow, the wood used in the oblations, and even the "*vapa*" or sacrificial post. To Usha, or the dawn, some of the most beautiful hymns in the Veda are addressed. All these deities are expressly declared to be 'the progeny of the heavens and the earth' (*Wilson's Vedas*, Vol. I, p. 276). No mention is made of the planets: for Bruhaspati, is not a planet, but 'the lord of prayer:' and the moon has not even a sakta.

The worship of the Vedic race is briefly but comprehensively described by themselves, (*Asht. I, Adhy. I, Sukta* 6), where it is said, the standers around associate with (Indra) the mighty (sun), the indestructive (fire), the moving (wind), and the lights that shine in the sky.' The religion described in the Vedas was nature-worship, light, careless and irreverent, utterly animal in its inmost spirit, with little or no sense of sin, no longings or hopes of immortality, nothing high, serious, or thoughtful. There was no love in their worship. They cared only for wealth, victory, animal gratification, and freedom from disease. The blessings they implore" says Professor Wilson, "are for the most part of a temporal and personal description, wealth, food, life, posterity, cattle, cows and horses;—protection against enemies, victory over them, and sometimes their destruction.'" "There are a few indications of a hope of immortality and of further happiness but they are neither frequent, nor, in general, distinctly announced."The only notice of an after life is found in the legend (for nothing is founded on it) of three brothers, called Ribhus, who for their meritorious actions were made gods—the germ of mountains of Puranic rubbish. Also, in one or two passages, Yama, and his office of ruler of the dead, are obscurely alluded to. (*Dr. Wilson*, Vol. 1, p. 25.) Yama is usually connected with the Yamuna river, and was perhaps worshipped there by a native tribe. So merely fanciful, so wearisome and monotonous, so contemptuously irreverent, are the great bulk of their prayers (to Indra especially) that professor Wilson can scarcely believe them to be in earnest. An instance of this is the hymn addressed to the goddess Anna (*Anna devati*, known in Bengal as *Anna Purna*) personified as Pitu, or material food, by the rishi Agastya. (See *Wilson's Veda*, Vol. 2, p. 192 *quoted in Calcutta Review, No.* 64. *p.* 412) In a similar strain the Soma plant is addressed, mixed up with some curious associations, of which we have lost the key, with Soma, the Moon-god. This plant, the Sarcostemma brevistigma, is found all the way from the mountains of Mazenderan, through the Punjab and the Bolan pass to the Coromandel Coast, and Viswamitra is described as passing the Sutlej and Beyas to gather it. It was bruised between two stones; mixed with milk or barley juice, and, when fermented, formed a strong, inebriating, ardent spirit, probably not very unlike whisky. Herodotus, (*Book* I. *p.* 133) tells us that a singular custom prevailed amongst the ancient Persians "It is also" writes he, "their general practice to deliberate upon affairs of weight, when they are drunk; and then, on the morrow, when they are sober the decision to which they came the night before is put before them by the master of the house in which it was made; and if it is then approved of, they act on it; if not they set it aside. Sometimes however, they are sober at their first deliberation, but in this case they always reconsider the matter under the influence of wine." This drawing their inspiration from the bottle, as a trait of national manners, is

of the oddest. In other words they did nothing without drinking and many traces of the same habit still linger among their Indo-Germanic descendants. It appears that the rishis of the Vedas introduced this drinking custom, or belief, into religion. Indra, and all the gods are every where represented as unable to perform any great exploit without the inspiration of the Soma juice. Avatsara's account of a lady named Viswavara, who wrote or sung a hymn to Agni, and two or three more of his brother rishis (see *vol* 3, p. 311), indicates how much these Arians were given to drinking. He says swift is the excessive and girth distending inebriation of Vishwavara (!), Yayata and Matin; they urge one another to drink: they find the copious draught the prompt giver of intoxication." "Sit down, Indra," says Viswamitra, "on the sacred grass;—and, when thou hast drunk the Soma, then, Indra, go home," (Vol. 3, p. 84). "Drink, Indra, the Soma that is effused for thy exhilaration," sings rishi Bharadwaja: stop the friendly steeds; let them loose: sitting in our society, respond to our hymns (Vol. 3, p. 454.) "Who buys this, my Indra, with ten milch kine? when he shall have slain (your) foes, then let (the purchaser) give him again to me. (Vol. 3, p. 107)." The purifying Soma, like the sea rolling its waves, has poured forth songs, and hymns, and thought. Such worship seems to explain the Greek story of Bacchus, and shows that it was not an invention merely to flatter Alexander.

These fierce conquerors soon yielded to the climate. "The shameful luxury of their princes," writes Curtius (Lib. VIII. 32) "surpasses that of all other nations. He reclines in "a golden palankeen, with pearl-hangings." The dresses, which 'he puts on, are embroidered with purple and gold. The pillars of his palace are gilt; and a running pattern of a vine carved in gold, and figures of birds in silver, ornament each column. The durbar is held while he combs and dresses his hair: then he receives ambassadors, and decides cases. The women prepare the banquet, and pour out the wine, to which all the Indians are greatly addicted. Whenever he, or his queen, went on a journey, crowds of dancing girls in gilt palankeens attended; and, when he became intoxicated, they carried him to his couch.'—This drunken worship, the reclining king, as Curtius paints him, borne to his couch by troops of courtesans after an orgy, and wherever he went, so attended, and so surrounded,—realize and surpass Dionysius and the Bacchanals. The Soma juice then was the oblation, or libation, of the Vedic worship (the Homa of the Parsi); and allusions to it, are met with in almost every page. The use of the Soma in their worship seems sufficient to indicate the original country of the Arians. The ritual of these old hindus however was very simple. As described in Professor Wilson's epitome of the "*saktas*," it comprehended offerings, prayer, and praise; the former are chiefly oblations and libations of clarified butter poured on the fire, and the expressed and fermented juice of the Soma plant, presented in ladles to the deities invoked, in what manner does not exactly appear, although it seems to have been sometimes sprinkled on the fire, sometimes on the ground, or rather on the kusa, or sacred grass, strewed on the floor; and in all cases the residue was drank by the assistants. There is no mention of any temple, or any reference to a public place of worship, the sacrificial chamber was always in the house of the worshipper and it is clear that the worship was entirely domestic: the worshipper himself does not appear to have taken any part personally in the ceremony; and there is a goodly array of officiating priests —seven, and sometimes sixteen—by whom the different ceremonial rites are performed, and by whom, the mantras, or prayer and hymns, were recited." *Vol.* I. *p.* 24. The priests are thus enumerated in the text of Veda:—

1. Hotri	3. Ritwij	5. Agnidhra	7. Adhwaryu
2. Potri	4 Neshtri	6 Prasastri	8. Brahman

Five classes of men are repeatedly mentioned in the Vedas, but there are no allusions to Sudra or Kshatrya. A like division, into four, classes prevailed amongst the ancient Persians; the fifth probably being captives, enemies and slaves. Arrian makes the number, seven; but by taking in or leaving out classes and professions, they could be increased or diminished. The spirit of the Veda is fiercely intolerant to all of a different faith, or who did not conform to their ritual. The rishi intreat Indra "to strip off their black skins:" but any thing like caste, in its modern sense, it utterly ignores. If such a system as caste had prevailed in those ages, it is impossible that no allusion should be made to it in full five-hundred hymns, outspoken enough on other matters. Although, however, caste may not have been mentioned in the Rig Veda, it is expressly recognised by the Yajur and other Vedas. The following tabular statement of the number of saktas in the 500 hymns translated by Professor Wilson addressed to each deity,

sets their actual and relative worship clearly before us;

Indra	178	Mitra	17
Agni	147	Varuna	20
Aswini	28	Usha	11
Marut	24	Surya or Savitri.	5
Vayu	6	Sarasvati	1
Rudra	3	Vishnu, (none in the first *Ashtaka.*)	2
Brihaspati	2		

Total 444. This leaves less than sixty hymns for all the other denizens of their pantheon. They also worshipped "the lights of heaven" possibly the starry firmament. Scholars will recognise this as nothing more or less than the religion of the Persians when they first appear on the stage of history.

There are three lists of rishis given in the Upanishad of the Yejur Veda, called 'Vrihad Aranyaka,' each list, differing from the other. We select a few names in which the first and second agree

Atreya (Atri.)	*Asurayana* & Yaska.
Bharadwaja.	Jatukarnya.
Asuri.	*Parasarya or Parasaryayana.*
Aupajandhani.	Ghrita Kausika.
Srawani.	

Eight descents above Atreya we come to the mythological Abhuti Trastwar (Twashtri, the Vulcan of the Greeks) and the Aswini. Four descents downwards from Atreya we reach the Gotama, Bharadwaja, and Parasara or Parasarya of the hymns. In the last of the lists we find the following order.—Atreyi (Atri), Gautami, Bharadwaji, Parasari, Varkaruni, Artabhaga, but now removed by at least 40 descents from the devatas! But many of these are not the names of men but of countries. Asuri and Asurayana speak for themselves. Paras-arya is the Arian Persian or Parisi. Kausika is from Kaush or Kush in Aria; and as to the Arta-bhaga, Herodotus writes that the Persians originally were called Artoeans, from Arta (Herat): and Bhaga, in the Behistun inscription, means lord or god: so that Artabhaga is, word for word, lord of Arta (or Herat). It will be observed also that Assyria is before Persia in due chronological order. The Vedas allude also to "strong built cities" "perennial cities" "stone-built cities of the Asuras;" and, if these were in the air, as Professor Wilson observes, they could not be of much use to Divadasa and other mortal kings, to whom with all their spoil they were given by Indra.

We are led to Greece by the Aswini, and to Latium by Mena, or Menaca whose legendary springing from Indra seems at least (etymologically also) to identify her with Minerva springing from Jupiter. In

one case we have the chain complete Anna travels east from Babylon to India; west from Babylon to Phoenicia, accompanies her sister Dido to Carthage, flies thence to Italy, and then, the Anna Purna of the hindus becomes the Anna Perenna of the Latians Such is the Roman legend. Varuna too, rain, the sky, or hemispheric firmament resting on the waters, has obvious analogies with the Grecian Uranus. To this god, singly or associated with Mitra, are offered the rare and perfunctory prayers for protection from sin, which appear in one or two of the hymns. A common medium may be inferred and that Mena and the Aswini, Anna and Varuna were not (so to speak) indigenous. The great horse sacrifices is allowed to have been originally Turanian, whether derived directly from the Sakæ, or indirectly from Persia and Media, where the "white horse" is an important element in a campaign of Cyrus. Mr. Atkinson found traces of it still lingering on the Southern borders of Siberia. Niritti or Nairitti, the dread earth goddess, of whom terror and deprecation were the only worship, is all but certainly the evil goddess of the hill tribes to whom the Khonds till lately, offered human victims. She seems thrust by fear, rather than adopted, into the Vedic pantheon—the germ of the bloody Kali and the murderess Bhawani, in a day mercifully late, and to the Vedic men far away in the future. Did the Arians perform human sacrifices? In a legend, evidently alluding to Abraham's offering of Isaac, there is mention of a king so devoting his son. There are bonds alluded to in the Vedas, most probably, allegorical; but there is little doubt that the imagery is drawn from real human sacrifices, offered by the wild tribes in the neighbourhood to Nairitti, "with unfriendly looks," as she is expressly named in one sakta. The legend may perhaps point to an earlier practice, which Viswamitra and his party set themselves against. A god named Nairita, of a fierce and evil nature, is said to have been worshipped by the Sakæ. It appears, that there were two forms of worship in Vedic India; the one, domestic, universal, celebrated three times a day;—the other, rare and exceptional; but both blended by a compromise into one incongruous whole; and both gross and sensual almost beyond belief. The worship of the elements is clearly the national faith, with its offerings of the fruits of the earth, soma juice, barley, milk and butter. Animal sacrifice is from without, corrupted more and more and at last losing sight altogether of its original import, and coming to them perhaps from the wild no-

mades of Central Asia. The fair inference is that Indra and fire worship was the later form on Indian ground. The so called aboriginal tribes sacrifice buffaloes and other animals; but there is no trace of fire worship among them. On the other hand the Viswamitras or Agnisaras, claim the honour of having been the first to introduce the worship both of Agni and Indra, in various saktas of the Veda. However, Viswa-Mitra was not the name of a man, but of a body of immigrants, viswa-mitra, "the men, or people, of Mithra."

The Puranas do not afford any reliable information as to the state of the early occupants of India. The account which these books contain of the periods, dynasties, races, genealogies and kings of Vedic India, looks imposing, minute, and circumstantial. They describe two great dynasties of the sun and moon, branching off into separate kingdoms. Four great ages of the world, with an accurately defined list of kings for each, and these lists all so framed as in appearance to strengthen and support each other. Containing also the very names found in the Vedas, with an elaborate system of dynastic change, and of intermarriages. But the hindu of the middle ages, had an immoderate speculativeness, a love of wild extravagance, fiction and untruth. Colebroke tells us, (*Vol.* II, *p.*, 100) that the Raghava Pandivegam an extraordinary poem by Caviraj, king of poets,—is composed with studied ambiguity, so that it may at the option of the reader be interpreted as relating to the history of Rama, and other descendants of Dasaratha, or that of Yudishthira and other sons of Pandu. It tells in short, two distinct stories in the same words, as the following sentence will show.

Succeeding in youth to the kingdom of his variously valiant father, who departed for heaven, he dwelt happily in the city of Ayodya, which was adorned with elephants, and upheld the prosperity of his realm.	Succeeding in youth to the kingdom of his father Vichitravirya, he dwelt happily in the peaceful city of Hastinapura, auspiciously inhabited by Dhritarashtra.

Writers with such perverted imaginations issued the yogas and genealogies of the Puranas, the little leaven of truth in some of them, being the names of a few Vedic kings, interspersed apparently at hap-hazard. The writer of the Vishnu Purana, in such a simple matter as writing out a list of rivers, puts down all he can remember, some twice over, and then adds to it the names of about a dozen rishi, taken bodily from the Vedas. The Puranas have not only added nothing to our stock of knowledge as to the state of ancient India, but have done much to retard research. For partly from the skill and elaborateness of the fiction and partly from the mutual support, which the Puranic writers gave each other, astronomy, poetry, legend, chronology and history all helping on the deceit, modern scholars received the dynasties and the historical eras of two or perhaps three of the Yogas, as having some reality. But the Rig-Veda does not contain many of the Puranic names nor even an allusion to them. It makes no mention of Solar or Lunar races. It knows nothing, and indeed can know nothing of Ayodhya, and Kusi, and Mithila, and Vesali and Magadha, or even of Indraprestha, while the Puranas on the other hand know nothing of dynasties in the Punjab, or on the Indus.

When the Arians had advanced further and large portions of what is now termed India were under their sway, we read of one monarch with many names—Divodasa, Atithigwa, Aswateha, Prastoka, Srinjaga, and Puru. Three of these are found in one verse (Vol. 2, p. 34); "For Puru, the giver of offerings, for the mighty Divodasa, through Indra, has destroyed ninety cities. For Atithigwa the fierce (Indra), hurled Sambara from off the mountain, bestowing (upon the prince) immense treasure." Divodasa, was a warrior and a conqueror; he is described as overcoming and destroying many cities of Sambara, reserving one for his own use. He made a successful expedition as far as Parnaya (Quere the modern Purniya?). In his old age at the head of a confederacy of twenty kings, Kusta and Ayu being the chief, he leads an army of 60,00 against the mighty and youthful Sa-sravas, is defeated and compelled to submit. And a writer in the Calcutta Review (No, 64, p. 432), views this war to be the historical foundation for the traditional great war of the Mahabarata. The age of Divodasa is estimated to have been about the time of Cyrus, and the engagement described to have been with some Satrap (Kshatra-p,) left by Cyrus, when he was occupied with his great Median, Lydian or Babylonian campaigns. It may, however, have been during the rebellions and troubles of the early days of Darius Hystaspes. And by a curious coincidence, Bentley places Garga (the bard of Divodasa) in 548 B. C. and the cautious professor Wilson suspects an allusion to the buddhists, which could not be earlier than 545, B. C.

Budd'hism.—The religious opinions of the hindoos were greatly modified by the philoso-

phy introduced by Sakya Muni, which even yet forms the faith of about 220 millions of the human race. The valley of the Ganges was the cradle of Indian buddhism, and Sakya muni the founder of the new doctrines. As the champion of religious liberty and social equality, Sakya Muni attacked the brahmans in their weakest and most vulnerable points; in their impious assumption of all mediation between man and his Maker, and in their arrogant claims to hereditary priesthood. His boldness was successful, and before the end of his long career he had seen his principles zealously and successfully promulgated by his brahman disciples Sariputra, Mangalyana, Ananda, and Kasyapa, as well as by the vaisya Katyayana and the sudra Upali. At his death in B. C. 543, his doctrines had been firmly established, and the holiness of his mission was fully recognized by the eager claims preferred by kings and rulers for relics of their divine teacher. His ashes were distributed amongst eight cities, and the charcoal from the funeral pile, was given to a ninth, but the spread of his influence is more clearly shown by the mention of the numerous cities where he had lived and preached. Amongst these are Champa and Bajagriha in the east, Sravasti and Kausambi in the west. In the short space of forty-five years, this wonderful man succeeded in establishing his own peculiar doctrines over the fairest districts of the Ganges, from the Delta to the neighbourhood of Agra and Cawnpore. This success was perhaps as much due to the early corrupt state of brahmanism as to the greater purity and more practical wisdom of his own system.

From his time until the end of the long reign of Ajatasatra, 519 B. C. the creed of Buddha advanced slowly but surely. This success was partly due to the politic admission of women, who, even in the east, have always possessed much secret, though not apparent influence over mankind. To most of them the words of Buddha preached comfort in this life, and hope in the next. To the young widow, the neglected wife, and the cast-off mistress, the buddhist teachers offered an honourable career as nuns. Instead of the daily indignities to which they were subjected by grasping relatives, treacherous husbands, and faithless lords, the most miserable of the sex could now share, although still in an humble way, with the general respect accorded to all who had taken the vows. The bhikshuni were indebted to Ananda's intercession with Sakya for their admission into the ranks of the buddha community, and (*See Csoma's Analysis of the Dulva, Res. As. Soc. Bengal, vol.* xx. *p.* 90; *also Fow-kwe-ki, chap.* xvi. *p.* 101.) the pi-khiu-ni, or bhikshuni, at Mathura, in token of their gratitude paid their devotions chiefly to the stupa of Anan (Ananda), because he had besought Buddha that he would grant to women the liberty of embracing ascetic life. The observances required from the nuns are recorded in note 23, chap. xvi. of the Fo-kwe-ki. The female ascetic even of a hundred years of age, however, was bound to respect a monk even in the first year of his ordination. (*Major Cunningham Bhilsa Topes.*)

From its rise in the sixth century before Christ the doctrines of Buddha gradually spread over the whole of India. It was extended by Asoka to Kashmir and Kabul shortly after Alexander's invasion, and it was introduced into China about the beginning of the christian era by five-hundred Kashmirian missionaries. In A. D. 400, when Fa Hian visited India, buddhism was still the dominant religion, but the vaishnavas, with a mixture of the old Arian creed and the buddhist faith, were already rising into consequence. In the middle of the seventh century, although the pilgrim Hwan Thsang found numerous temples of the saivas, whose doctrines had been embraced by Skanda Gupta and the later princes of Pataliputra, yet buddhism was still the prevailing religion of the people. But though the faith of Sakya lingered about the holy cities of Benares and Gaya for two or three centuries later, it was no longer the honoured religion of kings and princes, protected by the strong arm of power, but the persecuted heresy of a weaker party, who were forced to hide their images under ground, and were ultimately expelled from their monasteries by fire. In 1835, Major Cunningham excavated numerous buddhist images at Sarnath near Benares, all of which had evidently been purposely hidden under ground. He found quantities of ashes also, and there could be no doubt that the buildings had been destroyed by fire, and Major Kittoe, who subsequently made further excavations was of the same opinion. The buddhist religion has long been extinct in British India. Its last remnants were extinguished, in blood and violence, about the fourteenth century, dying out about Trichinopoly and along the coast line from Vizianagram to Masulipatam. But it still flourishes in the countries on its north and north-east borders, in Nepal and Tibet, in Ava, Ceylon, and China, and amongst the Indo-Chinese nations of Anan, Siam, and Japan. Its followers far outnumber those

of all other existing creeds except the christian, and they form one-fourth of the whole human race.

The buddhist faith was pre-eminently a religion of mercy and peace and charity, and benevolence. It had the vital defect of not teaching or knowing God:—in the topes dedicated to the celestial Buddha, Adinath, the invisible being who pervaded all space, no deposit was made, but the divine Spirit, who is 'Light,' was supposed to occupy the interior, and was typified on the outside by a pair of eyes, placed on each of the four sides either of the base or of the crown of the edifice. But in ages of strife and violence, of deifying mortals, and of arrogant assumptions of an ignorant priesthood, a creed that taught gentleness and meekness and kindness to living creatures, must have exercised a great influence over the community, must early have gained many converts amongst the peaceable and good, and largely leavened the minds even of those who did not openly become converts; and amongst this class, must be included the entire populations from the primœval land east of the Oxus to China and Japan in the furthest east, to Singapore and Ceylon in the extreme south.

Christianity, Mahomedanism.—The doctrines of the Arian race have been further modified by other religionists. Since buddhism disappeared from India, its nations have been overrun and conquered by races professing creeds, with followers as numerous as buddhism had ever acquired. Rapid as was the progress of buddhism, the gentle but steady swell of its current shrinks into nothing before the sweeping flood of mahomedanism, which, in a few years, spread over one-half of the civilized world, from the sands of the Nile to the swampy fens of the Oxus. From the 11th century when the inroads into India, of mahomedans, began, up almost to the present time when they too as a ruling race, have in their turn almost disappeared before christians, the Semitic Arabs, the Arian Persians, the Scythic Tartars, and the Anglo-Saxons, have successively swayed the destinies of the races who are the subjects of these remarks, and each of the new comers has to some extent modified the belief and social customs of the conquered people. For, a prevailing characteristic of these races is a speculative theorising on the great end of man, his duties here and his hopes in eternity, with a disposition to asceticism, as the better means of obtaining the future rewards of a good life on earth. But great changes have been retarded by the circumstance that the mahomedan and the christian came amongst them as warriors, with all the fierceness and license which are to be found in camps—and the arrogance and contempt for strange things which youth engenders. And it is only since a few years that the voices of the meek followers of the lowly Jesus, the christian missionaries, have been heard proclaiming amongst the varied nations, and to each of them in their own tongue, the good tidings of great joy, which shall be to all people, and saying Glory to God in the highest, and on earth peace, good will toward men. But even in the short time, less than a century, during which they have been labouring, the effect on the hindu mind has been immeasurable. A great portion of this result is doubtless owing to the steady increase of schools for secular instruction in English, which have every year been on the increase and are crowded with the youth of all sects and castes and ranks. In this respect, every teacher of English is a missionary, for it is impossible for the youth of India, if educated under christian teachers by means of a christian literature, to be otherwise than christians in belief, whatever their professions may be. The first reforming sect that arose was a theist body, in Calcutta, who at present are making somewhat loud professions, a sure indication of the doubts that its followers entertain, as to the solid character of their new, or as they say, their reformed faith. And even in the case of hindus who have had no English education and have never heard the voice of the missionary, such are receiving instruction from others of their own people who have been so taught; and the mass has been so leavened that the great tendency amongst youthful inquiring minds is to accept some form of theism,—either to acknowledge one of their own deities, whether Vishnu or Siva, as the Lord of all, or adopt an ideal Supreme Being of their own creation, whom they clothe with attributes, purer, more just, and more worthy of reverence than any god which the hindu pantheon possesses.

Brahminism.—Buddhism was not finally swept away from the peninsula till about the 14th century of the christian era. For ten centuries it had been the prevailing religion of India but when the unwritten Tartar faith became corrupt and feeble, brahmanism was revived, mixed with the worship of new gods, a Siva and a Vishnu and every form of absurd fetichism gathered from local idolatries and superstitions. It is this mixture of several creeds which is now styled hinduism and its followers hindus. It is found amongst

the people in every variety of belief, from the mildest demon worship and recognition of numerous forms of gods and their idols, to a distinct theism: from the grossest ignorance and superstition to the most refined speculativeness; performed and associated with bloody and most inhuman rites, and, again, followed with the greatest tenderness for animal life. In Europe, the hindu religion is a term which is always employed in a collective sense, to designate a faith and worship of an almost endlessly diversified description. An early division of the hindu system, and one conformable to the genius of polytheism, just as at present, is said to have separated the practical and popular belief from the speculative and philosophical doctrines. And whilst the common people addressed their hopes and fears to stocks and stones and multiplied by their credulity and superstition the grotesque objects of their veneration, some few of deeper thought and wider contemplation plunged into the mysteries of man and nature and assiduously endeavoured to obtain just notions of the cause, the character and the consequence of existence. The Vedas throw little light upon the strange theology and most eccentric tenets of the present hindus. Besides being unable to find in the Vedas the true origin of caste, there cannot be found in them the primitive forms of the hindu triad, the source of the doctrine of metempsychosis, nor that combination of polytheism and pantheism which ought to have preceded the schism of the philosophical schools from orthodox brahmanism. The "North British Review" remarks that for centuries the brahmins appealed to the Vedas as their authority for every error and malpractice which they maintained: and met the arguments of Europeans, by referring to those books, which were always quoted in support of every doctrine and every practice, and to confound an opponent. It has been ceded that the laws of Menu, though excellent and authoritative in one age, were not binding in all; but the universality of Vedic precept has always been insisted on, and it was said that if a principle were not found in those books it would not be adhered to. Upon these grounds, all the institutions, social as well as religious, of modern brahmanism, might be overthrown, and in this respect, no labour has possessed such value as that given to the interpretation and criticism of those works which the present hindus assert to have proceeded from the mouth of Brahma himself. The study of the Vedas and Puranas, would serve to dissipate much of the mysterious awe with which the hindoo regards these books. The more he may read, the less respect could he feel for them. Not only is the divine origin claimed for them at once refuted by the very ordinary characters which distinguish them as peculiarly mortal, but they are not even all of them on sacred subjects. In one place we have an erratic dialogue of a loose description between a man and his wife; in another, an address to food, in another, a gambler complains of his ill luck. In one the hawk, in another the sacrificial pole, in a third the Francoline partridge, in others even the mortar and pestle, and the wheel-barrow in which the victim is brought to the sacrifice, are the subjects of laudation.

In the later hymns of the Vedas can be traced the origin of the Vishnu worship and the setting aside of Indra. But the foreign Mahadeva and Bhavani came in with the Sakæ, and mingled in their worshippings until the doctrines of Buddha, himself a Sakyan, were promulgated and held their own for nearly a thousand years, until Vishnu, Brahma, Siva, Durga, Kali, Rama, Krishna, Ganesa, Kartikeya, and a host of new divinities, prevailed about 1200 years ago, over a better faith than their own and up to the present day, enslave and degrade the hindu.

Sufficient has been given above of the religious history of the races now dwelling in India and known as hindus, to show how varied has been the origin of their present beliefs and the mind will have been prepared to find that the religions, drawn from so many sources, are even yet unfused into a homogeneous whole. Doubtless one great difficulty in the way of such an amalgamation has been the difference in race even of the brahminical teachers, for there can be no doubt that the Mahratta brahman, in physical form and mental constitution, is very different from others, if indeed he be of those Arian immigrants who crossed the Indus into north-western India. There are numerous other brahminical tribes in India, who do not intermarry, not because of any difference in their creed, but because of differences in lineage and descent. But the great obstacle in the way of amalgamation, has been the numerous languages which the peoples called hindus speak, and this of itself is indicative of the variety of races from which they have sprung. It is true that there are two learned languages, the Sanscrit and the Pali, in which the religions of the hindus and the buddhists are contained. The buddhist scriptures of Tibet, Mongolia, Pegu, Ava, Siam, Kamboga, Cochin-China and Ceylon, are all in the Pali, and the Vedas of the hindus are in a form of the Sanscrit tongue. But so igno-

rant of this language are the people of India that, in 1860, in Madras, a city of 830,000 people, five-sixths of whom are hindus, and of these about 7,000 brahman men, each of whom thrice daily repeats in prayer, the Gayatri or holiest verse of the Vedas, though it only contains fourteen words and is the most revered of their religious texts, although Mr. C. P. Brown has given it and its translation, in the last edition of his Telugu Dictionary, only two or three brahmans are acquainted with its meaning. Doubtless the same could be said of the Pali of the buddhists. With this ignorance, even amongst the learned, of the language of their holy books, how difficult must be the progress of knowledge or of reformation through the races professing hinduism, who speak Bengali, Canarese, Singhalese, Guzerati, Hindi, Kodaga, Kashmiri, Mahratta, Malealam, Rakhui, Tamil, Telugu, Tulu, Uria, and various dialects of each of these, and it is equally so with the buddhists, who speak Burmese, Chinese, Cochin-Chinese, Singhalese, Japanese, Javanese, Malay, Siamese, and Tibetan. Amongst those professing hinduism, also, there is no general teaching of the people, in the mode adopted by Hebrews, mahomedans and christians, by one of the priesthood being set apart to preach to high and low. A few pupils sit at the feet of teachers and learn from those teachers, it may be, peculiar doctrines, but there is no general instruction for the entire community whose worship consists in a ritual of prayers of the meaning of which they are ignorant, and an endless wearisome ceremonial pervading every social duty, their ignorance being such that the mere listening to or repeating the unknown words of the sacred books, is considered meritorious.

Hinduism as it is.—Coleman tells us that five great sects, exclusively worship a single deity and one recognises the five divinities: These are

1. Saiva, worshippers of Siva, in his thousand forms, who however, worship Siva and Bhawani conjointly.
2. The Vaishnava, who worship Vishnu.
3. The Surya, who worship Surya, or the Sun.
4. The Ganapatia, who worship Ganesa.
5. The Sacta, who exclusively worship Bhavani or Parvati,—the sacti, or female energy of Siva.
6. The Bhagavati, who recognise all divinities equally.

The fourth and fifth are sub-divisions, or ramifications of the first, or Saiva; of which may be traced these distinctions.—1, Saiva proper, meaning the worshippers of Siva and Parvati conjointly. 2. Lingi or Langaet, the adorers of Siva, or his phallic type, separately, and these are a very strict and rigid sect. 3. Sacta, the adorers of the Yoni of Bhavani, or her symbol, separately. 4. The Ganapatya the exclusive worshippers of Ganesa, the first born of Mahadeva and Parvati.

The second grand sect or Vaishnava, is variously divided and subdivided. First or division of Gocalast'ha, or worshippers of Gocal, or Krishna, is subdivided into three:

1. Exclusively worship Krishna and Vishnu himself: this is generally deemed the true and orthodox Vaishnava.
2. Exclusively worship Radha as the sacti of Krishna or Vishnu: this sect is called Radha Vallabhi.
3. Worship Krishna and Radha conjointly.

Second or division of Ramanuj, or worshippers of Ramachandra, is, in like manner, subdivided into three;

1. Worship Rama only.
2. Worship Sita only as his Sacti.
3. Worship both Rama and Sita conjointly.

Their theologists have entered into vain disputes on the question, which, among the attributes of God, shall be deemed characteristic and pre-eminent? Sancara Acharya, the celebrated commentator on the Veda, contended for the attributes of Siva; and founded, or confirmed, the saiva sect who worship Mahadeva as the Supreme Being, and deny the independent existence of Vishnu and other deities. Madhava Acharya, and Vallabha Acharya in like manner, established the sect of vaishnava, who adore Vishnu as God. The Suria (less numerous than the sects above mentioned) worship the Sun, and acknowledge no other divinity. The Ganapatya adore Ganesa as uniting in his person all the attributes of the Deity. As the saiva has a fourth undivided sect in the gahapatya, so the vaishnava has a fourth undivided sect in the bhagavata. And indeed, we find the sects merging into each other; for, in consequence of the interposition of Vishnu to appease a physiological difference between Mahadeva and Parvati, or the worshippers of the Linga and Yoni, his (Vishnu's) navel, says Major Moor, came to be considered as the same with the Yoni, confounding the yonijas with the vaishnava. "The vaishnava of the present day, though nominally worshippers of Vishnu, are, in fact, votaries of deified heroes. The Goculast'ha (one branch of this sect) adore Krishna, while the Ramanuj worship Ramachandra. Both have again

branched into three sects; one consists in the exclusive worshipper of Krishna, and these only are deemed true and orthodox vaishnava; another joins his favorite Radha with the hero; a third called radha-vallabhi, adores Radha only, considering her as the active power of Vishnu. The followers of these last mentioned sects have adopted the singular practice of presenting to their own wives the oblations intended for the goddess; and those among them who follow the left-handed path (there is in most sects a right-handed, or decent path, and a left-handed, or indecent mode of worship) are said to require their wives to be naked when attending them at their devotions. Among the ramanuj some worship Rama only, and others both Rama and Sita; none of them practise any indecent mode of worship. And they all, like the goculast'-ha as well as the followers of the bhagavata, delineate on their fore-heads a double upright line with chalk, or with sandal-wood, and a red circlet with red sanders wood, or with turmeric and lime; but the Ramanuj add an upright red-line in the middle of the double white one.

The saivas are all worshippers of Siva and Bhavani conjointly; and they adore the linga, or compound type of this god and goddess, as the vaishnava do the image of Lakshimi-Narayana. There are no exclusive worshippers of Siva besides the sect of naked gymnosophists, called Lingi; and the exclusive adorers of the goddess are the Sacta sect. In this last mentioned sect, as in most others, there is a right-handed and decent path, and left-handed and indecent mode of worship; but Major Moor mentions that the indecent worship of this sect is most grossly so and consists of unbridled debauchery with wine and women. This profligate sect is supposed to be numerous, though unavowed. In most parts of India, if not in all, they are held in deserved detestation; and even the decent sacta followers do not make public profession of their tenets, nor wear on their foreheads the marks of their sect, lest they should be suspected of belonging to the other branch of it. The saiva and sacta delineate on their foreheads three horizontal lines with ashes obtained, if possible, from the hearth on which a consecrated fire has been maintained; they add a red circlet, which the saiva make of red sanders, and which the sacta, when they avow themselves, mark either with saffron, or with turmeric and borax. "The saura or suria, are true worshippers of the Sun; and some of them, adore the dormant and active energies of the planet conjointly. This sect, which is not very numerous, is distinguished by the use of red sanders for the horizontal triple line, as well as for the circlet on their foreheads. The left-handed path, or indecent mode of worship, of the several sects, especially that of the sacta, is founded on the Tantras, which are, for this reason, held in disesteem. The worshippers of Vishnu, Siva and the Sakti, are not to be confounded with the orthodox adorers of those divinities; few brahmans of learning, if they have any religion at all, will acknowledge themselves to belong to any of the popular divisions of the hindu faith, although, as a matter of simple preference, they more especially worship some individual deity as their chosen or Ishta Devata. They refer also to the Vedas, the books of law, the Puranas, and Tantras, as the only ritual which they recognise, and regard all practices not derived from those sources as irregular and profane. These deities have their different avatars or incarnations, in all of which, except that of the Sacti themselves, they have their sacti (wives) or energies of their attributes. These have again ramified into numerous names and forms.

The great point of difference amongst the sectaries is as to the claims of respective deities to be regarded as the First Cause. Some assert that as Vishnu (the preserving spirit of God) was sleeping on the serpent Ananta, or eternity, on the face of the waters, after the annihilation of a former world, a lotus sprung from his navel. From this issued Brahma, who produced the elements, formed the present world, and gave birth to the god Rudra (or Siva) the destroyer. He then produced the human race. From his head he formed the Brahmans or priests; from his arms, the Khetries or warriors; from his thighs, the Vaisyas or merchants; and from his feet the Sudras or husbandmen. If inquiry be made of a Vaishnava, or one of the exclusive adorers of Vishnu, he will not fail of exalting the object of his own adoration to the throne of the one only Almighty Being; and with that view will call him Narayana, although in fact such name is not strictly applicable to that being, but to his spirit, if such a personification can be conceived. The Goculast'ha, a branch of the Vaishnava, will similarly exalt Krishna, the exclusive object of their adoration; and in other personages we are scarcely able to distinguish the persons of Narayana and Brahma. On the other hand, many of the hindu sects seem to have originated in a great measure, out of opposition to the brahminical order; teachers and disciples are chosen from any class and the distinction of castes is, in a great measure,

sunk in the new one, of similarity of schism. The ascetics and mendicants, also, in many instances, affect to treat the brahmans with particular contempt and this is generally repaid with interest by the brahmans A portion, though not a large one of the populace, is still attached to the Smarta brahmans, as their spiritual guides and so far distinct from any of the sects: whilst most of the followers even of the sects, pay the ordinary deference to the brahminical order and especially evince towards the brahmans of their own fellowship, of whom there is generally abundance, the devotedness and submission which the original hindu code so perpetually inculcates. Excluding those hindus who may be regarded as the regular worshippers of recognised gods, the following is an enumeration of the several sectaries of each class, and to them we refer for separate notices of their origin and tenets.

Vaishnava sects.

1. Ramanuja or Sri Sampradayi or Sri Vaishnava.
2. Ramanandi or Ramawat.
3. Kabir Panthi.
4. Khaki.
5. Maluk Dasi.
6. Dadhu Panthi.
7. Raya Dasi.
8. Senai.
9. Vallabha Chari or Rudra Sampradayi.
10. Mira Bai.
11. Madhawa Chari, or Brahma Sampradayi.
12. Nimawat or Sanakadi Sampradayi.
13. Vaishnava of Bengal.
14. Radha Vallabhi.
15. Sak'hi Bhava.
16. Charan Dasi.
17. Harischandi.
18. Sadhua Panthi.
19. Madhavi.
20 Sanayasi, Vairagi and Naga.

Saiva sects.

1. Dandi and Dasnami.
2. Jogi.
3. Jungama.
4. Paramahansa.
5. Urdhaba'hu, Akas Muk'hi and Nak'hi.
6. Gudara.
7. Ruk'hara, Suk'haras and Uk'hara.
8. Kara Lingi.
9. Sanyasi.

Sakta sects.

1. Dakshini.
2. Vami.
3. Kanchebiya.
4. Kararia.

Miscellaneous sects.

1. Ganupatya.
2. Samapatya.
3. Nanik Shahi, of seven classes, viz.
   a Udasi
   b. Ganjbakhshi.
   c. Ramrayi.
   d. Suthra Shahi.
   e. Govind Sinhi.
   f. Nirmala.
   g. Naga.
4. Jaina of two principal orders,
   a. Digambara.
   b Swetambara.
5. Baba Lali,
6. Pran Nathi.
7. Sadh.
8. Satnami.
9. Siva Narayini.
10. Sunyabadi.

Amongst other Saiva sectarians we have the following.

Aghori.	Nakhi.
Avadhuta.	Paramahansa.
Gudara.	Dakshina.
Kanchelia.	Dandi.
Bhakta.	Dasnami.
Brahmacha	Saurapata or Saura.
Kerari.	

Most of these comprise a number of subdivisions, and besides these acknowledged classifications, many individual mendicants are to be found all over India, who can scarcely be included within the limits of any of them, exercising a sort of independence both in thought and act, and attached very loosely if at all to any of the popular schismatical sects. Some of the popular works of the hindus adopt a different classification and allude to 96 prashada or heresies, which are thus arranged:—viz. Amongst the

Brahmans	24	Saura	18
Sanyasi	12	Jangama	18
Viragi	12	Jogi	12

Mythology of the Hindus.—Amongst the hindus, mythology is all pervading. Their history, science, literature, arts, customs, and conversation, are replete with mythological allusions. A respectable knowledge of their pantheon is consequently an almost indispensable preparatory acquirement to the study and comprehension of nearly every thing which relates to them. The mythology of India, has done much to explain that of Greece and Scandinavia as will be seen by the following list of the principal of the hindu deities of the present day, and their principal analogues.

Vaitarini, in the hindu pantheon, has its supposed analogue, in the river Styx.

Durga	analogue of Juno.
Narada	God of Music = Mercury.
Krishna,	= Apollo.
Bhawani	= Venus.
Kali or Durga	Proserpine,
Agni,	Vulcan-Fire. Ignis.
Swaha,	Vesta, his wife.
Aswini. Kumara.	Castor and Pollux.
Aruna,	= Aurora.
Atadeva	= Diana.
Kuvera,	Plutus, the god of riches.
Ganesa,	A member of the hindu pantheon male minerva.
Indra,	God of firmament = Jupiter.
Varuna	God of Water = Neptune.
Prithivi	Goddess of Earth = Cybele.
Viswakarma,	Architect of Gods = Vulcan.
Kartikeya or Skanda,	God of war = Mars.
Kama,	God of love = Cupid.
Surya or Arka	The sun = Sol.
Hanuman son of Pavana,	The Monkey God = Pan.
Rama,	The God of Wine = Bacchus.
Heracula	A Hindu deity = Hercules.
Aswiculapa,	Æsculapicus? = Genii.
Vayu,	Æolus.
Sri,	Ceres.
Anna Purna,	Anna Perenna.

Vahan or Vehicles of the hindu gods.—Several animals are appropriated as the vahan or vehicles to the mythological personages of modern hinduism. The swan, eagle and bull, appertain respectively to Brahma, Vishnu, and Siva, and are severally denomi-

nated Hanasa, Garuda and Nandi. Ganesa, eldest son of Mahadeva (Siva) and Parvati, the elephant-headed god of prudence and policy, rides a rat supposed to be a very sagacious animal—Kartika, their second son, the generalissimo of the celestial armies, mounts on a peacock. Indra, the powerful regent of the firmament, the Jupiter Pluvius of the hindus, rides the elephant Iravatam, symbolical of might. Varuna, genius of the waters, bestrides a fish; as doth also Ganga, the prime goddess of rivers—Kama Deva, the god of love, is carried by a lory, or parrot: Agni, god of fire, by an ardent ram.

Sakti or goddesses—The hindu goddesses are uniformly represented as the subordinate powers of their respective lords: thus Lakshmi, the consort of Vishnu the preserver, is the goddess of abundance and prosperity; Bhavani, the wife of (Siva) Mahadeva, is the general power of fecundity; and Saraswati, whose husband was the creator, Brahma, possesses the powers of imagination and invention, which may justly be termed creative. She is, therefore, adored as the patroness of the fine arts, especially of music and rhetoric; as the inventress of the Sanskrit language, of the Devanagri writing characters, and of the sciences which writing perpetuates: so that her attributes correspond with those of Minerva Musica of Greeee or Italy, who invented the flute, and presided over literature.—*Coleman*, p. 125.

The saivaism and vaishnuism described above, from the writings of Coleman, Major Moor and Professor Wilson are the common every day religions of the bulk of the hindu populations. But the internal beliefs of the worshippers have no such community, and their various tenets must be sought for under the history of their several sects. A saiva sect the Satnami profess to adore the true name, the one God, but they nevertheless recognize the whole hindu pantheon, and pay reverence to what they consider manifestations of his nature visible in the avatars, particularly Rama and Krishna. The Saud or Sadh, on the other hand, utterly reject all kinds of idolatry, are pure deists with a simple worship. Between these unitarian sects and such as adore every deity, there is the utmost diversity of theory and practice. The fusing of their creeds, doctrines and customs is continually going on. Major Moor tells of a mahomedan butcher at Poona, who occasionally supplied the residency with meat, being asked if he would kill a calf, he started back with horror at the proposal, ejaculating a prayer to be forgiven for having even heard it. Many mahomedans of India borrow from the hindus ceremonies that are celebrated with festivity. They take an active part in the gambols of the Huli, and even solicit the favours of the Indian Plutus at the Diwali. Many hindus on the other hand join in the festival of the moharam. The bridal procession of the mahomedans, on the fourth day, with all the sports and gambols of the Chaut'hi, is evidently copied from the similar custom of the hindus. The mahomedans have adopted the premature marriage of infants, and hindus largely imitate the mahomedan seclusion of their wives. (*Colebroke, As. Res.*, Vol. VII, p. 307.) A mahomedan is forbidden to eat meat which has not been killed by one of the faithful; who is directed to 'halal,' or sanctify, the animal by turning its face toward Mecca, and while the blood is ejected, to repeat their creed, or profession of faith—"There is no deity but God, and Mahommed is the prophet of God,—or a short prayer. Many mahrattas, and other hindus, pleased with the ceremony, bring their sheep, fowls, &c., to mahomedans to be made 'halal,' and then eat them with increased satisfaction. Junctions of any sort, especially of waters, are held sacred by hindus, and above all, the union of the sacred rivers, Ganga and Yamuna or Jumna near Allahabad: the latter river having previously received the Saraswati below Delhi, so that, in fact, all three do unite at this famed sangam or confluence. But the hindu poet, feigns a subterrane flow of the Saraswasti, and a mystical union at the sacred point, where bathing is deemed peculiarly efficacious, and where zealots are persuaded that suicide is of a most meritorious description. Major Moor, once saw, (p. 429) at Poona, a well modelled group in clay, where Rad'ha's locks, tripartite, were plaited into the mystical Triveni by the amorous Krishna, who sat rapturously admiring the work of, and in, his hands. The Triveni or three plaited locks, is, in hindu mythology, the mystical union of these three sacred rivers, the Ganges, Jumna and Saraswati, severally the consorts, or energies, of the three great powers; and a female triad, similar to that of the trimurti or male powers. Coleman also, says (pp. 394, 398) that the Triveni, or three plaited locks, is allegorical of the holy rivers Gunga (or Ganges), Yamuna (or Jumna) which join near Allahabad, and the Saraswati, which is also supposed to join the other two under ground. A person dying near the imagined confluence of the three streams, or even of those of the Gunga and Yamuna, attains immediate beatitude, consequently self or self-permitted immolation, suttees, &c., are meritorious on this peculiarly holy spot and

where the juncture occurs, at Allahabad, of the Jumna and Ganges multitudes of pilgrims annually resort to bathe. Numerous other rivers are, however, held sacred by the hindus, viz., the Godaveri, the Sindhu or Indus the Krishna or Kistna and the Brahmaputra.

The hindus have reverence for the impressions of feet. On the top of Adam's peak, in Ceylon is a natural hollow artificially enlarged, said to be the impression of a foot, of Budda'ha called however by the hindus, Sripada, or Sripad, meaning the divine footstep, Vishnu having, they say, alighted on that spot—in his Avatara of Rama, although mahomedans and christians have also claimed that foot-mark as of their religious relics. Hindus make pilgrimages to the Sripad, in Ceylon and in other places, where similar proofs of an avatar or descent have been discovered.

The Mahrattas, make images in honour of deceased ancestors, and of their guru, or spiritual instructors: but brahmans are said to discourage this idolatrous propensity. These Lares, or Penates, or Lemures, for the household gods of the hindus partake of the characters assigned by the European heathens of old to those different descriptions of departed spirits, are easily confounded with the variety of forms in which Bhairava appears. Nat and Vira ('nat'ha,' lord, 'vira,' brave), are epithets that Major Moor heard brahmans apply to such domestic images, which others have called of Bhairava; while, to many other images in use they seem altogether at a loss what epithet to apply.

Devil and Spirit worship.—It would lead into too great detail to attempt a notice of the multitudinous religious customs of the hindus, but the Rev. Dr. Caldwell, has so well described the extravagant Devil or Demon worship of the Shanar race in the south of India, that it may here well find a place in illustration of the varieties of forms in which, what is supposed in Europe to be called hinduism, appears. He tells us that every hindu work containing allusions to Native life, and the dictionaries of all the hindu tongues, prove the general prevalence of a belief in the existence of malicious or mischievous demons, in demoniacal inflictions and possessions, and in the power of exorcisms. But the Shanar race systematically worship the demons in which they believe. Their devil temples are called "Pe-'Koil." Some of them, especially those erected to the sanguinary form of Kali, are small mean tomb-like-buildings with an image at the further end of the cloister. But the majority of the devil-temples are of a still more primitive construction. A heap of earth raised into a pyramidal shape and adorned with streaks of white-wash, sometimes alternating with red ochre, constitutes, in the majority of cases, both the temple and the demon's image; and a smaller heap in front of the temple with a flat surface forms the altar. In such cases a large conspicuous tree—at amarind,—an umbrella tree, or even a palmyra whose leaves have never been cut or trimmed—will generally be observed in the vicinity This tree is supposed to be the devil's ordinary dwelling place, from which he snuffs the odour of the sacrificial blood and descends unseen, to join in the feast. The devil pyramid is sometimes built of brick and stuccoed over; and when thus built of coherent materials it rises into something of the shape of an obelisk. The angles of the pyramid are made to correspond with the cardinal points. Its height rarely exceeds eight feet and is generally less than five. This pyramidal obelisk is a distinguishing characteristic of devil-worship, and appears to have no compartment in brahmanism or any other *ism* in India. Dr. Caldwell, often wished to discover what was supposed to be signified by this peculiar style of image; but never met with any one who could give him any information. Sometimes the worshippers go to the expense of building walls and a roof for the permanent accommodation of their demon, with a porch for the musicians. The devil in this case being of brahminical lineage, they generally erect an image to his honor, in imitation of their brahminical neighbours. Such images generally accord with those monstrous figures with which all over India orthodox hindus depict the enemies of their gods, or the terrific forms of Siva or Durga. They are generally made of earthen-ware, painted white to look horrible in hindu eyes; with numerous upraised hands and instruments of torture and death in each, and the representation of infants crushed between their teeth; or with buffalo-heads and huge spiked clubs. In every such case the artist borrows his realization of the fiend's character from images invented and patronized by the brahmans themselves. In the worship of the aboriginal Shanar devils, the pyramid mentioned is the nearest approach to an image which Dr. Caldwell observed. It is worthy of remark that every word which denotes an image is of Sanscrit origin, and as such must have been introduced from the brahmans. Two particulars connected with devil-worship, are essential features of the system, namely, devil-dancing and the offering of bloody sacrifices. This demono-

latrous creed is found in all the hill-regions, and amongst all the semi-civilized or migratory tribes who have not yet been enslaved by the higher castes and completely subjected to brahmanism, and prevails more or less throughout India especially as allied with the worship of the female powers of Siva, and in its most primitive shape, it still forms the creed of the greater part of Tinnevelly and Travancore. And though brahmans despise both devils and their worship, as also the worship of the village gods called Amman, in times of calamity, the brahmans do not hesitate to worship the Amman and even make offerings to demons, though by stealth or through the medium of other persons. Emigrants from the Telugu country, who form a considerable portion of the population in some parts of Tinnevelly, have generally become worshippers of devils. But the system more usually followed by this class is the worship of the satellites of the brahminical deities, or that of the female energies. Such devils, in the proper sense of the term, as they are found to worship, are of Tamil origin, as their names denote, and were probably worshipped at first from a wish to conciliate the gods of the soil. The origin of the Shanar demonolatry lies in the unknown depths of antiquity, an antiquity apparently equal to that of the worship of the elements or the heavenly bodies. If the allusions contained in the Vedas to the victories gained by the elementary deities over hostile fiends be considered mythic representation of historical facts, the worship of devils would seem to have been anterior to the Vedic system itself. Of elementary worship there is no trace whatever in the history, language, or usages of any portion of the Tamil people. The emigration of the brahmans to Peninsular India appears, consequently, to have been subsequent to the first great change in their religious system. The religion they introduced was probably a rudimental form of saivaism, with a tendency to the mystical and mythological system of the Puranas. There is not the least reason to suppose that the Vedic or elementary system was ever known in the Tamil country either as an indigenous religion, or as introduced by the brahmans. The brahmans were doubtless the civilizers of the Tamil people; and the traditional leader of their migration, Agastya, is said to have reduced the Tamil language to order and to have given it a Grammar, yet not one of the old Tamil names of the elements, the heavenly bodies, or the operations of nature is masculine or feminine, as they are in Sanscrit, in accordance with the elementary doctrines of the Vedas; and there is not the least trace of the elements, or powers of nature, having at any time been considered as personal intelligences. The inventors of both the Vedic and the demonolatrous systems seem to have been equally destitute of moral sentiments. Each adored power not goodness, operations not virtues; but whilst the former deified the operations of nature, the latter demonized the powers of heaven. It appears very improbable that demonolatry originated in any form of brahmanism, though it may be true that from time to time, especially after the lapse of elementary worship into mysticism and of hero worship into terrorism, a few brahminical ideas have been added to the demonolatry of the Shanar race and a few of the demons who were formerly independent may have been taken into the service of the petty divinities; there are traces amongst them of a vague traditionary belief in the existence of a god: but the term in use also signifies ruler or lord, and they ascribe to him the punishments which overtake the wicked; monstrous births and prodigies, and on the death of a child they abuse him for his want of mercy and blindness in slaying the infant. Hence, it may be inferred that they regard the ruler or lord as the author of life. Their literature is either of brahminical origin or it is confined to the recital of the praises of demons, the power of incantations and the virtues of medicines. They nominally acknowledge as deities some of the brahminical mythologies: but they know only their names and a few popular myths or deified heroes. Dr. Caldwell, with one exception, has not discovered the least vestige of their acquaintance with the pantheistic notion, so popular with Tamil poets, that God is an all pervading essence without qualities or acts. Notwithstanding their traditional use of the name of one god, practically the Shanar race are destitute of the belief in God's existence, and their only real faith is in demonolatry. They do not appear to believe in any future state or any state of rewards and punishments. When a person has died a sudden, untimely or violent death, especially if in his life time he had been remarkable for crimes or a violent temper, his spirit is supposed to haunt the place where his body lies, or wanders to and fro in the neighbourhood, as a newly born demon, an aerification and amplification of the bad features of the deceased persons character, a goblin which with the acquisition of super human power, has acquired super-human maliguity. A few of the

Shanar race, however, imitate the brahminical practice of ceremonies for the dead; and similarly a few are believers in the metempsychosis. The brahminical deities that have obtained a place in their esteem are honored merely with a passing bow and an annual festival. They attend the festival of Subramanya, the second son of Siva, at Trichendoor, and Shasta, the Hari-haraputra of the brahman, and the guardian of boundaries and protector of paddy fields, is worshipped to a considerable extent in his official relations. But it is demons, devils or fiends, of unmixed malignity, spirits of a jealous, watchful and vindictive temper that they worship with earnestness and assiduity as the worship of their every day life. It is that which governs their minds, sways their wills, and influences their characters, and which they have recourse to in sickness and loss. A large portion of the devils are of purely Shanar or Tamil origin and are totally unconnected with brahmanism. A few of their demons are forms of Kali, or rather that of Amman, the earth goddess whom the people of Southern India who follow brahmanism, have consented to regard as Kali, and whose worship is performed by a particular class of sudra priests. Their devils were originally human beings who in their lives had made themselves objects of dread, or who met a violent or sudden death, and are therefore of both sexes of all ranks, and of native or foreign origin. But all of them are powerful, malicious and interfering; and all desirous of bloody sacrifices and frantic dances. The temples or images built to the honor of the different demons, also differ—as do also the insignia of the priests, who variously prefer for the sacrifice, a hog, a goat, or a cock, and Pariar demons, invariably require ardent spirits. The majority of the demons are supposed to take their abode in trees. Some wander in uninhabited wastes, or seek shady retreats. Demons occasionally take up their abode in houses, and it often happens that a devil will take a fancy to dispossess the soul and inhabit the body of one of his votaries; in which case the personal consciousness of the possessed party ceases, and the screaming gesticulating, and pythonizing are supposed to be the demon's acts. Every malady however trivial is supposed by the more superstitious to be inflicted by a devil, and a sacrifice is necessary for its removal; but the unusual severity or continuance of any disease, or the appearance of symptoms which are not recorded in the physician's shastra, are proofs of possession of which no Shanar can entertain any doubt. The medical science of so rude a people not being very extensive cases of unquestionable possession, are, as they think, of frequent occurrence. When a woman is heard to laugh and weep alternately, without any adequate cause, or shriek and look wild when no snake or wild beast can be perceived, a Shanar can only suppose a devil to be the cause of the mischief. The Native doctor, himself a Shanar, is sent for to give his advice. He brings his library with him, (he can't read, but it is all safe in his memory,)—his "complete science of medicine in one hundred stanzas, as revealed by the sage Agastya to his disciple Pulastya;" but in vain he recites his prescriptions, in vain he coins hard words. As no description of hysterical complaints is contained in his authorities, what can he do but decide that a devil has taken possession of the woman, and recommend that a sacrifice be offered to him forthwith, with a cloth and a white fowl to the doctor? Sometimes the possession takes the shape of a stroke of the sun, epilepsy or catalepsy, a sudden fright, mania, or the vertigo and stupor caused by an overflow of bile. But any ordinary disease, when it seems incurable and the patient begins to waste away, is pronounced a possession. Sometimes the friends are not desirous of expelling the evil spirit all at once, but send for music, get up a devil-dance, and call upon the demon to prophesy. This is particularly the case when some member of the family has long been sick, and they are anxious to know what is to be the result of the sickness, and are wishing and waiting for a demon's visit. If they desire to expel the devil, there is no lack of moving ceremonies and powerful incantations, each of which has been tried and found successful innumerable times. If the devil should prove an obstinate one and refuse to leave, charm they never so wisely, his retreat may generally be hastened by the vigorous application of a slipper or a broom to the shoulders of the possessed person, the operator taking care to use at the same time the most scurrilous language he can think of. After a time the demoniac loses his downcast, sullen look. He begins to get angry and writhe about under the slippering, and at length cries, "I go, I go." They then ask him his name, and why he came there. He tells them he is such and such a devil whom they have neglected ever so long and that he wants an offering: or he calls himself by the name of some deceased relation who as they now learn for the first time, has become a demon. So soon as the demon consents to leave, the beating ceases; and not unfrequently immediate preparations are made

for a sacrifice, as a compensation to his feelings for the ignominy of the exorcism. The possessed person now awakes as from a sleep and appears to have no knowledge of anything that has happened.

Native christians sometimes become similarly possessed but the missionaries have found the attacks always yield to Tartar emetic. The demons are frequently contented with inflicting minor injuries. The failure of rain, a blight on the crops, accidents, diseases which befal cattle, losses in trade are all considered instances of a demon's malevolence. A people hear a strange noise at night and immediately they see a devil making his escape in the shape of a dog as large as a hyena, or a cat with eyes like two lamps. In the dusk of the evening devils have been observed in a burial or burning ground, assuming various shapes one after another as often as the eye of the observer is turned away; and they have often been known at night to ride across the country on invisible horses, or glide over marshy land in the shape of a wandering, flickering light. In all their journeyings they move along without touching the ground: their elevation above the ground being proportioned to their rank and importance. Dr. Caldwell has known a village deserted and the people afraid even to remove the materials of their houses, in consequence of the terror caused by stones being thrown on their roofs, at night, by invisible hands. Demons more malicious still have sometimes been known under cover of the night to insert combustible materials under the eaves of thatched roofs. Even in the day time, about the close of the hot season, when the winds fail, they may often be seen careering along in the shape of a whirlwind, catching up and whisking about in their fierce play every dry stick and leaf that happens to lie in their path. In short, the demons do much evil, but no good. They often cause terror but never bestow benefits, or evince any affection for their votaries. They must be placated by sacrifice because they are so mischievous; but there is no use of supplicating their favour. If in any case the hope of obtaining a benefit may seem to be their votary's motive in worshipping them; further inquiry proves that it is under the supposition that the demon's malignity stands in the way of what would otherwise be obtained as a matter of course. Natives think that Europeans have no reason to fear from demons and a similar exception is sometimes made in the case of the mahomedans. The god worshipped by the mahomedans is supposed to be more powerful than the demons, and able to protect his worshippers from their assaults. The demonolaters seem to consider European christians as secure from danger. They suppose them even more than a match for any of the poor black man's goblins. In consequence of this immunity, whilst the servants and followers of a European are exposed to many alarms, their master neither sees nor hears any thing unusual. When it is determined to offer a sacrifice to a devil, a person is appointed to act the part of priest. Devil-worship is not, like the worship of the hindu deities, whether supreme or subordinate, appropriated to a particular order of men, but may be performed by any one who chooses. This priest is styled a "devil-dancer." Usually one of the principal men of the village officiates; but sometimes the duty is voluntarily undertaken by some devotee, male or female, who wishes to gain notoriety, or in whom the sight of the preparations excites a sudden zeal. The officiating priest, whoever he may happen to be, is dressed for the occasion in the vestments and ornaments appropriate to the particular devil worshipped. The object in view in donning the demon's insignia is to strike terror into the imagination of the beholders. But the party-coloured dress and grotesque ornaments, the cap and trident and jingling bells of the performer, bear so close a resemblance to the usual adjuncts of a pantomime that a European would find it difficult to look grave. The musical instruments, or rather the instruments of noise, chiefly used in the devil-dance are the tom-tom, or ordinary Indian drum, and the horn; with occasionally the addition of a clarionet when the parties can afford it. But the favorite instrument, because the noisiest, is that which is called the bow. A series of bells of various sizes is fastened to the frame of a gigantic bow; the strings are tightened so as to emit a musical note when struck; and the bow rests on a large empty brazen pot. The instrument is played on by a plectrum, and several musicians join in the performance. One strikes the string of the bow with the plectrum, another produces the base by striking the brazen pot with his hand, and the third keeps time and improves the harmony by a pair of cymbals. As each musician kindles in his work and strives to outstrip his neighbour in the rapidity of his flourishes, and the loudness of the tone with which he sings the accompaniment, the result is a tumult of frightful sounds, such as may be supposed to delight even a demon's ear. When the preparations are completed and the devil-dance is about to commence, the music is at first comparatively slow, and the dancer

seems impassive and sullen, and either he stands still, or moves about in gloomy silence. Gradually, as the music becomes quicker and louder, his excitement begins to rise. Sometimes to help him to work himself up into a frenzy he uses medicated draughts, cuts and lacerates his flesh till the blood flows, lashes himself with a huge whip, presses a burning torch to his breast, drinks the blood which flows from his own wounds, or drinks the blood of the sacrifice, putting the throat of the decapitated goat to his mouth. Then, as if he had acquired new life, he begins to brandish his staff of bells and dance with a quick but wild, unsteady step. Suddenly the afflatus descends. There is no mistaking that glare, or those frantic leaps. He snorts, he stares, he gyrates. The demon has now taken bodily possession of him; and though he retains the power of utterance and of motion, both are under the demon's control, and his separate consciousness is in abeyance. The by-standers signalize the event by raising a long shout attended with a peculiar vibratory noise, caused, by the motion of the hand and tongue, or the tongue alone. The devil dancer is now worshipped as a present deity, and every bystander consults him respecting his disease, his wants, the welfare of his absent relatives, the offerings to be made for the accomplishment of his wishes, and, in short, everything for which superhuman knowledge is supposed to be available. As the devil dancer acts to admiration the part of a maniac, it requires some experience to enable a person to interpret his dubious or unmeaning replies—his muttered voices and uncouth gestures; but the wishes of the parties who consult him help them greatly to interpret his meaning. Sometimes the devil dance and the demoniacal clairvoyance are extemporized, especially where the mass of the people are peculiarly addicted to devil-worship, and perfectly familiar with the various stages of the process. In such cases, if a person happen to feel the commencement of the shivering fit of an ague or the vertigo of a bilious headache, his untutored imagination teaches him to think himself possessed. He then sways his head from side, fixes his eyes into a stare, puts himself into a posture, and begins the maniac dance; and the by-standers run for flowers and fruit for an offering, or a cock or goat to sacrifice to his honor. The night is the time usually devoted to the orgies of devil-dancing. And as the number of devils worshipped is in some districts equal to the number of the worshippers, and as every act of worship is accompanied with the monotonous din of drums and the bray of horns, the stillness of the night, especially during the prevalence of cholera or any other epidemic disease, is frequently broken by a dismal uproar, more painful to hear on account of the associations connected with it, than on account of its unpleasant effect on the ear and nerves."—*Dr. Caldwell.*

Daily life of the hindus.—Having sketched the origin of the various rites now forming the religion called hindoo, and the differences in the forms of idol worshipping which are to be found it may be interesting to conduct one of this faith from the cradle to the grave.

Childhood.—The ceremonials observed on the birth of children, at the commencement of their education, on investiture with the sacred thread, communication of a gayatri, or initiatory sentence, in their marriage ceremonies and those adhered to on the occurrences of a death in a family, have now a general resemblance among, or are more or less imitated by, all castes, classes and ranks. On the birth of a brahman child, the ceremony called "Putrotsavam" is performed and on this occasion, the father presents sugar and sugar candy to relatives and friends. On the 11th day, the mother is anointed with the oil of the oriental sesamum. This practice of anointing with oil, is wholly confined to the hindu community, the mahomedans whether of India or Western Asia are not acquainted with it, and it may therefore be surmised that the Arab descendants of Ismail separated at an age when the ancestors of the Hebrew people had not adopted the rite. It is probable that the Hebrews learned the practice in Egypt or from their Assyrian neighbours and that the anointing of kings which European nations have adopted was handed down through the Old Testament. On the same day (11th) the "Punyahavachanam" or the purification rite for the mother and house is performed. It is then that the child receives its name,—that of some one of its grand, or great grand parents,—by the father writing it three times, with a golden ring, in unhusked rice, spread on a plate. This naming is called "Namakaranam", and is followed by the guests bestowing blessings on the young one, as they scatter rice, coloured with turmeric, over it and the mother who are seated in the midst of the assembly. The father then distributes money to the poor, and entertains relatives and friends. On this night, for the first time, the child is put into the cradle by the female guests, some of whom sing religious songs while others rock the little one, and at the close, the assembly are dismissed after being presented with betel-

nut, plaintains and boiled pigeon pea, Cajanus Indicus. The birth of a girl is less a source of rejoicing because of that part of the hindu creed which lays down that parents and other ancestors attain Swarga-locum or Indra's heaven, through a son's efforts. Each new moon, as also on the occurrence of an eclipse, either of the sun or moon, also, at the summer and winter solstices, their "utrayanam" and "datchanayanam" every caste hindu, whether brahman, chetria, vaisia or sudra, offers the "Tharpanam" or water sacrifice, in the names of his deceased father, grand-fathers, great grand fathers, and their wives, seeds of the oriental sesamum being mixed with the water. It is as a means of continuing this ceremony, that hindus long to have a son born to them as, in their creed, it is taught that the manes of ancestors are gratified by the "Tharpanam." At five months of age, the ceremony called "Choulam" occurs, and the lobes of the ears are pierced with a small thin gold ring. When six months old, "Anaprasanam" or giving rice for the first time, is a social and sacred rite, at which, as also at "Choula," relatives and friends are entertained. The first occurrence of the birth day is celebrated. The child is anointed and decorated with jewels; relatives and friends are entertained and in the evening the child is carried to a temple and presented to the deity of their sect. As the second anniversary draws near, or about that time, the boy's head is shaved on a propitious day, which affords another opportunity for feasting friends. When five years old, the father fixes on an auspicious day and entrusts his son to a teacher. The instructor writes the alphabet or rather engraves it with an iron style, sometimes set in silver or gold, on a leaf of the palmyra tree, which is then coloured with turmeric. The leaf is placed on unhusked rice spread over the floor, and the teacher, whatever the sect or caste of the pupil be, invokes the god "Vigneswara" to smooth the difficulties in the way of the child's studies. Then, holding the boy's fore-finger, he thrice traces with it the forms of the vowels in the rice, teaching the boy their sounds. The pedagogue is presented with a new cloth and some money, and dismissed, after which relatives and friends are entertained. On the seventh or ninth year, the "Upanayanam" is performed, on which occasion, the family priests; 'Upad'hay-ya Sanscrit, Upa-dhialu, Telugu causes the boy to offer a burnt offering "Homam" to the entire pantheon of gods, by pouring ghi 'clarified butter' over the fire. He then invests the youth with the zandiyam, the zonar or sacred cord, letting it fall from over the left shoulder to the right side. He subsequently teaches the Gayatri to the boy, if he be of the brahmanical order, as also the morning, noontide, and evening prayers, the due attention to which is considered sufficient to remove all sins committed during the day and night. The Gayatri or Gayatri mantrum of the brahminical or priestly order, is never pronounced aloud—and it is exceedingly rare that any brahman can be induced to divulge it. Its literal translation is "Om! earth, air, heaven, Om! Let us meditate on the supreme splendour of the divine sun; may he illuminate our minds." It is considered the most venerable text of the Vedas, and the common belief in and reverence for it, is the bond of union amongst the entire priestly order. With this ceremony, the boy is considered to be born again and he is of the Punar Janma or twice born. This is the spiritual birth of the hindu or his regeneration, for, until this time, the uninitiated youth though of the brahminical class, is only, so far as his right to perform religious ceremonies is concerned, regarded in the light of a sudra. If the youth who has now been initiated into the mysteries of the brahminical order, be set apart for the sacerdotal office of the priesthood, he is further marked on the muscular part of both arms, by being branded with the sanku or chank and the chakram or disc of Vishnu. This is called the "chakrankitam." From this time, however, he is ranked as a bramhachari, or of the order of bachelors, for he has now entered on his religious life, the whole of the days of a spiritual brahman being apportioned into four religious stages, viz; that of the Bramhacharyam or bachelor-hood; Grahastasramam or the married state: Vanaprastam, the living in solitude with his family; and Sannyasam or the abandonment of all worldly matters. A bachelor's dress differs from that of a married man in so far as he does not wear the dhoti, but only a wrapper round the lower part of the body: he is prohibited from eating betel, and continence is enjoined. Among other hindu castes, the bram'hachari ceremony, is performed at any time prior to the celebration of marriage, but their gayatri is from the Puranas, not the Vedas.

Marriage.—There is no time fixed for the marriage of sons. It is performed at any time from infancy, as the parents may please. But amongst the priestly and mercantile orders, the brahmans and vaisia, as also among the goldsmiths, girls must be married before they attain puberty. The

HINDOO.

brahmans believe that they would be as if guilty of murder if they allowed a girl to grow up before being married. And in southern India they, as also the goldsmith tribe or race or caste, regard such an occurrence with so great horror that they consider it would be incumbent on them, if it happened, but which is invariably guarded against, for all the family to drown themselves. At length, the marriage time comes. Children have no voice in the matter of their marriage. When parents are desirous of having their sons married, they institute inquiries amongst their relatives or friends not of their own 'gotram' or tribe. They visit her parents in a propitious hour, and request their daughter in marriage for their son. The parents of the girl make inquiries as to the character of the boy, and, if satisfied, they promise their daughter for him. It is not customary for a girls' parents to go seeking for a husband for their daughter. When so far arranged, if the girls' parents be poor, they may perhaps stipulate that jewels and money shall be presented to their daughter, at the marriage time. But this practice which is a remnant of the ancient custom of purchasing a wife, is gradually dying out with all but the humbler people. Now a days, a rich hindu would disdain to receive money from the parents of their son-in-law, for giving their daughter to him, and many tribes, for India contains the descendants of numerous distinct races, repel with disdain any insinuation of their readiness to sell their daughters. Indeed son's-in-law do now, occasionally, receive some dower of money or property with their brides. But the former practice of disposal of their female children, is clearly marked in their marriage law, in which a girl who quits her father's house for her husband, in another family, ceases to be an heir of her own parents, though she acquires rights in the property of her new home.

When all the preliminary arrangements are settled, a day is fixed for the performance of the marriage: preparations are made by the father of the girl, who invites relatives and friends to be present on the occasion, the invitations being usually communicated verbally, but sometimes by letter. On the day preceding that of the marriage, by the "Snat'haka Varattam," the youth is relieved of his bachelor-hood, the ceremony on this occasion consisting in the Homa or fire sacrifice and giving of charity. On the marriage eve, the bridegroom accompanied by his parents, relatives and friends, goes in procession to the bride's house, and presents her with a new cloth of some value; with the jewels that may have been before agreed on; betel nut is handed to the guests, and friends and relations are entertained. The poor brahmans, too, are remembered on the occasion, the money gifts to whom are called Datchana. The wedding day at length arrives, but with emotions very different from those of the principal actors in ancient hindu times, for now-a-days, both bride and bridegroom are usually quite infants—and if not both so, the bride with most tribes certainly is. Tribes of sudras, however, and a fair intellectual literary race called Kait, who claim their origin from a deified mortal called Chatr-goputr, also many of the Pariar tribes, allow their girls to grow up and remain in their fathers' house without any feeling of shame being associated with the practice. And the Vedas teach us, that in their times, virtuous maidens remained unmarried in their fathers' house long after they had grown up. On the wedding-day, the bride and bride-groom, are anointed with oil, (the Abhiangana-s'nanam), are dressed in their best and decorated with jewels. The father of the bride has erected a temporary canopy in the court of his house, beneath which she is seated beside her groom, and the family priest commences the ceremony by causing them to make a burnt offering by the Homa sacrifice, of pouring ghee into the fire,—whilst the priest utters a mantram. At the same instant, by the Navagraha Aratanam, and Asht'ha dik palaka aratanam, a series of incantations, they bring Indra, Varuna, Agni, Yama, &c., from Sorgalogum and locate them in any casual article, in some part of the house.

When seated, the girl is formally given to the husband (Kania-danam) literally spinster giving: a priest blesses some water in a small vessel, and the father of the girl taking this and his daughter's right-hand places them together in the bridegroom's right-hand, saying I do this that my father, grand-fathers, and great grand-fathers may attain (Sorga) heaven. The bridegroom then rising and standing before the bride, amidst the deafening din of tom-toms, ties round her neck the mangala sutram, a thread coloured with turmeric to which a golden jewel called Bottu or Tala is attached. Sandal wood paste, perfume, and flowers are presented to the guests, betel-nut is offered to all relatives and friends and money presents are made. The married couple receive 'Asir-vadam' benedictions and congratulations from the assembly, and as they prostrate themselves at their parents feet, their parents bless them.

The prostrations are also occasionally made at the feet of other near relatives who likewise bestow a blessing. Amongst the brahmans, the ceremonials of the marriage are continued for five successive days, and for three days, or one day, or seven days, with other castes. On the fifth or last day the gods who were brought from Sorga into the bride's home and have been daily worshipped there, are released. Four earthenware pots placed beneath the pandal or canopy are filled with rice highly coloured with turmeric and a Brahman sitting near, by motions from his hands, affects to feed the located gods (Navediam) and then release them. This is the Naka balli, or offering of victims, to the gods of Sorga-locum. And now the parents of the newly married couple, as also relatives and friends, interchange presents and make gifts to the young people. In the evening of that day, the bridegroom takes his wife home. This is done in procession, in which parents and relations join, and is treated as a religious ceremony called "Grahapravesam" or house entering, immediately after which the bride and bridegroom are seated in the middle of the floor, the father of the girl presents them with new clothes, and the relations and friends are feasted. After remaining three days in her husband's home, the girl is taken back to the house of her parents with whom she lives, making only occasional visits to her husband's residence, until puberty. On this event, her father sends word to her husband who presents gifts to the bearer of the happy tidings, fixes on an auspicious day to bring his wife home and intimates the date to his father-in-law. The latter prepares a cot or bed, candlestick, cooking utensils, chairs, boxes and other household fittings, also buys new clothes for his daughter, whom they convey to her husband's house for good, and an entertainment is given to all relatives and friends. Her parents remain in the house with their daughter and son-in-law, for two or three days, and before taking leave of them they give them some advice for their guidance.

Married life.—From this time, the young wife lives with her husband, in subservience to her mother-in-law, or sister-in-law, whichever be the head woman in her new home. As a young thing, she cannot have much to say; but her little ways and tiny talk are at an end, and it is even, on many occasions, considered highly indecorous for her to speak at all. She cannot speak to her husband in the presence of his father or mother or other people, and partly from shame-facedness, partly from fear of them, her husband rarely speaks to his wife in their presence. This intense reserve goes off greatly, as they grow older, but in no instance, perhaps, does the hindu wife ever attain to the same freedom of speech with her husband, as marks the intercourse with the young wife in a mahomedan family, where they are sometimes married equally young, and where their innocent prattle is the very life of the household. At home, however long she be a wife, a hindu woman never eats till her husband finishes his meal, she rises and stands in a respectful attitude if her husband or his parents or brothers enter the house, and at all times addresses them in a low tone of voice and speaks slowly. And so long as the husband's mother, or his sister is the head of the house, the husband communicates his wishes as to what he wants his wife to do, not to her directly, but through his mother or sister. Abroad from home, the hindu husband and wife may at all times be seen walking along the roads, but the wife never presumes to walk at the side of her partner. She is always a pace or so behind and a little at the side. If they be out on matters of business, the wife continues all along the road, to prompt her husband as to what he is to say, or do, but the instant that the place of business is reached, she falls off to a distance and never presumes to take any part in the discussion. In a poor family, the wife, as in all countries, has to perform the entire domestic duties of the household, but with richer people who keep servants, the wife's labours are restricted to superintendence, attention to her children, sewing and other female acquirements. They are in this social respect much in the position that Europe was a few hundred years ago. But there is this difference, that scarcely a hindu wife is able to read or write or even permitted to learn. Lately, in the presidency towns, a few female schools have been established by the better educated hindus, who are desirous that the next generation shall receive educated partners in their homes. But in all India, out of a population of nearly one hundred millions of hindus, there were not, perhaps, in 1860, three thousand girls, of the higher hindu castes, under tuition. The younger men are averse to the continuance of the intense restraint hitherto imposed on their homes and are breaking through it, but these are almost solitary exceptions to the vast mass. Brahman girls are forbidden to be educated at all, and those who urge education on them are opposed by the women themselves who will exclaim what! would you make us as dancing girls! the educational efforts having only hitherto been

directed to such unfortunate sisters, from the fear, and it is shared with many men of the hindus and mahomedans, that education may tempt, by giving facilities, to vice. In this, they evidence a great ignorance of human nature, a more enlarged knowledge of which would convince them that only the training of the moral faculties can uproot vice which, where the evil desire prevails, no restrictions can restrain. The utmost that a brahman woman learns are the songs and hymns sung by women in their own houses, during marriages and other festivals. The hindu wife, bred from her childhood in the strictest seclusion; consigned at an early age to the care of a husband of whom she can have previously known little or nothing, and who is often as dependent upon others as herself—she leads a life of mysterious quietude, varied only by the rites of religion and the ordinary events of the family. Of the world around her she knows nothing. All her thoughts and feelings, joys and sorrows, desires and affections, are imprisoned within the little circle of her own household. Her mental faculties are either altogether undeveloped, or wasted upon toys, ornaments, idle tales, family gossip, or similar frivolities. Her moral powers too are overlaid by superstition and prejudice. Yet these ladies are the mothers of the rising generation who are acquiring a language and the literature of Europe and fondly imagining that its members are as capable of exercising the rights of self government and self control as those who have sprung from the free and independent women of the western world, whose mothers in the warlike ages, took part in the councils of their nations and accompanied their warriors to the field. Hindu wives are only allowed to speak to their nearest relations, fathers, brothers, &c. and are never trusted from home alone. Married women, when at the daily bath, smear their bodies with turmeric, and place on their foreheads the round mark with the red colouring matter from the turmeric? and like many other orientals paint their eye-lashes with lamp black. Married women also wear a boddice. Though the shastras permit the hindu widow to re-marry, custom which is more rigorous forbids it, and, once widows, they ever after remain single.

Death and future state.—When a hindu dies, there is the usual tokens of grief amongst relatives; but women, evince their emotion with great demonstrations and noise, proclaiming aloud the good qualities of the deceased as they beat their breasts and mouths. The death wail is heard far distant, and once heard is never forgotten. Relatives, and friends, on learning the melancholy tidings go to the house of mourning to condole with the bereaved family and the women join in the death wail, which rises loud above all the other sounds of the busy world around. As death is drawing near, however, the attendants after purifying the house with cow-dung, perform the Jiva Praias-chittam, by laving the dying man's body with water, placing in his mouth or causing him to drink a little milk, buttermilk, honey, treacle and plantains (panchakavia) and then releasing a cow. Such an ordeal few men in weak health could withstand, and it may not be doubted that it is never performed without hastening the fatal event, for the attendants force the five things into the dying man's mouth. After demise the corpse is washed and dressed. The family priest pronounces certain mantrams of purification over it, for every household has its own brahman teacher. It is borne on a bier to the burning ground, by four men, and followed by relatives and friends, both men and women. A large heap of firewood and dried cowdung cakes, has been already gathered together there, which are stacked up over the remains and the son sets the pile on fire. It is their belief that as death parts the soul from the body, the god of Justice, Yama, sends two angels with an invisible form to receive into it the flitting spirit and convey it to Yama-locum, his hall of justice, to be tried there and awarded its sentence of future punishment or reward. The secretary, Chitrogupta, records the decree, and the disembodied spirit takes up its abode in Sorga, or in Narika, or re-visits earth to be re-born and afforded another opportunity of gaining release from mortality. The day following the demise and incremation, they re-visit the spot. They pour milk or water, or milk and water over the ashes and make an offering of rice, to the Preta, the departed soul. On the second, third or fifth day, the son selects any small black stone or three blackstones which he places against a pipal tree, Ficus religiosa, on the bank of a pond or tank. This represents the deceased, or rather his Preta is supposed to be located in the stone and where three stones are used, those also of his grandfather or great grandfather, and each day the son offers to the stone or stones a water sacrifice to quench the thirst of the departed. He also cooks rice there, and offers it to a crow to satisfy the hunger of the deceased; he continues this every morning till the tenth day; because it is the hindu belief that the soul of the departed hovers about the house for ten or twelve days, and then takes up that future habitation which, according to their view of the

transmigration of souls, may be its lot. On the tenth day, the stone is thrown into the water. The object of all this, is their belief that the shade of the departed is occupying five separate beings and places, one descends upon his son, a second rests on the place of incremation, a third in the house he has left, a fourth in the stones that are raised to represent him, and the fifth in the crow to which the food is thrown And if the crow refuse the food, the beholders deem it an augury of the ill life of the departed, or that some object of his life remained incomplete. If the deceased was a married man, the "Mangala sutram" or sacred thread, which was tied round the neck of his bride on the wedding day, is now broken by other widows of the family. She ceases to wear a boddice, or jewels, or flowers in her hair. She discontinues the use of turmeric when at the bath, the red mark is no longer placed on her forehead and in many cases the long black tresses are removed, for some classes of brahman women have their head shaved. From this time their lives are one continued scene of misery. Restricted to the meanest of the household avocations, they are treated by their nearest relatives with contumely and neglect. Their very loneliness and bereavement, instead of being occasion for sympathy and endearment, only calls forth harsh, often brutal, treatment. Their very condition is a term of abuse, and denied it on earth many a hindu widow seeks peace in the grave, for there the wicked cease from troubling and there the weary be at rest. On the eleventh day, among brahmans, the son of the deceased selects two or three relatives or several brahmans to be in the place, or representatives, of his parent. They are anointed with the oil of the oriental sesamum. The son presents them with flowers, the sandal perfume and new cloths, and then entertains them. Until they finish their meal, no member of the household is allowed to partake of food. So soon as they rise, however, a morsel of rice is thrown to the crows and the representatives of the deceased are dismissed with betel-nut, new cloths, and presents of money, according to the sons means. All other relations present are then entertained. For one year, from this time this becomes a monthly ceremonial on the day of the deceased's demise. On the first anniversary of deceased persons "Samvatsarikam," a hindu, however poor, must, with much display, perform the ceremonies which are then required. This necessity is a great tax to all of them, but where several deaths have occurred in a family, it is an intolerable burthen, for the rules of their faith compel their performance, and if a person have not money of his own with which to perform this, he must beg for it or borrow it for the purpose. The importance to the deceased of the performance of this anniversary rite, is considered very great, and it is this which occasions the great desire to have a son. If the family be what in law is called a united hindu family, the ceremonial is conducted by the eldest son, but where they have separated, each son must perform it separately. For those who have no sons, the widow can perform it, and the widower husband can do the same for his wife. On the future anniversaries the Sradha only is performed.

Village deities.—Amongst the hindu gods, of which the various Vedas and the more recent Puranas make no mention, are the village deities. Every hamlet has its own object of adoration, always supposed to be a goddess and the idol is generally a black stone or piece of wood. Amongst names given to it are

Ai-Ankal-Amma.	Yellamma.
Poni-Amma or gold mother.	Padavettu Amma.
Kani-amma.	Tulukan Amma.
Yegatal	Muttumari.
Mutialamma or Pearl mother.	Potearamma.
Tripura-sundari or the beautiful of three cities :—	Karikatta.
Paleri Amma or Periya-amma or great goddess.	Tanthoniamma.
Osuramma.	Dandumari.
Sellamma.	Mallamma.
	Chinnamma.
	Ammannamma.
	Choundeswari.
	Vadivatta.
	Nagattamma.

They are also called Amman, (*m sc.*) and Amma (*fem.*) is generally supposed to mean mother, but, the Ammun may also be the western word for the sun. The villagers believe that these goddesses protect them from sickness and losses, and that their worship averts or remedies such. A pujali or pujari, a worshipping priest, of the sudra caste, is appointed for her daily worship. He anoints her daily and puts ashes on her head, really on the top of the stone, for it is not an image being entirely without shape, a mere stone from the neighbouring brook or river. In a small pot, he cooks rice, which he collects from the villagers in turn, presents it to the idol and then takes it to his own home. He breaks a cocoanut in front of the idol, to which he offers it. But the one-half he keeps for himself and gives the other to the families from whom he collected the fruit. The villagers make vows to their goddess to offer up to her fowls and sheep in sacrifice, if she will fulfill their desires. Once a year, the villagers collect money by subscription.

and celebrate a feast in honor of their goddess during which sheep and fowls are largely sacrificed. The sudra hindus and the entire servile tribes in the south of India, have the fullest faith in their respective village goddesses. When they or their children are overtaken by sickness, they seek the idol, and consult the pujari, who sings songs, affects to hear the Amman's voice, and then announces to the worshipper the offering that must be presented. If cholera break out it is not unusual for some neighbouring village deity suddenly to rise into great importance and the sacrificial rite is then almost unceasingly performed. The hindus too have even personified this pestilence into a goddess whom they have named Maha Kali, and believe that if they neglect her worship she destroys them by the disease. Indeed gods are still in process of establishment and small pox and cholera, have thus been personified, Maha-Kali of Ujjain being the goddess of cholera and Mari-Amman of the Tamils is a small pox deity. When a person is attacked with small pox, they believe that the goddess has taken possession of the sick man. They entertain a great dread of this goddess. While in the house, the sexes remain apart until recovery and until the sick has been purified by ablution. They place the leaves of the margosa tree besides the sick person, because the goddess is supposed to delight in this tree. They give cooling food but employ neither internal nor external remedies, in reverence for the deity. The women of the household, offer rice flour mixed with jagri or coarse sugar and black gram (pairu, Tam. pesalu, Tel.) before the patient in honor of the goddess, and afterwards distribute offerings to sudras and others. On the seventh day, *i. e.* what medical men call the 15th day, the invalid is bathed in cold water, and the whole body rubbed with a pasty mixture of leaves of the margosa (melia and azadirachta) mixed with turmeric, and on the same day rice mixed with curds are distributed to sudras. If in the virulence of the disease an eye be lost, it is attributed to something having been done, displeasing to the goddess. The goddess indeed is supposed to appear in three forms as Tatta ammavaru or Chinnamavaru, i. e. small goddess or measles. Peddamavaru or great goddess or small pox, and Pairammavaru or goddess of green gram, the two first of which are most feared.

The cow.—Hindus regard the cow as sacred. Every morning, the hindu wife or maid servant spreads the floor with cowdung mixed with water, partly as a holy duty, partly for cleanliness. She sprinkles the urine of the cow over her head, and sprinkles it about the house in purification, when anything has occurred to make it, in their religion, unclean. Every morning on rising from bed, every hindu is enjoined to cast a glance on the objects mentioned in the following

Slokam.

కపిలాందర్శనంభానుం। భాగ్యవంతంచభూపతిం।
ఆచార్యమన్నదాతారం। ప్రాతఃపశ్యేత్పతివ్రతాం.

A (kapalam brindled) cow, a mirror, the sun, a rich man, a king, a priest, a giver of rice (in charity) and a chaste woman. It is not, however, the cow's face, but its tail, on which they cast their look, there being no merit in its face Their faith regards the protecting of the cow as a highly meritorious duty. When a hindu is dying, his relations give a cow to a brahmin, and repeat the gift on the eleventh day after the demise. When a brahmin is married, the father of the bride always gives a cow, "Surabhi," to his son-in-law, along with other presents. Every Friday, the hindu wife washes her cow. She smears its face with turmeric and ornaments the animals forehead with a round mark from the red powder prepared from lime and turmeric. Some hindus call the cow Kama Denava, or Kama-dhenu, the servant of Indra, other hindus believe that the cow is Lakshmi, the goddess of prosperity whom they thus propitiate by their worship. If they see any one beat a cow they will beseech him to desist. Those who do not possess a cow, will buy some grass and give it to that of their neighbour, and regard this as meritorious. Amongst the five deadly sins, is that of killing a cow, the other four are killing a brahman, a pregnant woman, a child, and killing one's mother.

The bull is the vahan or vehicle of Siva and called nandi. In all temples of this god, may be seen the image of this animal made of black stone kneeling before the lingam and yoni, the symbols of Siva and Parvati. And, in pictures, Siva is invariably represented riding on his vahan or vehicle, a bull. A bull, both in the Saiva and Vaishnava temples, carries the kettle drums which are sounded for worship, three times daily. When a cow or bull falls sick, hindus will vow that if the animal recover, it shall be left in the temple; and every Friday, the brahmins employed in the services of the temple when they lave Siva's symbol and the nandi with milk, in the ceremony called Palu Abhishekam, the devoted bullocks are likewise thus washed.

Clerical and lay hindus and forms of worship.—The hindus are classed as Vaidikam and Laokalam or Lao-kikam, clergy and laity. It is a common notion that the brahmins, of India are the priests of the hindus. but this is not correct. Even brahmins, though of the priestly or sacred order, are not all priests, the vast bulk of this class being employed in lay pursuits, as soldiers, merchants, lawyers, clerks, perhaps in every avocation of daily life except such as involve manual labour which in the south of India, is not known though they are agriculturists in northern India. Various sects of hindus have priests of the sudra caste, and the many Pariah races employ members of their particular tribe or race. Speaking in a general way it may be stated that where the people of India are followers of the Puranas and Vedas, their priests are invariably brahmins, but the extensive Lingait sect and the Jain, and all the sects or tribes who worship the village deities, or adhere to spirit or devil worship, select priests from their own classes. Also the komsallar, or artificer tribes of sudras, all of whom wear the sacred cord, though paying respect to brahmins, select an ascetic member of their own caste as their priest. They have also their family priest from their own circle. Indeed they claim for themselves a superiority to the entire brahminical order, asserting their origin to be higher, and no one of the komsallar would accept of water from a brahmin. But, in the usual discrepant character of the people although the komsalar claim that their caste is superior to that of the brahmins and though they have got the brahminical vedas yet their manner of conversing and dressing their women's clothes and ornaments resembles that of non-brahminical castes. There also exists a vast difference in their religious matters; and, in paying respect to brahmins they say and use the "Dandam" and not, as from an inferior to a superior the Namaskarum, as one brahmin will to another. Amongst the saiva sect who have brahmin priests, he is styled sankara chari, and is invariably a sanyasi or ascetic. He resides in a matham or monastery along with other brahmins to whom he imparts religious instruction or preaches. He is greatly reverenced by his disciples, who regard him as almost equal to a god. The monastery is supported by the disciples' gifts. The members of the monastery are charitable to all the poor, and erect temples out of surplus receipts. But the head of the establishment, the Mat'ha di-padi, when he travels to superintend his followers, does so with vast pomp and display, in a litter of a peculiar form, often richly ornamented, and accompanied by a great concourse of people, with elephants, horses and conveyances for his property. Like all sanyasi and brahmins engaged in religious duties the members of the Matham bathe thrice daily. Twice daily, the chief worships the salagrama, a fossil ammonite from the Gogra, or a gold, silver, or copper idol of Kristna or Siva. After washing the idol with water he decorates it with the sectarian mark and worships it with offerings of flowers and tulsi leaves, he drinks a little of the water used in the worship and the rest is carefully preserved in a silver cup along with tulsi leaves, and given from a small spoon, "Voodharni," into the hands of disciples who greatly esteem the gift as cleansing from all sin. The head priest only eats once a day, and before taking his meal, he invariably presents it to the deity. Disciples when they approach the head priest, prostrate themselves before him.

Superstitions.—The hindus believe in omens, good and bad, and look for them, as encouragements or warnings, on most occasions, such as in journeying from one place to another or when a marriage is on the tapis. It is considered a favourable omen, if when proceeding on business, a crow fly from left to right; or the traveller meet two brahmans; or a married woman; or a sudra with a stick in his hand; or a jackall be seen. If these good omens occur they believe that they will certainly succeed in the object of their journey. It is a bad omen to meet a single brahman; or a widow; or if a crow fly from right to left: or a cat cross their path. On seeing any of these evil omens, almost every hindu will postpone his journey, however emergent; though in this latter case he may return home for a little and start again. It is a good omen if when a marriage is under discussion, the toll of a bell be heard or the neigh of a horse. But a person sneezing, or the sudden extinguishing of a light, are bad omens.

Ceremonials of worship.—A brahman who attends to his religious duties, bathes before sun rise in cold water and performs a water sacrifice or libation from his hand: for instance he says—

అపవిత్రః పవిత్రోవా సర్వావస్థాం గతోపివా
యస్మరే త్పుండరీకాక్షం సబాహ్యా భ్యంతర శ్శుచిః.

Apavitr'ha p'vitrova sărwāwastham g'topiya yesmăret'h Pund'rikach'm sūbāhia bhi'ent'r'aha shuchihi.

i. e. He who meditates on Pundri kachă (he with the lotos-eye) though a very great sinner, will be forgiven.

ఆపోహిష్టా మఐూభువఃు స్నాన ఘ్రూజెక దథా తన మహేరణాయ చక్షనై ఐూవ స్పివతమో రసఃు తస్యభాజయతే హన్నఃు పుశతీవ మాతరఃు తస్మా దరం మామవో యస్యక్షయాయ జిన్వథ ఆపోజన యథా చనఃు.

All sins committed during the night by word, deed, mind, mouth, hands, feet, belly, organs, or in anger, will be forgiven by Surié jotishi (the light of the sun.)

The next part of the ritual is the ceremony called అర్ఘ్యం Arg'hiam which is performed to free thesun from the Ragshisa who is striving to hinder its appearance. This consists in offering, four times, a water sacrifice or libation, by taking water in the hands and throwing it on the ground, as he four times pronounces the Vedic gaitri:

ఓం భూర్భువ స్సువఃు ఓం తత్సి వితు ర్వరేణ్యం భర్గో దేవస్య ధీమహి ధీయో యోనఃు ప్రచో తయాత్.

O'm! Bhurbhuvă ssuvahā, O'm! Tatsa vit'hru varennyăm. B'hargo dévăsyă dhimahi dhiyo yonaha pracho dăyăth.

O'm! Earth, air, heaven. O'm! let us meditate on the supreme splendour of the divine sun. May he illuminate our minds.

After this he prays at length or briefly, at will, but it is in the form of a commenting or expounding of the above gaitri, something in this wise,

ఓం ఇత్యే కాక్షరం బ్రంహ్మ అగ్ని ర్దేవతా బ్రంహ్మ ఇత్యారుషం గాయత్రీం ఛందం పరమాత్మం స్వరూపం సాయుజ్యం వినియోగం ఓం ఆయాతు వరదా దేవి అక్షరం బంహ్మ సంమితం గాయత్రీం ఛందసాం మాతెదం బ్రంహ్మ జుష స్వామె యదహ్న స్తుకురుతే పాపం తదహ్న స్త్రతి ముచ్యతెయద్రాత్రియా తుకురుతే పాపం తద్రాత్రియా త్రతి ముచ్యతె. సర్వ వర్నె మహా దేవి సంధ్యా విద్యే సరస్వతీ ఓజోసి సహొసి బలమసి బ్రాజోసి దేవానాం ధామ నామాసి విశ్వ మసి విశ్వాయుఃు సర్వమసి సర్వాయుఃు అభిభూరోం గాయత్రీ మావాహయామి సావిత్రీ మావాహయామి సరస్వతీ మావాహయామి ఛందరుషీ మావాహయామి శ్రీయ మావాహయామి బల మావాహయామి గాయత్రి యాగాయత్రి ఛందో విశ్వామిత్ర రుషిఃు సవితా దేవతా అగ్ని ర్ముఖం బ్రంహ్మ శిరఃు విష్ణుఃు హృదయం రుద్ర శ్శిఖఃు పృథివ్యోనిఃు ప్రాణాపాన వ్యానోధాన సమానా సప్రాణ శ్వేతవర్న సాం

O'm! is Brahma: its god is Agni. Bramha is Rishi. Gaetri is Chanda: the form is Arsham (the true being): its province is to join Para Brahmam (Supreme being) and it is the giver of everything asked. As the Gayatri is the purest of all Chăndas, I beg to be shown the form of Para Brahmam and to be forgiven the sins committed by day and night. I beg that the Gayatri, the form of Para Brahmam, Saraswati, Mukti, Locum (the world,) kălăm (ages of the world), all created things of the world, and their lives, may pervade my heart. He then meditates on the Gaitri, Savitri, (the sun), Saraswati, Chandrushi, &c. As for Gaitri, Gaitri is Chanda, Viswa-mitra, Rishi. Suria (the sun) is god; Agni is face; Brahma is head; Vishnu is heart; Rudra is hair; Prit'hivi is the yoni; Pancha-pranalu (form of five lives) prana, pana, viana, udana, samana, S'weta-varna (white colour) Sankhayanasa, Gotra (tribe); and twenty-four letters, three feet,—six bellies, five heads, as such I pray and believe. The worshipper here repeats the Gaitri, ten times over and over, for it is regarded as the holiest verse of the Vedas. And he again meditates on its beauty and sanctity. He says, Gaiuri is splendour; is like pearls, corals, sapphire, gold, &c. It wears a crown studded with moon and precious stones, and he invokes Tatwam (Chastity,) Vara pradai (bestower of gifts), and he who possesses the Sanka, Chakra, Gada, &c., (Vishnu).

మిత్రస్య చర్షణే ధృతఃశ్రవో దేవస్య సానశం సత్యం చిత్రశ్ర వస్రమం మిత్రోజనాక్ యాతయతి ప్రజానన్ను మిత్రోధాధారా పృథివీ ముతద్యాం మిత్రఃకృష్టి రనిమిషా భిచష్టె సత్యాయ హవ్యం ఘృతవ ద్విధేమ ప్రస మిత్ర మర్తోస్యా అస్తు పయస్వాక్ నవ్యస్త ఆదిత్య శిక్షతివ తేన నహ స్యతే సదియ్యతె తోతో నయన మగుంహూ శ్నో త్వంతితో నదూరాత్ ఓం నమఃప్రాచ్యై దిశే మొదలయిన మంత్రములు.

Mitrăsĭa chershané d'hrutăha s'rāvo dévăsĭa s'ianasim sat'iăm' chitras'ra was'ramăm mitroj'năn ū yatăiti prajăuănū mitrodha-d'hāra prudivi mutadĭam mitrăhă kristĭhi animisha bijast'he sat'iaya hav'iam, ghrutăvā d'vid'hema prasa mitra mărtĭo āstu paia 'swan niasta aditia titchativra ténanahanaté năjiaté toto nayana m'gumao ashno tientito nadurat'h O'm nămăhā prachai d'sé.

In this he prays or offers supplications to Suria (the sun), and to the cardinal points prachi-desa, dachina, pradichi and udichi and their deities Agni, Yama, Nairuti and Eshania, and prostrates himself in adoration. He begs that the Rishis who dwell between the Ganga and Jamna may always be with him, and again prostrates himself to them, and also to Sundeya, Gaitri, Savatri, Saraswati, and all the gods; also to the Rishis, Munis, Gurus, and Pithrus. He prostrates himself to Prit'hivi, (earth) Apana (water) Tej'ha, (light) Vayu (air) and Akasam the god who possesses the form of the five elements and begs Sandeya who is adored by all creatures, all created things and prapancham (the world) to protect him. If a Saiva he also thus meditates: Siva is Vishnu and Vishnu is Siva; and Vishnu's heart is Siva's heart, and Siva's heart is Vishnu's:—If a Vaishnava, he prostrates to Govinda and to Kristna, as the protector of the world, and implores that as the water from the sky is gathered on earth and flows to the sea so to let his prayers be gathered by all the gods and offered to Kesava (a name of Vishnu). He then pronounces the name of J'năr dhana, (the protector of mankind) and prays that all virtue and blessings may attend those that go to all the sacred rivers and read all the sacred books. He then prostrates himself (to Vasu deva if a Saiva) or to Vishnu (if a Vaishnava) to Sarvantariami, god, who pervades all creatures, and prays him to bless all the brahmins and cows within the four seas, mentioning his own name, his Got'hram or tribe, Rishis. At the close, he offers to Narayana, his deeds by body, mouth, heart and senses.

This concludes the morning prayer. At noon, the same is repeated, and he prays to Suria (the sun) in words to the following effect.

ఆ సత్యేన రజసా వర్తమానో నివేశయన్ అమృతం మర్త్యంచ హిరణ్యయేన సవితారథేన ఆదే వోయాతి భువనా విపశ్యన్ మొదలయిన మంత్రములు.

Asătiénah rājīsa vartămano niveshiennu am'rutăm martiencha Hirănaiéna, sawitaradbéna adé, vo-yati bhuvana vipāshiennu.

In the evening, the same prayers recur, and he implores Varuna (the god of the West,) in sacred words commencing

అగ్నిశ్చ మామన్యశ్చ మన్యుపతయశ్చ మన్యు కృతేభ్యః పాపేభ్యో రక్షంతాం యదహ్నాత్ మొద లయినవి. యిమంమే వరుణ శ్రుధి హవ మద్యా చ మృడయ త్వావ మస్యురాచకే మొదలయిన మంత్రములు.

Agnistchia, Mamaniastcha, Manninpātayastch, Manniukrutébhiyāha papébhi'yo, rakchântám Yadanu'hat. Imámmé Varuna s'ruti hávám adiaétha murudaya twama vas'yurachaké.

Legal rights of husband and wife.—After this general view of their social customs, their legal rights in marriage may now be described. A girl is accounted by law marriageable at the age of eight. Girls are however given in marriage at the age of two, and upwards, till they attain their maturity. A brahmin girl attaining maturity without having contracted marriage forfeits her caste. The girl when married remains with her own family until she reach maturity, when her husband can claim her and remove her to his house. The right of choosing a husband for the girl rests first with her father. Should he have demised, it devolves in succession upon her paternal grand-father, brother, paternal uncle, male paternal cousins, and lastly upon her mother. If these relatives should have neglected the duty of choosing a husband for the girl up to three years after she may have attained the age of eight, she is at liberty to choose for herself. The three superior classes, namely the brahman, or the sacerdotal order, the Kshatrya, or the military tribe, and the Vaisya, or the mercantile body, may not contract marriage until they have completed the stage of studentship (Menu iii. 4., the opening of which period is marked by performance of the upianayanam, or investiture with the sacred thread, and the close by a ceremony termed Samavusthana. For the sudras, or the servile class, who have no stage of studentship, there is no limitation as to the time for marriage. There are eight species of marriage viz: Brahma, Daiva, Arsha, and Prajapatya which are appropriate for brahmans, and are based upon disinterested motives; the Gandharva and Rashasa, which are appropriate for Kshatryas, and are founded the former on reciprocal desire, and the latter on conquest; the Asura, which is practised by Vaisya and Sudras, wherein the consent of the party giving away the girl is obtained by a pecuniary consideration; and the Paishacha where the marriage may have been effected through fraud practised upon the girl, and which is reprobated for all classes. Though each class has its characteristic description of marriage there is nothing to bind them to the rites appropriate to them. A brahman for example may contract an Asura marriage and a Sudra a Brahma one. The Brahma and Asura are the most usual species of marriage. The former is an approved one, and the latter, as a sordid proceeding, is disapproved (I. 42, 43; *Macnaughten Jurr. I.* 60.) The binding circumstances essential to the completion of a marriage are gift and acceptance of the girl, and the ceremony termed Saptapathi, or the seven steps. This is performed by the bridegroom placing the bride's foot successively on seven lines drawn on rice in a platter. From this observance has followed the practice of any two persons pledging mutual friendship by taking seven steps together, so that the term Saptapathinam has come to be synonymous witlr friendship. The ceremonial in question accomplishes the marriage. The other ceremonies observed, including sacrifice by fire (Homam,) are of minor significance. The tying the tali, or nuptial token, by the bridegroom round the neck of the bride, is a practice sanctioned by usage, but not prescribed in the Sastras. The above matrimonial contract in itself fixes the condition of the parties as married, irrespective of the consummation of the marriage when the female, on reaching maturity, is taken home by the husband. It brings the girl, should her husband, die, to the state of widowhood, with its attendant consequence, and gives her right of inheritance in her husband's family. When either party incurs forfeiture of caste, intercourse between them ceases; and should the loss of caste be on the side of the female, and she be sonless she is accounted as dead and funeral rites are performed for her (Smruti chandrika, on text of Vasista and Yajna vulkia.) If she have a son, he is bound to maintain her, and in this way, under such circumstances, her existence is recognized notwithstanding her loss of caste. Infidelity in the female, save in certain of the lowest classes, occasions forfeiture of caste and puts an end to the marriage (Smruti chandrika.) The husband however is not entitled to damages from the adulterer, the Hindu law not providing for discretionary damages upon any account. Impotence in the man and confirmed barreness in the woman, as also loathesome or incurable disease in either, justify separation (I 47), but will not sever the marriage.—(*Strange's Hindu Law.*)

Ancient India.—Many cairns, or heaps of stones or tumuli, piled over the resting place of the dead, are found in different parts of Southern India, and have been described by Major Congreve and others. Prior to the buddhist Stupas or Topes, this seems to have been a common mode of covering the dead; indeed, as Colonel Cunningham remarks, the Tope is only a cairn regularly built. On the Neilgherry hills are found remains of cairns, burrows, cromlechs, kistvaens, and circles of upright loose stones which are nearly identical with those found in Europe, in the ancient seat of the Celts; and cairns are also found in many other parts of the peninsula, and whatever mystery may hang over those remains and over the race of which they are the only surviving relics, there seems no reason for hesitating to style them, in a general sense, Druidical. In these cairns or burrows, vases, cinerary urns, and other vessels of glazed pottery are often found, which sometimes contain human bones, more or less charred, and mixed with ashes, sometimes a little animal charcoal alone. They are met with in various districts in the Presidency of Bombay, in Malabar, in almost every part of the Dekkan and peninsular India, from Nagpore to Madura, in immense numbers on the Anamalay Hills, a range on the south side of the great Coimbatore gap, which forms the commencement and northern face of the Southern Ghats, those on the Anamalay being of a more advanced order and in a better condition than the Neilgherry burrows. Similar remains are found in Circassia and Russia, and circles of stones surrounding ancient graves are found on the Southern Arabian Coast and in the Somali country in Africa. Major Congreve directed much attention to those on the Neilgherry Hills, and Captain Meadows Taylor discovered and examined a large number of these remains at Rajan Kooloor, in Sorapoor and also at Siwarji, near Ferozabad, on the Bhima, and devoted much attention to the comparison of them with similar remains found in England. He calls them Scytho-Celtic or Scytho-Druidical. Neither the Hill people, the Toda and Curnbar, nor any Hindus know anything about the race to which these Druidical remains belonged, and neither in Sanscrit literature, nor in that of the Dravidian languages is there any tradition on the subject. The Tamil people generally call these cairns pandu-kuri; meaning old-pit. The race who raised these cairns were probably dwellers in the country prior to the advent of the present Dravidian occupants, and were expelled by or ultimately became absorbed in the latter, or they may have been a race of nomade Scytho-Druidical shepherds, who wandered into India after it was peopled and settled, about the beginning of the christian era, and then wandered out again or became absorbed amongst the people of the country. But the remarkable fact connected with the people, whose religious rites and usages of sepulture gave rise to these cairns, is that they have everywhere disappeared from peninsular India, and not even a tradition of their existence survives, though the Gond races in the Vindhya use great stones over the graves and the Khassya in the North East erect minhars. The resemblance of the burrows and their contents with the cromlechs, &c. to the Druidical remains which are discovered in the ancient seats of the Celtic race in Europe is too exact and remarkable to be accounted for on any other supposition than that of their derivation from the same origin. Hence the people who introduced Druidical rites into India, must have brought them with them from Central Asia and they must have entered India at a period as early as the introduction of Druidical rites into Europe. (*Dr. Caldwell's Grammar*) In India, the topes or tumuli of Kraku-chanda, Kanaka and Kasyapa, existed before the preaching of Sakya; and the ancient elemental deities of the Vedas preceded the worship of Dharma or concrete Nature.

Sectarian marks.—Amongst the peculiarities which first attract the eye of a stranger on seeing these religionists, are the red and white marks on their foreheads. Their prominence is often so glaring as to be unseemly. When the theistical Sikh religionists hastened from the Punjab, in 1857 and 1858, to aid in quelling the mutiny and rebellion in India, in their wild enthusiasm they named all the hindus contemptuously 'Matha Din,' literally, carrying their faiths on their foreheads, and a more expressive term could not per-

haps have been coined; for all that ordinary hindus know of their religion are the differences in these sectarian marks, which indicate differences of religious sects not of castes.

The sectaries have a superstitious regard for such distinctions. It is held necessary, where convenient or no especial objection or difficulty exist, for these marks to be daily renewed. A brahman cannot perform any of his daily sacrifices, &c., without the completion or contemplation of this distinction; and it is irreverent in one of an inferior tribe to approach a holy man or to ask his blessing, or to partake in the benefit of any religious rite, without, or in view to, this sectarial decoration. The Saiva, called Siva-bakht, worshippers of Siva; and the vaishnava otherwise Vishnu-bakht, worshippers of Vishnu, are to be known, the former by the horizontal position of their forehead lines, and the latter, by their perpendicularity. One perpendicular mark, centrally between the eyes, is generally referable to one of Vishnu's sectaries: it is not common. Two upright paralled lines, with a black or open circlet between or under them are the commonest distinction of vaishnavas, whether seen on pictures of Vishnu himself, or on Rama and Krishna, or others of his avatars. Bartolomeo p. 404, says, that "the smearings or paintings on the breast and forehead, with yellow, red, or white earth; the lateral strokes, white, or yellow; the middle, always red, represents, the 'medhra,' or womb, of Bhavani, from which every thing existing was produced; and is much used by the Shivanites and Vishnuvites: he calls the hieroglyphic Triumanna, the holy earth. Also another mark as Shula, and Trishula, is the trident held by Siva, as a symbol of his power over heaven, the earth, and hell. The Shivanites, he says, paint them with white earth on their forehead and breast; and some call it Tirnama, that is, the most sacred name of god." A circle, with one line raised on it, is often seen. The circle or dot, alone, is often seen both in men and women of both grand divisions, or sects. Major Moor's Pandit called the dot purma, a point, typical of the deity, having neither length nor breadth, self-existing, containing nothing: the circle, he said, similarly, was Brahm—without beginning or end, unity, perfection. In general, perpendicular lines appertain to vaishnava sects, and horizontal lines, appertain to saiva sects, Siva, Parvati, their offspring or adherents. Mr. Colebrooke says, that the Saiva and Sacta draw on their foreheads three horizontal lines, with ashes, obtained, if possible, from the earth on which a consecrated fire has been maintained; adding a red circlet, which the Saiva mark with red sanders wood, the Sacta sect when they avow themselves, with saffron, or with turmeric and borax. The Saura also are distinguished, he says, by the horizontal triple line, made, as well as the circlet, of red sanders; while the Ganapatya, or adorers of Ganesa, use red minium for the circlet: Mr. Colebrooke does not notice what lines the latter delineate on their foreheads, but these being a Saiva sect, the lines are horizontal and of white ashes. They likewise use three lines, open and closed at the ends, with and without dots; or the dots over, under, and central: the lines of equal and unequal lengths; the dots or circlets of different hues; and the central marks of different shapes and positions. The brahminical Buddha is sometimes marked. In one avatar, where he is seated in the usual position in a temple, he has a mark in white, tinged with yellow: he is represented as a very fair handsome youth, two handed, decked with a gay coronet, earrings, garlands, &c., &c., and with an appearance of hair: two long-haired fair attendants fan him; and two cows are near his temple. In another, he is four-handed, without any mark: in a third, he is four-armed, with the mark of red lines and the dot black. Major Mackenzie says, that "the Jain mark their foreheads with sandal powder; and some have a small circlet of red powder in the centre of the sandal mark:" but the sort of mark is not hence discoverable.

Sacrifices.—Various sacrifices are familiar to many hindu sects. Gavu, *Tel.* Bali, *Tam.* Fida, *Ar. Pers. Hind* Kurban, *Arab. Pers. Hind.* Sadqa, *Arab. Pers. Hind.* Magha, *Sanse.* Tamasapooja, *Tel.* bloody sacrifice. Satwikapooja, a sacrifice in which there is no blood shed. Narabali human sacrifice. Sacrifices of animal life still form part of the religious rites of many races in southern Asia, and even human beings, as in the meriah sacrifices of the Kond districts in Ganjam, are offered up though it is reported that the year 1860 passed by without a single meriah. With the hindus, however, male buffaloes, sheep, and goats, and fowls are constantly sacrificed, and mahomedans occasionally sacrifice a camel, a sheep, a goat or a cow.

Sacrifices are common to all races and religions. They assume the form of offerings of the raw products of the earth, of cooked food, of water, and of living creatures. The earliest historical record is met with in the

Old Testament. The contest recorded between Cain and Abel, marks the jealous rivalry and strife between the powerful overbearing dwellers in cities who bear arms and till the ground and the harmless nomade shepherds. The first victim was Abel, but the struggle runs through the whole history of Asia. In the early ages of the world the offerings of living creatures was deemed the more acceptable, and, in the time of Solomon, an instance (2nd Chron. ii, 5) is recorded of the sacrifice of 22,000 oxen. The vedic offerings were of cooked food, delicious food and drink: the Rajasuya was a royal sacrifice and the Janamajaya was a sacrifice of snakes. The brahmins of India claimed a right of officiating at sacrifices. The Rajasuya of the Arian race was a sacrifice to the gods, in acknowledgement of sovereignty and supremacy. Originally it was a great national feast. Isaiah (i. 10-14) openly denounced the sacrifice of animals as an atonement for sin. "Hear the word of the Lord, ye rulers of Sodom; give ear unto the law of our God, ye people of Gomorrah. To what purpose is the multitude of your sacrifices unto me? saith the Lord: I am full of the burnt offerings of rams, and the fat of fed beasts; and I delight not in the blood of bullocks, or of lambs, or of he goats. When ye come to appear before me, who hath required this at your hand, to tread my courts? Bring no more vain oblations; incense is an abomination unto me; the new moons and sabbaths, the calling of assemblies, I cannot away with; *it is* iniquity, even the solemn meeting. Your new moons and your appointed feasts my soul hateth: they are a trouble unto me; I am weary to bear *them*." About the same time as Isaiah, Muddha appeared objecting to the animal sacrifices. The homa, an offering of ghi to the fire, from the dhenkna or sacrificial ladles; also the Pataya, sacred food of rice and milk, cooked in sacrificial kettles, are offerings, of hindus. Mr. Wheeler is of opinion that the homa was introduced by the brahmans to displace animal sacrifices.

Amongst other ancient Vedic customs was that of the self sacrifice of wives on the funeral piles of their husbands. It is related in the Mahab'harata that after the battle of Kurukshetra, when the widows of the slain were talking over their losses, Viyasa bid them repair to the banks of the Ganges. Viyasa also was present and called out the names of the slain. All appeared in great glory and splendour and more beautiful than when they were alive, and widows went to their husbands, and daughters to their fathers and mothers to their sons, and sisters to their brothers and all the fifteen years of sorrow which had passed since the war of the Maha Bharata were forgotten in the ecstasy of seeing each other again. The night passed away in the fullness of joy, and when the morning dawned all the dead mounted their horses and chariots and disappeared, but Viyasa said that the widows who wished to rejoin their dead husbands might do so, and all the widows went and bathed in the Ganges, and came out of the water again, and kissed one by one, the feet of Dhritarashtra and Gandhari, and then went and drowned themselves in the river; and, through the prayers of Vyasa, they all went to the place they wished and obtained their several desires.

In the hindu sacrifices, the sweet smelling kusa grass, seems to have been employed, and also a spirituous fluid, which they called the soma juice, and the Persians called poni. What this substance was is doubtful, but it had stimulating and intoxicating qualities, for the Rig Veda (iv) says, "the purifying Soma like the sea rolling its waves has poured forth songs and hymns and thoughts." It has been said to be the fermented acid juice of the Sarcostemma acidum, the Shomluta of Bengal, but the fierce exultations which are noticed in the Rig Veda, could only have been produced by strong alcoholic drink.

The duty of offering to the Lord of the first of every product has doubtless almost a universal hold on man. Exodus xxii and 29 commands the offering of the first fruits, and the same is enjoined in Deut. xxvi, 2; Lev. ii, 12 and numerous other places. Gen. iv, 4 tells us that Abel brought the first of his flock, and Ex. xiii, 12 and other places enjoins that the pouring out of water as an oblation is a very ancient rite, David when pressed by the people of Palestine, craved for a drink from the well at the gate of Bethlehem, afterwards would not drink it when brought by three men, "but poured it out unto the Lord." Ages prior thereto (Gen. xxxv, 14), Jacob is mentioned as setting up a pillar and he poured a drink offering thereon, and he poured oil thereon. Wine was occasionally used, as in Numbers xxviii, causing the strong wine to be poured unto the Lord for a drink offering I Samuel vii and 6. Israel gathered together to Mizpeh and drew water and poured it out before the Lord. The sacrificial rite, with human beings, seems to have prevailed amongst many peoples. We read in the Old Testament that Jephthah, when in pursuit of the Ammonites, vowed a vow unto the Lord, and said, "If thou shalt without fail deliver the children of Ammon into mine hands

then it shall be, that whatever cometh forth of the doors of my house to meet me, when I return in peace from the children of Ammon, shall surely be the Lord's and I will offer it up for a burnt-offering. * *

And Jephthah came to Mizpeh unto his house, and, behold, his daughter came out to meet him with timbrels and with dances. * * And he said, alas my daughter * * I have opened my mouth unto the Lord, and I cannot go back. * * And it came to pass that at the end of two months, that she returned unto her father, who did with her according to his vow which he had vowed: and she knew no man." One interpretation which has been put on the character of Jephthah's offering, from the concluding passage, viz.: that his daughter remained a virgin for the Lord's sake, is not supported by the preceding words where Jephthah declares the object of his vow should be a burnt offering. The readiness, also with which Abraham obeyed the command to offer up his only son Isaac, indicates an existing knowledge of this rite. Amongst the Arian hindus, the sacrifice of a horse, the Aswamed'ha, seems to have been practised in their religious rites. There are two hymns in the Rig Veda, describing the rite, and which leave no doubt, that in the early religion of the race, this sacrifice, as a burnt offering to the gods, was had recourse to. It was even then, however, falling into disuse, and was existing as a relic of an antevedic period, imported from some foreign region, possibly from Scythia, where animal victims, and especially horses, were commonly sacrificed. And in still later times, the Aswamed'ha consisted in certain ceremonies ending in the liberation of the horse, as throughout India is still practised with a bull or cow, many of which are met with in every village, freed or let loose in the name of Siva or Vishnu. Human sacrifices were actually performed by hindu races in India. And though the rite is more and more rarely performed the meriah sacrifices, the head-hunting of the Dyaks, and the cannabalism of the further Archipelago, up to the present day, can but be regarded as the partial continuance of rites which must have had a wider range in times long gone by. In fact the Purushamed'ha or human sacrifice, is prescribed in the Puranas, though amongst the hindus of the puranic times, the ceremony had seemingly long ceased to be other than emblematical. Some branches of the Scythic stock undoubtedly crossed to America in the early centuries of our era, and they seem to have carried with them the sacrificial customs which have been a peculiarity of all their offshoots. The Comanche, and the Nachez, Indian tribes of North America, formerly buried the wives of a deceased chief, along with him. The Ottawa still offer a horse in sacrifice on the tomb of the dead. With the Nachez, the victims placed themselves on mats and danced the death dance with their executioners, who formed a circle around them. The Pawnee tribes, supposed to be descendants from the ancient Mexicans also offered human sacrifices, though the rite is supposed to have lately fallen into abeyance. These sacrifices took place more particularly in the month of April, that is at sowing time, with a view to obtaining abundant harvests from the Great Spirit. The preparation lasted four days, on the fifth, the victim was bound to three stakes, placed above the funeral pile. He was painted red or black and his breast burned and pierced with arrows, and after his heart was reached, it was torn from his breast and devoured all bleeding. This barbarous ceremony was terminated either by setting the pile on fire, or by eating the victim, whose blood served to water the seeds about to be committed to the earth. But many Indian nations of the northern and western parts of North America celebrate annually solemn festivals when the leaves of the willow have attained their full size. These solemnities are in commemoration of a great event: in propitiation of the superior powers; or are offered in expiation. Among the Mandan, these are prolonged four days, and the greatest cruelties are practiced on the tortured. Abbe Domenech says that amongst the Arian races who went to the north-west, there are no grounds for believing that the Saxons continued to offer human sacrifices after their settlement in Great Britain, but in their own land the immolation of captives in honour of their gods was by no means uncommon. The great temple at Upsal, in Sweden, appears to have been especially dedicated to Odin, Thor and Frea. Its periodical festivals were accompanied by different degrees of conviviality and licence, in which human sacrifices were rarely wanting, varied in their number and value by the supposed exigency. In some cases even royal blood was selected that the imagined anger of the gods might be appeased. In Scandinavia, the authority of the priest was much greater than it would appear to have been among the Anglo-Saxons. It was his word often, which determined where the needed victims should be found. It was his hand that inflicted the wound, and his voice which said, "I send thee to Odin," declar-

ing the object of the sacrifice to be that the gods might be propitiated, that there might be a fruitful season or a successful war. In the present day, the cow is not offered in sacrifice by any Hindu sect or race, but in the marriage ceremony of some parts of the country, where a milk cow, surabhi, is released on the intercession of a barber, sufficient remains to show that the rite was formerly practised at marriages, for the sake of hospitality. The male buffalo is, however, frequently sacrificed, sometimes in considerable numbers, and only in 1859, the Government of Madras ordered the magistrate of the Krishna Division to forbid the cruel right of Ammavaru, wherein bullocks are impaled alive to appease that angry goddess, and avert cholera. On that occasion, in a small village, bullocks to the extent of twelve or twenty-four were sacrificed, as also several hundred sheep, and the heads of sacrificed buffaloes were carried in procession on the heads of men. As might be supposed from the sacrificial rights amongst the Jews, allusions to such are to be found in the New Testament. One such occurs as the word Corban (Kurban, Arab Pers. Hind Sacrifice) in Mark vii. v. 11. "But ye say, if a man shall say unto his father or mother, it is Corban, that is to say, a gift, by whatsoever thou mightest be profited by me; he shall be free." This word is almost equivalent to Sadqa or Tassaduq or Fida, and is often used by men or women addressing a superior, in which case it means merely, I am your Kurban. The word is Arabic, derived from the Hebrew, has allusion to an approaching to God, and means a sacrifice, a victim, an offering, an oblation: for which also, we have the Greek Καρπωμα. The other Arabic words, Sadqa, Fida and Tasaduq mark the continuance of the sacrificial rite. Sadqa, Arab. properly Sadaqa, from the Hebrew, means alms, propitiatory offerings and sacrifice. The words are continued into Hindustani, in Sadqe-'ana or Sadqe-hona, to become a sacrifice for the welfare of another, and Sadqe-karna, to sacrifice for the welfare of another. Amongst the Bhot, in the Ladak frontiers of the western Himalaya, the people salute by raising the back of both hands to a height even with the forehead and then repeatedly describing a circle in the air with them, ending by drooping the fingers downwards and turning the palm inwards. There is a similar mahomedan practice of Billain-lena, where a woman is supposed to take upon herself all the evils which would befal the person whom she addresses and thus encircles. Though, as has been seen, in Southern Asia, human and other sacrifices still continue to be made, the increasing power of the British in India may soon lead to the discontinuance of such barbarities. Sacrifices seem to have been a usual rite amongst all the Scythian races, and human sacrifices are even noticed in the Vedas, Harischandra son of Vedas, of the family of Ikshvaku was a king without a son. Narada bid him go to Varuna the king and say "may a son be born unto me, and I shall sacrifice him to you." Varuna the king assented: a son was born to him, on which Varuna demanded him in sacrifice but for various excuses this was deferred, until a substitute for the son, was found, in Sunasepha the son of a rishi who by invoking the gods *Agni*, fire, *Savitri*, the progenitor, *Varuna* the king, *Visva-Devah*, collective gods, *Indra* the friendly, *Asvini*, divine physicians, born of the sun, *Usha* the dawn, at last was released. But not before Sunasepha was bound to the sacrificial post and his father whitling his sword approached to kill him, when Suna-sepha exclaimed "They will really kill me, as if I was not a man." In the Atareya Brahmana, (6 8) it is said the gods took man for their victim but as he was taken the Medha (the sacrifice or the spirit) went out of him. It entered the horse. Therefore the horse became the sacrificial animal. Then the gods took the horse, but as it too was taken the medha went out of him and entered the ox. Therefore the ox became the sacrificial animal. The same happened with the ox, afterwards the sheep, then the goat and at last the earth became the victim. From the earth rice was produced, and rice was offered in the form of *puralasa*, in lieu of the sacrificial animal. The drift of the story is that in former times all these victims had been offered, as we know for certain that horses and oxen were so, though afterwards these were discontinued. In the sacrifice of the horse, part of the flesh was eaten by the assistants and part presented as an offering to the gods. No reasonable doubt can be entertained that the ritual of the early hindus, did authorise the sacrifice of a horse. In southern India, nor perhaps in any part of India, is a vaishnava brahman known to offer living creatures in sacrifice. The saiva brahmans on the contrary, annually in some towns, Conjeveram for instance, perform the bloody rite to their ancient gods Indra, Varuna, Yama, and both in 1859 and 1860, the saiva brahmans in Madras so sacrificed. Several brahmans are employed in this rite. One brahman assisted by his wife, the couple being styled the Soma Yaji, and Soma Devi, commence the rite by performing the fire sacri-

fice, by pouring ghi into a large fire. The pujari, a Sudra, then strikes the head from the victim and large portions of its flesh being thrown into the fire and reduced to ashes, portions, are distributed to the assembly. This being a Prasad'ham or food offered to the gods, all castes can partake of it. Many saiva sectarians when aversion to take life prevents them sacrificing an animal, substitute an image made of dough. On this point, of the object of sacrifice, there is however, at the present day, a great change in progress. Amongst the vaishnava brahmans of the three great sects of the Vaghala, Tengala and Madhava the practice differs. The vadagala brahmans, who evince much earnestness in the ceremonials of their belief follow the Saiva practice of offering living creatures in sacrifice; while the Tengala and Madhava substitute dough. In Southern India, no saiva brahman thus substitutes dough, but they present living creatures, though with many of the saivas the victim's head is not struck off, but it is strangled so that blood is not spilled. The lower classes of hindus of southern India also, though rarely, sacrifice pigs to the inferior gods. Living sacrifices are however, an essential part of the worship of all the tutelary village goddesses in Southern India, as also of the goddesses of cholera, small-pox, &c. Thousands of sheep and fowls are annually sacrificed at Periyapalayam, a village about 30 miles from Madras, and multitudes of people attend from Madras and the neighbouring villages, to celebrate the yearly festival, which takes place in the bright half of the month of Adi. Large herds of buffaloes were until recently, offered at the funeral rites of the Todawar race of Ootacamund but the Madras Government have put a stop to such wholesale massacre, and restricted the rite to the killing of only two animals at a time,—a measure which the Toda race viewed with unaffected alarm and dislike, as likely to decrease their children and cattle. Human sacrifices are deemed to be requisite to mollify goddesses and demons who guard hidden treasure and who are believed to have a partiality for the blood of a pregnant woman, especially of one who is conceived of twins, and to the first born of the goldsmith caste: indeed in popular belief one of the latter is credited to have been offered near Madras in times not very remote and during the famine of 1867, the head of a victim was found in the helots log in a town in Bengal. There is a shrine of Vatrappanáchiyár, the tutelary goddess of Tiruvattúr, a village to the north of Madras, on the road to Ennore. This is situate in a part of the great and much frequented pagoda of Tiyágaraia Sámi, for which the village is celebrated in ancient hindu books. The sacrifice now offered there is that of a male buffalo, but is conducted with so great secrecy, that people are not generally admitted to witness it. Indeed the fear of witnessing the sacrifice and its attendant ceremonies are so great that pregnant women are, if possible, kept out of the village for fear of abortion, which is believed to be the certain result, should the shrieks of the men who carry the Raktabali or bloody sacrifice fall on their ears. This Raktabali is assumed to be the food for devils and the attendant spirits of the goddess, and consists of rice mixed with the sacrificial blood. It is carried only during the last day of the annual festival of the goddess, after midnight, in an earthen pot of a peculiar shape and design, by men specially allotted to the duty. They run and shriek and howl in the streets to scare away the devils and evil spirits, and halt at the corners and windings, and throw balls of this blood-mixed-rice to the demons, &c. It is considered to be an evil omen for any man to meet them in their rounds, as fever, madness, and disease might befal him. All treasures concealed under ground for a length of time are said to become the property of demons, who take charge of and only part with it, to those who satisfy their desire for blood—the greater the demon, the higher is the kind of sacrifice he demands. Simple minded men, even among those who are considered to belong to the better informed classes of hindus, believe in the divination of quacks, who pretend to point out the very places in which treasure is to be found, by a collyrium which when applied to the eye is said to give it the power of discovering the treasure. Stories are now and then spread among the people regarding this subject; and this desire for discovering and exhuming hidden treasure, and the love of making gold and silver, prevails to some extent among the educated hindus and it is generally believed leads to the sacrifice of human beings. Bloody sacrifices form no part of the worship paid to Rama, Krishna, Hanuman, &c., of the vaishnava sectarians, nor Vigneswara, Subrahmaniya, &c., of the saiva sect or of their respective goddesses. In addition to the village deities, noticed, the only goddess who requires them is the Sakti of Siva, defined by her votaries, to be the visible energy of the divine essence symbolized as a female. She is highly venerated during the nine days of the Dassera or Nava-

ratri (the nine nights). at the close of which a sheep is generally offered in the houses of Rajputs and Mahrattas. The sacrifice of buffaloes on this occasion is very rare, and when it is offered, the ceremony takes place in temples, sacred to this goddess. but sometimes in jungles and unfrequented parts. The goddesses and demons of the helot races, all accept bloody sacrifices. which are generally accompanied with the offering of spirituous liquors. As a general rule, the offering of such sacrifices among the houses of educated hindus, and in the superior temples is observed with great secrecy. Madan is very little known, but deemed a very great and powerful demon with a class of native magicians. He is generally courted by the pariah, chuckler, labbay, and uneducated mahomedans, who offer beef and arrack to obtain his good will and favor.

It has been noted above that the terms used for the sacrifice are Bali, *Tam*, Gavu, *Tel*, Yagna Magha, *Sanscrit*. When an ox, lamb or fowl is offered up in sacrifice to a Devi or Mari female deity by the sudras, the first two words are used. The words Yagnya or Magha are used to indicate a sacrifice celebrated only by the brahmins in which they offer goats and not any other animals, as the following five things are forbidden in the Kaleyoga or the Iron age, అశ్వాలంబం, గవాలంబం, సన్యాసం, పలపైతృకం, దేవరేణ సుతోత్పత్తిః కలౌ పంచవివర్జయేత్,— the sacrifice of a horse, of a cow, the abandonment of all worldly affections, serving flesh to brahmins invited for the celebration of the funeral obsequies, or to have issue by a brother-in-law, that is husband's brother, in case of a woman not having any children by her husband.

Hindu Morality.— Major Moor remarks as to their moral character, that it is some comparative though negative praise to the hindus, that the emblems under which they everywhere exhibit the elements and operations of nature, are not externally indecorous. Unlike the abominable realities of Egypt and Greece, we see the phallic emblem in the hindu pantheon without offence; and know not, until the information be furnished, that we are contemplating a symbol whose prototype is indelicate. The external decency of the symbols, and the difficulty with which their recondite allusions are discovered, both offer evidence favourable to the moral delicacy of the hindu character. Temples are nevertheless commonly to be seen on which are represented, in statues almost of life size, figures which only the mind of man in all its corruptness and wickedness could conceive. However recently erected, these are perhaps but remnants of the period succeeding the asceticism and austerities of buddhism. Books were then written about heroes whom they deified, some of whose lives, as painted, are a continuous outrage of decency. But it may not be doubted that the people generally never followed such license. To have done so, society must have ended. At the present day, undoubtedly, the morality of the hindus is far above the stories in their books, the statues on their shrines, or the license which prevails amongst the few who associate with the Deva-dasi at their temples, and it is only their patience under such grossness, their not rising in wrath to reform it, their worship of fire and the elements, of the sun and moon, of the lingam and yoni, or the saligramma, the binlang, the tulsi and the poa; their reverence for, almost worship of, the cow, the kite and the cobra—their worship of nandi, of idols with unnatural or hideous forms, of shapeless blocks of wood or stone in which the educated have no faith and which are often treated with irreverence by all, their respect for books of the contents of which they are ignorant and which are not worthy of their present civilization; it is their adherence to all these confused amalgamations of the coarse vedic creed, scythic worship, fetichism, the austerities and sacredness of life of buddhism, and the license of Vishnu as Krishna, which excites the wonder and the contempt of all civilized men. And their indifference is the more remarkable because, two thousand years ago they had a religion 'less disgraced by idolatrous worship than most of those which prevailed in early times. They had a copious and cultivated language and an extensive and diversified literature: they had made great progress in the mathematical sciences, they speculated profoundly in the mysteries of man and nature, and they had acquired remarkable proficiency in many of the ornamental and useful arts of life. In short, whatever defects may be justly attributed to their religion, their government, their laws, their literature, their sciences, their arts, as contrasted with the same proofs of civilization in modern Europe, the hindus were in all these respects quite as civilized as any of the most civilized nations of the ancient world, and in as early times as any of which records or tradition remain.' In the re-ascendancy of brahmanism after the overthrow of buddhism, the prime defect of which was a want of knowledge of the true God and to which was subsequently added a relic worship and an over-fondness for asceticism,

the writers who are now regarded by the hindus as authorities introduced the outrageous matters, which at the present day are the shame and degradation of the followers of this extraordinary faith. Major Moor observes that, with a little alteration, the first part of Juvenal's fifteenth satire, beginning 'Quis nescit,' might be applied to the teachers of hinduism as now seen, as happily as to the Egyptians, the objects of Juvenal's severity, and the following is Major Moor's modification of Owen's paraphrase:

Who knows not that there's nothing vile nor odd,
Which brain sick brahmans turn not to a god?
Some of those blockheads bulls and cows adore;
Fish, reptiles, birds, and snakes, as many more.
A long tail'd ape some suppliants admire,
Or man-like elephant a god the sire:
One race a god half-man half-fish revere,
Others to unsightly moieties adhere:
Hosts to a stone's high deity bend down,
While others sticks with adoration crown;
Nay vegetables here hold rank divine—
On leeks or mushrooms 'tis profane to dine.
Oh, holy nation where the gardens bear
A crop of gods throughout the tedious year!

It has been remarked that the characters of many of the hindu deities, are faintly indicated by the term immoral. Every thing that is gross and sensual and wrong is to be found as ordinary acts of their deities and the followers of these faiths present the extraordinary spectacle of a people with purer lives than is to be found in the idolatrous or demonolatrous systems of religion which they follow. In their domestic lives, they are gentle, not aggressive, modest, reverent, respecters of authority, temporal and spiritual: desirous of knowledge, seekers of the truth, patient under mental or bodily labour, diligent in their callings, temperate and chaste, living with one wife though hindu law permits a plurality, amongst the entire hindu races, offences against the person are rare, drunkenness is almost unknown, except in the profligacy of great towns and it is only amidst the license of the temples that gross poligamy is common, and is even there confined to the habitues of the shrines.

Position and religion of hindu Women.—A great defect in their social system seems to be the unequal conditions of the sexes. In European households there is almost as little real mixing of different grades of society as occurs amongst the different castes of India. But among the hindus, although their creed permits the women to attain heaven on their demise, so long as they are here on earth, whatever secret influence a wife may have, it is not shown to the community. Speculative as are the entire brahminical populations, and to a large extent also all the races called hindus, many of them diving into the mysteries of their theology, except a vedantist occasionally make a remark to the women of his household as to the inutility of worshipping their ordinary images, the hindu wife has little or no instruction in religion, and takes no part in all that array of ceremonial which occupies so much of the daily time of a hindu, particularly if religious. The hindu prays morning, noon and night, a somewhat long prayer. The wife's prayer, if she pray at all, is very short, a saiva woman merely mentioning the name of her deity in the three words O'm! nama Saiva, Hail! name of Siva. Amongst the smartha brahmans, and mad'hava sect of vaisbnavas each household keeps a tulsi plant in the middle of its little parterre or court yard. A small pedestal is erected, in the hollowed centre of which the plant is placed. Daily, the women of the house resort to it, circle 'pradatchanam' and prostrate themselves six times before it, pour water over, and then standing before it, pray to Lakshmi. A similar worship to the pipal tree with a sculptured cobra at its foot, is offered, both by men and women, to whom offspring have not been given. This pipal tree is always on the bank of a tank, in which the devotees bathe dressed in a silk garment used only when performing sacred rites. The prayer of the brahman of every caste and sect includes the gaitri, an address to the sun.

Caste.—A great object with hindus in general is, to preserve their social position in caste. The divisions and sub-divisions of their different castes are very numerous,—the sudra are said to have nearly fifty, but with all hindus purity of caste is held of the highest consequence. Yet its loss may be caused by various means.

The division into castes or sects of the races whom we style hindus was known to the Greeks and seems to have been early known to the Arabs. The Grecian authors, on the authority of Megasthenes, divided the tribes into seven, and Ibn Khurdadba (obiit A. D.) an officer of the khalifs also arranges them into seven classes, but the occupations attributed to them, were different.

	Greek authors.			*Arab.*
Class.	Strabo.	Deodorus.	Arrian	Ibn Khurdadba
1.	Philosophers	Philosophers	Sophists.	Sab kufria.
2.	Husbandmen.	Husbandmen.	Husbandmen.	Brahma.
3.	Shepherds & Hunters.	Shepherds & Cowherds.	Shepherds & Cowherds.	Kataria.
4.	Artificers & Merchants.	Artificers.	Artificers, Merchants & Boatmen.	
5.	Warriors.	Warriors.	Warriors.	Sudaria.
6	Inspectors.	Inspectors	Inspectors.	Baisura.
7.	Counsellors & Assessors.	Counsellors & Assessors	Assessors.	Sandalia. Lahud.

Ibu Khurdadbas' first name is unknown. By the others he seems to indicate the Brahman, Kshatrya, Sudra, Vaisya, the Chandala and Jugglers.—*Elliot's Historian's* p. 18

Dr. Caldwell tells us that in all ordinary cases where illegitimate children are born, if there be no great disparity in rank or caste between the parents, the child takes that of the two parents which is the lower. Where considerable disparity exists and particularly when the woman is of the higher rank, as for instance when a high caste woman or even a woman belonging to the middling castes, has formed an intimacy with a Pariar man, the mother either procures abortion or commits suicide. The child never sees the light.

Alms.—Dr. Caldwell adds that almsgiving is expressly enjoined by the brahminical religion, as conferring merit and power over the unseen world, not for compassion or brotherly love, or for doing as we would be done by.

Inner belief.—The brahminical believer is punctiliously alive to his religion as a system of observances,—he never forgets his ablutions, his holy ashes, or any of the thousand and one ceremonies which sanctify his domestic life, but ordinarily he has not the smallest belief in the divinities whom he so elaborately worships. He is even forward to tell you that he is not so dull-witted as to believe that any of them exist.

Food and cooking and hospitality.—Like that of the bulk of the human race, the food of the hindus is obtained from the vegetable kingdom. But with the hindu, the adherence to this kind of diet forms part of their religious belief. Unlike the Hebrews (Deut. ch. xiv. Lev. xvii.) or the mahomedans, to whom only certain creatures were forbidden, several brahminical tribes do not touch animal food at all, and no hindu of the four great castes can partake of the flesh of the cow much less avow that he had so done. They also require their food to be prepared by people of their own or a higher caste, or, in their dread of pollution, even by their own hands. With some sects this dread is carried to such an extent that they do not permit any unconverted eye to see them cooking, and if accidentally overlooked will bury or give away the materials under preparation, however hungry they be. Many hindus likewise cook within a sacred circle, and if any lower caste or no-caste person enter it, the cooking is suspended and the article destroyed. Many hindus eat their meals dressed in silk clothes, used only for sacred rites,—and waited on by their wives or female relations, who do not presume to eat until their husbands have finished. They eat off metal dishes, of gold or silver or brass, —but the ordinary platter is made of leaves of the plantain, banyan, lotus, or palasa, pinned together with grass stalks in the form of a dish. These are sold in every bazaar. They are employed to ensure safety from pollution, being thrown away after the meal. There is a continued stream of their hospitality such as it is, but no one caste will eat with another, and at meals each brahman sits with his own leafy platter apart from his neighbour to prevent the possibility of even accidental pollution by his own food touching that of another, or vice versa. Where such stringency exists as regards people of their own faith, their associating at meals with people of other creeds is of course an impossibility. These remarks apply to the hindus in general; but the members of many of their reformed sects, eat with each other, without regard to former distinctions. In like manner, as followers of one faith, all individuals are equally entitled to the Prasad'ham or food which has been previously presented to a deity, and it is probably the distribution of this, in temples, as, for instance annually, at Jaganath, that has given rise to the idea that at this place all castes of hindus eat together. A hindu in general eats twice daily, in the forenoon and after sunset. But a brahman widow eats only once daily, at noon. The food of the hindus along the sea-board of India, is rice, partaken of with vegetable curries or pickles as condiments. In the higher lands of the interior and in the more northern portions of India, the pulses, and millets, with wheat and maize, are the articles in common use in the form of cakes. The prior processes which in Europe fall to the miller and the baker, are got through in the hindu household. The pestle and mortar is with hindu families a very important domestic implement, and few are without it. The mortar is generally of stone,—but often a log of wood, the lower part shaped like an hour glass stand, and in the upper is a conical cavity of the contents of about two gallons. The pestle is of hard wood, about four feet long, and two inches in diameter, with the ends tipped or ferrulled with iron, to prevent their splitting or wearing. It is usual for two women, to whose lot beating rice out of the husks, and similar domestic operations, generally fall, to work together; the pestle is raised perpendicularly by the right hand of one, and as it falls is caught by the right hand of the other, she who raised it quitting it in its fall. when tired with

their right hands, they use the left, relieving them. A song is frequently chaunted during the work The stone mill, so often alluded to in the Old and New Testament, consisting of two flat stones worked by one or two women, is in use in every house. The religious restriction to vegerable diet is doubtless of buddhist origin. Buddhism had the effect of inspiring a great respect for life, and all orthodox hindus regard the inviolability of life as the most sacred of laws. In whatever degree sanguinary rites may be practised by any portion of these people such are directly opposed, not only to the influence and example of the brahmans, but to the practice of the immense majority of the more cultivated and the higher castes. Myriads of hindus have lived and died without every partaking of animal food, and amongst the budd'histical Jains, every precaution is taken to prevent themselves involuntarily destroying or swallowing even insect life. Their priests never partake of stale food lest living creatures should have arisen in it, keeping a cloth over their mouths lest an insect unconsciously enter, and they walk with a small soft broom in hand with which they gently sweep the ground on which they are to tread or sit. With all this, there is occasionally witnessed amongst some one or other of the races following hinduism, an apathy and indifference as to the preservation of the lives of their fellow creatures, which Europeans fail to understand. An instance of this is described as having occurred in 1820, at the fair at Hurdwar, in which seven hundred persons are stated to have lost their lives. It was calculated that not less that two millions of people had assembled on the occasion, when, at the opening of the fair, the rush was so great towards the steps of the bathing-place as to cause this melancholy catastrophe. Dreadful as it was, the exertions of the British officers only prevented its being infinitely greater. An eyewitness remarked that the brahmans looked on not only with apathy, but with joy depicted in their countenances; and women, at a short distance, were bathing in other parts of the sacred water, with as much indifference as if the utmost serenity prevailed around them. After the fair the roads for miles round Hurdwar were strewed with dead bodies of men, women, horses, camels, and dogs.—

Differences explained.—The difficulties experienced in explaining the seeming contradictions in the character of these religionists are greatly overcome by remembering that though nominally of one faith, they are sprung from many races which continue as distinct and separated from each other, as when their Scythian, Arian and Babylonian forefathers poured into India. They are assuredly as varied in origin as are the Indian tribes of North America; and are marked with as varied moral and physical qualities.

Dress and Clothing. The dress of hindu men is of white muslin or cotton cloth, and their upper coat is now generally sewed. The under garment for the lower part of the body, the "do wati" or dhoti, is a loose unsewed wrapper. Women of all classes wear unsewed wrappers of green, red or yellow colored cotton, edged with silk or gold embroidery, and a boddice of cotton or silk.

Scalp-lock. All hindus retain only the tuft of hair on the crown of their heads, which is familiar to Europeans from the pictures and descriptions of the Indians of North America as the scalp-tuft, the most glorious trophy, if not the sole reward of their victor. The hindu practice of wearing this scalping tuft, Shik'ha, *Sans;* d'Zutu *Tel;* Kudimai, *Tam;* was doubtless brought with them from Scythia; for like the Indians of North America, the Scythians cleaned the scalp and hung it to their horses bridles. The decalvare of the ancient Germans, was nothing other than the scalping mentioned in the laws of the Visigoths, capillos et cutem detrahere. According to the annals of Flude, the Franks still scalped about the year 879, and also the Anglo-Saxons.

Titles.—Amongst the honorific social distinctions of the hindus, is that of Acharya a religious teacher, properly a brahman who instructs the brahman, kshatriya and vaisya religious students of the Vedas, but in use as relating to any religious instructor. In the south of India, the term is applied to the head of a religious society, equivalent to the Mahant of Hindustan and the Panda or head priest of a temple. But it is assumed also by brahmans engaged in secular pursuits, by carpenters, artisans and amongst the Mahrattas, by cooks.

Learning and Books.—The Mahabharata and Ramayana books are the national treasuries of the traditions and legends of the hindus, and contain all that has been preserved of Vedic ideas and institutions as well as the expression of that later Brahminical system, which forms the basis of the existing religion and civilization of the masses, ramifying more or less throughout the entire body of hindu literature. The Mahabharata is the source of all the Puranas. It is the Purana properly so called. The Bharata war relates to the period of Aryan invasion, when the invaders had

reached the upper courses of the Jumna and Ganges. The Ramayana refers to a period when an Aryan empire had been established in Oudh, and when Vedic rites and institutions had been established in the very heart of Hindustan. The Veda are religious books of the hindus of which the Rig Veda, Yajur Veda, Sama Veda and Atharva Veda are deemed inspired and regarded as canonical. But the term is also applied to scientific works as Ayur Veda, the art of medicine; science of life; Dhanur Veda, the art of war (the bow) Gandharba Veda, the science of music. Besides these are several series of ancient books, the Upa-Veda, the Upanishad, the Purana, &c.

A knowledge of reading and writing is very widely diffused, but those who cannot write use trade-marks as their sign manual, of which the following may be mentioned;

Mang	- A daffra.
Dher	- A staff.
Carpenter	- Chisel or kikra.
Barber	- Looking glass.
Shopkeeper or Bakal	- A balance.
Dhangar	- Scissors.
Gardener	- Kurpi.
Banjara	- Spear.
Koli, Ramusi, and Bhil	- Bow and arrow.
Attar and Rangrez	- Joli.
Kassar (brazier)	- Tulai.
Kunbi	- A plough.
Goldsmith	- A hammer.
Blacksmith	- Anvil.
Chamar	- Leather knife or Rapi.
Tailor	- Yard measure.
Soldier	- Dagger.
Teli	- Subbal Pur.
Byragi	- Forceps.
Maniar	- Churi or bracelets.

Avocations.—The races following hinduism and the converts from amongst them to mahomedanism and the Sikh faith are, almost exclusively, the owners and tillers of the soil of India, and as agriculturists, in northern India, are in village proprietory communities: those of Central India, are village proprietors; and those of western and southern India are ryots or holders under Government.

The entire banking interests in India, monied men and capitalist class, smaller merchants, traders and carriers, prefer British rule. Hindoos are settled for merchandise in Arabia, all through Persia and Turkistan, they are in Astrachan, in the southern provinces of Russia and even as far as Moscow.

Religious liberty.—In India, during the time that history is extant, if the dominant power were hindu, mahomedans were molested, if mahomedans ruled, hindus were oppressed—under the British, all creeds has met with equal justice.—*Cunningham's Bhilsa Topes. HINDUAUCH? PERS. Cucurbita citrullus.

HINDUBA, HIND. Cichorium intibus.

HINDU KUSH, written also Hindoo Cush, a name of the Kouenlun chain, called by the historian of Alexander the Indian Caucasus, also Paropamisus. The Hindu Coosh is remakable for its mass and elevation. Viewed from the Koushan pass, distant ten miles south, its appearance is very sublime. The outline is serrated, being crowned by a succession of lofty peaks, with sides often perpendicular, and it is wrapped in a perpetual covering of snow, in all parts not too steep to admit of its lying. Humboldt regards it as the most striking phenomenon amongst all the mountain-ranges of the old world. He considers that it may be traced from Taurus, in Asia-Minor, across Persia, then, in the Huzarah mountains, to Hindu Coosh, and to the frontier of China, and that it is distinct from the Himalaya. The two ranges are physically discriminated by the depression down which the Indus flows.

The Hindoo Koosh, Kouenlun or Mooz Tagh are about 850 miles long, from Karakorum, in lat. 35°, long. 77°; to Bamian, lat. 34° 50', long. 67° 48'.

Hindoo-Koosh 35° 40', 60° 50', 21,000 feet.
Summit N. of Jellalabad, 20,248 ft.
Koushan Pass, 15,200 ft.
Khawak Pass, 13,200 ft.
Akrobat, 10,200 feet.

The Larana mountains in 35° 20', 62° 54', are about 60 miles from N. E. to S. W., dividing the valley of Suwat from that of Panjkora; and the Lasspissor mountains, S. of and subordinate to, Hindoo-Koosh, about 50 miles from E. to W., L. 36° and L. 70° are little known.

The limit of perpetual snow on south slope (lat. 37°), is 17,000 ft. The most re-

markable feature of the Hindu-Kush is that on the south it supports the plains of Kabool and Koh-Damaun 6,000 to 7000 ft.; while to the north lies the low tract of Turkestan. Koondooz town, distant in a direct line 80 miles north of Hindoo-Koosh, is only 900 ft. above the sea. The Hindu-Kush is a distinct mountain system, its parallelism being from S. W. to N. E., while that of the Himalaya is from S. E. to N. W.

The country between the Safed Koh and Hindoo-Koosh is hilly; breadth about 20 m It is divided into a series of plains by cross ranges (Khyber, Kurkutcha, &c.,) which pass between the Safed-Koh and the outer ranges of the Hindoo-Koosh. These plains are generally barren and stony, and have a slope from E. to W. The Kabool river, which flows through them has to make its way by narrow passages.

Passes of the Hindu Kush. Lt. Wood, in his journey to the Oxus, names only four. Three of these are reached from Kabul through the valley of Koh-Daman north of that city, and diverge from each other near Charekar: viz., the pass of Panjshir or Khawak, the Pass of Parwan, and the Pass of Ghorband; but each of these in fact represents a group of several routes over the mountains. The fourth that he mentions is the Pass of Hajjiyak lying much further west, passing by Bamian, and usually, in modern times at least, approached from Kabul by the road running west from that city by Rustam Khail, south of the offshoots of the Indian Caucasus called the Pugman Range and Kohistan of Kabul.

If we turn to sultan Baber we find the number of passes raised to seven. Those which he names are three leading out of the Panjshir valley, viz. (1) Khawak, (2) Tul, (3) Bazarak; then (4) the Pass of Parwan; and three described as in Ghorband, viz. (5) Yangi Yuli or the "New Road." (6) Kipchak, and (7) Shibrtu.

As Ritter understands this list it does not include the Hajjiyak at all.

Passes from Panjshir.

Pass of Anjuman. This is a pass starting from Puryan near the head of the Panjshir Valley and crossing into Badakhshan direct.

Khawak Pass, at the very head of the Panjshir Valley, crossing to the Valley of Anderab, which it descends to the town of that name.

Tul. This is a loop line to the Khawak Pass.

Zarya ascends from Safed Chir on the Panjshir river, some six miles below Tul, and joins the last pass just before reaching Sirab.

From Umraz are three bad passes, Shwa, Urza, Yatimak.

Bazarak. This quits the Panjshir at the village of that name, twenty-eight and a half miles from the mouth of the valley, and descends upon Khinjan on the Anderab River.

Shatpal. This starts from Gulbahar at the entrance to Panjshir Valley, and joins the Bazarak road on the other side at Kishnabad or Kishtabad, twenty-one miles from Khinjan.

Passes from Ghorband.

Kushan. This is the pass which leads close under the great peak specially known as Hindu Kush. It starts from a point in the Ghorband valley about ten miles from Tutan Dara. Kushan lies some miles up the pass. It descends upon Khinjan like the two last, which it probably receives before reaching that place.

Gwalian. This leaves the valley some twenty miles from Tutan Dara. It descends upon Gozan on the Anderab river.

Gwazyar. This pass leaves the valley near the ruins of the old town of Ghorband, some twenty-four and a half miles from Tutan Dara. It leads to Kilagai, a small town on the road from Khinjan, to Baghlan and Kunduz.

Char Darya. This pass leaves the valley at about twenty-nine miles from Tutan Dara, and descends upon Ghori, a considerable town. It is passable for kafilas of every description.

From this the road goes on along the valley of Ghorband, throwing off one or two minor passes, and eventually joins the Hajiyak road at the ruins of Zohak near Bamian.

The pass of Hajjiyak or Bamian.

Shibrtu.

Abdereh, for which the only authority is the Ayin Akbari. The two last are beyond the limits to which the name, Hindu Kush is applied.

Of these passes Hajjiyak was that crossed by Burnes, on his celebrated journey, the first European traveller who saw and described the great rock idols of Bamian; it was also that crossed by Wood on his journey north-ward to the Oxus. It was probably by this pass that Chinghiz crossed, for the siege of Bamian was one of the events of his campaign in these regions: and by it Hiwen Thsang travelled to India.

The pass of Chardarya was crossed by Aurungzib. The pass of Salulang was attempted by Capt. Wood, but unsuccessfully, owing to the lateness of the season. Timur on his expedition into India crossed the

Hindu Kush by the pass of Tul, and returned by that of Shibrtu. The Khawak pass was crossed by Wood and Lord on their return from the Oxus. By this pass or one of its branches, Ibn Batuta had crossed five hundred years before; and one of the passes into the Panjshir Valley seems to have been crossed by Friar Odoric on his return to Europe. Hiwen Thsang also returned by Pangshir and Anderab on his way to China. —*Yule Cathay*, II. p. 593; 595. *Burton's Sinde*, ii., 274, *Royal Sanitary Commission Report.*

HINDUN, a river in the Bulundshahr district of the N. W. provinces passing Seharanpoor fort running past Nougawaghat, 21 miles from Meerut.

HINDUSTAN includes Bahar, Oudh, Rajputana and Malwa. Hindustan, Bengal proper, the N. W. Provinces and Oude, the Panjab and Sind, with part of the adjoining desert country form a great semi-circular plain, in which there is no place of refuge for remains of original races; in all these countries the modern races live together as one social whole. Throughout Central and Peninsular India, the most open plains and uncultivated parts are similarly inhabited, but there are scattered about over every province, hill and jungle, giving cover to aboriginal tribes, who hold themselves aloof from the general population and are very different in language, manners and other particulars.

As known to Europe, Hindustan is a term applied to British India generally. To the people of British India, however, and to Europeans in India, the name is restricted to that part of India, which lies between the Himalaya and the Vindhya mountains. But, in considering the ethnological relations of India, the countries from the Indus and west of the five rivers of the Punjab, south easterly to the mouths of the Ganges, have been so often and so long in the occupation of so many different races, whose fragments are found in larger or smaller portions scattered throughout the region indicated, that it will be well to notice the occupants of Central India, Rajputanah, Bengal, Oudh, the N. W. Provinces, and the Punjab, as inhabitants of Hindustan, amounting to 136 millions of people.

Bengal, is a political division of British India, comprising Bengal Proper, Behar, Orissa including the tributary Mahals, Assam, Chota Nagpore, and the native states of Hill Tipperah and Cooch Behar. It extends from the Meridian 82° to 97° E. lon. and lies within the parallels of 19° 40' and 28° 10' N. lat. On its N. West is the native state of Rewah in Central India, also the districts of Mirzapore, Ghazipur, and Goruckpur belonging to the North West Provinces.

From the Chumparum district as far east as the Bhootan Dooars, the Himalaya range, running through the independent states of Nepal, Sikkim, Tibet and Bhutan, form its northern boundary. Further east, along the northern frontier boundary of Assam, lies a tract inhabited by the Akha, Dofla, Miri, Mishmi and other wild tribes: along its eastern frontier lies a part of the independent province of Burmah, below that is the Munnipore state: still lower are various hill tribes, the Naga, Looshai, Khyen, Mikir, &c., and at its extreme south east is British Burmah, (on the south of Chitagong, which is the south eastern district of the Bengal province,) and the Akyab district of Arakan. Between Chitagong and Orissa is the Bay of Bengal.

On the southwest of Orissa, is Ganjam in the Madras Presidency; on its west, are the Tributary Mahal estates and also the Sumbulpore and Belaspore districts of the Central Provinces.

The population of Bengal is supposed to be near 60,000,000. About two-thirds of its population profess hinduism, in its various sects, and about one-third are mahomedans, with a small number of christians, and inclusive of the hill tribes on its S. W., West, Northern and N. Eastern borders. Many of the higher caste hindus are recognised as former immigrants, but the origin of the vast bulk of the mahomedans is obscure. Calcutta, the capital, contains about 377,924 inhabitants, amongst whom are many foreigners, viz.:

Europeans,	11,224	Asiatics,	1,441
Indo-Europeans,	11,036	Parsees,	98
Greeks,	30	Africans,	53
Armenians,	703	Chinese,	409
Jews,	6,851	Hindoos,	239,190
		Mahomedans	113,059

Central Hindustan, or Central India, was the Madhya-desa, of the ancient Aryans, the middle region of Aryavarta, the Arya country. In a slokam in the Sanscrit work, the Amarakosha, the ancient boundaries of it are thus defined—

"Ariavartaha punia bhumi hi
Mad'hiam Vindhya Himava yoho.

i. e. the Arian country, the sacred land (lies) between the Vindhya and Himalaya," in this way indicating both the ruling race and the boundaries of the country held by them, at the time that Amara Sinha wrote the Amarakosha. The first known dynasty was the Bharata, so called from the first king Bharata, and the last of the dynasty

was Samvarama, who was driven westward by the Panchala of Canouj B. C. 589. The Bharata kingdom seems to have been established between B. C. 2,600 to B. C. 2,200. *Central India*, is a table-land of unequal surface, from 1,500 to 2,500 feet above the sea, bounded by the Aravalli mountains on the west, and those of the Vindhya on the south, supported on the east by a lower range in Bundelcund, and sloping gradually on the north east into the basin of the Ganges. It is a diversified but fertile tract. The *Patar*, or plateau of Central India, is distinct from the Vindhya to the south and the Aravalli to the west, and its underlying rock is trap. Aravalli means the refuge of strength, and these hills have afforded protection to the most ancient sovereign race in the east or west—the ancient stock of the Suryavansa, the Heliadæ of India, or children of the sun, the princes of Mewar, who, when pressed, were wont to retire to its fastnesses, only to issue again when occasion offered. The Aravalli hills are connected by lower ranges with the western extremity of the Vindhya mountains on the borders of Guzerat, and stretch northwards to a considerable distance beyond Ajmir, in the direction of Delhi, forming the division between the desert on the west and the central tableland. It would be more correct to say the level of the desert, for the south eastern portion, including Jodpur, is a fertile country. Amarkantak, a great plateau, forms the watershed of the Mahanadi, Son, Tons, Johilla, and Nerbudda. The rivers, though large and full of water even half way from their mouths are very irregular in the slopes of their beds, and are disturbed by frequent rapids, so that, owing to these impediments, increased still further by the rocky character of the river beds or their banks, navigation is limited for the most part to the lower portions of their course. Many parts of Central India are covered with dense jungle.

The Central India of the British Indian Government, however, is a political division, under the care of a political agent. It has an area of 83,600 square miles, with a population of 7,670,000 and a revenue of 2,612,600. In this political division, there are 71 feudatory or mediated chiefs, of whom 4 are Mahratta, 7 are mahomedans, 17 are Bundela, 33 are Rajpoot, six are brahman, and 4 belong to other races. Of these, six are feudatory states, Gwalior, Indore, Bhopal, Dhar, Dewas and Jowrah, but the 71 states are as under:

Indore Residency, Indore, Dewas, Bagli.

Gwalior Agency, Gwalior.

Bhopal Agency, Bhopal, Rajgurh, Nursingurh, Kilchipore, Koorwai; Muksoodingurh; Mahomedgurh, Basoda, Patharee: Larawut, Gwalior districts; Seronje.

Bheel Agency, Dhar, Jhabooa, Ali Rajpore, Jobut; Mutwarh; Indore, and Gwalior district, British Pergunnah of Mundpore and State of Burwani.

Western Malwa Agency, Jowrah, Rutlam and Sillana.

Goonah.

Bundlecund Agency, Sohawal, Jignee, Ajyeygurh, Baonee, Beronda, Bijawar, Chirkary, Chutterpore, Duttia, Kotee, Myhere, Nagode, Orcha, Punna, Rewah, and Sumpthur. Of the principal states, Gwalior, Indore, Bhopal, Dhar, Dewas, and Jowra, Bhopal and Jowra are under mahomedan rulers and the rest Mahratta. The petty states hold under the immediate guarantee of the British Government, but have feudal relations with one or other of the larger states, and occasionally with more than one.

At the close of the Pindaree war, the districts in Central India and Malwa were left in a disorganized state, the mahratta chiefs had parcelled out amongst themselves the possessions of the Rajput chiefs and the smaller states were all subject to Sindia, Holkar or the Puar, and sometimes to all three. Many of the smaller chiefs had been driven from their possessions, and had sought refuge in the jungles and mountains where they robbed or levied "tankhah" or blackmail from the larger states. These robber chiefs were twenty four in number at Sir J. Malcolm's time.

Of the feudatory territory, consisting of 71 states, supervised by the Central Indian Agency, the head quarters is Indore, but has three grand divisions. The North East division comprises the native states of Bundlecund and Rewah. The Northern division consists of the Northern and Central districts of the Gwalior States. The South West division comprises the table-land known in modern times as Malwa, though far within the ancient limits of the province of that name, and the submontane territory between it and the Nerbudda, as also a considerable tract south of that river, extending to the Kandesh frontier. The first or N. East division, extending from the Bengal Presidency in the east to the Gwalior State in the west, includes Rewah and 35 other states and petty chiefships. Its area is about 22,400 square miles; its population about 3,170,000 souls, and its public revenues aggregate about Rs. 63,58,000. The 2nd or Northern division extends from Bundlecund and the Saugor district, and has an area of about 19,505 square miles; its population is about 1,180,000 souls, and its public revenue about Rupees 67,65,000.

The 3rd or South West division goes on, westward, to the Bombay Presidency, and contains the remainder of Gwalior, Holkar's states, Bhopal, Dhar and Dewas and other small states. The area of this division is about 41,700 square miles, its population about 3,320,000 souls and its public revenues about Rupees 1,30,00,000. The states and petty chiefships in Central India, form a political, and are in a natural, division of British India, and include an area of 83,600 square miles and a population of 7,670,000. This territory is divided thus,—viz.

	Principal states.	Secondary.	Minor and Petty.	Total.
Maharatta	2	2	...	4
Mahomedan..	1	2	4	7
Bundela . ..	...	6	11	17
Rajput	1	12	26	39
Brahmins, &c.	...	1	3	4
	4	23	44	71

with a total revenue of Rupees 2,61,23,000.

Bhil. The desolate wilds and jungles of the western Sathpura range, and parts of the country which extend from them to the Vindhya hills, are occupied by Bhil tribes, who abhor field labour or manual labour of any kind.

Malwa. Adjoining this, are the richly cultivated plains of Malwa with occasional intervening tracts of hill and jungle, from the Myhee on the west to Bhilsa on the east, a stretch of nearly 200 miles, and from the crest of the line of the Vindhya to Mundissore and Oomutwarra, a distance of 100 to 120 miles, and occupied by a thrifty agricultural people.

Hilly tract. This is succeeded by the more hilly and jungly tract of Oomutwarra, Seronge and Keechiwarra, with a scanty population.

Gwalior. Northwards, towards Gwalior, the country becomes more open, except on the wild border tracts of Kotah, of Bundlecund, till we come to the carefully cultivated plain of Gwalior stretching for a distance of 140 miles between the Chumbul, Pahooj and Sind rivers.

Bundlecund is ruled by the Bundela race. A vast portion of Bundlecund is hilly and unproductive, forming the northern slope of the table land of the Vindhya.

Rewah is ruled by the Baghela race. The plains of Rewah are fertile; but the valley on the Sone to the south of the Kymore range is desolate. The people are indolent and untrustworthy. Though widely different in other respects, there is one characteristic common to the Baghel of Rewah, the Bundela of Bundlecund and the rajput of Gwalior and Malwa, a dislike to labour, or service away from their homes. They generally leave tilling of the soil to the inferior and servile classes, and are regarded as the heads of the local society. Many of the Rajputs in the states of Central India, give themselves up to sloth and the immoderate use of opium.

Malwa and Gwalior are great centres of trade.

In Malwa, the towns of Indore, Bhopal, Oojein, Mundipore, Rutlam, Dhar, Jowra, Augur, Neemuch, Shoojawulpoor and Bhilsa are the principal marts.

Indore is the capital of the maharajah Holkar.

Gwalior, is the capital of the maharajah Sindiah.

Rajahputanah Agency. Rajputanah stretches from 23 ° 15' to 30 N. L. and from 69 °, 30' to 78 ° 15' E. L. containing an area of 123,000 sq. m., with a population estimated at ten millions and includes eighteen principalities, viz.

15. *Rajpoot.*

Bhurtpore. | Dhollpore.

Mahomedan.

Tonk.

Enclosed in these are two purely British districts, Ajmir and Mhairwara.

In Europe, Hindostan is generally understood to comprise the whole of India, from the base of the Himalaya to Cape Comorin, but in India the term is restricted to the provinces north of the Nerbudda whilst all to the southward of that river, in the peninsula of India, is called the Dekhan, or southern provinces.

Masudi mentions that at the time of the mahomedan conquest the country about Basrah was called Arz-ul-Hind, "The Land of India." India, however, is supposed to have obtained its name from the Indus river, the Sin, Sinda or Hinda or Hapta Hinda, the Abu-Sin of the Arabs, the first great river met with in the route from Europe and from Western and Central Asia. It is true that so far back as the reign of Darius Hystaspes, B. C. 521, the early writers placed Indians on both sides of the Indus and made India extend westward to Kandahar (Gandhara), embracing perhaps the fourteen Iranian provinces or

nations, enumerated on the Naksh-i-Rustum as lying between Sogdiana and the Punjab and subject to Darius. But eastward of the Indus, the country was always India, and this name seems to have been chiefly used in the south of Asia for it first occurs in the Bible, in the book of Esther (i, 1; viii, 9) as the limit of the territories of king Ahaseurus in the East, as Ethiopia was on the west: and the names are similarly connected by Herodotus (vii, 9). The term "Hoddu" used by the Hebrews is an abbreviation of Honadu which is identical with the names of the river Indus, for, to the present day, all along the course of that river the letters S. and H. are interchanged, and, in the Vendidad, the Panjab is described as the "Hapta-Hindu" and the native form "Sindus" is noticed by Pliny (vi, 23.) The India of the book of Esther is not the peninsula of Hindustan, but the country surrounding the Indus—the Punjab, and perhaps Sind—the India which Herodotus describes (iii. 98) as forming part of the Persian empire under Darius, and the India which at a later period was conquered by Alexander the Great. The name occurs in the inscriptions of Persepolis and Nakhsh-i-Rustum, but not in those of Behistun.

In more recent times, also, the term India, has been applied by the nations of Europe to the localities which they have occupied or with which they have traded. With the Portuguese, the northern part of Hindustan held by the Moghul sovereigns, was styled Mogor, and Goa and the Western Coast of the Peninsula was to them India, just as the British now designate all their possessions, and as with the Dutch, now, India means the Java, Sumatra, and the Netherland possessions in the Archipelago.

Most of the traffic with India seems to have been by way of the Persian Gulf and the Red Sea. The Tyrians established depots on the shores of the Persian Gulf, and the course of trade being through the land of the Cushdi, the races in India came to be included under the ethnological title of Cush. (Gen. x. 6), and hence the Persian, Chaldean and Arabic version frequently render that term by India as in. *Is.* xi. 2., xviii., 1.; *Jer.* xiii. 23; By the natives, however, Hindustan, is the term applied to the whole of that central region of northern India, from the Punjab on one side to Bengal on the other, and from the Himalaya to the southern declivities of the Satpura range running across India in about the parallel of L. 22 N.

Religious changes.—The ancient history of India shows that there were four great religious eras. *The Vedic*, in which Agni, Indra and other personifications of spiritual existences were propitiated with feasts and invoked with the hymns of the Rig Veda, and in which maidens selected their husbands in the Swayamvara and monarchs sacrificed the Aswamedha *In the Brahminic period* the Kshatriya feasts were converted into sacrifices for the atonement of sins against brahminical law and divine worship was reduced to a system of austerities and meditations upon the Supreme Spirit as Brahma. It was in this era that the brahmins assumed the character of a great ecclesiastical hierarchy and established that priestly dominion which still extends over the minds and senses of the hindus of India. Thirdly, *the budd'hist period*, in which Sakya Muni appeared, and Fourthly, *the brahminical revival* during which brahmins abandoned the worship of their god Brahma, and reverted to the old national gods and heroes of the Vedic Aryans. In this era, Vishnu came to be regarded as the Supreme Being, and Rama and Krishna as his incarnations. The countries between Hindustan and China, came to be called the further India; or India Extra-Gangem; whereas, Hind or India, proper, belonged only to the country of the people called Hindoos; or those of India Intra-Gangem. The name is as ancient as the earliest profane history extant: and this may serve, among many other instances, to prove the high antiquity of the Persian language.

Inhabitants. It is admitted that during all ages, either as immigrants or as conquerors, the races from the north and west have been entering India. How little these have amalgamated may be judged of by mentioning, that out of 1030 villages, lying here and there between the Jumna and Sutlej and which were under British management in 1844, there were found to be 41 different tribes of agriculturists, of whom may be mentioned—

Jat,	443	Brahmin,	28	Doghur	28
Rajput,	194	Khetr,	6	Kulal,	5
Gujur,	109	Raien or		Gossaeen,	3
Syed,	17	Araien,	47	Bairagi,	2
Sheikh,	25	Kumbo,	19	Miscellaneous,	46
Pathan,	8	Malee,	12		
Mughl,	5	Ror,	33	Total.	1,030

And as a character of the great revolt and rebellion of 1857 and 1858, it was observed that certain classes of villagers attacked and destroyed other classes:—the powerful hand of a regular government being temporarily removed, the ancient antipathies of race at once came into play. Dwelling amongst each other, door to door, but yet never mixing, most of the races remain as distinct as when ten, fifteen, twenty, thirty,

forty and fifty centuries before, they came to the south, neither eating together nor intermarrying. It is this separating system which has kept the stocks of Arian and Turanian races of India pure. On the slightest suspicion as to descent all social intercourse ceases, and the descendants, in different lines from the same recognised ancestor form new castes. In this way, almost every family of a few hundred years' duration is now separate. The cause of the origin of this exclusive propensity is unknown, further than that the system of caste and the forms of brahminic worship commenced amongst the East Arians after their passage of the Sutlej, and now every Arian and most Turanian households are guided by its rules. This separation into castes or sections seems, however, primarily to have been a race distinction. It has, now, however, as regards the East Arians and others who follow the brahminical teachings, and even as regards the Turanian races, a bearing quite irrespective of race or faith or creed. In explanation of this, it may be mentioned that the countries comprising British India are essentially hindu, by which is merely meant that the bulk of the agricultural and commercial classes—perhaps 86 per cent.—are neither buddhists nor mahomedans, but are followers of some form or other of the brahminical teachings and reverencing their teachers.

Climate seasons and cultivation.—Dr. Royle gives the following arrangement of the countries of which the plants will grow in the different parts of India.

Tropical and East-Indian Islands, Tropical Africa, Brazil, Guiana, West-Indies, and Florida.	Travancore, Cochin, Malabar, Ceylon, Malayan Peninsula, Chittagong, Bengal, Lower Assam.
East and West Coast of Africa.	Coromandel Coast, Northern Circars, Concan.
Southern States of North America, Egypt, north of Africa, Syria.	Gujerat, Behar, Doab, Delhi, Malwa.
Mexican Highlands, Lower Mountains of Spain.	Mysore, Hilly ranges in Deccan, Rajpootana.
South of Africa, Extra-Tropical New Holland, South America beyond 23½° S. lat.	Saharunpore and Northern Doab.
Mediterranean Region.	Deyra Doon, and Himalayan Valleys to moderate elevations.
Chino-Japanese Region, Middle Andes, Peru, and Mountains of Brazil.	Neilgherries, Upper Assam, Himalayan Mountains.
North of Europe, North of Asia, & North America.	Himalayan Mountains, Regions of Oaks and Pines.
Arctic Regions, Mountains of Europe, Elevated Andes.	Himalayas above Region of Forest.

The northern, like the southern part of India, enjoys two crops during the year, one called the khureef, or rain crop, sown in June, and reaped in October, the other sown in October, and reaped in March and April, called the rubbee or cold weather crop. The latter, embracing the months which approximate in temperature to that of the season of cultivation in colder countries, corresponds with them also in the nature of the plants cultivated, as for instance, wheat, barley, oats, and millet, peas, beans, vetch, tares, chik-pea, pigeon-pea, and lentils; tobacco, safflower, and succory; flax, and plants allied to mustard and rape, as oil seeds; carrot, coriander, and cummin, and other seeds of a similar kind, as ajwain, sonf, soya, and aneeson. In the rainy season, a totally different set of plants engages the agriculturist's attention, as rice, cotton, indigo, and maize, with sorghum, pulse, joar, koda, most of the tropical legumes, as well as several of the cucumber and gourd tribes, together with the sesamum for oil, and the varieties of the egg plant, as a vegetable. The sun and sunnee, two cordage plants, are also cultivated at this season.

In Hindustan the people usually arrange the year into three periods, the 'Choumasa' or 'Burk'ha,' which is the rainy season of four months duration; after which is the 'Seeala' or 'Jara' or 'Mohasa' the cold season; followed by the Dhoopkala or K'hursa or hot season. This division indicates generally, the course of the seasons in India, though, in one locality, the rains or the hot or cold seasons may be somewhat more prolonged.

The primary divisions of continental India are four: Hindostan, including in that term the whole Peninsula of India and the Gangetic plain to the base of the Himalaya. 2. The Himalaya, a mountain chain which rises abruptly from the Gangetic plain, and is connected with a still loftier mountain mass (of Tibet) to the north, and beyond India. 3. Eastern India, India Ultra-Gangem including the kingdom of Ava and the Malay Peninsula. 4. Afghanistan. These divisions are marked out by the great mountain barriers and by the ocean. The Himalaya mountains on the north are nowhere under 15,000 feet, usually exceed 17,000, and 18,000 feet and rise in isolated peaks or groups of peaks from 21,000 to 28,000 feet.

From the western extremity of the Himalaya the Afghan mountains descend parallel with the Indus, with a gradually decreasing elevation from above 15,000 feet to the level of the sea at the Arabian gulf. Throughout Afghanistan the climate is excessive.

The cold of the winter is intense, the spring is damp and raw and the summer, during which hot west winds prevail, is intensely hot at all elevations. The general aspect of the whole of Afghanistan is that of a desert. The crops are chiefly wheat and barley, even up to 10,000 feet elevation. Rice is cultivated in great quantity at Jellalabad, 2,000 ft. At Kabul 6,400 feet, and to a considerable extent at Ghazni 7,730 feet. Poplars, willows and date-palm trees are extensively planted as well as mulberry, walnut, apricot, apple, pear, and peach-trees, and also the Elæagnus orientalis, which bears an eatable fruit. The vine abounds as in all warm and dry temperate climates The majority of the Afghan and Tibetan plants are also on the one hand, natives respectively of the Caspian steppes and N. Persia, and of Siberia on the other.

The date is cultivated in Beluchistan up to 4,500 feet, and a dwarf palm, Chamærops Ritchieana of Griffith, perhaps identical with the Chamærops humilis of Europe, occurs abundantly in many places, but with a somewhat local distribution.

Mountains.—The Aravalli mountains extend from Hansi and Dehli to Guzerat.

The Vindhya chain stretches across the centre of Hindustan, from the Gulf of Cambay to the Ganges, and is three to four thousand feet high.

A Peninsular chain, called the Ghats also the Western Ghats, extends from Cape Comorin to the Tapti river, for upwards of 900 miles, running parallel to the coast line, and perpendicular to the direction of the monsoons. This chain divides the peninsula into two distinct climates, of a narrow western one, in Malabar and the Concan, and a broad eastern one, in which are the Carnatic, Mysore, and the Dekhan, traversed by all the peninsular rivers.

Winds, Temperature and Rains.—The S. W. monsoon comes from the Southern Ocean, and is loaded with vapour. It passes over the plains of Bengal, and strikes on the Khassya mountains, and the whole length of the Himalaya, discharging itself in heavy rains. From April till August it blows from the East of South, in August S. S. E., and in September more easterly lowering the temperature of Bengal and of the northern plains, though the plains of the Punjab continue excessively heated.

From the vernal till the autumnal equinox, the heat of a great part of India continues great; but after the autumnal equinox, the great mass of the Himalaya becomes intensely cold, and the plains of India generally become cool. Where the north-east monsoon prevails it is everywhere a land wind, except on the East coast of the Carnatic and in the Malayan Peninsula. In Malaya it blows over a great extent of sea, and is therefore very rainy, but in the Carnatic the width of sea is not great, so that the rain-fall, though well marked, is less, and terminates long before the end of the monsoon, probably from the wind acquiring a more directly southerly direction, after the sun has reached the southern tropic. The amount of rain varies prodigiously in different parts of India, from almost none to six hundred inches, but the rain-fall affords no direct criterion of the humidity of any climate, for the atmosphere may be saturated with moisture without any precipitation taking place. Thus, while in Sikkim 1 ° for 300 feet is the proportion for elevations below 7000 feet, on the Nilghiri Hills it is about 1 ° for 340 feet, in Khassia 1 ° for 380 feet; and the elevations of Nagpur and Umbala produce no perceptible diminution in their mean temperature, which is as great as that which would normally be assigned to them were they at the level of the sea. At Mahabaleshwar, it amounts to 248 inches annually. In the Southern Concan, especially in the Sawantwari district, the rains are as heavy as in Canara. At Bombay the rains last from June till the end of September, and the fall is only eighty inches, which is considerably less than at any point further south on the coast. At Tannah, however, the average fall is more than 100 inches. In the Himalaya, the truly temperate vegetation supersedes the sub-tropical above 4,000 to 6,000 feet, and the elevation at which this change takes place corresponds roughly with that at which the winter is marked by an annual fall of snow. This phenomenon varies extremely with the latitude, humidity, and many local circumstances. In Ceylon and the Madras Peninsula, whose mountains attain 9,000 feet, and where considerable tracts are elevated above 6 to 8,000 feet, snow has never been known to fall. On the Khassia mountains, which attain 7,000 feet, and where a great extent of surface is above 5,000, snow seems to be unknown. Sikkim occupies an intermediate position between Nepaul and Bhotan, and unites the floras of Nepaul, Bhootan, East Tibet, and the Khassia mountains, being hence, in a geographico-botanical point of view, one of the most important provinces in India, if not in all Asia. In Sikkim snow annually falls at about 6,000 feet elevation, in Nepaul at 5,000 feet, in Kumaon and Garhwal at 4,000, and in the extreme West Himalaya lower still.

That the mountain system of East Tibet is an enormously elevated mountain mass, is proved by the statements of many intelligent Tibetans, by the Chinese geographers, by the narrative of M. Huc, and by the fact of so many of the large rivers of Asia flowing from it in several directions.

The Travancore group of mountains presents a striking analogy to the island of Ceylon. They are loftiest at the extreme north of the district, where they stretch east and west for sixty or seventy miles, separating the districts of Dindigul and Madura. Notwithstanding the perennial humidity, the rainfall at Courtalam is only 40 inches: on the hills around, however, it is doubtless much greater.

The Pulney or Palnai mountains west of Dindigul, the Animalaya south of Coimbatore, the Shevaghiri mountains south-west of Madura, and the ranges near Courtalam, are all well known. The remarkable palm, Bentinckia, so common on its mountains, is, however, not known in Ceylon. The other palms are Caryota urens, an Areca, Phœnix farinifera, and one or two species of Calamus.

To the north of Coimbatore the peninsular chain rises abruptly to 8,000 feet, as the Neilgherry range, and continues northward as the mountains of Coorg. The rain-fall, which is great on the western coast, is less on the Neilgherries, being 100 inches at Dodabetta and 64 inches at Ootacamund. Farther north in the Nagar district of Mysore, where are many rounded or table topped hills 4,500 feet high, often cultivated to that height and rising in some places to upwards of 6,000 feet, the climate of the western part is very humid and particularly so at the town of Nagar or Bednore, 4,000 feet high, on a spur of the western chain, where inclement rain is said to last for nine months.

The Eastern Archipelago, from consisting of large islands, separated by belts of sea, possesses a humid and equable climate; but the great continent of Australia being a vast expanse of low land, becomes enormously heated when the sun is in the southern hemisphere, and presents extremes of climate.

Intimately connected with climate is the mean annual temperature of different localities.

	Lat.	Mean.		Lat.	Mean

Madras	...13·4	80 4			

Sir John Leslie deduced from calculation that within the tropics, at the level of the sea, the thermometer ranges from 84 to 76. ° Humboldt, from a very extensive generalization, estimated the mean temperature of tropical regions at 81½. At Trincomalee the mean annual temp. is 80½. ° At London it is 49·651. The thermometer sometimes rises higher in the tropics, in Arabia to 110 ° and during the night falls to 94.

Sir John Leslie calculates that the thermometer sinks 1 ° for every 100 yards of ascent within the tropics. In northern latitudes, the number of rainy days are

12 ° to 43 °	78½	43 ° to 46 °	103
46 ° to 50 °	134	51 ° to 60 °	161

The people of northern India live much on wheat, and those of the south on rice, and on ragi, the Penicillaria spicata, a grain

almost as unknown in Hindostan as in England.

Shades of character are found in different parts of India. The inhabitants of the dry countries in the north, which in winter are cold, are comparatively manly and active. The Mahratta, inhabiting a mountainous and fertile region are hardy and laborious, while the Bengalee, with their moist climate and their double crops of rice, where the cocoanut tree and the bamboo furnish all the materials for the construction of their houses unwrought, are more effeminate than any other people in India, and a love of repose, though not sufficient to extinguish industry or repress occasional exertions, may be taken as a characteristic of the whole people of the Bengal province. And akin to their indolence is their timidity, which arises more from the dread of being involved in trouble and difficulties than from want of physical courage: and from these two radical influences almost all their vices are derived.

In the prisons of the North-west provinces of India, in 1868, the average height and average weight of 16,694 prisoners was 5 ft. 4⅔ and 110½ lbs. The mahomedans and hindus were of equal height and weight, viz. 5 ft. 4 in. and lbs. 109½; the christians about 1½ inches taller and lb. 10 heavier and, as the criminal classes are all under the average of their race and nation, these averages may be considered as somewhat under the national standard of grown men. The Punjabee, Afghan, Marwaree, Jat and Goojur prisoners were on the average between 5 ft. 6 in. and 5 ft 7 in. in height. The Goorkha were only 4 ft. 9 in. in height and weighed lbs. 102. The Goorkha have rather broad faces, small dark eyes, dark straight hair, and small features; they are good tempered but not so intelligent as the Caucasian race.

Religion, the Vedic hymns are the chief of the religious books of the hindoos and contain the earliest records of the worship of the Aryan race who reached India, the date which is assigned to them being from 1,500 to 1,200 B. C. They indicate primarily a worship of the elements, for the deva named are Agni (Ignis) lord of fire: Surya, the sun; Marut, storms; Prithivi, the earth; Ap, the waters; Usha the dawn; Varuna (*ουρανος*) the heavens: and to them the hymns are addressed. Below this seeming polytheism, there is a sense of unity. That which is one, the wise call in divers manners; wise poets (I. 29) make the beautiful winged, though he is One, manifold by words. The hymns contain repetitions to weariness, but they are for the most part prayers for earthly blessings, for rain, sunshine, harvest, wealth, and conquest. Sometimes they expand in glowing adoration of the attributes of the God invoked, the "one king of the breathing and awakening world," whose greatness "the snowy mountains and the sea proclaim," "whose shadow is immortality." (I. p. 29.) Sometimes they embody the confessions of the penitent craving for forgiveness. "Through want of strength, thou strong and bright God, have I gone wrong; have mercy Almighty, have mercy." (I. p. 39) "Whenever we men, O Varuna, commit an offence before the heavenly host, whenever we break the law through thoughtlessness, have mercy, Almighty, have mercy;" now, they utter (as in the Gayatri, used by every brahmin for more than 3,000 years as his prayer on waking) the prayer that the "adorable light of Savitri, the sun, may illumine (or rouse) the spirit of the worshipper." Now, they recognise a power from whom no secrets are hid. "If a man stand, or walk, or hide; if he go to lie down or to get up, what two people sitting together whisper, king Varuna knows it; he is there as the third." (I. 41.) with no trace of the metempsychosis which we associate with later hindoo religion, they express a hope of immortality. "Where life is free, where the worlds are radiant, there make me immortal." But, the Vedas sow the seeds of a mythology yet in the future by fanciful playing with the phenomena of nature. The dawn is a young bride, gold-coloured, daughter of the sky, mother of the cows (the mornings), leading the white and lovely steed (the sun). Sometimes their thoughts on the mystery of the universe clothe themselves in words which sound like the utterances of a later pantheism, as in the hymn which Mr. Colebrooke has translated.—

Nor Aught nor Nought existed; yon bright sky
Was not, nor heaven's loved works outstretched above.
What covered all? What sheltered? What concealed?
Was it the water's fathomless abyss?
There was not death,—yet there was nought immortal.
There was no confine between day and night,
The only One breathed breathless by itself
Other than it there nothing since has been.
Darkness there was, and all at first was veiled
In gloom profound, an ocean without light: *.
* * * * * *
Then first came Love upon it.

Vedic thought is pure as contrasted with the worship of later brahminism. The triad of Brahma, Vishnu and Siva is but a secondary formation, and in the Vedic times, the Kali worship and Sutteeism, were unknown.

The Vedas however indicate the caste system which has overruled Indian's social life since 3,000 years, the verse recognising it being "the brahmana was his (Brahma's) mouth, the Raganya was made his arms, the Vaisya became his thighs, the Sudra was born from his feet."

The religion of the bulk of the people of Hindustan, is hinduism called also brahminism. About a third of the population follow mahomedanism, which its adherents style the Deen-i-Islam, or the Faith of Salvation. and designate themselves, Mussulman, or the saved people. There are in Western Hindustan a considerable number of the Jain religionists and in N. Western India are more than a million of the Sikh persuasion. There are few buddhists. There are a considerable number of christians.

Of late, christianity has not been holding so prominent a position, as in the earlier part of the nineteenth century. At that time, almost the sole instructors of the youth of the country, in all pertaining to an English education, were the christian missionaries who while giving secular edution had the opportunity of imparting christian truths at a period of their pupil's lives when much that is learned is permanently acquired. Then, also, the condition of the country and the form of Government did not furnish many openings for the employment of educated natives, and those whom the missionaries trained had leisure to meditate on the doctrines they had been taught. About the middle of the nineteenth century, however, the British Government undertook to impart to its native subjects an English education higher than anything obtainable in the missionary schools and at the present time about half a million sterling is being annually expended for that object. The mode of training pursued in the Indian Universities and the resulting over education of the alumni have created in them a veneration for mere intellectual attainments with a desire for mere worldly advancement which have unspiritualized the educational efforts of missionaries and thrown even their most successful pupils in the shade.

Languages, a language of mixed origin is in use amongst the mahomedans of India, and employed by the British as the ordinary lingua franca, in their intercourse with the people of the country. It is called hindustani also, urdu, and is essentially Hindi, with large admixtures of words of Sanscrit origin or of Persian and Arabic, according as the speakers or writers, are hindu or mahomedan. At present the Hindustani or Urdu, the Punjabi and the Persian, are written and printed in the same character, but the Arabic, Bengali, Burmese, Canarese, Chinese, Guzerati, Hindi, Mahratta, Malayalam, Malay, Siamese, Singhalese, Tamul, and Telugu are all distinct tongues, each written and printed in a separate character. In the south of India, the Arabic numerals have been generally introduced into Government accounts This was on the recommendation of Sir Erskine Perry, and it has been supposed possible to use the Roman and Italian character for the other tongues and doubtless, it is quite possible to do so, but another generation will see the bulk of the people of India using English with very little knowledge of their respective mother tongues.—*Ann. Ind. Admin. Royle, Productive Resources of India. Hook. and Thoms. Fl. Indica Cal. Rev.*

HINDWANA, Hindi, also Tarbuz, the water melon. Cucurbita citrullus. Citrullus vulgaris.

HINDYAN, a town in the province of Fars, at the mouth of the Kheirabad river, the Ab-i-Shereen of Timur's expedition, and perhaps the Arosis of Nearchus. The Hindyan river is navigable from the sea up to Zeitun, which latter town is only a day's journey (five fursangs) to Behbehan.—*De Bode.* See Kal.

HINEREDURA. SINGH. Anethum sowa. *Roxb.*

HING. HIND. Narthex assafœtida, Ferula assafœtida, Assafœtida.

HINGAM. AR, HIND time; season; hence Hingami, temporary.

HINGHUDI, SANS., Terminalia catappa, *Linn.*

HING-GACH, BENG.. Assafœtida plant, Ferula assafœtida.

HINGGO; Hingol, also Hingot, HIND. Balanitis Ægyptiaca.

HINGLAZ, a town near the sea, about eighty miles from the mouth of the Indus. As a place of Hindoo pilgrimage, it is little visited, from the difficulties which attend the journey when made from most parts of Hindustan. It is said, however, to contain twenty-four temples of Bhawani. *Postan's Western India* Vol. I p. 158.

HINGOLI, 19° 43'; 77° 11', in the Dekhan, S. E. of Aurangabad and 185 miles N. W. of Hyderabad the mean height of the village is 1,495 feet according to Scott and 1,478 feet according to Wilson.

HINGOOLEE, Beng. Solanum melongena.

HINGRA, Guz. Cinnabar.

HINGU, Malay Ferula assafœtida. *Linn.* Assafœtida.

HINGUL GASS, Singh Amoora rohituka. *W. and A.*

HINGUNBET, Duk., Balanites Ægyptiaca. *Delile.*

HINGUN, a river in the Bulundshahar district of the N. W. Provinces.

HINGUR, Hind? Cinnabar.

HINGUPATRI CHETTU, Tel. Ferula assafœtida.—*Linn.*

HINHURU PECALLIEULLA, Sing. Zedoary.

HINJARA. Karn. A cotton beater or cotton dresser. See Pinjara.

HINJOLO, Uria. Eugenia acutangula.

HINNA, Hind. Lawsonia inermis.

HINNE KOREISH, Arab. Lichen rotundatus.

HINNOM. At the union of the vales of Hinnom and Jehoshaphat, there is a basin of water, where the fire of the Temple was preserved; and beyond it, where a clear stream runs through a very narrow inlet between the Mount of Olives and that where Aceldama and the other sepulchres stand, are many olive trees. *Skinner's Overland Journey* Vol. I. p. 218.

HINNUP, Dut. Hemp; Cannabis sativa. —*Linn.*

HIN-PUS-WAEL. Singh. Entada purs-æ tha.—*D. C.*

HINTAL. Beng. HINTALAMU. Sans. Tel. Phœnix paludosa.

HINTEH. Arab. Wheat.

HINTRUNJE, See Kashbin.

HINZIL Arab. Pers. Cucumis colocynthis. Colocynth.

HIONG-NU. See India.

HIPPALUS, the Greek name of the south-west monsoon. See Musiris.—*India in the 15th Cent.*

HIPPALUS, a Greek of Alexandria who, some time prior to the reign of Claudius Cæsar, discovered the direct passage across the Indian Ocean. The ancient mariners boldly crossed the Arabian Sea, and reached Muziris a port on the Malabar Coast of India in a voyage of forty days, or in the middle of September. They left India on their return at the end of December. The place on the Indian coast which the Egyptian merchant vessels then reached is learnt from the coins found there, and was, we know, in the course of the trade wind by which they arrived; we also know the port of Africa where they left the shore and braved the dangers of the ocean. A hoard of Roman gold coins has been dug up in the middle of the nineteenth century near Calicut, under the roots of a banyan tree. It tells its own tale. It had been buried there by an Alexandrian merchant on his arrival from the voyage, and left safe under the cover of the sacred tree to await his return from a second journey. *Sharpe's History of Egypt, Vol.* II. p. 115-116. See Aden p. 29.

HIPPARCHUS, See Yoga.

HIP-PE. Can. See Honge.

HIPPORUS, Annius Plocamus was a freeman of Rome, who farmed the customs in the Red Sea, Pliny mentions that he was blown off the African coast in a violent gale, and, after fifteen days, he was driven on Ceylon at the port of Hipporos which Mr. Roberts supposes to be the Greek words Hippos and orus or horse mountain, a Greek translation of "Kuthri'-Malei" a hill on the N. W. coast of Ceylon.—*Roberts* p. 81.

HIPPELAPHE, *F. Cuv.* syn, of Rusa hippelaphus, Cuv.

HIPPION HYSSOPIFOLIUM. Spreng. Syn. of Cicendia hyssopifolia.

HIPPOCAMPUS a genus of fishes of the Syngnathidæ. H. Mannulus and H. comes, of the Indian seas, when drying, assume the figure of a horse's head and are known to all as the Sea-horse, which the word Kuda, in Malay, implies. The body is tapering and curled near the tail. *Journal of the Indian Archipelago*, 1853. p. 265.

HIPPOCRATEA ARBOREA.

Tree like Hippocratea. | Katha-puhariya, Hind.

Found in Kotah hill jungles. Dr. Wight, in Icones, also mentions H. Grahami and H. obtusifolia.—*Genl. Med. Top.* p. 173. *W. Ic.*

HIPPOPHAE SALICIFOLIA. A plant of Spiti used for fuel.

HIPPOGLOSSUS. A genus of fishes of the Family Pleuronectidæ.

HIPPOLYTE. A genus of the Crustaceæ of the tribe Palemoniens, as under

Hippolyte ventricosus, *Edws.*		Asiatic Seas.	
,,	quoyanus,	,,	New Guinea.
,,	spinifrons,	,,	New Zealand.
,,	spinicaudus,	,,	New Holland.
,,	gibberosus,	,,	New Holland.
,,	marmoratus,	,,	Occanica.

HIPPOMANE BIGLANDULOSA of Borneo, yields caoutchouc.

HIPPOPHAE RHAMNOIDES. *Linn.* A shrub of the Punjab and N. W. Himalaya, in Kangra, Lahore and Ladak, with many vernacular names. Its stem is sometimes 5 or

6 feet in girth. It bears an acid fruit, which makes a good jelly with half its weight of sugar. Its stem gives a good fuel and charcoal.—*Drs. Stewart and Cleghorn.*

HIPPOPHAE SALICIFOLIA.

Buckthorn,	ENG.	Tser-khar,	PUNJABI
Soorch,	PUNJABI.		

This is found in the Sutlej valley between Rampur and at an elevation of 10,000 feet. Its berries mixed with sugar form a good preserve. Near the Chenab it is a stout shrub with spinous branches, and frequent in the valleys. The yellow berries are extremely acid, but when boiled with sugar form an agreeable and wholesome preserve. The people use the branches for dry hedges and fuel, and they are so valued for these purposes as to be considered village property. A species of Prunus, "litsi," ripens in September, with a tolerably sweet fruit, sometimes like the cherry. A gooseberry, "bilitsi," with small woolly sour berries is common, and a black fruited Ribes, "rasta," resembling in taste the European red currant is largely eaten by the people.—*Cleghorn Punjab Report*, p. 67, 150. *Dr. J. L. Stewart.*

HIPPOPOTAMUS the Behemoth of the old Testament, is found in Africa in great numbers and the existence of two species is suspected. The natives kill it with spears after enticing, it into a pitfall. They eat its flesh as they do that of the elephant though both are said to be tougher than caoutchouc. The skin, of which the curbaj, (hence the Spanish corvacho, and French cravache,) the real sceptre of Egypt, is made, has, from the use it is applied to, a certain value.

The hippopotamus has been discovered in a fossil state, in the Sub-Himalaya, where there is an admixture of extinct and existing forms, well preserved remains of hippopotamus, rhinoceros, mastodon, peculiar forms of elephas and very remarkable bovines, dissimilar from those now in India, but seemingly identical with those of Europe. Of animals still existing in India, are found the fossil Emys (Pangshura) tecta. The imbedded shells are all of species still living in the valley, and indicate conclusively that the changes have been gradual from the time that the hippopotami wallowed in the muds, and rhinoceros roamed in the swampy forests of the country, where mastodons abounded and where the strange forms of the sivatherium, dinotherium and camelopardis existed.

The ivory of the great canine teeth of the hippopotamus, is highly valued by dentists for making artificial teeth. No other ivory keeps its colour equally well; and these canine teeth are imported in great numbers into England for this purpose, and sell at a very high price, from the closeness of the ivory. The weight of the tooth, a portion only of which is available for the artificial purpose above mentioned, is heavy in proportion to its bulk; and the article fetches, or did fetch, upon an average, about thirty shillings per pound. One of the specific distinctions pointed out by M. Desmoulins is the comparative abrasion of the canines in the supposed two species.—*Eng. Cyc. Hamilton's Sinai Hedjaz, Soudan*, p. 339.

HIPPOSIDEROS, a genus of the mammalia, of the order Cheiroptera, of which the following species may be named.

H. apiculatus.	H. fulvus.	H. nobilis.
H. armiger.	H lankadiva.	H. speoris.
H. ater.	H. larvatus.	H penicillatus.
H. bicolor.	H. murinus.	H. templetoni.

H. Atèr, Templeton, resembles H. speoris in everything but size and color. The back is coal-black, the hair near the body dark silvery-grey; belly greyish-black; the membrane deep black; tail one-half longer than the femora, its tip exserted. Length $1\frac{3}{5}$ to 1_{10}^{9} in; expanse 10 to $10\frac{3}{4}$ in; tail 7 to 8 in. Common in old buildings about Colombo.—*Mr. Blyth's Report.*

H Lankadiva, Kelaart, is the dubiously cited Rh. insignis of Mr. Waterhouse's Catalogue—Insignis being a true Hipposideros, while Pusillus is a restricted Rhinolophus, and the latter therefore cannot be the small Indian Hipposideros. Length of a full grown male, head and body $4\frac{3}{12}$ in.; tail 2 in.; fore-arm 3 in.; tibia $1\frac{1}{6}$ in.; carpus $1\frac{3}{4}$ in.; tarsus $\frac{4}{12}$ in.; ears $\frac{10}{12}$ in. broad and nearly as long; space between them $\frac{3}{4}$ in.; weight 2 oz. $3\frac{1}{2}$ dr., ears large, acuminate, and emarginated externally near apex; with transverse striæ on their inner surface; naked, with the exception of the inner edge. Muzzle short, but face rather elongated. Body long covered with soft dusky rufous-brown fur, which is grayish at base. Head, neck, and beneath, of a lighter brown colour; pubes hairy. Interfemoral membrane acuminated to tip of tail, which is not exserted. No frontal sac, but two tubercular points from which grow stiffish hairs. This bat is found in great abundance in and about Kandy. The Kornegalle Tunnel swarms with them. It is the largest of all the Rhinolophinæ hitherto seen in Ceylon.

Other two are described as H. Templetonii, *Kelaart*, (R. voulha *Templeton*,) which is no other than H. Speoris, H. atratus. Kelaart (Rh. ater *Templeton*), which is the supposed variety of H murinus.

Besides the latter, Dr. Kelaart forwarded to Calcutta a specimen of what was presumed to be H. vulgaris, *Horsfield, apud*

Gray, of India,—and one of indubitable H, murinus, (Elliot). Mr. Blyth accordingly recognised the following as Singhalese species of Hipposideros.' 1. H. Lankadiva (vel insignis? 2. H. vulgaris? H. Speoris v. voulha) 4 H. Murinus? 5 H. Murinus, var? vel ater et atratus) "Voulha is the Cinghalese word applied to all bats." —*Mr. Blyth's Report.* See Cheiroptera, Mammalia.

HIPPURINÆ, the order Hippurinæ furnishes the water caltrops (Trapa) the seeds of which are vended in the Chinese streets as a fruit, after boiling. The Chinese name means buffalo-head-fruit, which the unopened nuts strikingly resemble.— *Williams' Middle Kingdom*, p. 282.

HIPTAGE MADABLOTA, *Gærtn.*

Gærtnera racemosa.—*Roxb. Rheede.*

Bokhi or Utimukta	Duk.	Madhavitige	
Delight of the woods	Eng.	Potu-Vadla;	Vadla
Ati Muktamu:	Tel.	yarala.	Tel.

A large climbing shrub, with very beautiful white and yellow flowers in terminal racemes: petals fringed; four white, one yellow;—one of the stamens is much longer than the rest; fruit unequally three winged. The bark is a good sub-aromatic bitter.— *Riddell.*

HIRA, a diamond, Hira-ba-rang-i-nausadir a gray or neutral colored diamond.

HIRA DAKHUN, Pterocarpus draco, or Calamus draco, dragon's blood, See Khun Siawa-shan.

HIRAJ, Hind. Pers. Auction.

HIRAK, or hirek of Hushyarpur, Diospyros montana.

HIRA-KASIS, an earth containing sulphate of iron.

HIRALI, Sing. Artocarpus integrifolia. *Linn.*

HIRAM, king of Tyre, was contemporary with Solomon, whom be assisted, he received from Solomon, 20 villages of Gallilee and was a partner with Solomon in the Indian trade. He reigned B. C. 1025 to B. C. 992. —*Bunsen.* III 414-20.

HIRAN, a river near Jubbalpore.

HIRANYA or Hiranya Kasipa, a king destroyed by Vishnu as Narasimha. See Avataram, Avatar, Krishna p. 545. Narasinga or Man Lion.

HIRANYA-BAHU, See Chandragupta.

HIRCUS ÆGAGRUS one of the Capreæ.

HIRDA, Duk. Mar. also Huldah. Terminalia chebula.

HIRI-KODDOL, Singh., Rhizophora, *sp.*

HIRIDA, Mahr. Nauclea? ? *Species.*

HIRINACHEREN, See Vishnu.

HIRN, the common deer, the black buck, &c.

HIRN-PADI, Hind. Convolvulus arvensis.

HIRN PARDI, also Hirn-Shikari, a hunter race of the Peninsula of India, who call themselves Bhaora.

HIRSE, Ger. Millet.

HIRSUF, Ben. Artichoke, Cynara scolymus.

HIRU, Hind. Cassia tora.

HIRUDO, the leech, one of the class Annelidæ, many of which occur in the South and East of Asia. The two species commonly used are H. medicinalis and H. officinalis and in America, H. decora. Six kinds of useful leech are mentioned in Susruta and by Avicenna.—*Royle.*

HIRUNDINIDÆ, a family of birds consisting of one genus and ten species, the familiar swallows, one or two species produce the edible birds nests of commerce. Mr. Blyth says: "there is no reason to suppose that the Hirundo esculenta of Linnæus, as described, with yellow irides and white-tipped tail has any prototype in nature: the latter would be an anomaly throughout the cypselidæ, but may refer perhaps to the white tail-markings of some real hirundo, erroneously supposed to be the constructor of the edible nests. Dr. Horsfield gives the species termed lawet by the Javanese as Hirundo esculenta, *Osbeck*, stating that the specimens which he examined in Java, and those which he took to England, differ from Latham's description in being uniformly of a blackish colour, without a white extremity to the rectrices. Another species, the linchi of the Javanese, he gives as H. fuciphaga, *Thunberg*, stating that 'its nest is constructed of mosses and lichens, connected with the same gelatinous substance which composes the edible nest of the preceding species.' In the Journal of the Indian Archipelago, the same two species are distinguished by the names "lawet" and "lyntye," and the nest of the latter is described to be without the least value. And, it is added: 'the residence of "lyntye," in the caves, contributes greatly to the injury of the true nests, for which reason the "lyntye" are destroyed as much as possible at each gathering. The nests which they make are constructed of grass-stalks. They are, however, of the same form, and are as artfully made as the others.' "Heer Hooyman, likewise, states, that besides the lawet, other species resort to the same caverns, which are named momomo, boerong-itam, boerong-zoekoe, and lintje. 'These,' he adds, 'are very similar to each other, excepting the second, which has the head larger; and the feathers

of all are entirely black. The nests which they construct are black and friable, composed of a light down,' (agglutinated ?) 'An opinion prevails that the presence of these birds is injurious to the caverns, on which account they are driven away as much as possible.' Another writer in the same volume of the Bataviaasch Genootschap, mentions the momos or boerong-itam (thus bringing together M. Hooyman's first two species,) as a large kind with plumed tarsi, indicating thus a true cypselus, which is probably the constructor of the nests assigned by Dr. Horsfield and others to the linchi. Assuredly, however, says Mr. Blyth, the Collocalia fuciphaga, (Hirundo fuciphaga, (*Thunberg*,) linchi or lintye of the Javanese, identical upon comparison with Javanese specimens, would appear to. be the sole producer of the numerous nests gathered on the rocky coasts of the Bay of Bengal: and the often quoted notice by Sir G. Staunton, in his account of the Earl of Macartney's Embassy to China, must refer either to C. fuciphaga, or to an entirely new species, which is hardly to be supposed in the locality. 'For, he remarks: 'the birds which build these nests are small grey swallows, with bellies of a dirty white. The white belly is characteristic of C. fuciphaga; and this particular species occurs abundantly on parts of the coast of the Malayan Peninsula, in the Nicobar Islands, and the Mergui Archipelago, and so high as on certain rocky islets off the southern portion of the coast of Arracan, where the nests are annually gathered and exported to China. From all this range of coast Mr. Blyth has seen no other species than C. fuciphaga, nor does it appear that any other has been observed; and he had examined a multitude both of the adults and of young taken from the nests, collected in the Nicobars and preserved in spirit, all of which were of the same species. Still, what appears to be C. nidifica, inhabits the mountains far in the interior of India, though hitherto unobserved upon the coasts; and it is worthy of notice that C. fuciphaga does not appear to have been hitherto remarked inland in this country." Dr. Mason however observes that C. fuciphaga is constantly seen inland in the Tenasserim Provinces. The Karen in the valley of the Tenasserim in the latitude of Tavoy, are well acquainted with the bird, and they say it crosses the mountains to and from the interior every year. That it is the same species there can be no doubt, for the Karen name of the bird is "the white swallow," from its white belly.—*Mason.*

Hirundo flavicolla, Blyth, belongs to the group of Republican Swallows, (Petrochelidon of the prince of Canino), and has similar habits to the H. fulva of N. America. Upper parts glossy black with white lateral edges to the dorsal feathers more or less seen: the rump brownish and crown dark rufous; lower parts white, with black mesial streaks to the feathers of the throat and breast; the under surface of wing pale brown: tail slightly furcate, with a slight whitish spot more or less developed, towards the top of the inner web of the most of the feathers: tertiaries also white tipped. Length about $4\frac{1}{2}$ inches: of which tail $1\frac{1}{4}$ inch, wing $3\frac{1}{2}$. This retort nest-building swallow, hitherto found only in two spots, building in company, the nests crowded together in rocks overlying the rivers Sone and Karne in Bundelcund, at which time it was breeding.

Hirundo Riocourii, Savigny is the H. cahirrica, *Licht.*; and H. rustica orientalis, *Schlegel*), from Abyssinia, with under parts not more rufous than in ordinary H. rustica, from which it is insufficiently distinguished.

Hirundo rustica the Rustic 'Swallow,' of Europe, Asia, Africa; is migratory and common in the plains of India during the cold season chiefly over water.

Hirundo sinensis the ordinary Indian SandMartin occurs together with H. riparia.

Hirundo urbica the 'Martin' of Europe, Africa, Asia and Siberia; is somewhat rare or local? in India and migratory.

Hirundo riparia the 'Sand Martin' of Europe, Asia, Africa; N. America is migratory, in India and local, and mostly replaced by H. sinensis.

Hirundo rupestris of S. Europe is common in the high mountains of India; and there is a diminutive of it also in the H. concolor of Sykes.

HIRANYA-GARBHA, Sans. from hiranya, gold, and garbha, the womb.

HIRANYAKASHA, Sans. from hiranya, gold, and akshee, an eye.

HIRANYA-KASHIPOO, Sans. from hiranya, gold, and kashipoo, a sheath.

HISCHPANSKIE MUQHI. Rus. Cantharis vesicatoria, *Latreille*. Cantharides.

HIS'HIUN GARNA, Hind. Capparis horrida.

HISLOP, Revd. Stephen, born 8th Sept. 1817, at Dunse, Berwickshire, he joined the Free Church, in 1844 and a munificent donation of Rs. 25,000, having been offered by Captain Hill, on condition of founding a mission at Nagpore, Mr. Hislop was nominated the first missionary and on the 5th September 1844 ordained. He arrived at Nagpore on 13th February 1845 and gave much

time to geology, in the course of his mission-tours In March 1853, he submitted to the Bombay Asiatic Society a paper on the "Geology of the Nagpore State." which was inserted in their Journal for July. Along with his friend Mr. Hunter, he wrote a more lengthened Memoir with a similar title for the London Geological Society, of which the first Part appeared in their Quarterly Journal for August 1855. In the following No of the last mentioned periodical, there is a Memoir from Mr. Hislop; on the connexion of the plant bearing sandstone of Nagpore with the coal-beds of Central India and Western Bengal, and the Bengal Asiatic Society's Journal No. IV. 1855 contains another on the age of the Carbonaceous strata just referred to. In those papers Mr. Hislop describes some of the numerous fossils, which have been found in the tertiary deposit, and the sandstone, coal and shells of the Province of Nagpore; he suggests that the regur may have been formed of decomposed vegetation mingled in moist situations with the debris of any kind of rock; he proves that the trap covering the tertiary was not poured out at the bottom of the ocean, but must have been consolidated under no greater than an aerial pressure; and he maintains that the underlying volcanic rock is more recent than the overlying one and shows that the argillaceous sandstone of Nagpore with vegetable remains is identical with the common coal formation of India, that these are of fresh-water origin, and seem to belong to the era of the Lias or Lower Oolite. Mr. Hislop was accidently drowned, in crossing a river.

HISN KEIFA, See Mesopotamia.

HISPED HARE. Eng. Syn. of Lepus hispidus.

HISSA, Ar. Hind. Pers. an Indian term for a share or division, a portion.

HISSAR, a hill state north of Badakhshan, whose chief claims a Grecian origin. See Kush.

HISTA, a Malayan measure of arbitrary length, the fourth of the dippa, about half a yard. *Simmond's Dict.* See Dippa.

HISTER, a genus of the Coleoptera.

HISTIOPHORUS, the sword fish or fan-fish, is the Ikan-layer of Amboyna, the Dutch zeylfish or sail-fish, and the "Sailor" fish of seamen. It is from 10 to 14 ft. long, and is said to raise its dorsal fin and use it as a sail. *Bennett.*

HISU or hiru, Hind. a species of Capparis of Kangra.

HIT, a miserable town at the usual place where caravans cross the Euphrates between Baghdad and Damascus. There are copious fountains of bitumen and naphtha outside the town with the smell of which the whole water and air is infected. It is undoubtedly the place mentioned by Herodotus, under the name of "Is," as furnishing bitumen for the building of Babylon. Near this, on the Euphrates, and a little below Samara on the Tigris, the country is mere alluvium. The works of salt and bitumen even yet, around Hit, give a most singular appearance to the country. As the Euphrates nears the town of Hit, the stream has an average width of 350 yards, with a depth of 16 feet and a current of three knots per hour in the season of the floods, when there are 14 islands, on some of which are small towns. See Karej and Iran.

HITOPADESHA, Sans. from hita, good, and oopadesha, teaching. See Kali.

HIUL. The grand festival of the German tribes of the Baltic was the Hi-ul, or Hi-el, the Aswa-Medha of the children of Soorya, on the Ganges. In the ceremonies of the ancient Aswamed'ha, a milk white steed was selected with peculiar marks, liberated, and, properly guarded, was allowed to wander where he listeth. It was a virtual challenge to all sovereigns. Arjoona guarded the steed, liberated by Yoodishtra; but that sent round by Parikhita, his grandson, was seized by the Takshac of the north. The same fate occurred to Sagara, father of Desaratha, which involved the loss of his kingdom. In the Ramayana, Desaratha, monarch of Ayodia, father of Rama, is represented as commanding the rite: "Let the sacrifice be prepared, and the horse liberated from the north bank of the Sarjoo." A year being ended, and the horse having returned from its wanderings, the sacrificial ground was prepared on the spot of liberation. Invitations were sent to all surrounding monarchs to repair to Ayodia,-Kykaya, the king of Cassi, Lompada of Angdes, Coshula of Magad-des, with the kings of Sindha, Soovira, and Saurashtra.—*Tod's Rajasthan.* See Bal.

HIUNSEW. Hind. Parmelia *sp.*

HIWEN-THSANG. A Chinese traveller who passed seventeen years (from A. D. 629 to 645) in travelling through the countries lying to the west of China and especially in India, through countries which few had visited before him, and he describes some parts of them which no one has since explored. His chief object was to study the religion of Buddha, but his observations, geographical, statistical and historical, are characterised by great minuteness and precision. He started from Pekin and made his way amidst hardships and difficulties through

Chinese Tartary, to the region where Buddha had laboured. Near Talas, on his way to India he fell in with the Great Khan of the Turks, a successor of Dizabulus, whom the Chinese traveller calls Shehu. His account is very like that of Zamarchus. The Khan "occupied a great tent adorned with gold flowers of dazzling richness. The officers of the court sat in two long rows on mats before the Khan, brilliantly attired in embroidered silk; the Khan's guard standing behind them. Although he was but a barbarian prince under a tent of felt, one could not look on him without respect and admiration." He appears to have regarded the Wakhsh branch as the main Postu or Oxus. *Histoire de la vie de Hiouen Thsang* pp. 55-56. *Yule Cathay*, I. pages clxv and ccxxxiv.

HLA TIBET, Musk deer. The finest musk comes from Khoten.

HLAINE, an elongated valley of Pegu, extending north and south with the Yomah range, at a distance of ten to thirty miles from the east bank of the Irawady river; the hills at intervals advancing and then receding from the river, but always leaving a broad plain on its bank. The lower part of the plain has been cultivated: the higher parts are covered with forest. The Phoungyee valley, which lies to the eastward of Hlaine, from which it is separated by a branch of the Yomah, is an amphitheatre, open to the south and surrounded on all other sides by hills. Its breadth from east to west is probably about ten or fifteen miles, and its length from north to south thirty. The Pegu or Zamayee valley lies to the east of Phoungye, from which it is separated by another branch of the Yomah. This valley is enclosed on all sides by hills; it is about forty or fifty miles in length from S. S. E. to N. N. W., which is the direction in which it lies, and twenty miles in breadth from E. to W. The Zamayee river is large and navigable for small craft in the rains, for a distance of sixty or eighty miles above Pegu, to the extremity of the valley; and although only about knee deep in the dry season, it rises forty feet in the rains: its bed is sandy and unimpeded by rocks. The mountains extending along the N. W. side of the valley, separating it from Phoungyee, the Hlaine and Tharawaddy, are of considerable extent and elevation and form a part of the Yomah range. On the east side it is separated from the plains of Tounghoo and Shoay Gyeen by a lower branch of the same chain, and finally it is enclosed to the south by a low hilly tract through which the river passes by a series of small defiles to Pegu. Dr. McClelland ascended the Thounzai valley in the Hlaine district to its head, and descended through the Oakkan valley, and, having traversed the forests from thence to Mazalee, ascended the Choung. This Hlaine forms a part of the valley of the Irrawaddy with which the Hlaine river is connected by means of creeks.—*Dr. McClelland, in Selec. Records Govt of India Foreign Dept. No. IX.* p. 8.

HLA-PET, BURMESE, literally Wet-Tea. In Burmah, to the eastward of Bamo and Koungtuno, hills are visible, peopled by cateran Kakhyen, and by breeches wearing Paloung, peaceably growing tea for pickling. This is the Hlapet under notice, which is made up with a little oil, salt, garlic or assafœtida, &c., into a sort of pickle, and is essential to the comfort of every Burman, being partaken of on all ceremonial occasions. It is floated to Ava on bamboo rafts, so as to be retained always partially wet, it is eaten by the Burmese in small quantities after dinner as Europeans eat cheese. They say it promotes digestion and they cannot live in comfort without it. Colonel Burney mentions that the Burmese Resident proceeding to Calcutta in 1830 took a large supply of hla-pet with him, as a necessary of life, not to be had where he was going. Hlapet is partaken of on many ceremonial occasions, and on the conclusion of law suits, the bill of costs is always rounded off with a charge for pickled tea, as European Agent's accounts are still rounded off with a charge for postages.—*Mason's Burmah Yule's: Embassy*, p 101.

H'LWA-BO. BURM. Eriolæna tiliifolia.

H'LWOT-DAU. BURM. The Cabinet and High Court of the realm of Burmah, in which there are four Woon-gye, or chief ministers assisted by as many Woondouk.—*Yule's Embassy*, p. 3.

H'MO. BURM. Agaric.

H'MAN. BURM. Feronia elephantum.

HMAN THEN. BURM. Curcuma roscoeana.—*Wall.*

HNAN. BURM. Nauclea cordifolia.—*Roxb.*

HNAU. BURM. A kind of boat, of Burmah. See Boat.

HNAW-BEN. BURM. is a large tree, of pale-yellow wood, preferred for making combs. It bears a large, fragrant fruit, but worthless.—*Crawfurd*, Vol. I, p. 192.

HNET. BURM. Bird.

HO, a Chinese measure of capacity, about $7\frac{3}{4}$ gallons.—*Simmond's Dict.*

HO. A branch of the Kol, residing in Singhbum. They are agricultural, but change their localities. A Ho bridegroom buys his bride, or rather his father buys her for him, the price being so many head of cattle. Ho, is a name of the Sonthal. The

Kol and Lurcha Kol, are tribes in India, cognate with the Khond. Some of them occupy Singhboom. The Ho language differs so little in phonology and glossary from the Mundah, Bhumij and Sonthal, that Captain Tickell's account of its grammar, may be taken as that of the Kol language generally. The Ho is the most compact, the purest, most powerful and interesting and best looking division of the whole Mundah nation. The more civilized Ho have an erect carriage and dignified, fine, manly, bearing, with figures, often models of beauty: the occupants of the less reclaimed parts are more savage looking. Their tradition is that they came from Chota Nagpur and that they brought with them their system of confederate governments of Purha, which they call Pirhi or Pir. The Ho of Singhbum are also styled Laraka Kol and have a tradition that they once wore leaves only, as the Juanga women now do, and not long since threatened to revert to them unless cloth-sellers lowered their prices. The Ho of the border land have probably much intermixed with the Urya, and are less ugly than the race is usually described to be.—*Captain Tickell. As. Soc. Jour.*, Vol. IX, pp. 783, 997, 1063. See India.

HOA-HOUNG-TAN. Cochin-Chin. Rose.

HOAI HOAI, Chinese name of Mahomedans and Jews.

HOA-MIEN. Chin. Gossypium Indicum.—*Lin*

HOANG-HO, a great river in China 3,040 miles long. The Yang-tse-Kiang forms with the Hoang-ho, a twin basin, to which the most advanced and powerful eastern civilization owes its development. The Yang-tse-Kiang is connected on the west with the twin basins of the Salwin and Irawadi, which are themselves connected inland with the Tibetan district and on the S. and E. with the Indian oceanic basin. It is undoubtedly one of the finest rivers in the world; it takes its rise in the mountains of Thibet, and, after traversing the Koukou-Noor, enters China at the province of Kan-Sou; it then leaves it again to water the sandy plains, at the foot of the Alechan mountains, surrounds the country of Ortous, and after having watered China from south to north, and then from west to east, goes on to throw itself into the Yellow Sea. The waters are pure and beautiful at their source, and only assume their yellow tint, after passing the Alechan and the Ortous. The river rises almost always to the level of the country through which it flows; and to this is to be attributed the disastrous inundations which it occasions. But these floods, which are so fatal to China, are of little consequence to the nomadic Tartars, who have only to strike their tents, and move off elsewhere.

The bed of the Hoang-Ho has suffered very remarkable variations. In ancient times its mouth is said to have been in lat. 39° north, at present it is in 34°. The Chinese government is obliged annually to expend enormous sums to keep the river within its bed. In the year 1799 it cost £1,682,000.—*Huc's Recollections of Journey*, p. 85.

HOANG-TI, the primitive Chinese ruler. The Chinese, in the reign of Hoang-Ti, invented the magnetic needle, the smelting of copper for making money and vases of high art. Hoang-Ti is the first historical emperor (B. C. 2,698) and the Chinese historians allege that in his reign, the inventors of sundry arts and sciences arrived from the western kingdoms in the neighbourhood of the Kuen lung mountains.—*Yule, Kathay*, I, p. xxxv.

HOA-PIN-SAN and Ti-a-Usu, two islands which lie 80 miles north of Formosa. With their neighbouring rocks, this group extends about 14 miles. The extreme height of Hoa-pin-san, was found to be 1,181 feet.

HOARY SUN ROSE. Helianthemum canum.

HOA-U-CHOW, a small island near Pakleak-low.

HOBNEM. Heb. Ebony.

HOCKEY. There is a game of Tibet, resembling hockey and called changhan, but played on horseback, on a plain about 60 yards broad and 350 long, with a stone pillar at each end as the goal. The ball is somewhat larger than a cricket ball and in Tibetan is called Pulu. The stick or Byntu, is of the strong and straight bough of the almond tree, about 4 feet long and let in at the top and passed quite through to the other end of a curved piece of solid birch wood—about the size and shape of a drenching horn. The game is mentioned by Baber. It is played in every valley in Little Tibet, Ladak, Yessen, Chitral.

HOCOMLIA MONTANA ?

Sampga,	Can.	Kudkoe,	Mahr
Tambut.	Mahr.		

grows in Canara and Sunda, on and close to the head of the Ghats; wood seldom runs large, is white, hard and tough; used for agricultural implements.—*Dr. Gibson.*

HODAIDA, on the East Coast of the Red Sea, is a large fortified town of Yemen, with lofty buildings, and is now the most flourishing of the Turkish ports. It is situated on the north-east side of a sandy bay and sheltered by a point of land running north-west.

Its custom dues, in 1857, realized by sale Rupees 1,50,000. It is surrounded by a high wall, and contains spacious bazaars. It is the seaport of Senaa. See Lohaia, Tehama; Kilaid us Sham.

HODGSON, Captain, Author of journey to the source of the Jumna: hot springs at Jumnotri, &c., in As. Res. vol, xiv. 128. On a new form of the hog kind in Sind in Bl. As. Soc. Trans. vol. xiv. 423. HODGSONIA HETEROCLITA, *Hooker*

Trichosanthes, *Roxburgh.*

Is the most magnificent plant of the jungles in the valley of the Teesta in Sikkim. It is a gigantic climber allied to the gourd, bearing immense yellowish-white pendulous blossoms, whose petals have a fringe of buff-coloured curling threads several inches long. The fruit is of a rich brown, like a small melon in form, and contains six large nuts, whose kernels (called "katior-pot" by the Lepcha) are eaten. The stem, when cut, discharges water profusely from whichever end is held downwards. It is a new cucurbitaceous genus, found in the Terai, clinging in profusion to the trees and also 5,000 feet up the mountains. This magnificent cucurbitaceous climber grows also in the forests; east of Chittagong: it is the same species as the Sikkim one. The long stem bleeds copiously when cut, and like almost all woody climbers, is full of large vessels; the juice does not, however, exude from these great tubes which hold air, but from the close woody fibres. *Hooker, Him. Jour Vol. I, p.* 395. *Vol.* II. *page* 350.

HODHAD, king of Yemen father of Balkees queen of Sheba, lived about the beginning of the Christian era. See Balkees.

HOD'HU, a name of India. See India.

HODUNG. Hind. Populus euphratica.

HOE a secret society of the Chinese into which the members are initiated; the concluding ceremony consists in pricking the middle finger of the right hand, dropping the blood into a bowl of arrack, from which each of the candidates drink and are then saluted as brethren.

HOE.

Mamoti. Tam. | Phaora. Hind.

HOEDEN. Dut. Hats.

HOEI KING, a Chinese budd'hist traveller in India, Kotan (Yu-than) and Tibet in

A. D. 399-400, along with Fa Hian the Fo-kue-ki of Remusat, Klaproth and Landresse. Fa-Hian with Hoei-king, and other Chinese pilgrims reached Yu-thau or Khutan, in A. D. 399-400. Fahian then travelled by Tsu-bo and Yu-hoei and over the Tsu-Ling mountains southwards to Kie-Chha the modern Ladak where he rejoined Hoei King. From Kie-Chha the pilgrims proceeded westward to Tho-ly which they reached in one month. They came to India, overland by way of Tartary and Cabul, visited Ceylon and sailed thence to Java. On his return, Fa Hian left behind him an account of his travels called Foe Koue Ki or an account of the buddhist countries. At the time of his visit, buddhism was still the dominant religion, though vaishnava doctrines were gaining ground. *Cunningham, Ladak. Cal Rev.* See Airun, Buddha, Indra, p. 364. Inscriptions 378, 384.

HŒMATOPUS OSTRALEGUS, or 'Oyster catcher,' a bird of the circuit of northern regions to the equator, if not further south: not rare along the shores of the Bay of Bengal, &c.

HŒMATORNIS, a genus of birds of which several species inhabit India. H. cafer, is the bulbul of the South of India, H. chrysorrhoides is another species. See Birds, Bulbul.

HOFFMEISTER, Author of Travels in Ceylon and parts of the Himalayas to the borders of Thibet.

HOG.

Khanzir, AR.	Sus scrofa: Porcus LAT.
Baraha, BENG. SANS. PERS.	Dukar, MAHR.
Indian wild boar: ENG.	Babi utan: Babi
Choiros. GR.	alas: Babi, MALAY.
Jangli Sur; HIND.	Ghrishvi, SANS.
Sur, ,,	

The wild hog abounds in many parts of India and the males attain to a very large size, it is generally believed that there is no specific difference between the wild hog of Europe and India. The adult males dwell apart from the herd. The wild boar is constantly hunted by Europeans on horseback, with the spear; Natives of India hunt the boar with dogs.

All the wild hogs in the Archipelago are small animals, compared with the wild boar of Europe, or even with that of continental India.

The Sus verrucosus, so called from the fleshy excrescence on the sides of the cheeks, has a grotesque and a formidable appearance, but is in reality a timid animal. The number of them in Java is immense, and in passing along the highway, in particular districts, scores of them are to be seen.

Mr. Blyth distinguished from the hog, common in India, a specimen sent to him from Ceylon, the skull of which approaches in form, that of a species from Borneo, the Sus barbatus of S. Muller.

The genus Babirussa of F. Cuvier takes its name from two Malay words, Babi, hog, and Rusa, a deer. It is the Sus babyrussa of Linnæus and the B. alfurus of Lesson, and occurs in the islands of Buru or Bouron one of the Moluccas, and in Celebes and Ternate.

The Porcula salvania, Hodgson, the Pigmy Hog of the Saul Forests of N. India, is the Sano banel and Chota sur of the Natives of India and confines itself to the deep recesses of primeval forest. The adult males abide constantly with the herd, and are its habitual and resolute defenders.—*Sykes Cat. Deck Mam.* p. 11. *Crawfurd, Dict.* p. 152. *Tennent's Sketches of the Natural History of Ceylon* p. 59. *Catalogue of Mammalia in the India House Museum,* See Babirussa Boar, Mammalia, Sus.

The Hog-deer inhabits continental India, central India, Bengal, the Gangetic valley, Punjab, Sind, Assam, Sylhet, Burmah. See Cervus, Deer. Mammalia.

HOG ISLAND, lies 17 or 18 leagues off the coast of Sumatra, and is the most northern of a group.

HOG ISLAND, a high pyramidal island, lying close off the main on the coast of Canara.

HOGG, Sir James Weir, Bart., for many years M. P. for Beverly, Honiton, &c. took a prominent part in discussions relating to Indian affairs in Parliament. He was a Director of the East India Company. He was born at Stoneyford in the county Antrim in 1790, and was called to the Bar in Ireland. At Calcutta, he practised as a barrister and held the office of Administrator General, then one of the most highly-paid offices in India, as being the Court which took cognizance of the administration to the effects of all persons who died intestate or otherwise, much in the same manner as the Prerogative Court of Canterbury. He returned to England in June 1833, and in December, 1834, was returned M. P. for Beverly as a supporter and follower of Sir Robert Peel, to whose policy and fortunes he zealously adhered throughout. He was re-chosen at Beverly in 1841, and from 1847. long represented Honiton. He was chosen

a Director of the Court of Proprietors in 1839, and twice served the office of Chairman. At the abolition of the old Court of Directors he was named one of the Political Military Committee. He was raised to the Baronetcy by Sir Robert Peel in 1846, just previous to his retirement from office.

HOGLA, Beng.

Typha elephantina, Roxb.

Elephant grass or cats tail grass.

HOG PLUM. Spondias mangifera.—*Pers.*

HOG-SKIN. See Leather.

HOG'S LARD.

Sur-ke-charbi, Hind | Adeps suillus, Lat.

This is the fat about the loins of the hog, Sus scrofa. It is purified by melting and straining. Its melting point is from 78° to 88°. Fahrt.; inodorous and tasteless while fresh, readily grows rancid. Lard contains carbon 79·098, hydrogen 11·146, oxygen 9·756—proximately it consists of ealine 62, stearine and margarine 38 per 100. In the rancid state it contains the margaric and stearic acids, and a peculiar volatile acid. In Europe, hog's lard is much employed in ointments, but in India the strong prejudice against the article renders it desirable to exclude it as much as possible from all pharmaceutical preparations, substituting for it the "simple liniment."—*O'Shaughnessy*, p. 690.

HOIMAVATI. Sans. From himavat. See Hima, snow.

HOJA DE LATA. Sp. Tin.

HOJAI KACHARI. See India Kachari.

HOKMCHIL. Hind. Phœnix dactylifera.

HOL. Hind. Medicago sativa.

HOLAN. A river of Seoni.

HOLAR, also Holiar, also Holaru, in the Karnatica districts of the Peninsula, the pariah or dher race. Professor Wilson describes the Holar as a man of a low or outcaste tribe, by profession a musician, which answers to the Mhang race, but there is no doubt but that the Holar is the Dher.

This plant grows throughout India. It has large flowers of a red, green and white colour.

HOLASHI. Hind. Rhus succedanea.

HOLCUS, a genus of grasses, belonging to the natural order Panicaceæ, of which the more important species have been transferred to the genus Sorghum. H. sorghum is now Sorghum vulgare. H. saccharatus, *Roxb.* now saccharatus, a native of Caffraria. Stalks thick, and full of a sugary medulla. Professor Arduino, (*Journ. Botanique*, iii. 168,) gives an account of his experiments on the extraction of sugar from this species. They were extremely satisfactory. This was introduced by the editor into the peninsula of India, and it has been recommended in the United States as a sugar producing plant and for the sake of its juice. Its stalks furnish three important products, sugar, which is identical with that of cane,—alcohol, and a fermented drink analagous to cider. This juice, when obtained with care and in small quantities, by depriving the stalk of its outer coating or woody fibre and bark, is nearly colourless and consists merely of sugar and water. Its

density varies from 1,050 to 1,075 and the proportion of sugar contained in it from 10 to 16 per cent, a third part of which is sometimes uncrystallisable.

HOLCUS DURRA. Forsk. Syn. of Sorghum vulgare.—*Pers.*

HOLCUS SORGHUM, is the Sorghum vulgare. There are two varieties, one with a reddish grain and one white: in districts where makai (maize) is called "bara jawar," this plant is called jawar-khurd "chota jawar" or "jawar barik." When jawar is used for fodder and cut down while green it is called "chara." It is grown in fields and sown during the rains; it is the common food of the poorer classes of India, being ground and made into cakes. It is a native of China, and India, but is cultivated in Peru, and in Europe; seeds very hard, rounded, very variable, sometimes entirely smooth, insipid, parenchyme farinaceous; but little different from maize in chemical composition. This plant as also the Indian corn or Zea mays, sometimes puts forth three or four stems and so many as 12,700 seeds have been gathered from one plant which had grown to eleven feet in height; in China ten or twelve feet are usual heights. *O'Shaughnessy, p.* 637 936. *Am. Rep. Com. of Patents p.* 220.

HOLDNA. Hind. in Kangra, the process of destroying weeds in a rice crop.

HOLEYA, a race of labourers in Coorg, ill-favoured, with coarse, stupid features, short in stature, but strong built, with dark and black skin and black straight hair. They practice demonology and are said to have no guru. See Holar.

HOLI. A popular hindu festival celebrated during the ten days preceding the full moon of Phalgun. It is an astronomical festival and is called in Sanscrit Holikha or phal gotsava or Hutasham also dola or dolavatra, the swinging festival. It is supposed to relate to the vernal equinox and to be similar to the Persian New-year's day. It is held about the 19th March, or 15 days before the full moon of Phalgun. It is in honour of Krishna and is quite a saturnalia, red powders being thrown and red fluids squirted at passers bye, and licentious songs sung. At the close of the festival, a pile is lighted, and a wheaten cake or "Poli," offered on it. The analogy between the goddess of the spring Saturnalia, Phalguni, and the Phagesia of the Greeks, will be recognised; the word is not derived from eating, with the Rajpoot votaries of Holica, as with those of the Dionysia of the Greeks, but from phalguni, compounded of guna, 'quality, virtue, or characteristic,' and phala, 'fruit,' in short, the fructifier, from which there is no definite meaning The Egyptian had the festival Phallica, the Holica of the hindus. Phula and phala, flower and fruit, are the roots of all, Floralia and Phalaria, the Phallus of Osiris the thyrsus of Bacchus, or lingam of Iswara, symbolized by the Sriphala, or Ananas, the 'food of the gods,' or the Sitaphala of the Helen of Ayodhia.

HOLIDAYS, of the several races dwelling in India chiefly occur at certain seasonal changes, but also at the anniversaries of certain occurrences connected with their religions. The dates of the festivals vary with the lunar months, and those below are approximate:

CHRISTIAN.

New Year's day	.. January 1st
Good Friday	.. April.
Christmas day	December 25th.
Easter Holidays	..March.
Ascension Day	..May.
Pentecost Holidays	. June.

HINDU.

Makar Sankranti	..January 11th
Maha Shivaratri	...February 24th.
Huli	...March 10th and 11th.
Ram Naomi	...April 4th.
Cocoanut Day	. August 6th.
Janm Ashtami	. August 14th.
Ganesh Chaturthi	.. August 25th.
Dasara	...September 30th.
Diwali	..October 18th and 19th.

PARSI—Rasami or Shahanshahi and Kadmi.

Jamshidi navroz	. .March 21st.
Aban Feast	.. April end of.
Adar Feast	..June 8th.
Farvardin Jasan	.. June 8th.
Gatha Gahanbars	. September 19th to 21st.
Pateti or New Year's Day.	September 23rd.
Kurdad Feast and Valava	September 28th and 29th.
Atishbehram Salgeri	.. November 8th.

PARSI—Kadmi.

Aban Feast	...March end of.
Farvardin Jasan	.. May 9th.
Gatha Gahanbars	.. August 20th to 22nd.
Pateti or New Year's Day.	August 24th.
Kurdad Feast and Valava.	August 29th and 30th.
Atishbehram Salgeri	.. September 9th

MAHOMEDAN—Suni.

Shab-i-Barat	.. January 14th.
Lailat-ul.Kadir	. February 23rd.
Ramadhan 'Id	..February 27th and 28th.
Bakar-'Id	.. May 6th,
Ashura	. June 4th 5th and 6th.
Bari Wafat	.. August 6th.
Ghilan	.. September 3rd.
Miraj-i Mahomed	..December 16th.

MAHOMEDAN—Shiah.

Khatl-i-Imam Ali	.. February 17th.
Shaha Kadir	..February 19th.
Ramadhan 'Id	.. February 27th and 28th.
Bakr 'Id	.. May 6th.
'Id Gadir	. May 14th.
Ashura	. June 4th and 5th.
Chahlam	...July 15th.

Khatl-i-Imam Ali	. July 23rd
'Id Maolud	...August 10th.

JEWISH.

Purim or day of Queen Esther	...March 13th.
Pesach or Passover	...April 11th and 17th.
Shabnoth or the delivery of the Law	May 31st.
Tishabaab or the day of Lamentation	August 1st
Rosh Hosana or New Year's Day	Sept. 21st, 22nd.
Kipur or the Days of Atonement	Sept. 29th, 30th.
Succoth or the Feast of Tabernacles	Oct. 5th, 13th.

HOLIGARNA LONGIFOLIA, *Roxb.*

Holgeree,	CAN	Holgeree,	MAHR.
Biba-Biba,	,,	Katu-jeru	MALEAL

One of the trees yielding the well known black lacquer varnish. It grows in Travancore, in Malabar, in Canara and Sunda, mostly above the ghats, at Nilgoond, in the Konkan, Assam, Chittagong, and in the forests of Tenasserim. Wood good for houses and beams. Its dangerously acrid exudation is used by the natives to varnish shields, and for other purposes. A fine black varnish from its fruit is brought from Munnipore. This turns of a beautiful black colour, when applied to a surface, owing, according to Sir D. Brewster, to the fresh varnish consisting of a congeries of minute organised particles, which disperse the rays of light in all directions; the organic structure is destroyed when the varnish dries, and the rays of light are consequently transmitted. There is brought also from Munnipore, a varnish, made from the Semecarpus anacardium (marking nut), and a remarkable black pigment resembling that from Melanorrhoea usitatissima, which is white when fresh, and requires to be kept under water.—*Drs. Roxb. Fl Ind.* ii. p. 80. *Voigt, Gibson, O'Shaughnessy, Mason, and Hooker's Him. Jour. Vol. II. p.* 331.

HOLIYA, Haliyanu, Hollera or Holiyaru, in the Canarese or Karnatica, a pariah, a predial slave in Coorg and Canara. In Canara he is regarded as a Dher. In Coorg as one of the three principal classes of predial slaves, called Holeyaroo, Yewaroo and Paleroo. The Holeyaroo have many subdivisions, and the Mare Holeroo follow the custom of descent through the female line, the descensus ab utero. *Wils.* See Holiar.

HOLKAR, the title of the prince of Indore, a Mahratta sovereign with the title of maharajah, Indore and Mhow are his chief towns. Indore the capital is built on a plateau. The Holkar family are of the dhangur or shepherd tribe. The first who rose to eminence was Mulhar Rao, who was born about the end of the 17th century and was one of the most distinguished leaders in the first Mahratta invasion of northern India. He died at the age of 76 and was succeeded by his grandson Malee Rao, who died, insane, nine months after his accession. The pious Ahilya Bai, the mother of Malee Rao, then took the management of affairs and appointed, as the commander of her army, Tookajee Holkar, a chief of the same tribe but in no way related to Mulhar Rao. This chief for many years served Ahilya Bai with the most devoted fidelity. Ahilya Bai died in 1795 and was not long survived by Tookajee Rao, after whose death the power of the house of Holkar was nearly extinguished by quarrels in the family and amid the dissensions which distracted the Mahratta confederacy at the close of the eighteenth century. The fortunes of the family however were restored by Jeswunt Rao, an illegitimate son of Tookajee Holkar, who, in 1802, defeated the united forces of Sindia and the Peshwa near Poona. The conclusion of the Treaty of Bassein between the Peshwa and the British Government defeated Jeswunt Rao's hopes of possessing himself of the person of the Peshwa. In the following year when Sindia and the rajah of Berar combined against the British, Holkar promised to join the confederacy. But on the actual outbreak of hostilities he kept aloof and apparently intended to take advantage of the war to aggrandize himself at Sindia's expense. His schemes, however, were rendered hopeless by the treaty of Surjee Anjengaum, and Holkar, after making a series of inadmissible proposals for an alliance, seems then to have hastily determined, unaided and alone, to provoke hostilities with the British. In the war which followed, Holkar was completely overthrown. He was pursued by Lord Lake across the Sutlej, whither he retired in the hopes of forming a combination with the Sikhs against the British Government, and on 24th December 1805 he signed a treaty on the banks of the Beas by which he was stripped of a large portion of his territories. Soon after the conclusion of the treaty, Jeswunt Rao Holkar became, in 1805, insane. He died in 1811, leaving an illegitimate son of Mulhar Rao during whose minority the State was torn by the most violent dissensions. Toolsee Bai, the favorite concubine of the late ruler secured herself in the regency. She was, however, subsequently barbarously murdered, and Holkar's army sustained a complete defeat at Mehidpore, and on 6th January 1818 the treaty of Mundisore was concluded, by which the supremacy over the rajpoot princes of Oudeypore, Jeypore, &c., was transferred to the British Government, the engagement between the British Government and Ameer Khan was confirmed, four districts rented by Zalim Sing of Kotah were ceded to him, Holkar lost all his possessions

within and to the south of the Satpoora hills, and his remaining territories came under the protection of the British Government. Mulhar Rao Holkar died in October 1833 at the age of 28. He left no issue, but his widow and his mother adopted a child between three and four years of age who was said to be of the same tribe and lineage as Mulhar Rao. The child was publicly installed on 17th January 1834 under the title of Martund Rao Holkar. The adoption of Martund Rao, however, proved to be a device of the mother of Mulhar Rao Holkar for the purpose of keeping the power in her own hands during a long minority. It was not acceptable to the people, who were in favour of the succession of Huree Rao Holkar, a cousin of the late maharajah. Hurre Rao had been kept in rigorous confinement, but he was released on the night of 2nd February 1834 by a powerful body of his partisans, and received a ready welcome from the troops and people. The policy of non-interference prevented the Resident from giving active support to Martund Rao although the installation of Martund Rao had been formally acknowledged by the British Government. This indifference on the part of the British Government as to who should rule gave rise to most serious disturbances. The wealthy merchants fled from Indore, trade was suspended, and the plundering Bheel tribes infested the roads and destroyed many villages. Martund Rao was banished from the country and granted an allowance of Rupees 500 a month on condition of his resigning all claims to the succession. On 8th September 1835 an attack was made on the palace for the purpose of assassinating the maharajah and his minister. The attempt was unsuccessful, and resulted in the slaughter of the whole of the assailants. Martund Rao Holkar died without issue at Poona on 2nd June 1849, and with his death ended the intrigues which from time to time endangered the peace of the country both during the rule of Huree Rao Holkar and his successor. When the attack was made on his person in 1835, Hurree Rao applied to the British Government for aid, but it was refused on the ground that the engagement to maintain the internal tranquillity of the country depended on the condition that the measures of its Government were not directly or indirectly the cause of disturbance, and because the grant of assistance would require a continual interference in the internal affairs of the state inconsistent with the position of Holkar and the policy of the British Government.

In 1841, the maharajah adopted as his heir and successor Khundee Rao, a boy of 13 years of age, son of an obscure zemindar and very distantly related to the reigning family, and Huree Rao died on the 24th October 1843 aged 48. Warned by the evils which resulted from the vacillating policy pursued on the accession of Martund Rao the British Government took immediate measures to proclaim Khundee Rao as the acknowledged successor and to make it known that no other claims would be recognized. Khundee Rao died on 17th February in the following year. He was never married. On this, Sir Robert Hamilton selected and installed the younger son of Bhao Holkar, who took the litle of Tookaji Rao Holkar. In a letter to the young chief the Governor General laid down the conditions on which the state was conferred on him. This letter No. lxxvii. was declared to have the force of a sunnud and the maharajah was required to present a nuzzer of 101 gold mohurs on its delivery.

The young chief Tookaji Rao Holkar, attained his majority in 1852, and was entrusted with the entire management of the affairs of the state and was granted a sunnud, guaranteeing to him the right of adoption.

An annual payment of Rupees 30,000 is made to Holkar by the British Government as compensation for his share of the district of Patun which was made over to Boondee in 1818. The maharajah also receives through the British Government a tribute of 72,700 Salim Sahi rupees, on account of Pertabgurh, but he has no feudal supremacy over that state. He receives credit for this tribute as part of his contribution towards the Malwa contingent, and it is realized from Pertabgurh one year in arrears.

In the war with Jeswant Rao Holkar, Lord Lake gave many lessons how to deal with the less coherent forces of Asiatic rulers. Jeswant Rao Holkar, when he opposed the British in 1803, had 100,000 regular troops, amongst whom were 60,000 light horse, and 130 guns with the fortresses of Chandore and Galingurh. From the tactics he adopted, this moveable force baffled the British commanders and all the military power of India from April 1804 till the 15th February 1805. But on the 2nd April 1805, Jeswunt Rao Holkar, was defeated by Lord Lake, who marched all night and at daybreak entered Holkar's camp, which he completely broke up: in this, in going and coming, Lord Lake marched fifty miles. Lord Lake subsequently, in December 1805, marched in his pursuit 405 miles in 43 days from Secundra to the Beas river at the Rajghat. In Jeswant Rao Holkar's final overthrow Lord Lake marched 350 miles in a fortnight. Sir D. Ouchterlony was defending Delhi against the Mahrattas. But on their

abandonment of Delhi on the 14th, or 15th October 1803, Lord Lake followed them, and at length, with a small body of 3,000 British horse and artillery amongst which were the 8th and 27th dragoons, made a forced march of about 48 miles, defeated the forces of the Mahrattas about 60,000, near Furruckabad, followed 10 miles in pursuit and returned to camp, making a journey of about 70 miles in 24 hours, with a loss of 22 dragoons killed, and 20 Europeans and natives wounded.

At that time, Amir Khan, the Rohilla chieftain of Rohilcund forsook the Bhurtpore rajah, but was followed by General Smith whom Lord Lake sent in pursuit. After a march of 700 miles in 43 days. Amir Khan's army was overtaken and defeated at Afzalghur at the foot of the Himalayas on the 2nd March 1804 and Amir Khan was conveyed across the Ganges and Jumnah in March, but he rejoined Holkar's camp under Bhurtpore. At Laswari, in Central India, in 1803, Lord Lake and General Fraser fought and won a battle against the battalions of Scindia and Perron.—*Treaties and Summuds*

HOLLAND, a country in Europe with great possessions in the Eastern Archipelago which are designated Netherland India, also the Dutch possessions in India.

HOLLOUNDA. Hind. Phaseolus rostratus.

HOLLYHOCK. Eng. Althæa rosea. This is a plant, of the genus Althea, and its varieties are well worth cultivating on the plains during the cold months of India. Seeds should be sown freely in wooden boxes successively during the rains. When they have formed 3 or 4 leaves they should be planted out in the flower garden. Nothing can excel their gaudy appearance, if planted in well prepared soil, where they will grow from 6 to 12 feet high. Double flowers will rarely be had on the plains. They take about four weeks or two months from the time of sowing to flowering. Native of China.—*Jaffrey.*

HOLMA. Hind. Leea aspera

HOLOCENTUS RUBER, a beautiful red fish of the New Hebrides. It is poisonous at certain seasons.—*Bennett.*

HOLOCANTHUS INSPERATOR. C. and V.

Kulloo Koli min, Tam.

A fish frequently taken at Madras. H. semicircularis C. and V. also a Madras fish.

HOLOFERNES, general of king Nebuchodnozor, he was killed by Judith B. C.—?

HOLONG. Hind. ? A tree of Chota Nagpore, furnishing a hard, red timber.—*Cal. Cat. Ex.* 1862.

HOLOSTEMMA RHEEDIANUM. *Spr.* This is the Ado-Modien of the Hortus Malabaricus. This plant is very abundant in the hills about Purulea, and is also found in the neighbouring plains, of Chota Nagpore. It is known to the Kol by the name of Apoong. The fibre is said to attain its best condition after the rains. This plant was introduced into the Calcutta Garden from Western India, and was well known to Dr. Wallich, who immediately recognized it as the Holostemma Rheedianum of Sprengel.—*Royle Fib. Pl.*, p. 306.

HOLOTHURIA.

Trepang;	Malay, Japan.	Biche de Mer,	Fr.
		Sea Cucumber,	Eng.
Swala,	„	„ Slug,	„
Hoy-shun,	Chin.	Holothurion,	Lat.
Cornechou,	Fr.	Biche-da-Mar,	Sp.

Several of the holothuria are used as food. They are found in the Eastern Archipelago, Australia, Mauritius, Ceylon, Zanzibar, &c, and are occasionally brought to Bombay from the latter place, and re-exported to China.

There are several species but the Trepang of commerce is a large black species. The great sea-cucumber of Europe, is the largest of all the known species and is probably a foot in diameter.

H. oceania, *Lesson*, is about 40 inches long; and secretes from the surface of its body, a fluid, which causes an intolerable itching.

H. lutea, *Quoy* and *Gamard*, is the Stychopus luteus *Brandt.*

H. tubulosa, of the Mediterranean; the Fierasfer fontanesii, a parasite fish, dwells within it.

In the Ladrones, H. guamensis is preferred.

H. edulis, the trepang of the Malay is fished for in April and May. It is relished in China and in Malay countries. It is harpooned at great depths. They are boiled in water, then flattened by stones, dried on mats in the sun and then smoked.—*Figuier.* It is, for the most part, caught by the hand, for it has little power of locomotion, but in deep water, sometimes by diving. It sells at Singapore 8 to 115 dollars per pical of lbs. 125. Trepang, although an article of considerable importance in the trade of the Indian islands, is never found in the printed price-currents of an European emporium, because seldom dealt in by Europeans, which arises from nice or rather capricious distinctions in their quality, which no European is competent to appreciate. We can discover no mention of the trepang in the early Portuguese writers; which seems to be a proof that the Chinese, who carry on

the trade and advance the funds, had not yet settled in the Archipelago when the Portuguese first appeared in it.

The Hon'ble Mr. Morrison mentions that it is found in all the islands from New Holland to Sumatra, and also on most of those in the Pacific; but is produced in the greatest abundance on small coral islands, especially those to the south of the Sulu group. The Chinese at Canton call it hoy-shun, which means sea ginseng.

The holothuria of Raffles Bay is about six inches long and two inches thick. There are six sorts, the best lying about twelve feet deep. It is an unseemly looking mollusc. Upwards of not less than 8,000 cwt. are yearly sent to China from Macassar. Large quantities of trepang and of the cuttle fish are annually collected and dried for the market in China. The naked Cephalopods, also, are not only eaten fresh, but one species, a Loligo, forms in its dried state a considerable article of traffic. The preparation consists in removing the ink-bag without laying open the mantle. After all impurities have been removed by water the mollusc is submitted to a slight pressure and ultimately exposed to the sun. Small bundles of one katty weight are tied up with slips of ratan, and enclosed in cases holding ten katties and upwards. The pekul sells at the rate of 14 to 16 Spanish Dollars.—*Beng. As. Soc. Jour.*, No. 208. *Collingwood, Journal of the Indian Archipelago*, Vol. IV, p. 480. *Hon'ble Mr. Morrison's Compendious History*, p. 141. *Crawfurd's Dictionary*, 440. *Figuier.*

HOLWAN, In A. H. 16, when the Arabs had taken this city, 300 horsemen returning from this enterprise under the command of Fadhilah, towards the end of the day encamped between two mountains in Syria. Fadhilah, having intimated that it was time for evening prayer, began to repeat with a loud voice, the usual form "God is great," &c., when he heard his words repeated by another voice, which continued to follow him to the end of his prayer.—*Bibliotheque Orientale, d'Herbelot in Rich's Residence in Koordistan*, Vol. I, p. 51.

HOLWELL, Mr., the chief of the settlement of Calcutta, when, on the 18th June 1756, it was taken by Suraj-ud-Dowlah, Mr. Holwell and 146 of his people were thrust into a guard room 20 feet square, from which in the morning only twenty-three re-issued alive. This guard room was known in Indian history as the blackhole of Calcutta. It was in the corner of Tank Square, near where was Messrs. Lyell, Mackintosh and Co 's office, but it was removed about the beginning of this century. See Black Hole, Calcutta.

HOLY LAND, See Palestine, Syria, Holy Sepulchre, Kenissat-ul-Kiamat.

HOM of the Zendavesta is the Soma of the Vedas and supposed to be the Sarcostemma brevistigma, but possibly is the vine of Bacchus, the ampelos, and identical with the Gaogird tree, which enlightened the eyes.

HOMA, a sacrificial offering of the hindus. It consists of clarified butter or ghi presented to the fire in sacrificial ladles. The word is Sanscrit from "hoo" to offer. Mr. Wheeler is of opinion that the homa fire sacrifice was introduced by the brahmans to displace animal sacrifices.

HOMAGE, is shown in Rajputanah, by offering of water. The kullas is a household utensil of brass. A female of each family, filling one of these with water, repairs to the house of the head of the village, when, being all convened, they proceed in a body to meet the person to whom they render honour, singing the suhailea, or 'song of joy.' The presenting of water as a token of homage and regard, is especially common in Mewar. —*Tod's Rajasthan*, Vol. ii. p. 98.

HOMAI. See Persian Kings.

HOMALIUM TOMENTOSUM? Myouk-kyan Burm. A tree of Moulmein, with a strong wood for any ordinary purpose.—*Cal. Cat. Ex.* 1862.

HOMALONEMA AROMATICA. Schott.

Calla aromatica, Roxb.	Zante-deschia aromatica, Spreng.
Kuchu gundubi, Beng.	

A perennial plant, native of Chittagong, tubers covered with the dried sheaths of the leaves, with long white fibres proceeding from every part. When cut they exhale an aromatic scent like ginger. As a stimulant it is highly esteemed in India. Dr. Wight figures also H. calyptratum, and H. rubescens. *W. Ic. Roxb.* iii. 513. *O'Shaughnessy*, p. 625. See Hydridæ.

HOMALOPSIDÆ, a family of harmless snakes of the order Ophidia, suborder Serpentes Colubrinæ nonvenenati as under;

Mele,	IT.		

Honey is obtained from the honeycomb of the Apis mellifica *Linn*, or Honey-Bee, of the Order Hymenoptera, *Linn.* Honey is secreted by the nectaries of flowers, sucked by the bee into its crop, where it undergoes some slight changes, and is then stored up in the comb for the food of its community. The finest honey is that which is allowed to drain from the comb; and, if obtained from hives which have never swarmed, it is called Virgin Honey. Honey consists essentially of sugar, with variable proportions of gum, wax, and aromatic and colouring principles. It is nutritive and slightly laxative. In some localities it is poisonous, owing to the deleterious nature of the plants from which it is collected. When of fine quality it is liquid and viscid, but translucent, having a fine, though peculiar odour, and a very sweet taste, but the best appears to some people slightly acrid, from the uneasiness experienced in the fauces. After a time honey becomes thick, white, and granular in texture. Inferior qualities are of a reddish brown colour, granular, and intermixed with impurities, and are usually obtained by pressure of the comb. Diluted with water, it undergoes the Vinous fermentation, and Hydromel, or Mead, is produced. The honey of the Archipelago is a thin syrup, very inferior in flavour to that of temperate climates. The comb is chiefly sought on account of the wax, which forms a large article of exportation to Europe, India, and China. The honeys of the Aravally and of Kashmir are praised, selling at ten pence the pound. There are wild bees in the woods of Kashmir but the zemindars have also hives in the walls of their houses. The bees are quite domesticated, and are as large and much resemble those of Europe. The price of honey is very moderate —about four pence a pound. Sir E. Tennent never heard of an instance of persons being attacked by bees in Ceylon, and the natives there assert that those most productive of honey are destitute of stings. On the Neilgherry Hills, bees when disturbed, attack with great fury. The pain is however readily relieved by a preparation of ammonia, the two most easily to be had being sal volatile and hartshorn. Dr. Hooker has stated that in some parts of Sikkim, the honey of Rhododendron flowers is believed to be poisonous, Azalea pontica, the Anabasis informs us, poisoned the soldiers of Xenophon in the retreat of the ten thousand. *Crawfurd's Des. Dic. of the Indian Islands*, p. 152, *Nat. His. of Bible*, *McCulloch's Commercial Dictionary*, *Tod's Travels*, p. 27. *Royle. Productive Resources; Materia Medica.*

HONAGUL, CAN. A Mysore wood.—*Mad. Cat. Ex.* 1862.

HO-NAN is bounded on the North by Pe-che-le, on the South by Hoo-pih, on the East by Gan-hwuy, and on the west by Shen-se ; it is also called by the Chinese Tong-hoa. The capital is situated on the south bank of the Hwang-ho, which flows through the whole breadth of the province. *Sirr's Chinese* i, 421.

HONAY. CAN. Calophyllum inophyllum.

HON-CAU, a low island in the Chinese seas called also Pulo Ceicer de Terre.

HONE. A fine kind of stone obtained from Germany and Turkey, used for sharpening or setting cutlery. It is of a greenish colour, inclining to yellow, often marked with thin dendrical lines, and is moderately hard, having a fine close texture, resembling indurated clay. Hones of good quality are obtainable in the Cuddapah and Kurnool districts of India.—*Waterston. M. Ex. J. Rep.*

HONEGA, CAN. Felis pardus. *Linn.*

HONEY DEW, a secretion on plants, from species of aphides.

HONEY-EATERS of the South Sea islands, are species of Melithreptes.

HONEY OF RAISINS. SHER. PERS. The juice of the unripe grape, after it is boiled to a syrup and is formed into a solid mass, like congealed honey out of the comb. It is supposed to be this honey to which Ezekiel, writing of Tyre, alludes. (Ch. xxvii. v. 17.) Judah, and the land of Israel, traded with thee ; corn of Minnith, honey of raisins and (in some editions honey alone), oil, and balm gave they to thee for thy wares." It is made in Syria and is exported to Egypt. *Baron De Bode's Travels, Vol.* II. *p.* 146.

HONEY SUCKER,—the name of a genus of birds, the Cinnyris, of which several species are common in India and the Archipelago. They are also called the sunbirds, and they take the place, in India, of the humming birds of S. America. They are easily distinguishable, however, as humming birds have straight bills, while the bill of the sun bird is curved. The species are all of small size, with some feathers of a bright metallic lustre. They hover over flowers, and extract the honey with their tongues. Dr. Jerdon, arranges the Cinnyridæ of Swainson and the Promeropidæ of Gray under the Family Nectarinidæ of Vigors and notices the following genera, Arachnothera magna and A. pusilla, the large and little spider hunter: Æthopyga miles, Æ. vigorsi Æ. gouldiæ, Æ. ignicauda; Æ. nipalensis, Æ. Horsfieldii and Æ. saturata; Leptocoma Zeylonica and L. minima. Arachnechthra Asiatica and A. lotenia.—*Tennent. Jerdon.*

HONEYSUCKLE: species of the genus Caprifolium, seldom cultivated on the plains of India, in a very satisfactory condition: with few exceptions, the species are natives of cold countries, require rich vegetable soil, grow freely from cuttings under glass, if not kept too damp.—*Jaffrey.*

HONG. Burm. Cocculus indicus, Eng.

HONG, A word used in original Malayan invocations in the same way as the Arabic Bismillah is used in the modern ones. Hong is deemed a very unhallowed word, of great power, and so panas, (hot), that if any man use a Hong invocation three times, nothing that he undertakes for himself will succeed, and he will live powerful but miserable, able to afflict or assist others, but unable to assist himself. It appears to be considered as a recognition of an essence or first principle beyond God and an appeal to it for power which God has not granted to man. It is used in Javanese invocations and a Javanese explains it to mean Embryo of Being, Primeval Essence, so that Sir T. Raffles' conjecture, that it is the budd'hist and hindoo Om (Aum), is probably correct.—*No. 5, Jour. Ind. Arch.*

HONG. Chin. A term applied to a united firm, a mercantile corporation.

HONGAY or HONGE.

Hip-pe.	Can.	Moha.	Hind. Mahr
Kuranj.	Hind. Mahr.	Nella Kalavalu.	Tel.

Under these names are known two different trees growing in the woods of Mysore. Oil is obtained from the seeds of both, but the oil of the Hongay is very smoky and bad though clear to look at; that of the Hippe, is as white and good as the cocoanut oil. The Hip-pe trees are extensively planted in topes in front of villages, for the purpose of obtaining oil. They seem to be species of Bassia or perhaps Pongamia glabra. *M. Ex. of* 1857.

HONG-KONG, a large island at the entrance of the Canton river, about 22 miles in circumference, but very mountainous and generally barren. The highest peak has 2,000 feet of elevation. The island was ceded to the British in the beginning of 1841 and Victoria town is on the north side of the island. The houses of the European Residents are built terrace like, on the face of the hill. Hong-Kong is the Heang-Keang of the Chinese and the name signifies the valley of fragrant waters, it is one of the group of islands which lie north of the estuary leading to Canton, in L. 22° 17," N. and L. 114° 12" E., and is distant from Macao 42 miles, and from Canton 105 miles. Hong-Kong is about ten miles in length, and four and a half in breadth; the noble harbour is nearly four miles in length, and rather more than one and three quarters in width. Hong-Kong is one of that cluster of islands, called by the Portuguese the Ladrones, or Piratical Islands, Its rocky sterile mountain rises from the shore, 2,000 feet above the level of the sea, houses of every variety of form have sprung up in the town of Victoria, with continuous ranges of buildings. The neighbourhood is liable to violent storms in the end of summer.—*Lay's Chinese as they are p.* 280.

HONG-LA-NE. Chin. Coptis teeta.—*Wall.*

HONIG. Ger. Dut. also Honing, Dut. Honey.

HONIGBERGER, Dr. a German medical man at the court of Ranjit Singh. Author of a work on the medicinal products of the Panjab.

HONNAY, Can. Saunders Wood? Pterocarpus marsupium.

HONORE, on the coast of Canara, a place of considerable trade in pepper, rice, &c. It is mentioned by many writers; is the Honor and Onor of Deb and Cesar Frederici, Hinawar, Hannaur of (Abulfeda), Manor and Hunawur of Abdur-Razzak, and probably the Nandor of the Catatan Map, Hunawar or Onodre (properly Hunur?). Abul Fadl describes it as a fine place with pleasant gardens and a mahomedan population with a great export trade of rice and much frequented by shipping but long a nest of pirates. *Yule Cathay* ii. p. 451.

HONOVER, the most sacred prayer of the Parsees. It is very ancient, consists of

three times seven holy words, divided into three lines of equal length. It mentions the two words Mazda Wise, then Ahura, living, from which the name Ormuzd has been derived. The words are now regarded only as a magical formula. *Bunsen, God in History.*

HOREB. The mountains Horeb and Sinai, are part of the Jab'l-ul-Tur range, with Hor or Seir, now called Jab'l Haiun or Aaron's mountain.

HOUTMAN, a native of Holland who served the Portuguese in the Eastern Archipelago, but in A. D 1595 commanded in the first expedition of the Dutch to the East.

HOODED, in natural history, a term applied to describe several animals. The hooded chameleon is the Chamæleo cucullatus. The Corvus cornix is the 'Hooded Crow' of Europe, Asia Minor, Afghanistan, Japan and Barbary, and the Hooded Presbytes is one of the Simiadæ.

HOOGHLY a district of Bengal to the south of Bardwan; the chief town, Hoogly is 27 miles from Calcutta and the river Hooghly, has on its banks the chief towns also called Calcutta, Serampur, Chandernagore, Hooghly and Moorshedabad. Hoogly fort was taken by the troops of shah Jehan by assault after a siege of three months and a half. More than a thousand Portuguese were slaughtered, and 4900 men, women, and children, were made prisoners of war. The best-looking young persons were sent to Agra, and circumcised, and made mahomedans. The girls were distributed among the harems of the emperor and his nobility. Hooghly was the first place where the press was set up in India. It was put up in 1778, by Messrs. Halhed and Wilkins, on the occasion of the publication of a Bengalee Grammar by Halhed. The Bandel church is the oldest christian church in Bengal, built, according to the inscribed date, in 1599. Prior to Hoogly, the royal port of Bengal was Satgaon. The Ganges formerly flowed by this place, and came out near Andool, and the remains of wrecked vessels have been turned out beneath the earth which has overlaid the bed of the deserted channel. Satgaon is of great antiquity, having been known to the Romans under the name of Ganges Regia. *Tr. of Hind. Vol*, I. *p.* 13, 15.

HOOGLY RIVER is formed by the junction of the Bhagaruttee and Tellinghee, two branches of the Ganges. It runs S. to Calcutta; S. W. to Diamond Harbour; E. and S. W. into the sea at Saugor roadstead, by an estuary 15 miles wide. Its length is 160 miles by winding of stream. It receives the Dummoodah, 350 miles, Dalkissore, 170 miles, Cossy, 240 miles Mor., 130 miles and about 49,000 sq. miles are drained. It was formerly navigable for a line of battle ship to Chandernagore; now, vessels drawing more than 17 feet, are not safe in passing from Calcutta to the sea, by reason of shoals, amongst the largest of which is that known to seamen as the James and Mary (jahaz-mara, ship-struck). The only class of Bengal fishermen who have seabuilt boats inhabit villages situated near the entrance of the Hoogly. Their chief and most profitable employment consists in attending with their boats, on the shipping entering and leaving the river, for which they receive 16 rupees per diem. Whenever this employment fails, they resort to work with their nets, which they drag during high water along the coasts of the Sunderbunds. The highest high water, being the highest rise of the river Hoogly spring tides during the freshes, or from July to September, from 1806 to 1835, was 20 feet 6 inches. In August 1856, neap tide rose 15 feet 6 inches, above the datum sill of the Kidderpore dock, and upon the 18th August 1856, spring tide rose to 22 feet 3 inches above the same datum. In the dry season the lowest fall of river spring tide at Calcutta is to 1 foot 9 inches above the datum of Kidderpore dock; the neaps 2 feet 8 inches, whilst the tides in the Salt Lakes only fall to 7 feet 10 inches above datum. The following is a table, showing the relative height of the river Hoogly and the salt water lakes:

	Dry weather.				Rainy season.			
	springs		neaps.		springs		neaps.	
	ft.	in.	ft.	in.	ft.	in.	ft	in.
River tide, lowest....	1	8	2	8	9	0	10	3
Calcutta, highest ...	17	3	9	0	23	4	15	11
Salt Water, lowest...	7	10			11	0		
Lake Tides, highest.	11	6			12	0		

The greatest rise of the Hoogly at Calcutta being 23" 4; average spring 17" 41. The greatest rise of the Salt Lakes being 12 feet. This is on the western side of the delta, very different from what occurs on the eastern side, where the tides rise from 40 to 80 feet.

The silt held in solution, earthy matter, carbonate of lime, magnesia, sulphates of lime and iron at three feet of depth, varies at Calcutta and in the Gasper channel from 7·34 to 18·92.

The water discharged has been found to be

Observers, and place and time of observation.	Width of River.	Mean depth.	Sectional area.	Mean velocity per second.	Discharge per second.
	Feet.	Feet.	Sq. feet	Feet.	Cubic feet.

Average of the Mississippi river as given in Mr Ellet's work p 30 41	3.300	115·0	200,000	Surface. 7.00	970,210 below New Orleans

* And below the point where the Damooda and Roopnarain join the Hoogly. The flood tide from the sea much augments the volume of water here so that the discharge shown is that of the whole tidal water of the estuary rather than that of the river.

The bore, at seasons, rushes up this river. The great tidal wave taking its origin in the Southern Ocean, rushes with impetuosity up the Bay of Bengal, breaking in an angry surf all along the Coromandel Coast, and at times cutting off all communication between the shipping and the shore. This wave, when aided by the south-west monsoon and by the full and change of the moon, rushes with great impetuosity up the rivers of the Gangetic delta where it is opposed by the freshes that descend from the up-country during the prevalence of the south-west monsoon, and, then for three or four days at the full and change of the moon, the bore may be seen racing up the Hoogly river at the rate of twenty miles an hour, dashing from side to side of the river according as the bends, or reaches, deflect it in its course. Upon the approach of this wave a distant murmur is heard which soon turns into the cry ban! ban! ban! from the mouths of thousands of people, boatmen, sailors, and

others who are on the look out for this much dreaded wave. This cry is the signal for all sorts of craft to push out into the centre of the river, the only spot where the wave does not curl over and break. Should any boat or larger craft be caught in that portion of the wave that breaks, instant destruction is inevitable. Numerous boats from the up-country provinces are lost every year from the crew being ignorant either of the existence of the bore, or from not knowing the correct position to take up so as to meet it. Ships at anchor in Calcutta though not exposed to the breaking portion of the bore frequently part their cables when struck by the wave. If standing on the shore during the rapid rushing passage of the bore, it is a curious sight to see the lower portion of the river or that nearest to the sea, six or eight feet higher than the upper portion of the river, the tide rising that number of feet in an instant. The height of the bore in the Hoogly varies from five to twelve feet, it is exceedingly dangerous in some parts of the river, but more moderate in others; it never breaks on both sides of the river at the same time. Deep water engulfs its force, but shallow water, or a sand bank, brings out all its power and fury. Dr. Hooker mentions, that at the mouth of the Megna river, also, the great object in the navigation is to keep afloat and to make progress towards the top of the tide and during its flood, and to ground during the ebb in creeks where the bore (tidal wave) is not violent; for where the channels are broad and open, the height and force of this wave rolls the largest coasting craft over and swamps them. The bore in 1782, flowed as far as Nuddea in the Hoogly but at the present day it falls short of that place by many miles, not ascending much beyond Sooksagor, It reaches Dacca on the Buree Gunga and Castee on the Horinghatta branch. See Bore.

HOOIN-THSANG, visited Balabhi, in the 7th century and found there 100 buddhist monasteries and 600 buddhist priests and the ruler was a buddhist. See Hiwan-Thsang.

HOOJEREE or Hujeri. ARAB. A term applied to one of the servile races of Arabia Qu. Khujra?

HOOKA. HIND. The native pipe and apparatus for smoking. The argyle of Damascus, is the common hooka of India, and this word is a corruption of the Persian 'Nargyle.' The common hookah consists of a cocoanut shell containing water, in which an upright reed, or wooden pipe ornamented or otherwise and about eighteen inches long is fixed, to support the tobacco

holder and lighted charcoal (chillam.) This perpendicular tube is grasped by the person who smokes; who draws the tobacco smoke through the water, by means of a similar reed, or pipe curved or straight reaching from the globe to the mouth. These tubes are sometimes made of silver, as well as the vase itself, and richly sculptured. The ordinary hookah of India, is termed by Europeans the hubble bubble from the noise created in the water.

The hookah has almost ceased to be used by Europeans in India, but natives continue to use it with gurako or prepared tobacco. Some hookah snake tubes are very costly, the precious metals and precious gems, being largely employed in their manufacture. The snake or pliable ornamental tubing lengthens out into several coils, and the smoke passes through a water-vase, while the mouth-piece is of amber, silver, &c.—*Simmond's Dict. Robinson's Travels*, Vol. II, p. 226.

HOOKER, Dr. Joseph Dalton, F. R. S., son of Sir W. J. Hooker, born at Hallsworth on the 30th June 1817, a medical officer of the British Navy, and a botanist of the highest scientific character. He was the naturalist under Sir James C. Ross, in 1840—1842, in the voyages to the Antartic Regions, and published his researches in six volumes. He dwelt amongst the Sikkim Himalaya and journeyed into Thibet, and published his Himalayan Journal, and subsequently his works on the plants of the Galapagos, and flora of the Malayan Archipelago and tropical Africa. Joint author with Dr. Thomas Thomson, of 'Flora Indica,' and Præcursores ad Floram Indicam in Linnæan Society's Journal. Drs. J. D. Hooker and Thomas Thomson travelled extensively in India and in 1865, issued the first volume of the Flora Indica, which would have summed up the labours of all previous writers, but it has not gone beyond that first volume and the loss to science seems, at present, irreparable, for no others are at present alive possessing equal knowledge of India and its plants. Dr. Thomson collected about 2,500 species, in Loodianah, Punjab, Rohilcund and along the whole line of the Himalaya, and Dr. Hooker, in 1848, 1849 and 1850, aided by Dr. Thomson, collected about 7,000 species.

HOO-KWANG, a province of China. Hunan, is the southern division of the ancient province of Hoo-kwang, and is larger than the northern portion, but it is not so thickly populated. See Hoo-Pih.

HOOL. Mahr. Chickrassia tabularis.

HOOLHOOL. Gynandropis pentaphilla.

HOOLI SHENA. Can. Tamarindus Indica.

HOOLOCK one of the Simiadæ.

HOOLOOGOO, grandson of Chengiz Khan, who sacked Baghad A. D. 1259; his name is said to have been Ali khan.

HOOLY, or Hohli, a hindu festival in honour of Krishna, which takes place in the month Phulgoon, February—March, at the commencement of the joyous spring. The amusements on this occasion consist in dancing, singing, and play. Their songs are called kuveer, or extempore stanzas, principally in allusion to the charms of Krisna and his amours with the Gopia, and are not marked by an excess of delicacy. One of the dances, is the favourite 'tipree' dance, or rasa-mandala, in which 20, 30, or more form a ring, each having a short stick in the hand, which the dancer strikes, alternately, those of the persons before and behind him, keeping time with it and his foot, the circle move round, keep time to a drum and shepherd's pipe, of three or four sweet and plaintive notes. In Major Moor's Hindu Pantheon is a beautiful plate on this subject, in which Krishna (with Radha) in the centre, is described as the sun, and the circle of dancers as the heavenly bodies moving round him. In the Hooly, the players throw a red powder, sometimes mixed with powdered talc to make it glitter, into the eyes, mouth, and nose, or over the persons of those who are the objects of the sport, splashing them well at the same time with an orange-coloured water. The powder is sometimes thrown from a syringe and sometimes put into small globules, which break as soon as they strike the object at which they are aimed. The hindu women are expert in throwing these. The Hooli among the hindus, reminds one strongly of the saturnalia of the Romans: people of humble condition take liberties with their superiors in a manner not admissible on other occasions. The chief fun in public is throwing the coloured powders above alluded to on the clothes of persons passing in the streets, and squirting about the tinted waters. Dignified personages avoid, as much as they can, appearing abroad while these jocularities are passing, unless with the view of gaining popularity they condescend to partake in them: in general they confine themselves to their houses, and amuse themselves with their families. In pictures, belonging to a series illustrating the domestic occupations of the Indians, the family diversions of the Hooli appear like those more publicly exhibited: scattering

yellow and red powders, and squirting coloured water. Sending simpletons on idle errands contributes also to the delights of the Hooly; this is performed exactly similar to our ceremony of making April-fools on the 1st of that month, and is common to all ranks of hindus, and mahomedans, indeed, join in this, as well as in other items of Hooly fun and humour. Another opportunity of merriment, similar to the May-day gambols of England is afforded to the hindus in a festival in honour of Bhavani, that always falls on, or near, that day. The Hooly seems a festival in honour more especially of Krishna. A log is burned, and it is supposed to be the Yule log.—*Cole. Myth. Hind.* p. 382. *Moor's Hindoo Pantheon.* See Hiel.

HOOM, Mahr. Guatteria cerasoides. *Duval.*

HOOMA, a fabulous bird, the Phœnix of classical writers.

HOONDEE, an Indian draft or bill of Exchange, drawn by or upon a native banker or sirraf, commonly written shrof.—*Simmond's Dict.*

HOONSAY, Can. A Mysore wood.

HOONSOOR, a large teak forest here has been much neglected, and requires to be conserved, for there has been wasteful exhaustion of teak. The Cooroobars have done immense damage, this forest alone if worked under a systematic plan would give a regular supply of good timber to the state and the public. It has better means of communication than any in the belt of teak, and contains about one hundred and thirty square miles of timber trees.—*Madras Conservator's Report.*

HOOSSAINI SYED, a descendant of Hoossain, son of Ali.

HOOPER SWAN, See Birds; Crane, Cygnus.

HOO-PIH, is the northern division of the ancient province of Hoo-kwang, and is bounded on the North-West, by Shen-se, on the South-East by Ho-nan, on the East by Gan-hwuy, and the West by Sze-chu-en. Its population is about twenty-seven millions. Hunan is the southern division of the ancient province of Hoo-kwang, is larger than the northern portion just described, but it is not so thickly populated. See Hoo-kwang.

HOOPOE, the *Upupa epops* is common in Southern Asia during the cold season, and on the table lands at all seasons. It is, to all appearance, a bird of fluttering and feeble flight, but has repeatedly been observed, during the seasons of migration, at altitudes considerably above the limits of vegetation. On the western side of the Lanak pass, about 16,500 feet, Major Cunningham saw a Hoopoe; also, at Momay (14,000 to 15,000 feet elevation), under the lofty Donkia pass in Northern Sikkim.

HOOR-I-SHADEED, the martyr.

HOORHOORIYA, Beng. Polanisia icosandra.

HOORINGATTAH, an entrance to the Ganges, on the west of Rabnadab Island.

HOORMUL, SEED.

Lahoori Hoormul. Hind. | Harmalæ semina. Lat.

Seeds of Peganum harmala, grey, small, pyramidal and triangular, and used as rue.—*Ben. Pharm. p.* 207.

HOORMUZ, the name of one of those parthian kings, known to the Romans as Artabanus. Of the Parthian kings, there were five of the name Artabanus, the first in B. C. 216 and the last about A. D. 235, and with whom ended the Arsacidæ, he having been slain by one of his officers, Ardashir Babegan (Artaxerxes) who became the first of the Sassanidæ. It is supposed by Malcolm, that Artabanus iii. was the Shahpoor of the Greeks. His son, Vonones, reigned for a short period. His name is sometimes written Pollas: he was the Volageses of the Greeks whose war with the emperor Nero, and embassy to Vespasian, are related in the Roman history. Hoormuz appears to have been Artabanus the fourth of the Romans.—*Malcolm's History of Persia, Vol.* i. p. 85. See Greeks of Asia Kabul, p. 437.

HOOR-HOORYA, Beng. and Hind. Polanisia icosandra.

HOOROOF-I-TAHJEE, the Arabic alphabet, any alphabet.

HOOROOYA, Sapium Indicum.

HOOSSAINI BULBUL, also called the Shah-bulbul, is of the sub-family Myagrinæ and is known also as the Paradise-flycatcher. It is of a chesnut colour for many months, but becomes white in the breeding season, in its plumage des noces. It is a very graceful bird, with very long tail feathers and it is a pretty sight to see it flitting from tree to tree: how the birds prevent the long tail feathers from becoming entangled in the thorny trees is difficult to understand. In Ceylon, the bird in its chesnut dress is called the Fire thief and the white bird the cotton thief, it is also called the Sultana Bulbul. Its colouring is chaste and its movements graceful. Mr. Layard has often watched them, when seeking their insect prey, turn suddenly on their perch and whisk their long tails with a jerk over the bough, as if to protect them from injury. It is common about Madras. It is the Tchitrea paradisi *Linn* and Europeans call it also "the Bird of Paradise."—*Tennent's Ceylon.* p. 249.

HOOSNEIN, meaning Hussun and Hosein sons of Ali and Fatimah.

HOOSUNZYE, an Afghan tribe.

HOOZAR or Hujar, a river near Rutlaee in Kotah.

HOPEA, a genus of plants of the Natural order Dipterocarpaceæ. A species of Hopea, the "Thin-ga-do" of the Burmese, is a large tree, abounds in the same localities of British Burmah as H. odorata, but the wood is not equally valued. A cubic foot weighs lbs. 52. in a full grown tree on good soil, the average length of the trunk to the first branch is 100 feet and average girth measured at 6 feet from the ground is 20 feet. It sells at 12 annas per cubic foot. H. decandra, *Buch.* called Ooroopa in Malayala, is a tree which the natives of Canara prefer to teak for building ships, being more durable and close grained. H. discolor, *Thw.* is a large tree of Ceylon growing in the Saffragam and Ambagamowa districts, at no great elevation. The under side of the leaves are of a rich brown colour. H. faginea, *Wall*, is a tree of Penang. H. floribunda? "The-ah" also "Tau-the-ya" of the Burmese is a very large tree of Tavoy.—*Dr. Brandis, Cal. Cat. Ex.* 1862. *Ain's. Mat. Med.* p. 207- *Thw. En Pl. Zeyl.* I p 36.

HOPEA ODORATA, *Roxb*

Thengan, BURM. | Then-gan-pha-yung BURM

This species grows in Chittagong, in Burmah and in Tenasserim, is considered the most valuable indigenous timber tree in the southern provinces of Tenasserim and at Tavoy and Mergui is sawn up for building purpose. The Thingan trees grow to a height of 250 feet; they are found near Moulmein in laterite and sandstone chiefly. The best canoes are made of it, and it is used extensively in native boat building. It is plentiful in the Tenasserim Forests, is scarce in Pegu, and a few trees are to be found about the vicinity of Rangoon. It is a light-brown wood, is used extensively by the Burmese in the construction of boats carrying 3 or 4 tons, formed from the trunks of these magnificent trees. The trunk is scooped or burnt out and stretched in the centre, whilst warm, by means of cross pieces of wood. When the required breadth is obtained, the sides are built up to obtain a greater capacity. These tree boats, if they may be so called, are from 7 to 8 feet beam. The breaking weight of Hopea odorata may be stated at 800 lbs. with a specific gravity of 45 to 46 lbs.—*Drs. Mason, McClelland.*

HOPEA SUAVA, *Wall.*

Engyin, BURM.

A valuable tree found in the Eng. forests of British Burmah, but large trees are not common in Pegu. Wood tough and hard but heavy, used in house building, for boats and a variety of other purposes, and said to be as durable as teak. A cubic foot weighs 55 lbs. In a full grown tree, on good soil, the average length of the trunk to the first branch is 60 feet and average girth measured at 6 feet from the ground is 7 feet —*Dr. Brandis, Cal. Cat. Ex.* 1862.

HOPFEN, GER. Hops.

HOPLOBACTRACHUS CEYLONICUS, *Pet.*, a reptile of Ceylon, of the sub class Batrachia, Order Batrachia Salientia and Family Ranidiæ.

HOPLOGNATHIDÆ, a family of fishes, with one genus Hoplognathus in which are three species. See Fishes.

HOPLOPTERUS VENTRALIS, in Jerdon's Catalogue of the birds of the peninsula of India Chœtusia gregaria was mistaken for Hoplopterus ventralis.

HOPPER.

Apum, TAM. | Appas, SINGH.

A term employed in Southern India to cakes made of wheaten flour and cocoanut milk. The Apps of the Bombay Presidency are made from the Holcus or Sorghum vulgare. The hopper is made of rice flour in Ceylon.

HOPS.

Hoppe,	DUT.	Luppoli,	IT.
Houblon,	FR	Humulus lupulus,	LAT.
Hopfen,	GER	Chmel,	RUS.
Bruscandoli,	IT.	Oblon,	SP.

The Hop plant has been introduced into India, grows well at Kaolagir, in the Dhoon, but flowers sparingly. The best hops are grown near Canterbury in England. The properties of hops of giving the bitter to beer, and, by preventing acetous fermentation, enables it to be kept much longer. To it, no doubt, is owing a portion of the stomachic properties of malt liquor, as we see exemplified in the bitter, often called Indian, ales. Hops are hypnotic, especially when stuffed into a pillow, but they should be first moistened with spirits, to prevent the rustling noise. Fomentations also have been used. Hops are thought, to be diuretic (as is also the root), and to be useful in correcting lithic acid deposits.—*Royle.*

HOR or Hor-pa. TIBETAN, Kao-tse CHINESE. This race call themselves Ighur. They seem to be Bhot. They dwell on the north-western frontier of Tibet, on the confines of the Turk districts of little Bokhara. Some of them are mahomedans and Mr. Hodgson considers them to be Turks.—*Latham's Ethnology.*

HOR. HIND. Terminalia chebula, *Retz.*

HORA. Sans. Lat. The 1-24th part of the natural day, answering to a European hour. A measure of time probably introduced into India by Europeans.—*Kala Sankalita.*

HORA. A goddess of Byblus, worshipped at Babylon as Hera, the equivalent of Juno. Her name in Tyre was Itea.—*Bunsen.*

HORAALIA. Singh. A rogue or must elephant.

HORA-BORA. A tank, now in ruins, in the Bintenne district of Ceylon. Its length is eight or ten miles, and breadth three or four. The embankment is from fifty to seventy feet high, and its base is 200 feet broad.—*Tennent's Ceylon.*

HORAN. A place to which Terah returned from Ur of the Chaldees.

HORANAWA. A shrill musical pipe, in use with the Kandians. Its tones have some resemblance to those of the bagpipe. Its mouth-piece is made from the talipot leaf, and its other parts of jack-wood and brass.—*Sirr's Ceylon.*

HORDE, an English word introduced from the Turkoman word Urdu.

HORDEUM, a genus of plants of the Natural Order Panicaceæ, furnishing the barley so much used by the more northern nations of the world. H. vulgare, *Linn*, is the spring barley of Europe, H. hexastichon *Linn*, is the common barley, and H. distichon *Linn*, is a plant of Tartary.

Hordeum ægiceras, *Royle, M.S.S.* has ears cylindrical; florets arranged in a confused manner, not in rows; awns soft, short, hooded; and bent downwards; grains loose in the husk. It is found in the northern parts of India, and probably in Tartary, as its grains have been sent to England under the name of 'Tartarian Wheat.' Its appearance is more that of wheat than of barley, and its naked grains assist the resemblance. It is however a genuine species of Hordeum. It appears to be a productive plant but little is as yet known of its quality in the climate of England.

Hordeum gymnodistichum, has the ear cylindrical; awns almost parallel with the ear; grains loose in the husk. Naked Barley, a species but little cultivated now, is of unknown origin. It is said to have been introduced into England in the year 1768; but it is reported to have preserved its characters unaltered from time immemorial in some parts of Europe.

Hordeum gymno-hexastichum, has the ear cylindrical: awns very long, rough, and rigid, rather spreading away from the ear; grains loose in the husk. The origin of this, the Naked Six-Rowed Barley, is unknown. It is extremely productive, and in some parts of Europe it is reckoned the most valuable of all. The French call it, on account of its good qualities, Orge celeste.—*Eng Cyc.* quoting *Lowe's 'Elements of Agriculture,' p.* 238.

HORDEUM CŒLESTE.

Elo of Barley	Chenab Eng.	Grim also Nas of Ujou Punjabi Ua of	Ladak. Sutlej.

This is found in the Sutlej valley between Rampur and Sungnam up to 15,000 feet. The beardless variety is most esteemed. Barley ripens in the end of May, several weeks before wheat. The dough made of it is called "ampe" in Ladak. *Cleghorn's Punjab Report, p.* 66. *Dr. J. L. Stewart,* 256.

HORDEUM DISTICHON. *Linn.*

Zeocritum distichon Beauv.

Dhourra, Shair.	Ar	Krithe	Gr. of Dios.

Shoreh.	Heb.		
Jao	Hind. Pers.		

This species of barley is grown in northern India. It is frequently cultivated as a cold-weather crop in the plains of the Punjab, as it requires less labour and gives more produce than wheat even in inferior soils and where the water is deep below the surface. Above 8,000 feet of elevation, it is much more common than wheat, while at lower heights it is less grown. In Lahoul and Ladak it is abundantly cultivated with Fagopyrum up to 13,000 feet in Ladak, some kinds of barley may be seen up to 14,000

feet, about Haule, near the Tsomoriri lake. and this is found in the Sutlej valley between Rampur and Sungnam at an elevation of highest limit 15,000 feet and much cultivated. Barley is cultivated much in the same way as wheat, but is ready for cutting somewhat sooner, it grows much on "sailaba" and "barani" lands: in the Punjab, it is much less esteemed than wheat and sells much cheaper, though it produces much more, and requires worse lands and less watering than wheat. The varieties are "jau-desi," (common country barley), and "jau paighambri." "Ghoni" jau is barley that has scarcely any husk at all but only a fine skin. Barley is one of the cheapest of the grains found in the bazaars of Kaira in Guzerat. *Powell, Hand Book, Econ. Prod. Punjab, p.* 228. *Cleghorn Punjab Report, p.* 66. *Dr. J. Stewart Punjab plants, p.* 256.

HOREHOUND, the black species is Ballota Nigra.

HOREHOUND, *White.*

Pucha Pat, Patch leaves,	Beng Anglo-Hind.	Patch Patta, Marrubium Indicum,	Guz. Lat.

This plant grows at elevations of 2,000 to 7,000 feet in the N. W Himalaya, in Kashmir, the Salt Range, on the Chenab and Trans-Indus. The leaves are of a whitish-gray colour, having a woolly appearance, and possessing a faint agreeable odour, and a sharp bitter taste. That met with in Bombay, is imported from Singapore and is used in various ways by the natives, but chiefly as an ingredient in Gooracoo, and when combined with other herbs, for scenting the hair of women. The essential oil is in great request among the superior classes of natives, for imparting the peculiar fragrance of the leaf to clothes.—*Faulkner. Dr. J. L. Stewart,* p. 169.

HOSHEARPUR, between this and Kangra are valleys and broken country.

HORI-KOWAN. Mahr. Alstonia scholaris.—*R.*

HORINGHATA, one of the mouths of the Ganges. See Saugor island; Hooringattah.

HORINGI MARAM, also Horingi Tanga Maram. Tam. and Maleal. species of soapnut trees. See Koringi.

HORKIKALLY, a river near Bishenpasha in Sylhet.

HORMARA, a section of Beluchistan, adjoining the Arabian sea. The Hormara tribe say they came originally from Sind. See Kelat.

HORMISDAS, son of Sapor. See Sassanian kings.

HORMUZ, or Ormuz, is an island at the entrance of the Persian Gulf, presenting a rugged appearance, its north end is in lat. 27° 5' N., long. 56° 29' E. It is the eastern extremity of the chain of the volcanic mountains, which runs parallel to the coast of Kirman, and at Hormuz, it consists of a number of isolated hills of rock-salt and sulphur, which compose a mass of about 15 miles in circumference, destitute of springs and vegetation, but abounding in copper and iron ore. On a plain, near the northern extremity of the island, are the cisterns and other remains of the once commercial Hormuz, which, in the time of its prosperity, under the Portuguese, when it was a great entrepot of Indian trade, had 4,000 houses and 40,000 inhabitants. The port and anchorage, which gave such importance to the spot, are within two miles of the town. The present inhabitants number about 3,000, and are employed in preparing rock-salt, from which the sultan or imam of Muscat as proprietor, derives a considerable revenue. The island lies, from the estuary of the Minnow river, nearly 16 miles, =300 stadia, according to Nearchus, which, at 11 1/2, would give 16 2/3 miles. The island gives its name to the Straits of Hormuz.

The islands of Larrack (or Larek) and Hormuz are twelve miles apart, and Hormuz is about twenty-six miles north of Ras Mussundum. Larrack is 400, and Hormuz 700 feet high. From Larrack we have specular iron ore as its characteristic; and from Hormuz, rock-salt, sulphur, gypsum, iron-ore, and pyrites. Hormuz is described as consisting of a plain of salt-rocks about 50 feet above the level of the sea, out of which rise several white peaks which attain the altitude mentioned.

Hormuz takes its name from a place on the neighbouring continent in Karmania; the Harmozia and Armuza or Harmozusa of Greek writers, where Nearchus landed and found one of his countrymen wandering from Alexander's camp, in which, some days after, the admiral was received with such well-merited honours by his sovereign. But in Alexander's time, the insulated Hormuz is generally supposed to have been the Organa of Arrian and Ptolemy and Tyrina or Gyrena of Strabo. The companions of Alfonzo de Albuquerque in 1507 took Hormuz, after a combat described with much animation by one of his countrymen; a few hundred Portuguese having contended, as he assures us, for eight hours against thirty thousand Persians and Arabians, valiantly defending

a place naturally strong and well fortified by art.

> High on a throne of royal state, which far
> Outshone the wealth of Ormus and of Ind:
> Or where the gorgeous East with richest hand
> Shower's on her kings barbaric pearl and gold."

Under the Portuguese it was a place of great trade, but in 1662, it was taken by shah Abbas the Great, with the assistance of the English, and the trade was destroyed.

The people on the neighbouring coast seem to be identical with the races who are known to have dwelt there two thousand years ago; and known to the ancients as the Ichthyophagi. From Basrah to Hormuz, the sea-coast people still principally live on fish. The mahi-abah and mahi-ashnah, literally fish bread and fish soup, used among the people of Lar is prepared from fish, (more particularly a small kind found near Hormuz) by exposing it to the sun Strabo and Arrian relate, that the ancient Ichthyophagi, made into bread in a similar manner, the fishes which they had dried and roasted. The region of the Ichthyophagi commenced at Malana near Cape Arabah and ended between the ancient Dagasira and the place now called Cape Jask, or more properly Jashk. "Churchill's Collection of voyages" mentions that "the coastes of Persia as they sailed in this sea, seemed as a parched wildernesse, without tree or grass; those few people that dwell there, and in the islands of Lar and Cailon live on fish, being in manner themselves transformed into the nature of fishes. So excellent swimmers are they, that seeing a vessel in the seas, though stormie and tempestuous, they will swimme to it five or six miles to begge almes. They eate their fish with rice, having no bread: their cats, hennes, dogges and other creatures which they keepe have no other dyet." Nieuhoff who travelled in 1662, says that about Gambraon, "the common people make use of dates instead of bread or rice; for it is observable that the ordinary food of the Indians all along the coast from Basora to Sinde, is dates and fish dried in the air; the heads and guts of the fishes they mix with date stones and boil it altogether with a little salt water, which they give at night to the cows after they come out of the field where they meet with very little herbage."—*Taylor's Travels from England to India, Vol.* I. *p.* 266. *Churchill's Collection of Voyages, Vol. II. p.* 230 (*first edition*). *Ouseley's Travels, Vol. I. pp.* 158 228. *Townsend's Outram and Havelock, p.* 297. *Kempthornes Survey of the Eastern shores of the Persian Gulf. HORMUZD or Hormisdas son of Sapor. See Sassanian kings.

HORN.

Horn,	Eng. Gebm.	Cornu,	Lat.
Hoorn,	Dut.	Tanduck Sungu,	Malay.
Corne,	Fr.	Kombu,	Tam.
Sing,	Hind.	Kommu,	Tel.

The horns of animals are largely utilized in the manufactures of the south and east of Asia and are both imported and exported. Horn is soft, tough, semi-transparent, and susceptible of being cut and pressed into a variety of forms. Horn of kinds is extensively used in the manufacture of handles for knives, walking sticks, spoons, combs, lanterns, snuff-boxes, powder flasks, buttons, hair-pins, &c. Glue is sometimes made of the refuse of horns. Horns and bones of various animals are brought to China in junks from the adjacent countries and islands, and form an important article of import with the native vessels. Buffalo horns are worked into lanterns, some of which are highly elegant, and small boxes in which to put opium to carry about the person; handles, and other useful articles, are also made; and the bones are burned into lime. In a single year, 502 peculs have been brought to Canton. In China, horn is softened by very intense heat, and then extended into thin laminæ of any shape. The best sort of rhinoceros horns comes from Cochin-China, and sells at times for $300 a piece: an inferior sort is imported into China from India, of which some probably are from southern Africa, which are sold for $30 and upwards a piece. The Chinese work the finest of these horns into elegant cups and other articles, but the most of the importation is used as a medicine; it also forms an article of commerce in the Chinese junks trading to Japan. The horns and antlers, exported from all India average more than Rs 30,000 a year. These are the deuse antlers of the "Samber" Cervus hippelephas, of the "barking deer" Cervus muntjac, of the "Axis" Cervus axis, the Neilghai Damalis rusa, and other species of Indian deer —also the horns of the Indian buffalo, ox, antelope, "thar," gural and yak, are exported to Europe and Ceylon.—*Hon'ble Mr. Morrison's Compendious Summary; Royle Arts, &c., of India p.* 513. *Faulkner. Powell, Hand-Book Econ. Prod. Punjab, p.* 159.

HORN WORK, such as Ivory, buffalo and deer horn, porcupine quill, &c., such as chessboards, work and knitting boxes, tea-chests and tea-caddies, ink-stands, baskets &c., which are lined with sandal wood, are generally very neatly made at Vizagapatam.

But they are far surpassed, both in cheapness and workmanship, by articles of a similar description, the produce of German industry, which are largely exported to England. The following are selling prices of Indian work; of Vizagapatam and of Viziadroog in the Concan.

	Rs.
Ivory backgamon board, ...	85
Do. fluted envelope case, ...	25
Do knitting box, ...	12
Sandalwood and Ivory box, ...	8
Porcupine quill do., ...	8
White elk-horn inkstand ...	12
Black do. do., ..	18
Porcupine quill, ivory and buffalo horn work box.	35
White elk-horn do., ...	30

Do. do. tea chest, ...	13
Sandalwood and ivory basket, ...	18
Porcupine quill basket, ...	5

—*M. Ex. Jur. Rep.*

HORNBEAM, Eng. Carpinus viminea.

Charkre	of Ravi	Shirash	of Beas.
Imar	of Sutlej.		

A moderate sized tree growing in the N. W. Himalaya, at from 5,500 to 6,000 feet up to the Ravi. Its wood is esteemed by Carpenters.—*Dr. J. L. Stewart.*

HORNBILLS, a family of birds Buceridæ, of the genus Buceros, whose bills arrest attention. Their food consists of fruits, berries, flesh, and even carrion, in short, omnivorous. In B. cavatus, the throat, ear-coverts, circle round the eye, and a narrow-band at the occipital edge of the protuberance of the beak, are black; neck dirty straw-colour, the feathers of the back of the neck elongated; body and wings black, greater coverts and quill-feathers tipped with white; thighs, upper and under tail coverts, white; as is the tail also, with the exception of a broad black band about three inches from the tip; beak yellowish, inclining to scarlet at the tip, under mandible black at the base; tarsi black. It is a native of India, the Himalaya Mountains, Java, and most of the Islands of the Arhcipelago.

B. pica, *Scopoli* is the B. coronata *Boddært* and the Kuchila kai of the Singhalese; the female is built up in the nest and fed by the male during incubation.

B. rhinoceros, the Rhinoceros Hornbill, the bill about 10 inches long and of a yellowish-white, the upper mandible red at the base, the lower black. The horn, or casque, varied with black and white. The body black, of a dirty white below and posteriorly; tail about 12 inches, the feathers white at the base and tip, black in the middle; feet and claws obscure gray. It is a native of India and the Indian Islands, Sunda, for instance.—*Eng. Cyc. Vol.* III. p. 139. *Gould. Sir J. E. Tenwent's Ceylon.* See Birds. Buceros.

HORN BOW, a bow made of horn is sometimes used in the East.

HORNBLENDE, Sp. gr. 3·202. occurs frequently in small dark colored grains or crystals embedded in other rocks, the form of the crytals is usually very oblique, four-sided prisms often found in pairs, rarelyit occurs in six-sided prisms. It also forms large masses of a greenish black or dark-brown color, greenish grey in the streak; it is semi-hard and breaks into long quadrangular pieces, the fracture is shining, coarse and granular; it is rather brittle and melts into a greyish black glass before the blowpipe.

HORNED HOG, The Babiroussa, or Horned Hog of travellers, is a wild hog that inhabits the woods of Java, Celebes, and others of the larger Sunda Isles. Its upper tusks are of great length, and curved form, and grow upwards and backwards like the horns of the Ruminantia. It is probably the Sus tetraceros of Ælian.—*Eng. Cyc. p.* 359.

HORNET.

Tsireah.	Heb.	Crabo;	Lat.

HORNSTONE, See Quartz.

HOROCKA TREE of New Zealand, syn. of Aralia crassifolia.

HOROLOGE, Horologien. Fr. Clock.

HORRE. Singh. A hard, though coarse, open-grained, heavy Ceylon wood.

HORRE. Singh. Dipterocarpus lævis.—*Buch.*

HORRFROED. Dan. Linseed.

HORSBURGH, Captain J., A celebrated hydrographer, who wrote the East India Directory, and in his honor a light-house was erected on Pulo Aor near Pedra Branca. His sailing directions are reckoned indispensable in navigation. The island of Pedra Branca is called Batu Putih by the Malays, both these terms signifying white rock. Prior to the quarrying operations on it, it was covered by the dung of the numerous sea-birds, that frequented it as a resting place. The rock is situated at the extremity of the Straits of Singapore, nearly in mid-channel, and as it advances beyond the mouth of the Straits considerably into the China sea, it has for ages served as the principal leading mark to vessels passing out of or into the Straits.—*Dr. Buist's Catalogue. Journ. of the Ind. Archipelago, July and August* 1852.

Ἵππος,	Gr.	Hya,	,,		

The king Sesonchosus, of Egypt, is supposed to have been the tamer of the horse. But, from time immemorial, the horse has been domesticated and subservient to man. In Eastern countries, the horse has been largely used in war; an ancient Eastern prince, (Job xxxix, 19-25,) describes the horse as a creature

——— impatient when the trumpet soundeth.
He saith among the trumpets Ha! Ha!
And smelleth the battle afar off,
The thunder of the Captains and the shouting,

Judging by its varied names, the horse seems to have been very generally diffused over the Central parts of the old world, some of the terms being derived from its neigh;

The horse has been termed the most noble conquest made by man and amongst every nation of the Old World its use and beauty have made him a favorite. Supernatural powers have even been attributed to him by some nations and he was sometimes considered the most acceptable sacrifice that could be offered to heathen deities, thus we read in 2nd Kings xxiii, 11, that Josiah took away the horses that the kings of Judah had given to the Sun. According to Herodotus the horse was the most appropriate offering that could be made to the Sun, on account of its great swiftness; the Persians dedicated horses to the Sun, and Sextus Pompeius sacrificed to Neptune by throwing horses into the sea. The Greeks and Romans highly appreciated the horse and races were among their favourite amusements, and were so popular that their kings often sent horses to compete. According to Greek mythology the horse was the result of the contention of two deities, Minerva having bestowed on mankind the olive tree, Neptune, in rivalry to the goddess of Wisdom, presented him with the horse.

White horses have always been much esteemed. The sacred horses of the Germans were white and the well known device of the Saxons was a white horse. Marco Polo tells us that 100,000 white horses were presented to the Great Khan on new year's day, and the Tartar chiefs continued at least to the time of Kanghi to present a tribute of white horses to the emperor.

Native princes in all parts of India are fond of white horses, and generally have one or more favourites of this colour in their stud. This taste extends among the zemindars and petty princes. A favourite colour for state occasions is cream colour. The royal carriage of Britain on state occasions is drawn by six cream coloured horses. In earlier ages, the horse he was different in many respects to the great variety of breeds we now possess. The horse represented on Greek and Roman bas reliefs was a small, compact, and spirited looking little animal, not larger than what we would call a pony, but he must have been perfectly trained, for neither bridle, nor bit, nor saddle, were used by his rider who guided him by a small stick, tapping him on either side of the neck as he wished to turn.

The history of the horse is lost in prehistoric times. There are, at present, numerous varieties, presenting great differences in size, shape of ears, length of mane, proportions of the body, form of the withers and hind quarters and especially of the head, and it is generally believed that the pedigree of a race horse is more to be relied on in judging of its probable success, than its appearance. Naturalists generally believe that varieties of all horses have descended from one species.

Horses become greatly reduced in size by living on mountains and islands, apparently caused by want of sufficient nutritive food.

The horse can bear both intense heat and intense cold. In Siberia are wild horses in lat. 56° N., and he comes to the highest perfection in Africa and Arabia. Much humidity seems more unfavourable to the horse than heat or cold, and this perhaps will explain why, to the eastward of the Bay of Bengal, over a humid area of enormous extent, in Burmah, Siam, Malayan Archipelago, the Loochoo islands and a large part of China, full sized horses do not occur. In Japan, to the east, they recur. The range of colour in horses is very great. The English race horse is said never to be dappled; cream coloured, light and mouse coloured duns are occasionally dappled; Horses of varied colours, of diverse breeds and from various parts of the world have a tendency to become streaked, and race

horses often have the spinal stripes, the stripe being generally darker than the other parts of the body—they occur on the shoulder and on the legs. Darwin considers the whole horse genus to have had, for a progenitor, an animal striped like a zebra, but, perhaps, otherwise very differently constructed, the common parent of our domestic horse, whether or not it be descended from one or more wild stocks, of the ass, the hemionus, quagga and zebra. He says that the spinal stripe, in the English race horse, is more common in the foal than in the grown animal. The ass, not rarely has distinct transverse bands on its legs, like those on the legs of the zebra. The spinal stripe occurs on horses of all colours, but on the mouse duns and on duns the transverse bands occur on the legs and sometimes, also, a faint shoulder stripe. In the Kattywar breed, a horse without stripes is not considered purely bred; the spine is always striped and the legs barred, and a shoulder stripe is common, and sometimes is double or treble The ass, has, almost always, a dark stripe or band on the shoulder which is sometimes even double, but is always variable in length and breadth. The koulan, of Pallas, has been seen with a double shoulder stripe. The hemionus has no shoulder stripe, but their foals legs are generally striped.

The prevailing belief amongst the Europeans in India, is that the native breeds of horses have decreased under British rule. Up to the beginning of the nineteenth century, there were several horse fairs in Rajputanah, especially those of Bhalotra and Poshkur, to which the horses of Cutch and Kattywar, the jungle, and Mooltan, were brought in great numbers. Valuable horses were then bred on the western frontier, on the Looni, those of Rardurro being in high estimation. But the successes of the British, over the Mahrattas and the Pindarah, dried up the sources of supply, the breeding studs of Rardurro, Cutch, and the jungle became almost extinct, and the horses from the west of the Indus were carried to the Sikhs. The destruction of the predatory system, which had created a constant demand lessened the supply. The Lakhi jungle, was well known in India for its once celebrated breed of horses, extinct since the early part of the nineteenth century.

Colonel Henry Shakespeare thinks that the cause of the decline of the native horse in India, arises from the fact that Government has encouraged the supply of a larger description of animal than the country naturally produced; and that failure in the brood farms has resulted from having imported English horses, which as a rule are too large for the small country mares. The hardy small breeds of native horses have thus been neglected, while a larger breed has been produced inheriting all the unsoundness and vice as well as the constitutional delicacy of the English horse. Perhaps, however, the chief causes of the decline in their numbers is their non-requirement for the predatory bands and parthian-like cavalry since the contentions of the princes of India have been extinguished; also cultivation has been extending over grazing lands; and as the several Governments of India and their military servants were the largest buyers of horses, though the British continue to buy extensively, the soldiers and the guns of the British Indian army are larger than those in use by former native powers, and the British admit only horses into the ranks of their armies and even in their equipage a mare is rarely seen.

Punjab.—Under native rule, the Punjab maintained an enormous cavalry force, mounted chiefly, if not entirely, on horses bred in the country, but that territory is now unable to meet the demands of its irregular force which is numerically insignificant compared with that kept up by the former government. The reasons assigned for this are three in number: 1*stly*—Large numbers of brood mares were withdrawn from the Punjab at the time of the annexation. 2*ndly* extensive demands were made on the province for both horses and mares during the mutiny. And, 3*rdly*, A large proportion of the remounts of the Sikh army were mares, which were regularly bred from; but under the British system, which requires remounts to be available for service at all times of the year, this cannot be done; it has therefore occurred that mares introduced into irregular cavalry corps, on account of their tractable nature, are not permitted to breed, and the result is that every one bought up for military purposes, and even every one bought up by the European community, may be regarded as a brood mare lost to the country. It has also been ascertained that breeders are parting with their best mares; the Dhunnee caste, of the Rawul Pindee districts, the best in the province, is almost extinct from this cause. Yet, many excellent brood mares were left, especially in the Rawul Pindee, Jhelum, Goojerat, Googaira and Lahore districts. There were also very good mares in the frontier districts, such as Bunnoo, Kohat, Dhera Ismail Khan and Dhera Gazee Khan; although small, they possess good blood and great powers of endurance, which is everything in the horse.

Pahlunpore has a really good breed, the mares of which are justly and highly esteemed and command considerable prices even among natives.

Rajputanah.—Few of the Rajpoot princes have generally good horses in their territories. The Marwar horse, contains apparently much Kattywar blood and bred with great care in many places throughout the country by the thakoors and others, is a valuable animal in every respect. Good mares are also scattered, but the generality of horses met with are inferior animals in every respect.

The breed of horses in Jeypore is exceedingly poor, as little care has been taken to improve the country animal in any way. Some few of the thakoors possess and breed good animals. The horses of Sheekawuttee are said to be good.

A late rajah of Ulwar, Bunnee Singh, founded a fine breeding stud, consisting of well selected Arabs and Kattiawar horses, and in Ulwar the troopers were better mounted than native cavalry generally, and a better stamp of horses was met with than in anyother Rajpoot state. The studwas still kept up. The finest of his cavalry were, however, almost annihilated on meeting with the rebels in superior numbers in 1857.

In Bhurtpoor also some attention has been given to the breed of horses, but they are inferior to those of the Ulwar district.

The Dekkan breed of horses was highly improved about the beginning of this century by crosses with the Arab horse. The small blood horse of the Bhima valley or terai, are of this breed, and the mares are beautiful. The horse very rarely grows above 14 to 14-1 in height. They have the fine limbs, broad forehead and much of the docility and all the enduring properties of the Arabs and have been mistaken for them. He is not so fiery as the small and blood Arab, and more manageable in the ranks. Malligaon, about twenty-five miles from Ganga Kheir on the Godavery is a great mart for the Dekkan horse and purchasers from all parts of the peninsula annually resort to the fair. Some of the horses are really very fine.

In the Dekkan, the larger horses are bred about the Gor river and Aligam between Punah and Ahmednuggur.

The Hyderabad territory in the Dekkan can breed about 2,000 horses a year, and 500 good colts could be purchased at lower rates there than are paid for Arabs or Cape or Australian horses.

The low statured horses of the Bhima and Man rivers, the Bhima terai and Man terai, are good. The Bhima horse has all the best points of the high-bred Arab without his very fine skin, irritable temper and rather long posteriors and has generally better feet. The marches of the Mahratta and Pindaree horsemen during the early part of the present century are well known and the Mahratta pony to this day, when of the proper breed, commands a high price in the Indian Markets. The little ponies used in Madras in the Jatka or little carriages are brought from Punah, Sholapoor Hubli, Dharwar, and a good pony costs 150 Rupees. A few of the ponies in use are brought from Kangayam, in the south of the peninsula

The tattu or pony of the Dekkan is a wonderful animal, often with great speed, or great strength and much endurance, and sometimes goes 20 miles a day. Their colours are generally bay, or brown or chesnut Grey seldom, and dun still more so. They are generally taught to amble four or five miles an hour.

The Kathi or Kathiwar horse was a large and powerful blood animal, but is now nearly extinct. They had fine lean heads, with much substance below the knee and made admirable cavalry chargers; commonly of a dun colour, with black points and black manes and tails. It has been said but not, seemingly, with correctness, that few of the Kattiawar horses of the present day are of the real Kattiawar breed, being much crossed with Arabs and half-bred horses of sorts. The pure bred Kat'hi are fine powerful horses, with one great deficiency in shape—a want of bone below the knee, and a fiery screaming temperament. This breed is specially preferred by native chiefs, who give very large sums for handsome Kattiawars. The stable of a chief or rajah is a sort of paradise for favorite horses; with plenty to eat of all fattening and stimulating substances, their carcases become so overloaded with fat that they resemble in the body a sleek dray horse with legs small enough to please an untaught lady's eye. The commoner or crossed breed are useful lasting animals, while the ponies and galloways are specially good animals.

The Ghoont, or Khund, is a hill breed of horses, of the Himalaya mountains, generally small, strongly made, hard-mouthed, and sometimes almost unmanageable. In ascending hill faces, or passing along the declivities of mountains, it is best to let them have their own way, for in an intricate passage they often show more sagacity than the rider; their common pace is a kind of amble, and they stop every now and then to breathe, when no application of the whip will move them; they are sure footed, and

sometimes halt at the edge of a precipice, to the terror of the rider; they are not so quick in ascending hills as the low country horses, but they descend with double the speed, and endure great fatigue. The Ghoont, though a useful animal, seldom carries any burden but a man, the total number in Spiti is 295; they are bred chiefly for sale. They have two breeds, one a small Ghoont, never above 12 hands high, peculiar to the country; and the other a large breed, from 13 to 13½ hands high, is bought from the Chinese, and usually comes from Choomoortee: for a Chinese ghoont two years old they give a Spiti ghoont four years old. All are equally hardy and are kept out the whole winter, except the yearlings, which are housed. During winter the ghoont live on the roots of the stunted bushes, and are very expert at scraping the snow from off them with their fore feet. The breed of ghoont might be improved with a little care. Many are killed during winter by wolves and leopards.

The Yarkand pony is a hardy little animal, and fetches a high price, being in request for the hill-stations in the north-western provinces of India. The variety called the Tangun piebald is common. They are shy and timid at first, and evince a strange dislike to Europeans, but soon get accustomed to their new masters, and for their strength, endurance, and sure footedness are well adapted for alpine travelling. While crossing the Kara Koram mountains, whole caravans are sometimes overwhelmed by snow storms, and I was told by Billah Shah, the chief merchant of Leh, mentioned that in many places the route to Yarkund is only traceable by the bones of horses.

The Tanghan of Thibet are wonderfully strong and enduring; they are never shod, and the hoof often cracks, and they become pigeon-toed: they are frequently blind of one eye, when they are called "Zemik" (blind ones), but this is thought no great defect. They average 5*l*. to 10*l*. for a good animal in Tibet; and the best fetch 40*l* to 50*l*. in the plains of India, where they become acclimated and thrive well. Giantchi (Jhansi-jeung of Turner) is the best mart for them in the eastern part of Tibet, where some breeds fetch very high prices. The Tibetans give the foals of value, messes of pig's blood and raw liver, which they devour greedily, and it is said to strengthen them wonderfully; the custom Dr. Hooker, believes, is general in Central Asia. Humboldt (*Per. Nar.* IV. p. 320) described the horses of Caraccas as occasionally eating salt meat.

The Thibetan pony, though born and bred 10,000 to 14,000 feet above the sea, is one of the most active and useful animals in the plains of Bengal, powerful and hardy and when well trained early, docile, although by nature vicious and obstinate.

China.—The horse commonly seen in China is a mere pony, not much larger than the Shetland pony: it is bony and strong, but kept with little care and presents a worse appearance than it would if its hair were trimmed, its fetlocks shorn, and its tail untied. This custom of knotting the tail is an ancient practice, and the sculptures at Persepolis show that the same fashion prevailed among the Persians. The Chinese language possess a great variety of terms to designate the horse; the difference of age, sex, color and disposition are all denoted by particular characters.

Archipelago.—The horse has been immemorially domesticated by most of the more advanced nations of the Malay Archipelago, wherever it could be made use of. The chief exceptions are the Malay peninsula, the eastern seaboard of Sumatra, and nearly the whole of Borneo; countries in which the people dwell on the marshy banks of rivers, in which there is not even a bridle path, and fit, therefore, only for the boat and the buffalo. The native horse is always a mere pony, seldom reaching 13 hands high, and more generally of about 12 hands. There are many different breeds, every island having at least one peculiar to itself, and the large islands, several.

Beginning with Sumatra, there are here at least two distinct races,—the Achin and Batubara, both small and spirited, but better adapted to draught than the saddle. The small but excellent breed of horses, reared in Achin excel all those of the Archipelago, excepting those of Bimah in Sumbawa. Those of Achin have fine crests and good strong shoulders, in which latter particular, as also in height of wither, they differ very much from the horses of Java, and the islands to the eastward which are generally deficient in these points. They are exported to Penang and Singapore and are driven in small carriages.

Of all the countries of the Archipelago, Java is that in which the horse most abounds, and here we find several different breeds, as those of the hill countries, and those of the plains. Generally, the Java horse is larger than that of Sumatra, but in the language of the turf has less blood and bottom. The lowland horses, the great majority, are somewhat coarse and sluggish,

but the upland are spirited, smaller, and handsomer.

The horse, although of a very inferior breed, is found in the islands of Bali and Lomboc, but the next island to these eastward, Sumbawa, produces the handsomest breeds of the whole Archipelago. They are the Arab of the Archipelago, yet the blood is not the same as the Arab, for the small horse of Sumbawa, although very handsome, wants the fine coat and the blood head of the Arabian. There are in this island, and adjacent islets, three different races, that of Tambora, of Bima, and of Gunung-api, the last being most esteemed.

Next to Java, horses are most abundant in Celebes. These are inferior in beauty to those of Sumbawa, but excel all others of the Malayan portion of the Archipelago, in combining the qualities of size, strength, speed, and bottom.

A very good breed is produced in Sumba, called in our maps Sandalwood island.

But perhaps the best breed of the whole Archipelago, although still but a pony, is that of the Philippines. It is superior in size to any of the breeds of the western islands, which it may owe to the superior pastures of the Philippines, and, possibly, to a small admixture of the Spanish horses of America, although this last is, by no means, an ascertained point. Generally, the horses of the Archipelago are hardy, surefooted, and docile. The horses are all entire, and the mares used only to breed and as beasts of burden.

By the natives of the Archipelago the horse is only used for the saddle or to carry burdens, and never for draught, either for plough, or wheel-carriage. To see horses drawing a native carriage, except in imitation of Europeans, we must go to the sculptures on ancient temples in Java, where they are thus represented.

In two islands only of the Archipelago is the horse found in the wild state, Celebes and Luzon, the only ones that are known to have extensive grassy plains fit for its pasture, and in these it is caught by the lasso and broke in as in the Llanos of America. In such situations it is certainly far more likely to have become wild from the domestic state than to be indigenous. In so far as Celebes is concerned this view is rendered probable by the name being a corruption to the Javanese from one language of that island, the Wugi, while in another, the Macassar, the horse is called 'the buffalo of Java.' In the Philippines it is not even alleged that the wild horses are anything else than domesticated ones become so. In Pigafetta's enumeration of the domestic animals of Cebu, he makes no mention of the horse. In the city of Manilla a pair of good riding horses cost from 100 to 120 dollars. and a pair of carriage horses from 120 to 130. Of course they are much cheaper in the provinces where they are reared. The horses of Sambawa, Celebes and Sumba, are largely exported to Java, to the British settlements in the Straits of Malacca, and even as far as the Mauritius. In Batavia a good Bima or Batak horse is worth from £10 to £15.

The Barb so famed in Europe was never brought to India: reared by the Moors of Barbary and Morocco, during their dominion in that country the Barb was introduced into Spain, where, however, it has been suffered to degenerate greatly since their expulsion. The noble Barbs are of rare occurrence even in their own country. The common horse of Barbary is a very inferior animal. In the beauty and symmetry of their forms, however, even the Barbs are far from excelling: their valuable qualities, and in these they are perhaps unequalled by any other breed in existence, are, unrivalled speed, surprising bottom, abstinence, patience and endurance under fatigue, and gentleness of temper.

Arabian Horses are latterly comparatively little seen in India. The demands of India have become greater, and a larger horse, with greater power, has been needed, to meet the wants of the British Government for its heavier ordnance and heavier soldiers and for the larger carriages now in use, by Europeans and the wealthier natives. Also, the prices demanded for the Arab horses are beyond the means of ordinary people, and the Arab never was in great request in India except as a riding horse.

The famous Algerian chief, Abdel Kader, speaking of Arab horses said—"A thorough bred horse is one that has three things long, three things short, three broad, and three things clean. The three things long, are the ears, the neck, and the fore-legs. The three things short, are the dock, the hind legs, and the back. The three things broad, are the forehead, the chest, and the croup. The three things clean, are the skin, the eyes, and the hoof. He ought to have the withers high, and the flanks hollow and without any superfluous flesh. These are very nearly the words which writers use in describing perfection in horses, and in these matters, therefore, they seem to have borrowed their ideas from Arabian writers.

The best Arab horses are bred in the desert by the Anizi Arab, in whose territory, before the conquest of the Wahabees, the district

of Nejid was included, where the richest pasture of Arabia is found. That name, in India, used to procure a high price, at all times, for a horse.

The Arab people do not keep any long pedigrees of their thoroughbred horses. The certificates which they furnish merely give the names of the clans, under the assumption that the purity of blood is notorious throughout the tribe. Of all their domestic animals, Arabs put the greatest value on their horses. Of these, says Niebuhr, they have two great branches, the Kadischi, whose descent is unknown, and the Kochlani, of whom a written genealogy has been kept for two thousand years. The Kadischi are in no better estimation than European horses, and are usually employed in bearing burthens, and in ordinary labour. The Kochlani are reserved for riding solely. They are highly esteemed and consequently are very dear. They are said to derive their origin from king Solomon's studs. However this may be, they are fit to bear the greatest fatigues, and can pass whole days without food. The Kochlani are bred chiefly by the bedouins settled between Basra, Merdin, and Syria. That of Dsjulfa seems to be the most numerous.

The Arab horse, says Colonel Shakespeare, ever has been deemed by all the British officers in India, as the very best under saddle and for general purposes that can be procured in India, and has invariably commanded the highest price whether bought for a racer, a charger, a hunter, or a hack. He is the soundest horse, the most enduring, the most beautiful to the eye, the most courageous, and the most easily broken in. Bombay and Bangalore are the chief marts for the Arab horse. The Nejid from the province of that name and a pure Arab breed, and Anizah in the desert two marches from Baghdad are the best. The Anizah is the produce of the Arab stallion and the Turcoman mare. In the Arab, the favorite colors are grays of kinds. The "nila," i.e., a gray with a blue skin, is generally more hardy than the "sabza," a gray with a light coloured skin, and the feet of the "nila" are more generally black than the sabza. The other colours are bay and brown of different shades, and chesnuts. Black is very rare. Arab roans are common. The high caste Arab, like most bloodhorses, goes rather near the ground, and thus trips in his walk, but will go at full speed over rock and stone, when the soil is not visible, or up and down the sides of a precipice and, if properly handled, never make a mistake.

Some of the Aniza Arabs have a great prominence in the foreheads, and are not marked at the root of the ears with the firing iron, like the Nejid and other Arab horses.

The mark put on the highest form of Nejid horse is a very fine crescent not more than half an inch from the points of its horns.

Source of Supply.—Arabian horses are latterly but little seen in India. The demands of India for horses have become greater, and a larger horse with greater power has been more and more needed, to meet the wants of Government for its heavier ordnance and the requirements of the community for the conveyances which are now so commonly in use, by all Europeans and the wealthier natives. Also the prices demanded for the Arab horse are beyond the means of the people, and it never was in great request except as a riding horse. Mr. Palgrave tells us that, at the present day, more than half of the Arab horses exported to Bombay are shipped from the seaport of Koweyt. They are generally brought from the north of Arabia, or the Syrian desert and are real Arab though not of Nejdean breed. There are good horses of this kind at Hayel and Jabl Shomer. Those of Shomer or Anizah breed are high blooded and often very perfect in all their points. The best of the Nejid horses are small, few reaching fifteen hands, and fourteen being about the average, but their small stature is not observed, in their excellent shape. Full in the haunches, sloping shoulder, slightly saddle backed, sufficient to ensure springiness without any weakness; head broad above and tapering to a nose, fine enough to drink out of a tumbler, a full eye, with an intelligent yet gentle look, sharp thorn-like ear, legs fore and hind, clean but sinewy, like hammered iron, a neat round hoof, just the requisite for hard ground, the tail projecting at a perfect arch. Coat smooth, shining and light, mane long but not overgrown or heavy, and air and step jaunty. But the genuine Nejid breed is obtainable only in Nejid and the distinctive points of the Nejid Arab horse, are the full rounded haunch; the slope of the shoulder and the extreme cleanness of the shank. In Nejid breeding, care is taken to select a good stallion and good mare. The total number is about 5,000 and horses are kept only for war or parade, all travelling and other drudgery being performed on Camels or on asses. The Nejid horses are esteemed for their great speed and endurance, and in the latter quality, indeed, they are unequalled, bearing up through abstinence and labour, for 48 hours, under an Arab sky. They are often ridden, without bit or bridle, saddle, rein or stirrup, but they yield to the pressure of the knee or thigh and to the voice, can be

wheeled and turned and brought to a dead stand in mid career of full gallop. Mares are never parted with and good stallions rarely so. Those of Hayel and Jabl Shomer are a fine breed and horses from them often find their way to Europe where they are sold at high prices. These are generally the produce of a Jabl Shomer mare, with Nejid stallion or the reverse. Their height varies from 14 to over 16 hands: but their shape is less elegant than the Nejid and often indicates some defect such as a heavy shoulder; small rump, shelly or contracted hoof or small eye

To the east and south of Toweyk, the Arab horse loses in beauty and perfection, in size and strength, and in Oman, they resemble the tattoo of India.

The Arab colts bred in India from either pure or imported stallions or mares, do not come to their strength and size till they are six or often seven years old.

The Cape horses brought to India are fine looking animals, with sound limbs.

Syria.—Mr. Robinson says there are three breeds of horses in Syria, the true Arab breed, the Turkoman, and the Kurdy, which is a mixture of the two former. The bedouins of Syria count five noble breeds of horses, descended as they say from the five favourite mares of Mahomed, Tanese, Manekeye, Kokeyl, Sablaye, and Djulfie. These five principal races diverge into ancient ramifications. Every mare, particularly swift and handsome, belonging to any one of the chief races, may give origin to a new breed, the descendants of which are called after her, so that the names of different Arab breeds in the desert are innumerable. The horses of the bedouin of Syria are mostly small, seldom exceeding fourteen hands. They ride, almost exclusively, their mares, having the advantage over the horses in speed and good temper. The latter they sell to the towns people, or to the fellahs. They object to them, not only because they are more vicious than the mares, but because they neigh, which in an expedition by night, might be the means of betraying them. They are first mounted after the second year, from which time the saddle is seldom taken off their backs. They are kept in the open air during the whole year, never entering the tent, even in the rainy season. In summer, they stand exposed to the mid-day sun. In winter, a sackcloth is thrown over the saddle. Like his master, with very little attention to his health, he is seldom ill. Burning is the most general remedy, and as this is done with a hot iron, it has given rise to the erroneous notion that the Arabs mark all their horses.

S. Arabia. In the south of Arabia, the horses are mere 'rats,' short and stunted, ragged and fleshless, with rough coats and a slouching walk; but with fine snake-like head, ears like reeds, wide and projecting nostrils, large eyes, fiery and soft alternately, broad brow, deep base of skull, wide chest, crooked tail, limbs padded with muscle, and long elastic pasterns. And the animal put out to speed soon displays the wondrous force of blood. In fact, when buying Arabs, there are only three things to be considered, blood, and again blood.

In Marco Polo's time Aden supplied the Indian market, and it was told to Captain Burton (*Pilgrimage*, III, 269) that the Zu Mohammed and the Zu Husayn, sub-families of the Beni Yam, a large tribe living around and north of Sanaa, in Yemen, have a fine large breed called El Jaufi, and that the clan El Aulaki, rear animals celebrated for swiftness and endurance. The other races are stunted, and some Arabs declare that the air of Yemen causes degeneracy in the first generation. The bedouins, on the contrary, uphold their superiority, and talk with the utmost contempt of the African horse.

The prices of horses in Arabia continue high. In Solomon's time the Egyptian horse cost 150 silver shekels, which, if the greater shekel be meant, would still be about the average price, £18, and Wellsted tells us (i, 306) that several of the Imam's horses in his time were of the noblest breed in Nejid, some of his mares being valued at from 1,500 to 2,000 dollars.

Persia.—Arabian horses are not very common in the north of Persia; but the breed between them and a Persian mare is all elegance and elasticity, being of a rather stronger mould than the Arab of Nejid, the best race of the country. The Persian horses never exceed fourteen, or fourteen and a half hands; yet, certainly, on the whole, are taller than the Arabs.

The horses of Persia, although neither so swift nor so beautiful as those of Arabia, are larger, more powerful, and all things considered, better calculated for cavalry. Of the several breeds of horses in use in Persia, the most valuable is that called the Turkoman. In the eyes of an English jockey, however, these horses would hardly seem to possess a single good point. They are from fourteen hands and a half to sixteen hands high, have long legs and little bone under the knee, spare carcases and large heads. But what renders the

Turkoman horses so valuable to the natives is their size, and extraordinary powers of supporting fatigue; for they have been known to travel nine hundred miles in eleven successive days. The Arabian blood has also been introduced into Persia, and some horses bred in Dushtistan, in point of speed and symmetry, emulate the most admired coursers of Nejid. Their usual food is chopped straw and barley: the bed is made of dung, which is dried and beat into powder, and regularly every morning exposed to the sun. No people are fonder, or take more care of their horses, than the Persians. They are clothed with the greatest attention, according to the climate and season of the year, and in the warm weather are put into the stable during the day, but taken out at night. The horses in Persia are not so subject to internal disorders as in England; but their heels are invariably contracted, from the badness of shoeing.

The Persian horses brought to Bombay from Basrah, and Bushaher and those bred on the shores of the gulf, are in use with the British Government and some are of great power, strong and enduring. The Gulf horses are out of Persian mares by Arab horses.

Turkoman. Horses of excellent breed are found amongst the Turkomans who export the finest to Afghanistan, Persia and India. The Akhal and Yomut horse is little inferior to the Arab in swiftness, endurance, and beauty of form.

The Turkoman horse is a fine animal, between fifteen and sixteen hands high. He is bred from the Arabian: but the cross of the breed of the country, and the fine pasture, have given him great size and strength. There are probably no horses in the world that can endure so much fatigue. Sir J. Malcolm ascertained, after minute examination of the fact, that the small parties of Turkoman who ventured several hundred miles into Persia, used both to advance and retreat at the average of nearly one hundred miles a day. They train their horses for these expeditions as we should for a race, and the expression they use to describe a horse in condition for a chapow or forage is, that "his flesh is marble" and may be purchased for a comparatively small sum.

The Turkoman horse stands very high for an Eastern horse, and the reports as to his feats show him to be a very superior animal, but they are almost unknown in India. The Turkoman horse around the Hindu Kush is carefully reared. It is a large bony animal, more remarkable for strength and bottom than symmetry and beauty. Its crest is nobly erect, its head is not so small or its coat so sleek as the brood of Arabia, and the length of its body is greater. They will perform six hundred miles in 7 or even 6 days. Those that reach India are reared about Balkh and Andkhu and Maimana.

The horses of the Turko-Tartar races are

1. The Turkoman horse, or Argomak, chiefly in the western and southern parts of the Khanat.

2. The Uzbek horse, more especially in the north of Bokhara, and in Miankale; and lastly,

3. The Khokand horse, in the neighbourhood of Samarkand, and the east of it.

Independently of the above mentioned three breeds, there are two more, which are, however, inferior to the former; these breeds are the following,—the Kirghiz horse and the Karab Airi, the latter being a cross-breed from the Turkoman stallion and an Uzbek mare, and *vice versa*. All these breeds differ from each other by their coat, as well as by other qualities.

The Argomak is usually tall, well-shaped, with slender legs, and a swan-like neck, carrying its head proudly and with ease aloft.

But its great beauty consists in the peculiar lustre of its coat, which is especially observable in the bay coloured Argomak. Their defects are, a narrow chest, and a scarcity tail and mane, in addition to which, some have the defect of being saddle-backed. These defects incapacitate the Argomak for undertaking long journeys, and it would be above all things unadvisable to make use of them in travelling over the steppes of the Kirghiz, because they are so much spoiled by the excessive care which is taken of them, that they are almost incapable of finding food for themselves not only in winter, but even in summer.

The Uzbek horses, which are smaller than the former, and inferior to them in point of external beauty, have, nevertheless, many redeeming qualities, of which the principal is their strength. Some of their defects arise in consequence of their being badly broken in by the Uzbeks. With these horses, the pace is neither a walk nor a proper trot, but what the Kossaks term a grana or short trot; qu? does Baron de Bode here mean the amble? The second defect is that the Uzbeks never geld their horses, which renders it impossible to picket them together, but each horse is obliged to be attached to a separate stake; a circumstance which, although trivial at first sight, is one of the reasons why the Uzbek camps take so much room, and are therefore more exposed to sudden attacks.

The strongest race of the Turko-Tartar horses is undoubtedly that of Khokand; hence they are usually employed by carriers for transporting goods from one place to another. Five batman is the usual weight of a loaded cart, although they increase the weight sometimes to seven and eight batman from Bokhara to Samarkand. The power of these horses becomes still more apparent when they are used as packhorses. Baron de Bode has seen a horse loaded with two large tents, some kettles flung over the back, and a man sitting astride. It accompanied him in this fashion the whole way from Samarkand to Karshi, and from thence to Bokhara.

The Karab-airi is a very handsome race of horses, in size equal to the Uzbek horse, but in the shape of the head and legs resembling the Argomak. They are reckoned good racing-horses in Bokhara, but as they are trained for the game of kukbari, in which, after running a certain distance, the riders rest, these horses cannot hold out a protracted race, especially as they exhaust their strength from the very outset.

The horses of the Kirghiz Kazak are trained to run races, in distances sometimes from twenty-five and thirty to forty and fifty versts. Every Kirghiz, in setting out on a journey, fastens to his saddle a bag of "kurut" or cheese made from sour milk. He soaks some of it in water, and thus appeases his hunger and thirst together.

Muss of the Kirghiz is the wild horse of the Asiatic plains. This animal is not like the wild horse of S. America, which undoubtedly sprung from those taken into the country by the Spaniards. He is of a distinct race from the Asiatic horse, very small (not so large as an ass), beautiful in form, having a small head and short ears, and varying in colour from black, bay, grey, and white, the latter being the most rare. He is called 'muss' by the Khirghiz. His sense of smell is very acute, which renders him most difficult to approach. He is exceedingly fleet, and few horses can run him down. In hunting him, a great number of Kirghis assemble and when the scouts have found the herd, the horsemen form an extended line at a considerable distance towards the steppe. When so much has been accomplished they gradually ride up, forcing the herd towards a pass in the mountains. As they approach near to the ravine the hunters draw closer, forming a crescent, and proceed with extreme caution till the stallions enter the pass. While this has been going on, another party of hunters, have made their way into the pass, taking their stand in the narrowest part, and waiting till the herd appears. Having signalled to the hunters on the plain that the pass is secured, the whole body close up and the wild animals are in a trap. They are now driven onward till stopped by the hunters above, when the work of slaughter begins, and vast numbers of these beautiful creatures are killed by their battle-axes. The Kirghis consider their flesh the greatest delicacy the steppe affords.

Imported horses.—The supplies in British India itself, and from the neighbouring inland countries, have been insufficient to meet the demands and wants of India, and ever since 1840 small batches have been received from the Cape of Good Hope. These are horses of good figure and good temper, suitable for riding horses and for draft, but, like the Arab horse, higher priced than can easily be afforded. Australia however has taken a hold on the Madras and Calcutta markets and are termed "Walers." What number of new horses of all sorts are needed for British India annually, is not known, but, the town of Madras alone takes about sixty every month and the following have been the numbers of Walers imported into Calcutta since 1863-64.

1863-64	1,020	In 1867-68	899
1864-65	469	1868-69	1,198
1865-66	667		5,278
1866-67	1,025

HORSE HIDE. See Leather.

HORSE RADISH.

Cran de Bretange, Fr. | Raphanus rusticanus, Lat.

The pungent root of the Cochlearia armoracia of *Linneus*, a perennial plant common in moist places of Europe and grown in India. It is used as a condiment, and is besides an article of the materia medica.—*Waterston. Faulkner.*

HORSE RADISH TREE.

Hub-ul ban, (seeds) Ar	Sagul, Mahr.
Sujna, Beng.	Moriaben, Pers.
Sohunjana, Duk.	Sigrumalla sohanjana, Sans.
Munga-ke-jhar-ki-jar, Hind.	Muranghai ver, Tam.
Sagul-ke-jhar-ki-jur, „	Munaga veru, Tel.
Moringa pterygosperma Hyperanthera moringa, Lat.	

This tree grows easily from seeds, in gardens, only requiring watering for the first few months. The scraped roots are very like horse radish, and are served up as a substitute. The long pods are boiled and used as a vegetable, also made into curry. The flowers and leaves are used as a vegetable, and its gum is used medicinally.—*Faulkner. Voigt.*

HORSE-SHOE BAT. See Cheiroptera.

HORSE TAIL The tails of the horse and of the Yak are used as standards. Amongst the Turkoman, the Tupha, Tugh or Tau, according to Remusat, is the Turkish name of the horse-tail standard, but is applied also by the Chinese to the Yak-tail, which, respectively with those nations mark the supreme military command.—*Rech sur les langues Tartares*, 303; *also D'Ohsson*, I, 40 *in Yule Cathay*, I, pa. clxxiv.

HORSFIELD, Dr. Thomas and Mr. Moore's Catalogue of Birds in the India House Museum, appeared in 1856 and 1858. Dr. Horsfield was one of the earliest naturalists labouring in India, though the extent of his labours in Java and Sumatra, is unfortunately but little known. His researches in Java and the neighbouring islands began in 1802, and were continued till 1819. During that time he collected upwards of two thousand species, the most curious and interesting of which have been published by Messrs. Brown and Bennett, in the 'Plantæ Javanicæ rariores' one of the most profound and accurate botanical works of the day, and one most important for the Indian botanist to study with attention.—*Drs. Hooker and Thomson.*

HORTON PLAIN, a few miles from Nuwera Elia, in Ceylon, is the highest table land in that island. The pitcher plant, Nepenthis distillatoria, grows in great luxuriance on it.

HORTUS MALABARICUS, this botonical work was undertaken at the suggestion of Henry von Rheede, a Dutch Governor of Malabar: the specimens were collected in 1674 and 1675 by brahmans, and sent to Cochin, where drawings of them were executed by Mathæus, a Carmelite and missionary: corresponding descriptions were at the same time made in the Malabar language, which were afterwards translated into Portuguese by Emanuel Carneiro, a Cochin interpreter, and from that into Latin by Hermann van Douep, the Secretary to the city of Cochin: the whole was under the superintendence of Casearius, a missionary there. The work was at length published at Amsterdam between 1686 and 1703, in 12 volumes folio with 794 plates, and was edited by Commelyn, who has occasionally added remarks on the plants.—*Wight's Prodromus Floræ*, Vol. I, p. vii.

HORU, of Surat. Urtica heterophylla.

HORUS, a god of the Egyptians. One of the most remarkable fictions in the Egyptian and Syrian mythologies is that of the annual disappearance and resurrection of Horus, or the solar Osiris, and the lamentations for Adonis and the joy at his restoration. These as well as the Deot'han of India, bear evident reference to the sun's annual motion. *Elliott Supp. Gloss.* See Macrob. Saturn. Lib. I. Cap. 21. and the authorities quoted in the Fetes de la Nature. vol. I. p. 125.

HOSEA, king of Israel, murdered king Pekah B. C. 726, and began to reign B. C 727. Salmanassar attacked him B. C. 721 and made him tributary, and in 719 Samaria was taken and the people carried away to Assyria and Medea. *Bunsen.*

HOSEIN, a son of Ali.

HOSEIN ABDOOL, see Baba Wullee.

HOSEIN KE FAQEERAN, Moharram faqeers.

HOSHANGABAD, a town in the central provinces of India in the Sagur and Nerbudda territories. Mandoo, now in ruins, was some time the capital of the independent mahomedan kingdom of Malwa. It is on a spur of the Vindhia mountains, overlooking the valley of the Nerbudda and the plains of Nimar, having a site at an elevation of more than 2,000 feet above the sea, and a climate not unlike that of the Mohtoor sanatarium with similar scenery. The city of Mandoo was founded by Hoshung shah, also the founder of Hoshungabad; the second

king, Mahomed Khiljee, erected a mausoleum of white marble over the remains of Hoshung shah, still in good preservation. The Mandoo hill, on which the hindoo queen would recline, to gaze on the sacred Nurbudda winding through Nimar; close to this terrace was erected a palace, near a well known spring, which to this day is called the Queen's fountain. In general, mahomedan ruins are situated on the plain, without any imposing back-ground to the picture, but at Mandoo the ruins are situated in the midst of beautiful mountain scenery, so that the combination of works of art with the beauties of nature is most charming.

HOSHIARPUR, in L. 31° 32' 2; N. L. 75° 53' 9, E. a large civil and military station, in the Panjab, N. of Ludhiana. Mean height of the cantonment, is 1,066 feet above the sea.

HOTA, SANS. he who directs the homa or burnt offering, from "hoo" Sanscrit, to offer. The Hota throws the clarified butter on the fire in the burnt offering, repeating the proper formulas. *Ward's view of the Hindoos.* vol. II. p. 17.

HOTRI, See Hindu or Hindoo.

HO-TSING, according to the statement of the missionary Imbert, the Fire-springs, "Ho-tsing" of the Chinese, which are sunk to obtain a carburetted-hydrogen gas for salt-boiling, far exceed the European artesian springs in depth. These fire-springs are very commonly more than 2,000 feet deep; and a spring of continued flow was found to be 3,197 feet deep. This natural gas has been used in the Chinese province Tsetschuan for several thousand years; and "portable gas," in bamboo-canes, has for ages been used in the city of Khiung-tschen. More recently, in the village of Fredonia, in the United States, such gas has been used both for cooking and for illumination. *Curiosities of Science.* p. 118.

HOT SEASON. Noay kalaoo-doo Burm.

HOT-SPRINGS occur, in Ceylon, in two places in the Kandyan province, at Badulla, at Kitool near Bintenne, near Yaviootoo, in the Veddah country, and a fourth at Kanneah, 7 miles beyond Trincomallee. and there are two in the province of Oova. Their waters are considered efficacious in cutaneous ailments and rheumatism. A fifth is said to exist near the Patipal Aar, south of Batticoloa. The water in each is sufficiently pure to be used by the natives for domestic purposes.

In the hot springs of Kannea, the water flows at a temperature varying at different seasons from 85° to 115°. In the stream formed by these wells, M. Reynaud found and forwarded to Cuvier two fishes which he took from the water at a time when his thermometer indicated a temperature of 37° Reaumur equal to 115°. of Fahrenheit. The one was an Apogon, the other an Ambassis, and to each, from the heat of its habitat, he assigned the specific name of "thermalis." Also a loche. Cobitis thermalis, and a carp, Nuria thermoicos, were found in the hot springs of Kannea, at a heat of 40° Cent., 114° Fahr, and a roach Leuciscus thermalis, when the thermometer indicated 50° Cent. 122° Fahr. Fish have been taken from a hot spring at Pooree when the thermometer stood at 112° Fahr., and as it belonged to a carnivorous genus, they must have found prey living in the same high temperature. Fishes have been observed in a hot spring at Maniha which raises the thermometer to 187° and in another in Barbary, the usual temperature of which is 172°, and Humboldt and Bonpland, when travelling in South America, saw fishes thrown up alive from a volcano, in water that raised the temperature to 210° being two degrees below the boiling point. The springs of Kanneah are situated in low ground, abounding in quartz, surrounded by low jungle, in an unhealthy country. Of the two warm springs in the province of Ouva, one is at Badalla, in Upper Ouva, about 1861 feet above the level of the sea, where the mean animal temperature, is about 69°; the other is about a mile and a half from Alipoota, in lower Ouva, near the path on the way to Kotahowa, about 1061 feet above the level of the sea, where the mean annual temperature is probably about 76°.

There are two warm springs in the bed of the Godavery.

Hot springs, about 150 in number, occur near Wujerabaee, in the Bhewnday talooka of the Tanna collectorate. The Bombay district, in which they occur borders upon the river Tansa, on the Duganel side of the Bhewndy talook, and is seemingly confined to the villages of Akulkolee, Guneshpuri, Gorad, and Nimbuwullee, in a tract about 3 miles long and a mile broad. The Argurd Koond spring, which is the hottest, has a temperature of 130.60. Hot springs, having a temperature of 87°, rise through the limestone near the Pindee hills and globules of gas escape from round holes in the debris and mud covering the bottom of the ravine. About five miles north of the hot springs of Urjunah and four miles south of those of Kair, sandstone caps a gently rising ground, covered with basaltic soil. Near the last mentioned town many hot springs

rise in the argillaceous limestone, which has been remarkably broken up and altered by the globular basalt protruding through it in different places. The principal springs issue at the foot of the rising ground, where the rock is most remarkably altered. Their temperature (87°) was the same as that of Urjunah, on the other side of the Pindee hills, and it did not vary during the hot and cold months of 1831 and 1833.

Beluchistan.—Lt. Pottinger halted at Basman, and found the hot well upwards of twelve yards in circumference, and two or three feet in depth; in the centre of it was a circular pipe built of red burnt brick, about eight inches in diameter, and within as many of being level with the water, which boiled out of it as thick as a man's thigh, with considerable violence, and, at noon, so heated that he could not venture to put his hand into the ebullition. One side of the well had been gradually worn away by the incessant gushing of water over it, and thence a limpid brook flows past the village, and suffices the husbandmen for the irrigation of their grounds. He bathed in this stream about five yards from its source, and found the water pleasantly tepid, with a strong sulphureous smell and taste, which unfit it for culinary purposes; but the Belooches regard it as aperient in its effects, and an excellent specific in cutaneous disorders.

Bheerbhoom.—Hot springs occur at Bukkesur in Bheerbhoom. There are about eight of these, each being enclosed by little walls of sandstone in the form of wells, and known by different names, taken from those of the hindoo gods. The spring that has the highest temperature is the Soorajkoond, in which, says a hindu traveller, we could not dip our hand, and in which an egg may be boiled, but not rice, of which he threw in a handful to try the experiment. A few paces from the Soorajkoond is a cold spring There are springs in the bed of the Paphara, the washer-of-sins. The water of the Setgunga has a milky whiteness, whence the origin of its name.

Confervæ abound in the hot springs of Soorajkhund, and two species, one ochreous brown, and the other green, occur on the margin of the tanks themselves, and in the hottest water; the brown is capable of bearing the greatest heat and forms a belt in deeper water than the green: both appear in broad luxuriant strata, wherever the temperature is cooled down to 168° and as low as 90°.

There is a hot spring near Chirana Puteh, and another at Salamana in Rambu. Tin has been procured near Taba, and also near Chirana Puteh.

There are two hot springs in the village of Kujoorah.

Sind.—Pectines, a few coats of small spiral and bivalve shells are met with, but in no abundance, till nearing the Hub or Pub river beyond the basin formed by the curved ridges, small fossil crabs and other fossils similar to the Kurrachee bed from all the other formations in Sind. There are a few other springs in the neighbourhood of these hot springs, but they are cold and chiefly salt. The other hot springs of Sind are the Lukkee and Gazee Peer springs; of the latter Lt. Maclagan gave the following account: There is, he says, a hot spring on a considerably elevated plateau upon the hill called Bhil, above Gazee Peer, a saint's shrine, a few miles west of Shah Hussun, on the Meunchar lake. He could not hold his hand in the spring for any length of time. The water fills a small reservoir under a clump of trees, then escapes in a narrow stream which flows along to the edge of the plateau, and throws itself over the rock in a white cascade." The sulphur springs near the village of Lukkee, like the springs at Mungul Peer, are three in number, but are much more highly impregnated with sulphur, though their temperature is not so great. The following is the temperature of sulphur springs near Lukkee pass, lower Sind;

1st Spring at 12 A. M. water 102° F. in shade 82° F.

2nd spring at 12-12 A. M. water 103°" F. in sun 86° F.

3rd Spring at 2 P. M. water 105°" F. in shade 68 F.

Water boiled at third spring by thermometer, at 212°75' and at Kurrachee by same thermometer at 214°—Difference, 1°25.'

Nos. 1 and 2 might almost be called one spring, as they are separated only by a foot or two of rock, No. 3, being some little distance from them at the foot, but the waters of all unite and flow through the lower range or rather ridge of rocks, and are then lost in the sandy bed of what must, during the rains, be a mountain torrent, the water collected in the pools had an azure hue: there is a great deal of sediment contained in it on first issuing from the rocks, which is deposited, as it flows along the margins of the stream and on the stones at its bottom in a red, yellow and white, and all three combined gave a crustlike congealed froth.

Munnie Karn is situated on the right bank of the Parbutti (or Parub) river. There is a large village here, and high mountains covered with snow environ the place. There are several hot springs, three or four of which boil furiously. The latter issue out of rocks near the edge of the river, and dense steam rises out of them in considerable volumes, heating the air all round, absolutely darkening the path for a few yards, and the heat is very distressing.

All the inhabitants of Munnie Karn cook their food in these boiling springs, and wood is never used by them for culinary purposes.

Ladak.—Many hot springs occur in Ladak but the best known are those of Nubra, Puga, and Chushul, the two first have clear water and a temperature of 167 ° with beds of soda below the springs. Those at Puga, occur in the bed of a rivulet, where they bubble out at temperatures from 80 ° to 140 °. The hottest contain chloride of soda, and sulphuretted hydrogen in solution and those of low temperature chloride, and borate of soda. The hot spring of Chushul has a temperature of 96 ° without taste or smell, but is said to have medicinal properties.

A hot spring occurs at Behitsil in the Basha valley in Little Tibet, from which a deposit of sulphur occurs. Two hot springs, sulphureous and chalybeate, also occur near the village of Duchin, in Little Tibet. The temperature of one, visited by Mr. Vigne was 154 ° Fahr. One occurs twelve miles east of Rajawur, the temperature about 140 °. It is sulphureous and deposits sulphur in its course.

Sind.—The following means of temperature of the hot springs at Peer Mungul, or Munga, or Mungear, were taken in September 1844 by Major Baker and Lt. Maclagan.

Temperature of 1st Spring. Fahrenheit.

			Water.	Air.
4th	11 30	A. M.	119·	89 ° 25
4th	4·45	P. M	118·25	86·
4th	9·5	P. M.	117·	86·
5th	5·45	A. M.	119·	78·
5th	9·5	A M.	119·	83·

Temperature of 2nd Spring. Fahrenheit.

4th	11·45	A. M.	127·5	91·
4th	4·55	P. M.	126·25	86·5
4th	9·25	P. M.	126·05	80
4th	5 50	A. M.	128·25	78·
5th	9·15	A. M.	128	83·

2° 25' hotter than the hottest spring of Switzerland. Temperature of 3rd, and principal spring which is the saint's shrine, and which feeds the alligator ponds,

4th September 1844, 5-30 P. M. Temperature of water, 99 F. Temperature of air, 85° 5' F.

The water of these springs, where it first issues, has a slightly sulphureous smell and taste, but after a short exposure to the air, becomes perfectly sweet and pure; it leaves a slightly blackish deposit on the pebbles. The rocks in the vicinity are found in ridges in nearly concentric curves. The strata appear to dip from the centre of the course at an angle varying from 50° to 80°. They consist of an upper cap of coarse limestone overlaying coarse soft sandstone, below which the strata is hidden by debris. The rocks abound with exuviæ of zoophites, echini and pectines, a few casts of small spiral and bivalve shells are met with, but in no abundance, till nearing the Hub or Pub river. Beyond the basin formed by the curved ridges, small fossil crabs and other fossils similar to the Kurrachee bed form the other formations in Sind. There are a few other springs in the neighbourhood of these hot springs, but they are cold and chiefly salt.

The other hot springs of Sind are the Lukkee and Gazee Peer springs; of the latter, Lieutenant Maclagan gave the following account: "There is a hot spring on a considerably elevated plateau upon the hill called Bhil, above Gazee Peer, a saint's shrine, a few miles west of Shah Hussun, on the Meunchar Lake. He could not hold his hand in the spring for any length of time. The water fills a small reservoir under a clump of trees, then escapes in a narrow stream which flows along to the edge of the plateau, and throws itself over the rock in a white cascade." The following is a memorandum of the temperature of the sulphur springs near the village of Lukkee. Like the springs at Mungul Peer, they are three in number, but are much more highly impregnanted with sulphur, though their temperature is not so great.

Temperature of sulphur springs near Lukkee pass, lower Sind,

1st spring at 12 A. M. water 102° F. air in shade 82° F.

2nd spring at 12-12 A. M. water 103°" F. air in sun 86· Farh.

3rd spring at 2 P M. water 105°" in shade 68 ° F.

Water boiled at third spring by thermometer, at 212° 75' and at Kurrachee by same thermometer at 214°—Difference 1° 25.'

Nos. 1 and 2 might almost be called one spring, as they are separated only by a foot or two of rock. No. 3, being some little distance from them, but the waters of all

unite and flow through the lower range or rather ridge of rocks, and are then lost in the sandy bed of what must, during the rains, be a mountain torrent: the water collected in the pools, had an azure hue: there is a great deal of sediment contained in it on first issuing from the rocks, which is deposited, as it flows along the margins of the stream and on the stones at its bottom, in red, yellow and white, and all three combined gave a crustlike congealed froth, but he did not know what it contains. On adding a little nitrate of silver to about a wine glass full of the water, a considerable flaky white deposit fell immediately to the bottom, which shortly after acquired a violet hue, and on exposure to the sun's rays became almost black; on adding a few crystals of barytes to another glassful, the water in which was perfectly clear, it at once became like milk and water, but shortly after it settled, a considerable white deposit falling to the bottom of the glass. On adding a little potass to another glass of water, a few minute bubbles of air or gas escaped from the crystal, but eventually the water became slightly turbid and on clearing, a slight white deposit was observed on the bottom of the glass The high range of rocks in their vicinity are a kind of soft limestone, at least the parts exposed to the weather are soft and white, almost like chalk, but seemingly with small crystals of sulphur in it. The lower range or rather ridge is coarse sandstone, capped with lime; the strata in some parts is almost perpendicular, and in others curved." There is seen from top, a jumble of hills of all sizes, shapes and colours: the lower ones apparently full of beds of gypsum, the continuation of them, beyond the Lukkee pass, was full of that substance. Nasseer Khan commenced to work the sulphur here but found it a losing speculation owing to his not having descended deep enough through the blue marl at the base of the ridge.

There is a sulphurous hot spring at Tulsiram in the centre of Geer, in Kattyawar.

Ayarpanas (hot water) spring near Malacca; its water 115° is said to be useful in rheumatism.

Hot springs, issue from the flats near a stream at Chung-leng, 16,170 feet above the sea; the temperature 122° to 130°. The hot springs of India are resorted to by the people for the cure of lingering ailments.—*Beng. As. Soc. Jour.* Nos. cx. civ, August 1848. *Forbes Eleven years in Ceylon*, vol. ii. p. 49. *Bengal As. HOTUKI. See Afghan, Nasiri.

HOUBARA. A genus of birds of the Order Grallatores, Tribe Pressirostres, and family Otidæ.

HOUBARA MACQUEENII, *Gray.*

Otis marmorata, *Gray.*	O. Macqueenii, *Gray.*
Macqueens Bustard ENG.	Tilaor, HIND,
Indian Houbara Bustard, „	Dugdoor of AFFGH.
Hurriana Florikin, „	Obarra, W. PUNJAB.

This bird is rare in Europe, but occurs in N. West India and Afghanistan. It has a beautifully crested head, is 25 to 30 inches long, and extended is 4 feet. It weighs 3¼ to 3½ lbs. It is supposed that both the male and the female assume the ruff in the breeding season. It is found throughout the plains of the Punjab, and upper Sind, where it is much hawked with the Charragh falcon, the Falco sacer. It also occurs in Delhi, in Afghanistan, in Mesopotamia, in Europe and England. It occasionally baffles the hawk by ejecting on it a horribly stinking fluid which besmears and soils the hawk's plumage.—*Horsfield and Moore.*

HOUBARA UNDULATA, occurs in N. Africa and Arabia and visits Spain.

HOUEN TSANG, visited the kingdoms of Fa-la-pi (Ballabhi) Su-la-cha (Surashtra.) His itinerary is, however, very confused. See Hiwan Tsang.

HOULUGU, grandson of Chengiz Khan, on the 22nd of January 1258, appeared with his army before Baghdad. On the first of February, he took the city of Baghdad by storm, and put an end to the power of the caliphs. He had made Mostassim believe that he was willing to give his daughter in marriage to the Caliph's son. But when the principal people were thus all got together, the Tartars set on them, and put them all to death. Baghdad, the city of science, learning, and pleasure, was given up to pillage and slaughter, and more than 800,000 persons were mercilessly destroyed. Sanut declares that Houlugu killed the caliph by pouring molten gold down his throat. Whilst the Mongol were covering Poland with blood and ruins, Houlugu, in the East, was completing the conquest of Syria. After the capture of Baghdad he entered Mesopotamia, seized on Merdin and

Harran, passed the Euphrates, and made himself master of Aleppo and Damascus. The Tartar general had sent orders to Nassir, the sultan of Aleppo, to submit at once, and come in person to meet him. All his eloquence made small impression on the Tartar Houloogoo, who immediately advanced his army, and laid siege to Aleppo. Twenty catapults played for five days against the town, and it was taken by assault on the 18th of January 1260. An incredible amount of treasure was found in it, and the carnage was still more horrible than at Baghdad. The streets were choked up with corpses, and it is stated that 100,000 women and children were taken and sold for slaves in Little Armenia, or in the territories of Europeans.—*Huc's Christianity, Vol. I. p.* 268.

HOUR. A ghuree contains 24 minutes, and 60 ghuree make up the 24 hours.

HOURI, in mahomedan belief a woman in paradise. It is translated in Sale's Koran Chapter LV," beauteous damsels having fine black eyes."

HOURI GUNGE. See Khiva; Khanat.

HOUSES. In the granitic country of Telingana, the houses are usually of adhesive earth or clay of a square or rectangular form, smeared often with red earth, and picked out with perpendicular bands of slaked lime, with a pyramidal roof of palmyra leaves or grass. Houses in the Carnatic are of mud walls with roofs thatched with grass or palm leaves. Houses on the banks of the Kistna near its debouchure have circular walls of adhesive earth.

Houses of the Mahratta country are flat roofed, built of mud, and roof covered with mud. The houses are huddled close together and enclosed in a gharri or fort.

Houses in Telingana are detached from each other, outside the Gharri.

In Arab and mahomedan countries of Persia and India, houses have a common court yard, with numerous rooms leading from them.

The houses of Africa and upper Egypt, are circular and conical with only one opening for a door way.

The Yezdy, a Kurd family, settled near Aleppo, build a stone wall, and erect over it a goat hair roof.

Houses with a flat roof, have a parapet (Deut. xxii. 8.) to prevent any one falling into the street.

Persia. The cottages of the Persian villagers and peasantry are buildings of mud, or rough stones cemented with mud, and mostly consist of two rooms. The walls, which are usually about seven feet high, are very thick,

and full of niches and recesses, which serve as cup-boards for depositing all manner of miscellaneous articles. The roofs of the larger Persian houses are flat; and many have tall bad-gir or wind towers rising high above. The bad-gir is a large square tower, covered on the top, but opening below into the apartment above which it is erected. The four sides are laid open in long perpendicular apertures like narrow windows; and within these are partitions or walls, intersecting each other, so as to form four channels in the tower. By this contrivance, from whatever quarter the wind blows, it is caught in the tower and conveyed into the room below, so that a constant current of air is kept up, except when it happens to be a dead calm.

Houses in lower Bengal are of wattle walls, with mud daub.

In Tibet the peasant's house much resembles a brick kiln in shape and size. It is built of rough stones without cement and has two or three small apertures for ventilation. The roof is flat.

Houses in Burmah are raised on piles, some on the river side, are built over the river on piles several feet high with wooden, or bamboo matting walls. The whole frontage on the left bank of the Moulmein river is built over, as also in Mergui.

The arrangement of many of the oriental houses satisfactorily explains the circumstances of the letting down of the paralytic into the presence of Our Lord, in order that he might heal him. (Mark ii. 4; Luke v. 19). The paralytic was carried by some of his neighbours to the top of the house, either by forcing their way through the crowd by the gateway and passages up the stairs, or else by conveying him over some of the neighbouring terraces; and there, after they had drawn away the awning, " they let him down along the side of the roof, through the opening or impluvium, into the midst of the court before Jesus."

Acts x. 9. tells us that Peter went upon the housetop to pray.' All the flat roofed houses of India, would admit of this, but some of the rich hindoos have a room on the top of the house, in which they perform worship daily.

Matthew x. 12, 14. says ' And when ye come into an house, salute it. And whosoever shall not receive you, &c.' It is the custom amongst hindoos of a stranger to go to a house, and, as he enters it to say, ' Sir, I am a guest with you to-night,' If the person cannot receive him, he apologizes to the stranger.

2 Samuel xi. 2. says ' And it came to pass in an evening-tide, that David arose from off his bed, and walked upon the roof of the king's house.' It is common in India, with

mahomedans and hindoos, to sleep in the afternoon. The roofs of houses are flat; and it is a pleasing recreation in an evening to walk on the flat roofs.—*Horn's "Critical study of the Scriptures" Vol. I. p.* 385, *Dr. Shaw's Travels, Vol. I. pp.* 374-376, *and Hartley's Researches in Greece, Vol. II. p.* 240.—*Robinson's Travels,* Vol. II. p. 351. *Ward's Hindoos.*

HOUS-KHASS, a village, four or five miles from the Kootub minar, where the good Firoz lies buried.—*Tr. of Hind.*, Vol. II, p. 241.

HOUT KASSIE. Dut. Cassia lignea.

HOVELL-THURLOW. The Hon. T. J. author of "the Company and the Crown."

HOVA. The tombs of the Hova race of Madagascar, consist of stone vaults made of immense slabs of stones, flat inside, forming a subterranean grotto. They also erect stone pillars similar to Menhir. The supposed aborigines of Madagascar were the Vasimba, whose tombs are small tumuli or cairns, surmounted by an upright stone pillar.

HOVENIA DULCIS, has, like the cashew nut, a succulent peduncle, and is much esteemed as a fruit in China.

HOVI. Dut. Hay.

HOWA. Arab. Hind. Pers. Atmospheric air. Ab-o-Howa. Pers. Climate.

HOWA. Ar. Eve, the mother of the human race

HOWA. Hind. Solanum gracilipes.

HOWDAH, a seat, pad, or open litter, fixed on the back of an elephant, on which people ride.

HOWEISH. See Khalis.

HOWRAH, Seenagunge, Syndurah and Beejai, rivers and nuddies in Comillah.

HOYA. See Kyan.

HOYA, a genus of plants, of the natural order Asclepiaceæ. The species occurring in Southern Asia, are,—Hoya carnosa, fusca lanceolata, linearis, ovalifolia, pallida, parasittica, pottsii, pauciflora, pendula and viridiflora. Several of the species, under the name of wax plants, are cultivated on account of their elegant flowers. H. imperialis *Lindl* of Borneo, the imperial wax flower plant is highly beautiful, its large and rich purple flowers being relieved by the white, ivory-like centre, it is epiphytal. H. carnosa, *R. Br.* the Flesh colored wax plant, is a native of China.—*Voigt. Wight. Eng. Cyc. Low's Sarawak,* p. 67.

HOYA PENDULA.—*Wight and Arnott.*

Asclepias pendula. Roxb. | Hova revoluta, Wight.
Asclepias rheedii, W. & A. | Nøsjera patsja, Maleal.

This plant grows in the Circar mountains, Malabar and Neilgherry hills and is used in medicine. Its flowers, are middle sized white and fragrant.—*Voigt.*

HOYA PLANIFLORA. Wall. Syn. of Tylophora asthmatica. *W. and A.*

HOYA REVOLUTA. Wight. Syn. of Hoya pendula.—*W. and A..*

HOYA VIRIDIFLORA, *R. B.* Green flowered Hoya the Asclepias viridiflora of *Roxb.* A native of Coromandel, Sylhet and the Neilgherry hills. The root and tender stalks produce nausea and promote expectoration. The leaves peeled and dipped in oil are used by the natives of India as a discutient in the early stages of boils and in the more advanced stages to promote suppuration. See Vegetables of Southern India.

HOY SHUN. Chin. Biche de Mar.

H'PA-LAN. Burm. Bauhinia racemosa. —*Lam.*

H'SÆ LEE. Burm. Daphne, *sp.*

H'SAI-THAN-BAYAH. Burm. Gloxium bifarium, Gelonium bifarium.

H'SA-NWEN. Burm. Curcuma longa.—*Roxb.*

H'SAT LAY KHYOUNG. Burm. Commelyna cœspitosa.

H'SAY-DAN. Burm. also H'say-dan shwaywa. Burm. Yellow sulphuret of arsenic

H'SEIK-KYEE. Burm. Sapindus rubiginosus.

H'SEN Burm. Elephant.

H'SEN YOUK. Burm. Garuga, *sp.*

H'SOKE GYEE. Burm. Agyreia coccinea.

H'SOO. Burm. Carthamus tinctorius. *Linn. Roxb*

H'SOO-KYAN-BO. Burm. Cæsalpinia sepiaria, *Roxb.*

H'SOO KOUK. Burm. Cæsalpinia paniculata.

H'SOUK. Burm. Elæodendron integrifolia *McClell.*

H'TAH'MEN. Burm. Agyreia.

H'TA-H'MEN H'SOKE GYEE. Burm. Agyreia coccinea.

H'TEE. Burm. This is the umbrella, or canopy of gilt iron filagree, which crowns every pagoda in Burmah. Now-a-day, generally, a bottle is put on the H'tee, and a similar practice is said to be pursued in Ceylon, originating as it is surmised from the knowledge that glass is a non- conductor. —*Yule's Embassy.*

H'TEIN. Burm. Nauclea parvifolia, *Roxb.*

H'TEIN-GA-LAH. Burm. Nauclea elliptica, *Dalzell.*

H'TEIN-THAY. Burm. Nauclea ? ? *Species.*

H'TEN-ROO. Burm. Casuarina muricata, *Roxb.*

H'TOUK-GYAN. Burm. Terminalia macrocarpa.—*Brandis.*

H'TOUK SHA. Burm. Vitex arborea. —*Roxb.* V. leucoxylon.—*Roxb*

H'TOUNG H'PYU. Burm. Calcis carbonas.

H'TWA-NIE. Burm. Eriolæna candollii.—*Wall.*

HUB, (qu. Pub.) a river which falls into the sea at Cape Monze. Hot springs occur in the neighbourhood. A district on the river, called Chuha is occupied by a people of that name, who are said to be of Sumrah or Brahui origin.

HUBER. Hind. Juniperus communis.

HUB-OOL-MOOSHK. Ar.

Musk-okro,	Eng	Kah dustooree,	Beng.
Mushkana;	Hind.		

These are the seeds of Abelmoschus moschatus. The plant abounds in mucilage, which is employed in the West Indies and in North Western India in the process of clarifying sugar. Its seeds are scented as if with musk, hence their name, and are employed in India as a cordial medicine and in Arabia are added to coffee.

HUB-UL-BAN. Ar. Seeds of Moringa pterygosperma.

HUBUK-UL-BUKIR Ar. Anthemis nobilis.—*Linn.*

HUB-UL-GHAR. Ar. Laurus nobilis.

HUBUL-UL-HUBER. Arab. Juniper berries.

HUB-UL-MASHK. Ar. Abelmoschus moschatus, *Mœnch.*

HUB-UL-NIL. Arab. Pharbitis cærulea.

HUB-US-SOUDAN. Ar. Cassia absus.

HUB-US-SUFFURGUL. Arab. Quince seed.

HUBLA, a weight for pearls and diamonds used in Scinde; about two grains troy.—*Simmonds's Dict.*

HUC AND GABET. Two missionaries, who by a route, hitherto quite unexplored by any European, passed among the mountains north of Bootan and Ava, and so made their way due east to the plains of 'the Central Flowery Land.' M. Huc wrote an account of his travels.—*Prinsep's Tibet, Tartary and Mongolia*, pp. 32 and 33.

HUDANG. Malay. Shrimp.

HUDDI. Guz. Hind. Bone.

HUE or Fue. Chin. a secret society.

HUDDEEAROO. Hind. a kind of ring used at mahomedan marriages.

HUDDEES. Arab. a saying, but generally applied to the sayings which tradition has attributed to Mahomed. These are divided into two classes, the Huddees-i-Nabawi, or the sayings of the prophet; the other the Huddees-i-Qudsi, or the holy sayings, which they believe the angel Gabriel brought from heaven.

HUGEL, Baron Charles, author of Visit to the Himalaya mountains, and the valley of Cashmere. The 'Fische aus Caschemir' were described by M. M. von Hugel and von Heckel. Baron Hugel met other two travellers in Cashmere, and they agreed to carve the following inscription on a black marble tablet and set it up in the little building on the Char Chunar island:—"Three travellers in Kashmir on the 18th November 1835, the Baron Ch. Hugel. from Jamu; Th. G. Vigne, from Iskardu: and Dr. John Henderson, from Ladak, have caused the names of all the travellers who have preceded them in Kashmir to be engraven on this stone. Bernier, 1663, Forster, 1786, Moorcroft, Guthrie, and Trebeck, 1823, Victor Jacquemont, 1831, Joseph Wolff, 1832. Two only of these, the first and the last, ever returned to their native country."

In the list they did not include catholic missionaries; Forster did, strictly speaking, return home, but he came out again and died at Madras. When Chunar island was visited by Dr. Adams, in 1854, the tablet had been removed.—*Baron Hugel's Travels in Kashmir and the Punjab*, pp. 144 and 145. *Dr. Buist's Catalogue. Adams' Naturalist in India.*

HUGH LINDSAY was the first steamer that conveyed an overland mail from Bombay to Suez, also the first steamer that entered the Persian Gulf and was of teak-wood, built in Bombay. She was lost coming out of the roads of Bassidore, a port on the island of Kishm, in the Persian Gulf.

HUGONIA MYSTAX. *Linn. W. Ill.*

Modera kanni,	Maleal.	Agur,	Tam

A shrub growing in Southern India, in Malabar, the Coromandel Coast and Ceylon with large blossoms of golden yellow colour. It is employed in native medicine.—*Dr. W. Ill. Voigt* 101.

HUGUIN. See Camelus dromedarius.

HUIAN THSANG. See Inscriptions p. 376. Hiwén Thsang, Houen Thsang.

HUIDEN. Dut. Hides.

HUIER. Beng. Cocculus villosus.

HUILE. Fr. Oil. Huile-de-Girofle. Clove oil. Huile-de-Olives. Olive oil. Huile-de-Palme, also Huile-de Senegal, Palm oil. Huile-du-ricin. Castor oil.

HUITRE. Fr. Oyster.

HUJ. Ar. Hind. A pilgrimage.

HUJAM. Hind. A barber, in Central India it is usual for the village Hujam, or barber, particularly the mahomedan ones, to have some knowledge of medicine; they

are expert also at setting broken limbs; and their wives usually act as midwives.—*Malcolm's Central India.* Vol. II. p. 206.

HUJOOLOHA, Hind. an epithalmium.

HUJRA. Fr. A chamber, in Afghanistan, a house set apart for the accommodation of travellers, and where, in the evening, the old and the young assemble, to converse and smoke the chillam.—*Masson's Journeys* Vol. I. *p.*119.

HUJR-OOL-USWAD, the black stone at Mecca. See Hajr.

HUKEEM, a physician, a mohurrum faqeer.

HUKKA, a pipe used in India, in which smoke is made to pass through water.

HUKKAH BARDAR, a pipe bearer. See Hookah.

HUKMANDAZ. Hind. Carpesium racemosum.

HUKMCHIL. Hind. A dark colored gum obtained from the date palm.

HU-KONG. See India p. 346.

HULA. Hind. Rumex acutus.

HULAETA. Hind. in Hindustan, the first ploughing of the season, which is generally preceded by the taking of omens, and other superstitious ceremonies. The note of the Koel bird, amongst other auguries, is considered very favorable, and its utterance is of such authority as to enable the cultivator to dispense with a formal application to a brahmin. *Ell. Supp. Gloss.*

HULAKOO, The Mogul conqueror of Persia and grandson of Jengez khan. *Mignan's Travels.* p. 78. See Hooloogoo; Khalif.

HULAL-KHOR, scavengers, persons to whom all sorts of food are considered lawful.

HULAM HIK-GAHA, Singh. Chickrassia tabularis. *Ad. Juss.*

HULANHIK, Singh. Melia, *Sp.*

HULAN-MARA, Singh. Albizzia stipulata, *Boiv.*

HULARI, A mountainous district near Shiraz, with fine vineyards, from which the choicest Persian wine is prepared, both red and white. This wine has much body, and resembles the strong Cape wines, and is fit to be exported.

HULAS, Hind. Snuff.

HULAS KASHMIRI, Hind. Rhododendron campanulatum.

HULASA, Hind, Rhus vernicifera.

HULASHING, Hind. Rhus buckiamela, R. succedanea, also R. semialata.

HULDA, Mar. Chloroxylon swietenia.

HULDAH, Duk. Myrobalan: Terminalia chebula.—*Retz.*

HULDEE, Beng. Duk. Hind. Turmeric, Curcuma longa *Roxb.* The huldee takes an important place in many of the customs of the people of India. Huldee Mehndi is a mahomedan ceremonial, as also are Huldee or Munja baithna, Huldee chor and Huldee saoo. The Hindoo races use it largely for smearing their bodies and dye with it portions of their new clothes to avert the evil eye. It is sown in beds like ginger, and when ripe, in twelve months, is taken up and dried. It is extensively cultivated in most parts of India, and sells, green, from eight to eighteen seers the rupee.

HULDI, Beng. Ovate gardneria, Gardneria ovata.

HULDI-ALGOSA-LUTA, Beng. Bent back dodder, Cuscuta reflexa.

HULDI-BUSUNT, Beng. Lindenbergia ruderalis.

HULDI-LUNKA-MURICH, Beng. also Huldi-Murich, Capsicum frutescens.

HULDI-MOORGA, Beng. Celosia aurea.

HULHUL, Hind. Kashm. Cleome viscosa. C. pentaphylla. Gynandropsis pentaphylla.

HULI, See Hooly, Kali, Krishna.

HULIM, Beng. also Chunser, Guz. Hind. Cress.

HULI SHENA, Can. Tamarindus indica, *Linn.*

HULKUSHA, Beng. Leucas liniifolia.

HULLAH, Hind. or Neembolee, a neck ornament worn by mahomedans.

HULLAH Hind. also Hurla, Huldah or Zungeehur, Terminalia chebula, *Willd.* Chebulic myrobolan.

HULLIHAL, a town in Mysore.

HULLUD HULDI, also Daru Hullud, Mar. an inferior kind of turmeric.

HULLANDA, Hind. Phaseolus rostratus.—*Wall.*

HULSEE, Beng. Ægiceras fragrans. *Kon.* Æ. majus *Gœrt.*

HULUG, Rhus semialata, R. buckiamela.

HULUKOO, the Mogul conqueror of Persia, grandson of Chengiz Khan.—*Porter's Trav.* Vol. I. p. 288. See Hooloogoo.

HULUKAN, See Khajah.

HULWAI, Hind. a confectioner. In the Lower Doab the term "halwai" has become an appellation of a caste, or tribe.

HUM, Mar. Guatteria cerasoides.

HUM, Hind. Fraxinus floribunda. *Wall.*

HUMATU, Maleal. Datura alba.—*Rumph.*

HUMAYUN, son of the emperor Babér, an emperor of Hindustan who reigned twice, viz., from A. D. 1530 to 1543, when he was driven out by Sher-Khan and endured great distress in crossing the Sind desert, to Amerkot. At Amerkot, the empress Hamidah Banu, gave birth to their son, Akbar, and leaving his wife and son there, Humayun marched against Bikker. He

recovered his kingdoms in A. D. 1555, but died the following year and was buried at Delhi: a white marble dome covering his tomb forms a conspicuous object for miles around. The mausoleum was erected by Hamida Banu, at the cost of fifteen lacs of rupees, in sixteen years from 1554 to 1570. The enclosed area forms a square of 300 yards, laid out in beautiful shrubberies and fragrant flower beds.

In a corner room towards the left, lies Hamida Banu, who spent the years of her long widowhood in those pious acts and charities which earned to her the surname of Hadju Begum, by which she is popularly remembered.—*Tr. of Hind.* Vol. II. p. 259.

HUMAZ. Hind. Polygonum *sp.*

HUMBETHER. Guz. Hind. Myrobalan.

HUMBU. Hind. Myricaria Germanica, also M. elegans.

HUMBULEE. One of the four principal sects of the mahomedans.

HUME, Allen Octavius, C. B., a Civil servant of the Bengal Presidency. While magistrate of Etawah, by force of will and mild obstinacy of purpose, he overcame much resistance from the natives, and for years continued toiling at schools and christianity and all that elevates the human heart. He was an instance how much can be done in India by the influence of one man. It is in India where such influence attains its highest sway. A place more desert looking and hopeless of growth for any European seed could hardly be selected, yet this one pale Englishman, of slender frame and ascetic habits, developed upon that fiery soil a caste of natives unsurpassed in firm allegiance and educational distinction.—*T. J. Hovell-Thurlow, The Company and the Crown.* pp. 89—90.

HUMEA ELEGANS. A native of New South Wales, grows to the height of five or six feet, colour of the flower red, and well adapted for borders; it requires a good soil. *Riddell.*

HUMMATU. Malbal. Thorn apple, Datura alba.

HUMPEY. A ruined town in the Bellary district, known at one time as Bijanagar, also written Vijayanuggur, and Vijianagar, properly Vidianuggur or the town of learning. It was founded in the reign of Mahomed Toghlak, according to one account, by two fugitives from Telingana, but according to Prinsep, in 1338, by Bilal Deo, of Karnata, who resisted Mahomed Toghlak and founded Vijianuggur. In 1347, Krishna Rai, ruled there: in 1425, Deva Rai: in 1478, Siva Rai. Vijayanuggur was the seat of the last great Hindu empire in India. The sovereigns claimed to be of the Yadu race. In the beginning of the 16th century they granted to the E. I. C. the tract around Madras, engraved on a gold plate, which was lost in 1746 when Madras was captured by the French, under Labourdonnais. Towards the fifteenth century, it had become the capital of a great hindu power which ruled over the hindu chiefs to the south of the territories of the Adil Shahi, Nizam Shahi and Kutub Shahi kings of the Dekhan. In the middle of the 16th century, these three mahomedan kings, fearing the growing power of Ramarajah, the sovereign of Bijianuggur, made war against him, Rama was then in his 70th year. He met the confederates at Talicottah on the 25th January 1565 with a great army of 70,000 horse, 90,000 foot, 2,000 elephants and 1,000 pieces of cannon, but he was defeated with a loss of 100,000 men, and was taken prisoner. The authors Khafi Khan, and Shahab-ud-din, state that the elephant on which he was mounted ran away with him into the confederate's camp. He was beheaded at Kala Chabutra in the Raichore doab, and his head remained for 200 years at Bejapore as a trophy. Vijianuggur sank into an insignificant place, and is now known as the ruins of Humpey. The rajah's brother, however, took refuge in Penicondah, and subsequently at Chandargiri, whence the English merchants obtained the grant of the ground on which Madras was built. The descendant of Rama rajah is the Rajah of Anagoondee, whose title is Sree Mudrajadhee Raja, Raja Paramaswara, Sree Veerapratapa, Sree Veera Teroomala, Sree Veeravenkata Ramarawya, Dava Maharawya Sumstan Vedaya Nagarum.—*Wh. H. I.*, p. 459. See Humpee.

HUMULUS LUPULUS, *Linn.* the hop, has been extensively distributed in the Himalayas. At 2,500, in the Dehra Dhoon, it grows well: and at an altitude of 6,000 feet in the Government gardens Missoori, but, in those regions, the best limit appears to be 4,000 or 4,500. A small sample grown in the Kangra valley was pronounced equal to the finest Kent hops, but, more recently, the accounts have been less favorable. Lowther states that he had heard of the hop plant being seen in Kashmir (as others have done elsewhere in the Himalaya) but it is nowhere indigenous. In 1851 he proposed its introduction in Kashmir. It has been successfully cultivated in Dehra Doon for many years, so far as mere growth is concerned; but heavy rain at the flowering period prevents the flower from reaching perfection as to quantity and quality of the powder, on which its value depends, and the results have,

on the whole, been unsatisfactory.—*Dr. J. Stewart Punjab Plants*, p. 217. See Hops.

HUMUZ. Ar. Cicer arietinum. *Linn.*

HUN. Hind. A gold coin of the South of India of about 50 grains weight.

HUN. The Tartars are in European history styled Hun and were known in ancient times under the general denomination of Scythians. They consist of numerous tribes, who wander about the plains of Central Asia and live partly by hunting and partly by plunder. The Huns, who afterwards appeared in the west, dated their empire from one of the princes of the Heea dynasty. Their country was of great extent, situated on the west of Shen-se, of which they possessed the western parts, and their posterity still inhabit a part of that territory, the present Ele or Ili. They belonged to that extensive tribe which the ancients comprised under the name of Scythians. The country they inhabited was so barren as to render agriculture little available to the maintenance of life. Their indolent, pastoral habits had for them greater attractions than the constant toil of the Chinese peasant. Hunting is their chief amusement, and next to their herds, their principal means of subsistence. Without the arts of civilized life, they are cruel and blood-thirsty, desirous of conquest, and insatiable in rapine. Even the eastern provinces of the Grecian colonies were often molested by the savages who dwelt in the plains beyond the Oxus and Jaxartes. The famous valour of the Persian heroes, Rustam and Asfendiar, was signalized in the defence of their country against the Afrasiabs of the North; and the invincible spirit of the same barbarians resisted the victorious arms of Cyrus and Alexander. The Huns were not the least amongst those numerous hordes. Their rulers, named Tanjou, gradually became the conquerors and the sovereigns of a formidable empire. Their victorious arms were only bounded by the Eastern Ocean; the thinly-inhabited territories along the banks of the Amoor acknowledged their sway: they conquered countries near the Irtish and Imaus; nothing could stop them but the ice-fields of the Arctic seas. Their principal strength was in their innumerable cavalry, which appears to have been very skilful in the use of the bow. Their march was neither checked by mountains nor torrents; they swam over the deepest rivers, and surprised with rapid impetuosity the camps of their enemies. Against such hordes no military tactics, no fortifications, proved of any avail. They carried all before them with irresistible power, and never waited until a numerous army could be assembled to overwhelm them. Hardy to an extreme, they could support fatigue and hunger; and never lost view of the object of all their excursions—plunder.

It was to check the inroads of these warlike pastoral tribes, that the Great Wall of China was built. The generals of the emperor Che-hwang-te having subdued the people in the south, nothing more remained to be done than to subdue these Tartars, or, at least, to put a stop to their inroads. Some of the northern states had eventually built a wall, to keep these unbidden guests out of their territories. Che-hwang-te therefore resolved to erect the great wall, which commences at Lin-teëaou, in the western part of Shen-se, and terminates in the mountains of Leaou-tung, in the sea, a distance of more than fifteen hundred miles. It runs over hills and rivers, through valleys and plains, and is perhaps the most stupendous work ever produced by human labour. He lined it with fortresses, erected towers and battlements, and built it so broad that six horsemen might ride abreast upon it. To lay the foundation in the sea, several vessels, loaded with ballast, were sunk, and upon this the wall was erected. Every third man in the empire was required to work on it, under the direction of Mung-tëen, 240 B. C. Some of the Huns having acknowledged the supremacy of China, committed only occasional depredations; while others were fighting against their neighbours, and therefore wanted leisure to turn their arms against China. They finally resolved to turn their whole strength towards the west; they therefore directed their march towards the Wolga and Oxus, settled in the steppes east of the Caspian sea, where they were frequently involved in hostilities with Persia, but growing at length more civilized, they became acquainted with the comforts of a settled life.

One division of their hordes directed their march towards the north-west, and crossed the Imaus. Inured to the dreadful cold of Siberia, they lost nothing of their natural ferocity; but, unable to withstand the reiterated attacks of the Seën-pe (who with the Woo-Hisan form the Eastern Tartars) their implacable enemies, and of other tribes, they emigrated farther to the west. But the country had already been taken possession of by the Alani, a tribe equally fierce and brave with the Huns; but whose love of freedom was still greater, since they did not suffer slavery amongst them, Being descended from the Germanic and Sarmatian tribes, war was their principal occupation. A naked scimetar stuck in the ground was

the sole object of their worship, the scalps of their enemies formed the trappings of their horses, they treated with contempt the warrior who patiently awaited a natural lingering death. Unwearied in war, and considering all nations as their enemies, they had spread terror and desolation over all the regions of the Caspian sea, but encountered on the Tanais, their masters, the Huns. Their king was slain, their nation dispersed, and the remainder of this once large nation found an asylum in the inaccessible mountains of the Caucasus. The torrent of this immense swarm of barbarians, increased by the fugitive Alani, rushed further towards the west with irresistible force. There the Huns A. D. 372, met the well disciplined Ostrogoths, who shuddered at their approach. These semi-barbarians viewed the Huns as the offspring of witches and demons, who had just emerged from the boundless deserts of Asia, in order to inundate and destroy the world.

Hiatilla or the white Huns, was a tribe of Tartars who issued from the plains near the north wall of China, made themselves masters of the country of Transoxania and anticipated the irruption of those Turkish tribes, who some years afterwards expelled the Hiatilla from the lands that they had taken from the Sacæ or Scythians. There is every ground to conclude, that it was an army of the Hiatilla that invaded Persia in the reign of Bahram-Gor: and that it was to one of their kings that Firoz fled.

Ili is a valley and town in Central Asia, from which Lassen supposes the Szu Tartars were expelled by the Yue-tchi or White Huns, B. C. 150. The Szu Tartars he supposed to be the Sacæ and the Yue-tchi to be the Tocharri. After occupying Tahia or Sogdiana for a time, they are stated by the Chinese to have been driven thence, also, by the Yenger, some years afterwards, and to have established themselves in Kipen, in which name Lassen recognises the Kophen valley in the Kohistan. The great Kirghis horde is adjacent to Ili and Tarbagatai. It is under the dominion of China and exchanges large quantities of cattle on the frontier for silk goods.—*Gutzlaff's Chinese History Vol. I. p. from* 220 *to* 262. *Malcolm's History of Persia Vol. I.* p. 126. See Kabul p. 434. Kirghis.

HUN or Hoon, amongst the Scythic tribes who have secured for themselves a niche with the thirty-six races of India, is the Hun. At what period this race so well known by its ravages and settlement in Europe, invaded India, we know not. D'Anville, quoting Cosmas, the traveller, informs us, that the white Hun occupied the north of India; and it is most probable a colony of these found their way into Saurashtra and Mewar. It is on the eastern bank of the Chumbul, at the ancient Barolli, that tradition assigns a residence to the Hoon; and one of the celebrated temples at that place, called the Sengar Chaori, is the marriage hall of the Hun prince, who is also declared to have been possessed of a lordship on the opposite bank, occupying the site of the present town of Bhynsror. In the twelfth century, the Hun must have possessed consequence, to occupy the place he holds in the chronicle of the princes of Guzerat. The race is not extinct. One of the bards pointed out to Colonel Tod the residence of some in a village on the estuary of the Myhie, though degraded and mixed with other classes. There are two tribes in the Himalaya who have preserved this designation. The one in Gnari Khorsum, who call themselves Hunia; the other being the Limbu in Nepal and Sikkim, a large division of whom are called Hung.—*Tod's Rajasthan*, Vol I, p. 109, 110. See Hun-des.

HUNDA, near Attock, on the Indus, a marble slab obtained here, has an inscription in Sanscrit mixed with Hindi, of date the seventh or eighth century, probably, or later. It is in the Deva Nagari and mentions Deva, the husband of Parbati. The flesh-eating Turushca (Turks) are mentioned.—*Beng. As. Soc.* Vol. VI., p. 879.

HUNDA PALE, a Malabar and Canara tree, which grows to about 18 inches in diameter, and 20 feet high. It is not of much use except for its fruit which is eaten by the natives and by wild animals.—*Edye's Forests. Malabar and Canara.*

HUN-DES, is the snow tract of the further Himalaya. The Hunnia all drink tea and travel great distances living on it and 'sattu,' the flour of a parched grain. The Hunnia only grow small patches of 'Uwa' a kind of barley, and obtain their other grains from the hill territories of British India. They keep three years supply of grain in store; to obviate the stoppage of the roads. They are thorough barbarians. They are a nomade people, their villages are mere tents. See Garkun, Gartok, Sarkan, Shib chid, Zumpun.

HUNDI. Hind. A Bill of Exchange.

HUNGARIAN. See India. Koros.

HUNGOO. See Khyber, p. 517.

HUNGRUNG, a district adjoining Ladak belonging to the raja of Bisatun, its villages lying from 9,500 to 12,000 feet above the sea. See India, Maryul and Kunawar.

HUNGSHA. Sans. a duck, goose, or swan. Hangsa-Duta. Sans. from hangsa, a duck, or goose, and duta, a messenger.

HUNIYA. See Sheep.

HUNKARA. Sans. Capparis horrida.

HUNKATA JULI. Beng. Phyllanthus vitis-Idæa.

HUNNI. Hind. Quercus annulata.

HUNNOMAN, the Hindoo monkey-god. See Hanuman.

HUNNU. Sing. Quick lime.

HUNSRAJ. Hind. Adiantum capillus veneris also A. lunulatum, *Burm. Spr.* See Ferns.

HUNTER, Dr. Alexander, M. D., a medical officer of the Madras Army who founded the first School of Industrial Arts, seen in India. The first step he took, about the year 1851, was to appoint a committee of persons interested in the arts and manufactures of India, and with much devotion and self sacrifice, by the year 1871, he had taught one or other branch of Art to upwards of two thousand young men, all of whom had found ready employment. His success led to the formation of several other Schools of Art in various parts of India.

HUNTER, the hunter race, who style themselves Bhowri, are known as Hirn Shikari and Hirn Pardi. They do not use the gun, but snare or net birds and quadrupeds.

HUNTER, Dr. W. W. L. L. D. a Bengal Civil Servant, Author of Rural life in Bengal; Comparative Dictionary of the Non-Aryan languages of India.

HUNTING LEOPARD, or Hunting Cheeta, Felis jubata. See Cheeta, Felis.

HUNUFEE, one of the four principal mahomedan sects.

HUNU-KIRILLE, Singh. Grewia paniculata.—*Roxb.*

HUNUMAN, Singh. Presbytes priamus. See Simiadæ.

HUNYAL? a pheasant? of the Himalayas.

HUNZA-NAGER, are two adjoining towns and include a small tract of country on the upper course of a large feeder of the Gilgit river, having an area of 1672 square miles. See Kailas or Gangri Range.

HUN-ZIL, Arab. Pers. Colocynth.

HUPPUNA KULGA MANYAM, Karn. tax on people of the salt-maker's caste who use buffaloes.—*Wilson.*

HUR or HURA. Hind. Terminalia chebula. Myrobalan.

HUR! The battle shout of the Rajpoot.

HURA CREPITANS. *Linn.* The sand box tree, a middle sized tree of rapid growth, native of tropical America. The trunk is strongly armed, the wood light and useless. The seeds are poisonous.—*M. E. J. R. Voigt. Hort. Gard.*

HURAKAH. Can. Paspalum frumentaceum.

HURALA. Can. four sorts of this seed are grown in Mysore, viz., Maraharatta, Chitta Hurala, Doda Hurala, and Turaka Hurala. They are called, in English, Lamp oil seeds. The second and third are largely exported to the adjacent countries.—*M. E. of* 1857.

HURALI. Can. Dolichos biflorus.

HURBARAH. Duk Cicer arietinum.

HURDA. also Har-Hara, also Hurra. Mar. Gond. Hind. Terminalia chebula, Myrobalan.

HURDI-MURDI. Pers. in Persia a term employed to designate all the trifling but necessary articles which travellers fling in small bags, and carry across the saddle on a journey, in order to have them at hand.

HURDOO? Hind. Nauclea cordifolia.—*Roxb.*

HURDOUR or Hardaur, is the name given in Hindustan to the oblong mounds, raised in villages, and studded with flags, for the purpose of averting epidemic diseases, and especially the cholera morbus. It is called after Hurdoul Lala, the son of Bursing Deo, from whom are descended the rajas of Duttea. The natives have a firm persuasion that the cholera broke out in lord Hastings' camp in consequence of beef having been killed for the European soldiers within the grove where repose the ashes of this Bundelcund chief. So rapid has been the extension of this worship, that it now prevails throughout the Upper and Central Doab, a great part of Rohilcund, and to the banks of the Sutlej. To the eastward, the worship of Hoolka Devi (the goddess of vomitting) has been prevalent since the same period.—*Elliot Supp. Gloss.*

HURDWAR. The chief towns on the banks of the Ganges are Hurdwar, Bijnour, Furrakkabad, Cawnpore, Mirzapore, Benares, Ghazipur, Patna, Monghir, Bhagulpur, Rajmahal, Rampur, and Pubna. Hurdwar, situated on the right bank of the Ganges near Roorkee, is a well known place of hindoo pilgrimage. Every twelfth year the 'Koomb' fair, as it is called, assumes large proportions. The fair which was held in April 1867, was termed by the brahmins the 'Maha Kidar Koomb,' and, as it was supposed by many devotees to be the last Koomb of any magnitude which would be held at Hurdwar the gathering was proportionately great. Hurdwar, means the gate of the Ganges from Dwara, a door.—*Ann. Ind. Adm.*, Vol. XII, p. 102.

HUREE-HARA. Sans. both words are derived from rhree, to take away, possibly the source of the English word to harry.

HUREE-PRIYA. Sans. signifies beloved.

HUREETUKEE. Beng. Terminalia chebula.

HUREE-VALA. Sans. the last word is the imperative of vala, to speak.

HURFAREORI. Hind. also Chelmeri, Hind. Cicca disticha.

HURFEE. Arab. Beng. Guz. Hind Cress seed. See Hurif.

HUR-GANJ. A name of Khiva.

HUR GOVIND. See Sikh.

HUR, Har, or hara, also "hul." a plough, The ordinary plough of India has neither coulter to cut the soil, nor mould-board to turn it over. Nevertheless, simple as the Hul is and wretched in construction, it is admirably adapted to the light Indian soil, and does its duty well under the able agriculturists of India. The average produce of the province of Allahabad is fifty-six bushels of wheat to the English acre: the drill, which has within the last century been introduced into British field husbandry, and had, till lately, in the Northern counties to combat many native prejudices, has been in use in India from time immemorial.—*Elliot Supp. Gloss.*

HURHURYA. Hind. Cleome viscosa; Polanisia icosandra.—*W. and A.*

HURI.—?Casuarina muricata.

HURIAL. An animal of the goat or deer tribe inhabiting the Salt Range.

HURIDA. Beng. also Huridra Sansc. Curcuma longa, Turmeric, from "hurit," Sansc. light yellow.

HURIF. Ar. Beng. Guz. Hind. Cress seed. See Hurfee.

HURIHAYA, Sans. from harit, light yellow, and haya, a horse.

HURINHURA, Beng. Hind. Aglaia rohitica, Amoora rohituka. *W. and A.*

HURI-KANKRA, Beng. Erythrina ovalifolia.

HURI PURBAT, a peak in the mountain Takht-i-soliman.

HURI TUKI, Beng. Terminalia citrina, *Roxb.* also T. chebula.

HURKU of Kanawar, Rhus acuminata, *D. C.*

HURMAL.—Hind. Harmala ruta, Peganum harmala, wild rue.

HURMULI, See Purmuli.

HURNA, See Kattyawar.

HURNA, Beng. Duk. Sapium Indicum.

HURPOOJEE, or Harpuji. Amongst the agricultural races of India the worship of the plough. This takes place on the day which closes the season of ploughing and sowing. It generally occurs in the month of Katik, but in some places it occurs both after the Khureef and Rubbee sowing; i. e. in the months of Sawun and Katik. The plough is washed and decorated with garlands, and to use it, or lend it, after this day is deemed unlucky. The practice reminds of the Fool-plough in England, a ceremony observed on the Monday after twelfth day, which is therefore called Plough-Monday; on which occasion a plough adorned with ribands is carried about, and the peasants meet together to feast themselves, as well as wish themselves a plentiful harvest from the great corn sown (as they call Wheat and Rye), as well as to wish a God-speed to the plough, as soon as they begin to break the ground to sow barley and other corn.—*British Apollo*, Vol. II. No. 92 quoted in *Elliot Supp. Gloss.*

HURPHARURI, Duk. Phyllanthus longifolius.

HURR of Kumaon, Terminalia chebula.

HURREEBAYL, Lit. a green creeper, or Shookrana, a mahomedan ceremony.

HURREE-KE-PUTTUN, See Kunawer.

HURREERA, Hind. Cookery.

HURRIA, Daudin's name for certain Indian colubers, the scales or plates on the base of whose tails are constantly simple, and those of the point double.—*Eng. Cyc.* See Reptiles.

HURRIA-KADDU, Hind. Calabash.

HURRIALI, Duk Cynodon dactylon. See Graminaceæ.

HURRIA SHUK CHINA, Beng. Smilax lanceæfolia.

HURRICANES.

Tufan,	Ar.	Typhoon,	Eng.
Mon deing,	Burm.	Gird-bad,	Pers.

At the season of their occurrence, from December to April, hurricanes form a great topic of interest and discussion in the Mauritius. The immediate cause of these atmospherical phenomena has been supposed to be a disturbance of the equilibrium in the air that takes place at the change of the monsoons. This period of strife lasts about a month and then the hurricanes rage with terrific violence. Bedfield, Read, Capper, Thorn, Piddington, and others have explained the laws by which they suppose them to be governed and their hypothesis is perfectly well known and understood by the Mauritians. The islands of Mauritius, Bourbon and Roderique, lie directly in their ordinary track and if either of them happen to fall within the vortex of one of these hurricanes the consequences to life and property are terrible indeed. Of those who have resided at Mauritius who have earnestly studied and discussed the laws which govern these storms may be mentioned Dr. Thom,

whose writings are well known, Lieutenant Fryers of the Royal Engineers, and Mr. Sedgewick, who published a little work, which he called, "The True Principle," and which has been reviewed by Dr. Thom, and lastly, Mr. Bosquett, of the observatory at Mauritius, who translated into French Piddington's Horn book with annotations of his own and who claimed to be able, by careful and constant meteorological observations, to foretell the existence of hurricanes in the Indian ocean and to describe the course they will take. The chart in Piddington's Horn book, shows that these cyclones never extend to the northward of 10° or 12° south latitude in the meridian of Mauritius. Therefore vessels leaving the island in the hurricane season, for any part of India, should steer to the northward passing well to the westward of the Cargades, a most dangerous group, thus keeping a clear sea open to the westward, that there may be nothing in the way should it be desirable to run to the northward and westward, which would be the true course to take in case of encountering the southwestern or northwestern quadrants of a cyclone (of which in the hurricane season a vessel from Maur'tius is in danger) and this course she should keep until she is sufficiently far north to be beyond its influence. Steamers of course have superior means of avoiding these storms as they have the power of steering the most judicious course to escape from their greatest fury.

A hurricane means a turning storm of wind blowing with great violence, and shifting more or less suddenly, so as to blow half or entirely round the compass in a few hours. The present state of our knowledge seems to show that, for the West Indies, the Bay of Bengal, and the China Sea, the wind in a hurricane has two motions, the one a turning or veering round upon a centre, and the other a straight or curved motion forward, so that it is both turning round and rolling forward at the same time. It appears also that, when it occurs on the North side of the Equator it turns from the East, or the right hand, by the North, towards the West; or contrary to the hands of a watch; and in the Southern hemisphere, that its motion is the contrary way, or with the hands of a watch. Piddington's first memoir, with the charts and diagrams, showed that this rule held good for the storm of June 1839 off the Sand Heads; and that the wind was really blowing in great circles in a direction as described, i. e., against that of the hands of a watch. He assumed, then, that the hurricanes in the Bay of Bengal always follow this law.

The tyfoons and storms of the China Sea and eastern coast of Asia, appear to be similar in character to the hurricane of the West Indies and the storms of the United States Coast, when prevailing in the same latitudes. A tyfoon which occurred in the China sea in 1831, affords probable grounds for connecting the hurricane at Manilla, Oct. 23-24, with that of Oct. 31 at Balasore, on the shores of the Bay of Bengal.

A tremendous hurricane with an inundation caused by a storm wave, occurred at Cuttack and around Calcutta on the 30th Nov. 1831. A hurricane occurred at Coringa and Masulipatam on the 28th October 1800. One causing great loss occurred at Bombay on the 15th June 1837, a destructive one occurred at Bombay on the 2nd November, 1854. A violent hurricane occurred at Rutnagherry on the 19th April 1847. In the Bay of Bengal, the hurricanes usually occur at the changes of the monsoons, in March, April and May and in October, November and December. *Piddington's Law of Storms, p.* 524. *American Expedition to Japan.* p. 137. See Gales, Monsoons.

HURRIN-HARA. Hind. Amoora rohituka. *W & A.*

HURRIPHAL. Beng. Cicca disticha L.

HURRUK. Tel. Sing. Tallow.

HURRUM PILLU. Tam. Cynodon dactylon.

HURRUND. See Khyber p. 515.

HURSHMUN. Beng. Prasium melissifolium.

HURSING. Can. also Hursingar. Hind. Nyctanthes arbor tristis.

HURTAL. Persulphuret of Arsenic: Orpiment. There are two kinds, viz. Gobheri hurtal, in yellow flakes, used in oil painting, one seer costs one rupee four annas. Tabki hurtal, greenish, crystallized, given by fakeers, in fumigation: one ruttee of it is wrapped up in a leaf of "Muggarbel," and smoked in a hookah: it is evident that the smoker only escapes dangerous consequences, owing to the heat volatilizing most of the arsenic: as it is, the little inhaled often makes the person senseless, salt is then given to restore the senses: thus employed, tabki hurtal is considered a most powerful aphrodisiac, it is also used in ointment: costs three rupees for one seer.—*Genl. Med. Top. p.* 137.

HURUBA-HEGGADE. Hind. The headman of shepherds in Mysore &c., *Wilson.*

HURA-GOURI Sans. from Hara (Shiva,) and Gouri, the light yellow.

HURULI. Can. Dolichos uniflorus.

HURA-NAT'HA. Sans From Hara, a

name of Shiva, and Nat'-ha Sans, a lord, —literally the lord Shiva.

HURUNSEEA. See Kush.

HURUT, or harat. A Persian wheel for drawing water from a well. The word is a corruption of Ruhut or Arhut. *Elliot, Supp. Gloss.*

HUSAIN, a son of Ali. See Hasan, Khalif.

HUSAIN-BIN-ALI-UL-VAIZ, surnamed Kashifi. He translated the fables of Bedpai from the Arabic of Ibn Makaffa and named them Anwar-i-Sohaili, or the lights of Canopus.

HUSAINI. HIND. A kind of grape, the large sweet kind that are packed in boxes, and sent from Kabul in the cold season.

HUSAIN GANGA. In A. D. 1347, four years before the death of Mahommed Taghlak, Husain Ganga, an officer of high station in the Deccan, headed a successful revolt against his master, and established what is known as the Bahmanee dynasty of the Deccan, fixing his capital at Goolburga. Husain Ganga was the first independent mahomedan king of the Deccan, and was an Affghan of the lowest rank, a native of Delhi. He farmed a small spot of land belonging to a brahmin astrologer named Ganga, who was in favour with the king; and having accidentally found a treasure in his field, he had the honesty to give notice of it to his landlord. The astrologer was so much struck with his integrity that he exerted all his influence at court to advance his fortunes. Husain thus rose to a great station in the Deccan, where his merit marked him out among his equals to be their leader in their revolt. He had before assumed the name of Ganga, in gratitude to his benefactor; and now, from a similar motive, added that of Bahmanee (brahmin,) by which his dynasty was afterwards distinguished. With the extinction of the Bahmanee family, in 1512, sprang the separate mahomedan governments in the Deccan, respectively of Beejapoor, Ahmednugger, Beder, Ellichpoor, and Golconda. Mahmood's nominal sovereignty lasted for thirty-seven years, during which the Deccanee empire was divided into five several kingdoms—that of Beejapoor, or Viziapoor, founded by Eusuf Adal Shah; that of Amednugger founded by Ahmed Nizam Bhairi, that of Berar, founded by Ahmed-ool-Mulk, that of Golconda founded by Qutub-ool-Mulk, their respective governors, and that of Ahmedabad Beder, founded by Ameer Bareed, who rendered himself master of the person and throne of his master, and retained the provinces which had not been grasped by the other usurpers. This revolution, after being several years in progress, was consummated about the year 1526. A temporary union of the kings of Beejapoor, Golconda, and Ahmednugger, in 1564, enabled them to subvert the empire of Beejanugger and reduce the power of its chief to that of a petty raja. A similar fate awaited the portion of Ahmed, which consisted of the southern part of Berar; it subsisted as a kingdom only four generations, and was annexed to his dominions by the king of Ahmednugger in the year 1574. The Deccan was therefore, at the time when its invasion was projected by the Moguls, divided among the sovereigns of Beejapoor, Ahmednugger and Golconda. In the year 1593, when Akbar, the emperor of Delhi, found himself master from the mountains of Persia and Tartary to the confines of the Deccan, he cast his eyes on the contiguous land. —*Elphinstone's India, II. App, Briggs the Nizam.*

HUSBANDRY and silk weaving were the earliest of the arts cultivated by the Chinese people; the former was introduced by Shinnong, the immediate successor of Fo-hi and the silk weaving by an empress, and to both of these benefactors the Chinese perform annual sacrifices on their festival days. Husbandry is still highly honored and, annually, at a grand festival in honour of the spring, the emperor ploughs and sows a field. The Egyptians, Persians and Greeks held games and festivals mingled with religious ceremonies at seed sowing, and in England, formerly, the festival of Plough Monday was held, during which the plough light was set up before the image of the patron saint of the village.

HUSE, a transparent fabric of Manilla, of which the shirts of the coloured population are made. It is made from the fibre of the Musatextilis.—*Oliphant.*

HUSHANGABAD, in L. 22° 45; N, and 77° 42, E. in Malwa, on the left bank of the Nerbudda, 144 miles E. of Mhow is 1,050 ft. above the sea. Half of the principality of Bhopal was founded on usurpations from the Gonds, who appear to have migrated in force towards the middle of the 17th century, and to have made themselves supreme in the valley of the Nerbudda, about Hushangabad, in spite of the exertions of Aurungzeb, until an Afghan adventurer attacked and subdued them, converting some to mahomedanism. There are now several mahomedan Gonds in the possession of little fiefs on either side of the Nerbudda.—*Latham.*

HUSHTNUGGUR, a town to the west of the Eusufyze valley separated by a bare desert plain. The Hushtnuggur state is in a narrow but fertile tract. It was for many years the feudal domain of Dost Mahomed's brother, sultan Mahomed. It derives its

name from eight large villages, 'hasht-nagar' bordering on the Swat river.—*Rec. G. of I.* No. 11.

HUSHYARPUR, at this place and in Kangra are patches of the Sal tree, but the tree here attains its western limit, and has not been seen across the Ravi.—*Econ. Prod. Punj.*, p. 537.

HUSKS, on which the prodigal son desired to appease his hunger, were the pods of the Ceratonia siliqua.

HUSSAN YUSUF, of Lahore, is the siliceous frustule of one of the Diatomaceæ. It is of a pyramidal form with a convex base, and on each triangular face is a prominent rounded knot; these markings are not affected by acids, and remain after heating to redness. When heated in a reduction tube, it gives off a peculiar smell and combustible gas, showing that it is quite in a fresh state, otherwise it appears somewhat similar to a fossil. Hussan Yusuf is collected in lakes and ponds in the hills around Srinagar, in Kashmir. It floats on the surface and is skimmed off and dried.—*Powell's Handbook*, p. 320.

HUSSE LUBAN. Pers. Styrax benzoin. —*Dryander.*

HUSSEIN, sheikh of the Alouin tribe, was well known to all travellers who journeyed to Petra and Jerusalem by the way of Akaba, and generally to their cost. Taking advantage of their position, when they must either give up seeing Petra or accede to his exorbitant demands, he succeeded frequently in extorting a far larger sum than under ordinary circumstances would be paid for the hire of camels. He was sly, wily and cunning, possessed of great skill in arranging a bargain, but with his own tribe he bore the reputation of being a coward, though very clever with his tongue.

HUSSE-UL-JAWI. Arab. Styrax benzoin.—*Dryander.*

HUSSUN and HUSSEIN, sons of Ali and of his wife Fatimah, the daughter of Mahomed. Both were destroyed, the former by poison, and the latter slain by a party of Yezeed's soldiery. Hussun was buried at Medina. They are regarded as martyrs, and during the Moharrum, 'Marseea' or funeral odes are recited in their names, with a pathos such as few can listen to without deep emotion.

HUSSUNZYE. Between the extreme northern frontier of the Huzara district and the Indus there lies a somewhat narrow strip of rugged and mountainous territory—this is inhabited by the Hussunzye who therefore dwell in Cis-Indus, that is, on the left bank of the river. They could number, perhaps, 2,000 fightingmen. The principal hill is known as the 'Black mountain' from its dark and gloomy aspect. In the adjoining tract, within the Huzara border, lies Western Tournoulee, the fief of a chief politically dependent on the British.

HUSTI-SOONDA. Beng. Indian turnsole, Tiaridium indicum.

HUT. The circular form of hut is the only style of architecture adopted among all the tribes of Central Africa, and also among the Arabs of Upper Egypt; and although these differ more or less in the form of the roof, no tribe has ever yet sufficiently advanced to construct a window. See Houses.

HUTE. Ger. Hats.

HUT'HEELE or Hat'hile, one of the Puchpeeree, or five noted saints of the lower orders of Hindustan. He is said to be the sister's son of Ghazee Meean and lies buried at Bahraich, near the tomb of that celebrated martyr.

HUTSEAOU, Sing. Black pepper.

HUTSOO, a tributary to the Mahanuddy river Lat. 23° 18', lon. 82° 32'. S., flows into the Mahanuddy, length, 130 miles.

HUTTIAN, Hind. Eriodendron anfractuosum. Huttian ka Gond. Hind. Gum of Eriodendron anfractuosum.

HUWA, Eve. the mother of life.

HUNGER, Beng. Cocculus villosus D. C.

HUYA-GRUVA, Sans. from haya, a horse, and griva the back of the neck.

HUYER, Beng. Cocculus villosus.

HUZARA, a district in the extreme north-west angle of the Sind Saugur doab, between the rivers Jhelum and Indus. It consists of a series of valleys encircled by hills, among the most remarkable of which are the Doond and Suttee Hills (on a spur of which range the sanatarium of Murree is built; as also the Bhangree mountain, opposite to the lofty Mahaban, which, though rising on the other side of the Indus overtops the surrounding ranges. The whole tract undulates with ridges, and out of a horizontal area of 2,500 square miles, scarcely more than a tenth is level. The only plain of any extent is that of Hazara proper, in which are situated the cantonment of Baroo Kote, and Hurreepore the capital. There is also the valley of Puklee, the smaller one of Khanpur, and the tract between the Indus and the far-famed mountain of Gundgurh. *R. and G. of S. M.* 21.

HUZARA, about Herat, are enemies in creed to Persia, and the whole country to the Indus is inhabited by rigid soonee mahomedans. Still, with a tolerant policy that interfered not with their religion, any power might overrun and maintain the re-

gion lying between India and Persia. Had Runjeet Sing, in the outset of his career, permitted the mahomedans to pray aloud and kill cows, he might have possessed himself of the entire kingdom of Ahmed Shah Dooranee. *Paper's East India Cabul and Affghanistan*, p. 138. See Hazara

HUZIZ-I-HINDI. ARAB. Micrantha, *Wall.*

HUZRAT IMAM a town on the S bank of the Oxus, producing good silk.

HUZRAT SHAH, a name of Mowla Ali.

HUZRUT SHAH BABA, Fuqr-ood Deen, Gunj ool Israr, a mahomedan saint.

HUZURESH, name of the translation of the Zendavesta into Pehlavi, a mixture of Semitic and Iranian, made in the time of the Sassanidæ. Pehlavi was the language used by the Sassanian dynasty.—*Bunsen. Max Muller.* See Honover.

HVEDE. DAN. Wheat.

HWA-KEA-TSZE. The Chinese cycle of sixty years is called Hwa-kea-tsze. The Chinese year commences from the conjunction of the sun and moon, or from the nearest new moon, to the fifteenth degree of Aquarius. It has twelve lunar months, some of twenty-nine, some of thirty days. To adjust the lunations with the course of the sun, they insert, when necessary, an intercalary month. Day and night are divided into twelve periods, each of two hours.—*Gutzlaff's Chinese History.* p. 73.

HWAN-TE, the creature of the empress and Leang-ke, ascended the throne in 147. The harvest had for several years been very bad; and a drought destroying the crop of 153, more than 100,000 families of the province of Kechoo left their homes in search of a better country. *Gutzlaff's Chinese History.* Vol. I. p. 259.

HWANG HAE, or the Yellow Sea, on the east coast of China, is bounded on the west by the deep bight of the coast comprehended between the Yang-tsze-keang and the Shantung promontory, and on the east by the coast of Corea. It is mostly muddy and of a yellow colour near the land.—*Horsb.*

HWANG HO or Yellow River, on the east coast of China, is little inferior to the Yang-tsze-keang river in magnitude. Its entrance is in about lat. 34° 2' N, long 119° 51 E, but is little known to Europeans. —*Horsb.*

HWANG-PI. CHIN. Cookia punctata?

HWAN THSANG. A Chinese pilgrim into Afghanistan and India in the 6th Century who wrote a book entitled Si-in-Ki or descriptions of the countries of the west. See Hiwan Thsang.

HYA. SANS. A horse, El, sun, whence ἵππος and ηλιος ΗΛ. appears to have been a term of Scythic origin for the sun, and Heri, the Indian Apollo is addressed as the sun. Hiul or Jiul of northern nations is the Hindu Sacranta. Hiul may be the Noel of France. *Tod's Raj.* Vol. I. p. 24.

HYACINTH, a mineral consisting of silica and zirconia, transparent, and of a red colour. See Jargoon; Zircon; Garnet.

HYACINTHINA. See Ledebauria.

HYACINTHUS ORIENTALIS, the well known hyacinth plants of Europe, are much esteemed for their beautiful and ornamental appearance, they are grown both in beds and in glasses of water, the H. orientalis is one of the most beautiful and fragrant: native name is sambul; bulbs of different species are easily procurable from China.—*Riddell.*

HYÆNINA, the name of a sub-family of the Family Felidæ, of digitigrade carnivorous mammalia, distinguished by having their fore-legs longer than their hind-legs, by their rough tongue, great and conical molar, or rather cutting-and-crushing, teeth, projecting eyes, large ears, and a deep and glandular pouch beneath the anus.

$$\text{Incisors,}\frac{6}{6}\text{; canines,}\frac{1\text{-}1}{1\text{-}1}\text{; molars,}\frac{5\text{-}5}{4\text{-}4}\text{=34.}$$

The false molars, three above and four below, are conical, blunt, and very large. The upper flesh-tooth (carnassiere) has a small tubercle within and in front, but the lower one has none, and presents only two trenchant points. The whole of the dental and molar organisation, and indeed the whole cranial structure, appears to have been formed with a view to the bringing into the most available action the formidable natural instruments which enable the hyænas to break the hardest bones. In general form the hyænas resemble dogs more than cats and Linnæus classed them with the former to which they appear united by the Lycaon pictus of S. Africa. There is only one species in India, the striped Hyena, viz:

Hyæna striata, *Zimmerman*
H. vulgaris, *Demarest.*

Taras.	HIND.	Lakra-bag'h.	HIND.
Hundar.	„	Naukra Bagh.	BENG.
Jhirak of	UJJÉRIANA.	Har-vagh.	„
Lakhar-baghar.		Rera of CENTRAL INDIA..	
N. India.	HIND.	Kirba.	CANARESE
Lokra bag.	„	Kat-kirba.	„
Lakar-bag'h.	„	Korna-gandu.	„

The striped hyena is of a pale yellowish gray colour, with transverse tawny stripes, neck and back maned, and ordinary length is 3 ft. 6 in. to root of tail, tail 17 inches. It prefers open country and generally digs a

hole for its den on the side of a hill or mountain, or lurks amongst ruins. It is quite a nocturnal animal, sallying forth after dark and hunting for carcases, the bones of which it gnaws occasionally catching some prowling dog or stray sheep. It generally returns to its den before sunrise. Its call is very unpleasant, almost unearthly, The young are easily tamed and show much attachment to their keepers or masters, uttering sounds not unlike human laughter. *Jerdon's Mammals of India.*

HYA HYA.— ? Cow tree.

HYALÆA TRIDENTATA, *Lam.* of the seas of the E. Archipelago, has the power of expanding its keel appendices into the form of large oval semi-transparent leaves of a light green colour.— *Collingwood.*

HYAT, Ar. life, said by mahomedans to have been created on the tenth day of Mohurrum.

HYAT QULUNDUR, or Baba-Boodun or Bawa-Boodun, a mahomedan saint.

HY-CHY. Chin. Agar-agar Malay, a species of marine alga, the Fucus tenax; occurs in many of the Malayan islands, and forms a considerable article of export to China by junks. It is esculent when boiled to a jelly, and is also used by the Chinese as a vegetable glue and in their paintings. It abounds on the coral shoals in the vicinity of Singapore but the finest known in the Archipelago is found on the coast of Billiton. The chief consumption of it by the Chinese is in the dressing and glazing of their cotton manufactures and the preparation of sacrifice paper and paintings for their temples. A small portion of the finest part is sometimes made into a firm jelly which on being cut up and preserved in syrup makes a delicious sweetmeat.—*Crawfurd Dic. page* 6.

HYDASPES or Jehlum, the modern Behut, was called Bedaspes or Hydaspes by the Greeks, Behut is the modern abbreviation for the ancient Vitasta.

HYDATINA, a genus of molluscs.

HYDERABAD. The present dynasty, the Asof-Jahi, was preceded by the Qutub Shahi dynasty of Golcondah, and the following remarks on have been extracted from the Hadikat-ool-Alum, a work compiled by Meer Alam, minister to the nizam Sikunder Jah. Sultan Kuli, the founder of the dynasty, was descended from the chiefs of the Karakonilu tribe of Kurds, and appears to have been born near Diarbikr. The tribe to which he belonged having been subdued by Mir Hussain—and subjected to the Akunelu tribe of which that chief was head, —sultan Kuli, to save his life, fled from Diarbikr in company with his uncle, and after many difficulties and dangers, found his way to Beder, at which place sultan Mahomed Luskari Bahmani of Beder and Gulburgah then held his court. Ferishta, in his history of the Bahmani dynasty states that sultan Kuli, in the first instance, obtained employment at the Bahmani court as one of the Turki ghulam in personal attendance upon the king, but this appears to be denied by the author of Towarikh-i-Qutub Shahi, who asserts that sultan Kuli was from the first employed in a situation befitting his rank and family and from his talents and courage early rose to the command of the Beder armies, and the government of the province of Telingana. On the decadency of the Bahmani dynasty, during the latter part of the reign of Mahomed II. when the government had been virtually usurped by the minister Kasim Burid, sultan Kuli seized the province of Telingana and some years afterwards, took the title of Qutub shah, this latter event occurred in A. D. 1520 or thereabouts. and the Qutub Shahi dynasty existed in Telingana under this name for a period of nearly 200 years. The following kings of this house reigned between the period of its establishment and the siege and capture of Golcondah by Aurungzeb, in A. D. 1687:—

Sultan Kuli Qutub Shah -	- 1512-1543
Jumshid Qutub Shah -	- 1543
Sheik Sultan Kuli - -	- 1550
Ibrahim Kutub Shah -	- 1557
Abdul Muzuffer Sultan -	} 1580
Mahomed Kuli Qutub Shah	}
Sultan Mahomed Qutub Shah	- 1611-1626
Sultan Abdulah Qutub Shah	- 1626-1673
Abdul Hossain Qutub Shah	1673-1683.

The last named is commonly known by the name of Thannah Shah. Another account describes the founder of this dynasty, Sultan Kuli as the son of Omeer Kooli, a Toorkman chief, who claimed to be a lineal descendant of the prophet Noah, through his son Japhet. He was born in the town of Hamodur, and when a youth accompanied his paternal uncle to India and reached the town of Beder, then the seat of Government of the Bahmani kings, about the close of the reign of sultan Mahomed Shah Lashkarri Bahmani, was afterwards dignified with the title of Qutub-ul-Mulk i. e. 'the Polar star of the state' to it was attached as a jaghir the town of Golcondah and the surrounding villages. He was afterwards promoted to the command of all the troops in that vicinity. On the decadence of the Bahmani power, Qutub-ul-Mulk threw off its control, in 1512, though according to some historians he did not as-

sume the title of an independent sovereign for some years subsequently, probably about 1520. The seat of government was established at Golcondah formerly known by the Hindu name. The limits of the territory contained within his dominions are described by the author of the Hadikut-ool-alum, as extending from Chandah in the north to the Carnatic, and from the sea shore of Orissa, Vizagapatam and Masulipatam to Beder and the Bijapoor territories on the west The author declares that Sultan Kuli seeing that Sultan Mahomed Shah Lushkarri was much attached to his Turki slaves entered the band and was appointed to the charge of distributing the pay, &c., to the mahal. After a reign of 31 years, Sultan Kuli was murdered by a Turki slave at Golcondah at the instigation of his son Jumshid, A. D., 1543, A. H. 950. He was murdered in the mosque situated inside the town, and was in the act of directing the masons to break open a door to escape assassination, when the man employed by his son stabbed him. He died at the age of 90 years, and was succeeded by his son Yar Kuli Jumshid Khan, who had murdered his elder brother Malik Qutb-ud-din during their father's existence. Kasim Burid beseiged Golcondah with a large force, in aid of Ibrahim Qutb Shah, in which he failed, Ibrahim fled to Bijanuggur 1550-957, to Ram Raj, and Jhumshid died of cancer in 1553-957, having been guilty of great crimes—among others the assassination of his father and brother and the death of many individuals ordered for execution in moments of passion and pain: he is said to have lost the tip of his nose and a great part of his cheek by a sabre cut in battle—this is related by some of his father? He was succeeded by his son Sheikh Sultan Kuli, a boy of 10 years of age, who reigned for a period of 7 years. The weakness of the government, and the contentions existing between the reigning sovereign, and his uncle, Dowlut Kuli, whose cause had been espoused by Jagdeo Rao, rajah of Warungul, induced Ibrahim to leave the Bijanuggur court for Golcondah, which he reached and succeeded in establishing himself in 1557 and after a reign of 23 years he died in the year 1580-988, and lies buried in one of the tombs of Golcondah,—the two last figures, of the above date only are visible. He was succeeded by his son Sultan Mahomed Kuli Qutub Shah. In 1590, in consequence of the crowded state of the city, numbers died, and the seat of government was removed to the banks of the Musa river. The shah who was much attached to a woman named Bhagnuttee, to whom he had given 1,000 horse, called the city Bhagnuggur but afterwards changed it to Hyderabad. Hyderabad remained without walls till Mubariz khan, subadar of the Dekkan, commenced them—he, however, had not finished one-third, when he died, and they were afterwards finished by Asof Jah. Sultan Mahomed Kuli, built the Char Minar, the Mecca Musjid 1008, and died in 1611-1020, his tomb bears this date; succeeded by his nephew sultan Mahomed Qutb Shah, who died in 1626-1035, his tomb bears this date, between it and that of sultan Abdulla, is a tomb erected to his wife Hyat Begum, who died in 1660-1077. The musjid in its immediate vicinity was erected by the princess. Sultan Abdulla, died in 1673-1083; succeeded by his son-in-law Abdul Hoossein, commonly called Thannah Shah, and with this individual the dynasty closed—Aurungzebe attacked Golcondah, took the king prisoner in 1687-1092 and carried him to Ahmednuggur where he and Aurungzeb, died.

Nizam-ul-Mulk, was the first of the present dynasty. The territory which, as a deputy, he ruled, was 100,000 square miles in area, and he threw aside his allegiance to the emperor of Delhi. Asof Jah, Nizam-ul-Mulk, was a Turani noble, whose name was Chin Kilich Khan. He succeeded Daood Khan in the government of the Dekhan which his offspring still rule, as the Asof Jahi dynasty. Asof Jah was a distinguished ruler. After various intrigues during the weak reigns of Feroksir and the Syuds Mir Hussain Ali and Mir Abdullah, after the assassination of Feroksir in 1718, in the reign of Mahomed Shah, Asof Jah, in 1720, when governor of Guzerat, revolted, overran Candesh, and captured Asirghur. He was subsequently appointed vizir, but disgusted with the vicious courses of the emperor he returned to the Dekhan, defeated Mubaraz-ud-Dowlah and in 1724, established the Hyderabad kingdom near Golcondah, where the Kutub Shahi family had ruled.

In 1748, Nizam-ul-Mulk died, aged 104 years. His second son, Nasir Jung, assumed the government, but Muzaffar Jung, a grandson of Nizam-ul-Mulk, took the lead, declared himself subadar of the Dekhan, and joined Chunda Sahib and Dupleix, and in 1749, fought and won the battle of Amboor. Various intrigues occurred, in which Nasir Jung formed friendships with the three Pathan chiefs, of Cuddapah, Kurnool and Savanore, but he was attacked by the French before Ginjie, when one of the Pathan chiefs shot him. On this Muzaffar Jung was released from prison and declared

Nizam. He joined Chunda Sahib and the French under Dupleix but he was assassinated by the nabob of Kurnool on his way to Hyderabad, in 1751, when M. Bussy declared Sullabut Jung, the youngest uncle of the deceased to be the Nizam of Arcot. On the death of Nasir Jung, his eldest brother Ghazi-ud-Din was appointed subadar of the Dekkan, but he was poisoned by his own mother and Sullabut Jung succeeded.

Sallabut Jung, alternately combined with and opposed M. Bussy. Sullabut Jung was deposed in July 1761, and was shortly after assassinated by his brother Nizam Ali.

In 1763, Nizam Ali, met the army of Madhava Rao, Peshwa, under Raghoba, on the banks of the Godavery, and was completely routed.

Secundur Jah, reigned till 1828 ; Nazir-ud-Dowlah 1828 till Asof-ud-Dowlah died 1868 leaving an infant son.

Its chief towns are Hyderabad, Secunderabad, Aurangabad, Beder, Mominabad or Amba Joghi, Ellichpur, Warangal, Oomraotee and Nandeir.

Aurungabad, in L. 19° 53' N. and L. 75° 21' E. in the Dekkan, is a large but greatly decayed city and a military station. The mean height of the station is 1,885 feet above Bombay, at Colabah. It may now have about 15,000 people. It has, several times, for short periods, been occupied by the present dynasty. It has, in and near it, several places of interest. The daughter of Aurungzeb, son of shah Jahan, is buried there under a cupola, said to resemble the Taj Mahal at Agra. It is of white marble, in which elegant arabesques and flowers are carved with great skill, and the doors are ornamented with plates of metal, in which also are flowers and ornaments. Near the mosque is a handsome marble hall, and round it a neglected garden. Aurungzeb is buried at Roza 25 miles distant, on an elevated plateau overlooking the valley of the Godavery, and the Ellora caves are excated on its southern face. The fortress of Dowlatabad, also, is near.

There is a water mill at the Shah Mutafar garden.

Hyderabad, for revenue and judicial purposes, is arranged into 14 districts, grouped in five divisions. The area is 95,337 square miles with a population of about 10,666,080. The Nizam's territories comprehend the seats of some of the greatest and most powerful ancient sovereignties of the Dekhan. Such as Calyan the capital of the Western Chalukya, and Bijala Raya dynasties; Devagiri or Deoghur the capital of the Yadava; Warangal that of the Kakateya; and

the great mahommedan principalities of Kalburgah, subsequently split into the subordinate powers of Bijapur (the Adil Shah), Ahmednaggar (Nizam Shah), of Golconda (Qutub Shah), Berar (Imad Shah) and of Beder (Birud Shah), &c. The Hyderabad territories contain four distinct nations, the Canarese, Mahratta, Teling and Gond, with numerous fragmentary tribes, and many wandering houseless races. The Hyderabad territory has an annual revenue of Rs 1,65,00,000 or £1,650,000. Berar, now assigned to the British, belongs to the Nizam. It has 17,334 square miles, with a population of 2,231,565.

In the tract lying between the Mysore, Hyderabad and the Mahratta country were several petty sovereignties, such as that of the nabob of Banganapully a Syed family in the east of the Ceded districts; the Pathan nabobs of Kurnool on the right bank of the Tumbudrah river, further west, the Reddi chief of Gadwal; the Mahratta chief of Sundoor one of the Ghorpara family; the Kshetria rajah Narapati of Anagundah, the descendent of the great king Rama of Vijianaggur, who was overthrown by the combination of the mahomedan kings of Golcondah, Kalburgah, Bijapore and Ahmednuggur, the Pathan nabob of Shahnoor, the Ghorpara chieftains of Gunjundergurh and Akalkote, and at Ghoorgoontah and Beder Shorapore the descendents of that Beder soldier, Pid Naek, to whom Aurungzeb granted a small territory in the Raichore Doab, for the aid given at the siege of Bejapore. The Beder race have only these two small sovereignties, and some of the race there are tall well made robust men. The nizam of Hyderabad furnishes a contingent of 8,000 men, in six regiments of Infantry, four of Cavalry, and four batteries of Artillery as established by the treaty of 1798.

Nabob sir Salar Jung, in 1868, made changes in the administrative machinery and five Sudder Talookdars or Divisional Commissioners were appointed, as under :—

1. Aurungabad, Beer and Purbhanee.
2. Nandeir, Naldroog and Beder.
3. Nulgonda, Khummum.
4. Lingsoogoor and Raichoor.
5. Indoor, Meduck, Yelgundul and Surapoor

The first three commissioners on Rs. 1,500 a month, and last two on Rs. 1,000.

The people in the first two divisions speak Marathi, the next two the Telugu and the last are the Canarese districts of the nizam's territories. Each of the above fourteen Districts is presided over by a talookdar on from 400 to 600 Rupees a month, assisted by deputy talookdars, who control and superintend the

work of naibs or tahsildars of talookas. The commissioners go on circuit within their respective jurisdictions during eight months of the year, spending the remaining four at some central locality. The Commissioners communicate with the minister through the Malguzari or Civil Secretariat. There is a separate department of Police with a Suddur Mohtamim or Inspector General. Immediately under his orders are placed five naib mohtamim or deputy Inspectors General to whom the zillah Mohtamim or the District Superintendents are directly subordinate. Each district has its zillah engineer: there is a Conservator of forests, and Chief Inspector of the medical department.

The Hyderabad Assigned districts were, at first, subdivided into east and west Berar. In December 1864, however, they were reconstructed into the four districts of Woon, Oomraoti, Akolah and Maiker and in 1868, the district of Bassim was formed. The average area of each is 4,500 square miles, but from the circumstance that two of the districts are cut up by numerous ranges of hills, and in many parts are thinly inhabited, the share of the revenue contributed by them is not in proportion to their size. The area of all cultivated land, in consequence of the very high prices of all agricultural produce, increased from 3,670,430 acres in 1863-4 to 4,036,900 in 1864-5. The demand for land revenue in 1863-4 was £354,498 and in 1864-5 £381,602.

Berar is permanently assigned by the nizam to the Government of India to meet treaty obligations, subject to the condition that the surplus revenue shall be paid to Hyderabad. The province is administered by two Commissioners under the Resident of Hyderabad. As re-arranged in 1868 it contains 6 districts in 2 divisions.

Of the towns, Ellichpoor is the largest, having a population of 27,782 souls; Oomrawatie comes next, having 23,410, then Akolah having 14,006, and Akote (in the Akolah district) having 14,006. The proportion between the sexes in all ages was 48·3 females to 51·7 males.

The principal divisions of the people of Berar as to creed and caste were:

Christians	903	Sudra	1,441,271
Jews	16	Out-castes	301,379
Parsees	75	Aborigines	163,059
Mahomedans	154,951	Hindoo Sects	55,219
Brahmins	49,843		
Kshatriya	36.831	Total	2,231,565
Vaishya	28,018		

The Out-castes or Non-Aryans are thus detailed:—

Mhar.	
Somavanshi Adhucy, Telung, Madrasi, Ladoom Baider, Awdhatan. Holiar Bhilung, Perdeshi, Bhat, Hajam, Vatie, Loadey, Malvi, Gopal, Lawyaney Mhar, Labai, Dougra	2,27,824
Dhor	2,948
Khakrob (Bungee)	543
Kateek	4,069
Dasree	243
Chamar.	
Varadev, Pardeshi, Marathey Dakhnee Pudum, Holar, Hindustani, Chumbar, Mochee	19,172
Mang.	
Mang, Marothey, Vereday, Rant, Telung, Dukhnee, Ghutoley, Saradkar, Baonsee, Teeholey, Gavadey, Saveley, Devadey, Lakhari, Samus	35,453
Kalanki	46
Pirastee	8
Bahurupi	232
Pasee	20
Kaikadi	3,201
Aravia	15
Berad	11
Holar	274
Julnee	2
Monghey	332
Madgi	1,718
Total	296,111
Wandering tribe (Paradhi)	5,268
	3,01,379

All of the Bheel race, who live along the skirts of the Sautpoora range, appear to have embraced mahomedanism, though they do not intermarry with the purer mahomedans, and the list shows that there are 127 converts who were not born in that faith.

The Kshatriya class contains mostly a set of very dubious pretenders to the honor of Rajpoot descent. Mahrattas of no particular family usually call themselves thakoor—even a Koonbee will occasionally try to elevate himself thereby, while the Purbho, Kayuth and other castes of mixed origin and good social status are constantly invading the Kshatriya military order. The distinction is also claimed by the rajas of the Sautpoora hills, who assert that they are rajpoots depressed by the necessities of mountain life, whereas they are Gond or Kurkoo elevated by generations of highland chieftainship.

Under the heading Vaisya are placed all the commercial classes of hindus, the north-country Marwaree and Agurwalla, with those who are known by the general term Bunya, and a few castes like the Komtee from the south, or the Lar, who do not seem to be well known out of Berar.

The sudra caste in Berar, as in Mysore, all eat together, although they do not intermarry. The Koonbee and Malee eat flesh, drink liquor moderately, and their widows may always remarry if they choose, excepting the widows of Desmookhs, who ape high-caste prejudices. The Koshtee, is a weaving caste. The Bunjara are comparatively numerous in Berar, their occupation as carriers is rapidly going, and during their transitional stage they give a good deal of trouble to the police. The Dhungur are

sheep farmers, and the Hutker one of their clans, still hold much land on the border of the Nizam's territory, and was not long ago notorious for pugnacity and rebellion. The Bhoee has recently been supposed to belong to a widely spread primitive tribe; the Garpugaree, live by the profession of conjuring away hailstorms. Any one who has watched the medicine man at work has witnessed a relic of pure fetichism, possibly handed down from the Pre-Aryan races and their earliest liturgies. The Vidoor and Krishnapukshee are the same; they are descendants of brahmins by women of inferior caste, and Krishnapukshee is only an astronomical metaphor for describing a half-breed, the term meaning literally "dark-fortnight" and referring to the half darkened orb of the moon. All the sudras of this part of India are of Turanian origin. The Mhar have been taken to be the same with the Dher, a very useful and active tribe. The Mang appear to be the lowest in the social scale of all. The paucity of the Khakrob or Bhangee, who are so numerous in Northern India, is a serious sanitary difficulty. The Kaikaree are a tribe formerly well known for their thieving habits. Of the aborigines, the Gond, Kurkoo, and Bheel are the only completely preserved specimens of tribes. The two first retain their languages, while the Bheel tongue seems to have become extinct very recently, in Berar, its disuse being probably expedited by their general conversion to mahomedanism. The Ramosee, a predatory race, speak Telugu in their families, and are doubtless from Telinganah. The original Purdhan among the Gond answered to the Bhat among the hindus, but many seem to have settled in the plains as a separate class of Gond.

HYDERABAD in Sind, formerly the mahomedan capital of the country, is four miles on the left bank of the river Indus. It was built by the Kalora dynasty who preceded that of the Talpur race. Hyderabad is advantageously situated in the extremity of a ridge of limestone hills. It is 130 miles from the sea and in the time of the Amirs, in 1828 contained a population of 20,000. The town of Hyderabad is built on a low calcareous elevation, stretching at first north and south, the direction of the buildings, and then sweeping round towards the river.

The ancient name of Hyderabad was Neroon or Nirun, and Abulfeda says, was almost equi-distant, between Dabul (Dewul or Tatta) and Mansoora, Sehwan, or Minagara, the latitude of which, is 26° 11'.—*Sinnet's Voyage*, p. 159. *Eclaircissemens sur la Carte de l' Inde*, p. 37 *et seq.*, *Dr. Vincent's translation*, p. 386. *Postan's Personal Observation* p. 27. *Burnes Sind. Masson's Journeys*, Vol. I. p. 462.

HYDER ALI, was the son of Futteh Mahomed a native of the Punjab. He was born in 1702, and is said to have been a camel driver in his youth, but when 47 years of age, he took service with the rajah of Mysore, in some humble capacity as a soldier, but he rose in rank and gradually assumed power until, in 1749, he put the rajah aside and in 1761, he usurped the Government, and soon after conquered Bednore and extended his dominions to the sea. Hyder Ali was severely curbed by the Mahrattas and then entered into an alliance with Nizam-Ali and attacked the British, but the allies were defeated at Changama in August 1767, and again at Trinomalee. The war continued, however, and Hyder Ali in March 1769 arrived within ten miles of Madras, but on the 4th April a treaty was concluded. Hyder Ali conquered Coorg in 1772. In 1773 and 1774, he recovered all the territories which the Mahrattas had seized. In 1775, he captured Bellary, from Bassalut Jung. In 1776, he extinguished the power of Morari Rao and the independence of Savanore and in 1779, he annexed all the dominions of the Nabob of Cuddapah. In July 1780 he invaded the Carnatic, laid siege to Arcot, and on the 10th September 1780 totally destroyed the force of Colonel Baillie. Sir Eyre Coote arrived from Calcutta on the 5th November 1781, while Hyder was surrounding five forts, Coote, captured Carungally, overthrew Hyder's forces in a general battle at Porto-Novo, on the 1st July 1781, on which Hyder's investment of Trichinopoly and that of Wandewash by his son Tippoo, were abandoned. Coote met Hyder at Pollilore, but again on the 27th September 1781, at Sholingur, Coote completely defeated Hyder and compelled him to raise the siege of Vellore. Hyder Ali died on the 7th December 1782. His death took place in camp near Arcot, but was concealed until his son Tippoo could arrive. At his father's demise at the close of a virtual reign of thirty years, the army consisted of a hundred thousand well trained men, with about five millions sterling of money in the treasury. Tippoo, at first humble, grew arrogant. He invaded Travancore in 1791, but was attacked and defeated by the Mahratta Peshwa, the Hyderabad State and the British in 1792. By the resulting treaty of 1792, Tippoo agreed to cede one half of Mysore to England, to pay a large indemnity and to give up to Lord

Cornwallis his two eldest sons as hostages for his future conduct. They were removed to Vellore, but, in 1806, possibly incited by or through them, the native soldiers of that garrison, revolted and massacred the European garrison. After the suppression of this, they were removed to Russapuglah near Calcutta. In 1798, Tippoo again began intrigues, but this time with France, which brought on another war, and Tippoo fell at the siege and storm of Seringapatam by the British in 1799, and while a portion of the country was left to the son of Chum Raj, the remainder was portioned amongst the British, the Mahrattas and the Hyderabad State. Hyder Ali was not cruel without necessity; but, on the other hand, not merciful, if cruelty could in the least assist him. He entertained an implacable enmity and hatred towards the British. Hyder Ali formed a great tank in Mysore.—*Bjornsterna, British Empire in the East*, p. 166. *Hovell Thurlow*, p. 132. *Malleson's French in India.*

HYDNOCARPUS, a genus of plants, belonging to the Natural Order Pangiaceæ in which are two species, H. inebrians and H. odoratus. Dr. Hooker says, one of this genus, the "Took," grows in the Teesta valley in Sikkim. It is a beautiful evergreen tree, with tufts of yellow blossoms on the trunk: its fruit is as large as an orange, and is used to poison fish, while from the seeds an oil is expressed.—*Hooker Him. Journal*, Vol. II. p. 7.

HYDNOCARPUS INEBRIANS, *Vahl.*

H. venenata. *Gœrtner.*

Kowtee,	MAHR.	Makcoloo,	SINGH.
Moratti,	MALEAL.	Marra vattay	TAM

A large tree, growing in Ceylon on the banks of rivers, up to an elevation of 2,000 feet, also in Malabar, in Tinnevelly, and Travancore. It is a common tree on the west coast, not so in the Coimbatore jungles. The tree is hardly found in the Bombay northern jungles on the coast; more frequently in those south of the Savitree river. The wood is not used for any purpose. The seeds of the fruit afford an oil. Flowers small, white. Fruit used for poisoning fish.—The thortay oil of Canara, called also Neeradimootoo oil a very valuable vegetable solid oil, is from this tree. It is of the consistence of ordinary hard salt butter and is used as a remedy in scabies and ulcers of the feet. *Thwaites, Drs. Voigt, Gibson and Wight.*

HYDNOCARPUS ODORATUS. *Lindley.*

Gynocardia odorata ROXB.	Chaoolmoogra odorata ROXB
Chaulmoogra BENG. HIND.	Piturkurra BENG. HIND.

A tree of Assam, Silhet, seeds used in the cure of cutaneous disorders. Freed from their integuments, they are beaten up with clarified butter into a soft mass, and in this state applied thrice a day to the parts affected. *Roxb. Voigt.* 86.

HYDNOCARPUS VENENATA. GŒRTN. Syn of Hydnocarpus inebrians.—*Vahl.*

HYDRA. The Tauric and Hydra foes, with which Jason had to contend before he obtained the fleece of Aries, are the symbols of the sun-god, both of the Ganges and the Nile; this fable has occupied almost every pen of antiquity, but is clearly astronomical, as the names alone of the 'Argha-Nat'h,' sons of Apollo, Mars, Mercury, Sol, Arcus or Argus, Jupiter, Bacchus, &c., sufficiently testify, whose voyage is entirely celestial.—*Tod's Rajasthan*, Vol. I, p. 601. See Krishna.

HYDRANGEA, is a well-known genus of hardy shrubs, of which one species is commonly cultivated for the sake of its beautiful flowers. This plant is a native of China and Japan: it was originally observed in the gardens of Canton by Loureiro, who took it for a primrose, and called it Primula mutabilis. It was next met with by Commerson, a French traveller, who named it Hortensia, in compliment to Madame Hortense Lepleaute. H. hortensis, called Guelder Rose, from hydor, water, and aggion, a vessel, in allusion to some of the species growing in water, and the resemblance the capsule bears to a cup. The flowers are of various shades of rose colour. Propagation may be effected by cutting or layers. The soil most desired by the hydrangea is a black earth, mixed with well rotted leaf mould, and a small portion of sand. It requires moisture, and a supply of water should be freely given to it.

HYDRANGEA THUNBERGII.

Amatsja,	JAVAN.	Tea of Heaven,	ENG.

In use, in Java, as a tea.

HYDRARGYRÆ, of Carolina, these leave the drying pools and seek the nearest water, in a straight line, though at a considerable distance.

HYDRAOTES. See Khetri, Punjab.

HYDRARGYRI BICHLORIDUM. LAT. Corrosive sublimate.

HYDRARGYRI BISULPHURETUM. LAT. Cinnabar

HYDRARGYRUM. LAT. Mercury.

HYDRASTIS CANADENSIS, or Canadian yellow root, a valuable bitter tonic, and useful yellow dye-stuff.

HYDRATE DE SOUDE. FR. Soda.

HYDRAULIC CEMENT. The finer kinds of lime and cement on the coast of the Peninsula of India are made from shells. A piece of ground about ten

feet square is laid down even and floored over with clay: an upright pole is placed at each end of this, and a sheet stretched out with back stays spread between the poles which are steadied with strings On the floor a bed of shells and rice-chaff alternately, about ten inches thick and eight feet by six, is spread neatly out. Some firewood is placed along the windward side of this, and when the sea breeze sets in the wood is kindled. As the heat extends to leeward, and the shells become calcined, the lime-burners draw off the fore parts of them with a stick, and so soon as they have cooled on the floor sufficiently to allow them to be handled, they are placed in a scoop basket and the dirt and epidermis winnowed from them. The shells, now white and pearly, are next thrown into a small sized vat partially filled with water: here they for some time boil from the effects of the heat and slaking. The whole in a short time settles down into a fine semi-fluid mass, which is taken out and slightly dried, and is now ready for use. A good hydraulic cement is formed of the blue clay of Madras, and shell lime. Bitumen or asphalte seems to have been employed in Babylon, as a cement.

HYDRIDÆ, the Sea Snakes, venemous reptiles which appear to live on sea-weed. They lay their eggs on the shore and coil themselves up on the sand. They are found at sea all along the coast, within soundings, and their appearance always marks the approach to land. They are often thrown ashore by the surf and they are occasionally carried up rivers by the tide, but they cannot live in fresh-water. Fishermen greatly dread these snakes. The following genera and species occur in the south and east of Asia.

Pelamis bicolor,	Pacific ocean.
„ ornata,	Borneo.
Lapemis curtus,	Madras.
„ hardwickii,	Borneo.
Aturia belcheri N.	Guinea.
„ ornata,	Indian, Seas.
Microcephalophis gracilis, kadelnagam,	of Madras.
Enhydrina Bengalensis,	Madras.
„ valakadyen,	„
Hydrophis obscura, the shooter sun,	„
„ lindsayii,	China.
„ fasciata,	Indian ocean,
„ nigrocincta, the kerril,	Bengal.
„ doliata, the black headed kerril,	Australia.
„ subcincta, Shaw's chittul,	Indian ocean.
„ sublævis, the chittul,	China and Indian ocean.
„ mentalis the pale chittul,	Ind. ocean.
„ ocellata, the eyed chittul,	Australian seas
„ spiralis, the shiddil,	Indian ocean.
„ subannulata, the ringed sea snake,	India.
„ aspera, the rough sea snake,	Singapore
Hydrophis cærulescens, the bluish sea snake,	Bengal.
Chitulia inornata,	Indian ocean.
„ fasciata,	„
Kerilia Jerdonii, the kerilia,	Madras.
Hydrus major, the sea snake,	India, australia.
„ annulatus, the ringed sea snake,	Singapore.
Tomogaster eydouxii.	Indian ocean.
Stephanohydra fusca, Juke's hypotrophis,	Darnley islands.
Chersydrus annulatus,	Madras.
„ granulata, the chersydrus,	„
Acrochordus javanicus,	Java.
Erpetonina.	
Erpeton tentaculus, the erpeton	
Cerberus cinereus, the karoo bokadam,	India.

—*Eng. Cyc.*

HYDRILLA VERTICILLATA. *Roxb.*

Kurelee,	Hind.	Jhangh,	Panj.
Jala,	Panj.	Punachu,	Tel.

This, with other aquatic plants, is used by the sugar refiners of Saharunpore for covering the surface of sugar, in order to allow the slow percolation of water when refining it. It is common in water in parts of the Punjab plains up to Peshawar. It is used east of Sutlej, for refining sugar, but at Multan, west of that river, it is not obtainable.—*Dr. J. Stewart Punj. Plants*, p. 241.

HYDROCHARACEÆ. A natural order of floating or water plants of which six genera with eleven species occur in the East Indies, viz., 4 species of Ottalia, 3 of Vallisneria, 1 of Hydrilla, 1 of Blyxa, 1 of Enhalus and 1 of Hydrocharis. Hydrilla verticillata, along with similar plants is employed by the sugar refiners of Saharunpoor and Berhampoor for covering the surface of their sugars, as clay is used in the W. Indies, to permit the slow percolation of water. Enhalus acoroides has a sulphureous smell. Its fruit is eatable, raw, boiled or roasted, if boiled the nuts acquire the taste of boiled chesnuts. The natives of the Moluccas make nets of the tough threads, which remain after the putrified leaves, these nets are

said to be very durable in sea water. The following are the genera and species :

Hydrilla verticillata. LINN.

Serpicula verticillata, LINN. fil ROXB.
Vallisneria verticillata, „
Udora verticillata, SPRENG.
Hottonia serrata, WILLD.

Grows in most parts of India.

Vallisneria spiralis, L.

V. spiraloides, ROXB. | V. Jacquiniana, SPRENG.

A plant of Europe and America

Vallisneria physicum, JUSS.

A plant of Cochin China.

Bootia cordata, WALL.

A plant of Prome and Taong-Dong.

Blyxa octandra, RICH, grows all over India.

Enhalus acoroides, LINN.

Acorus marinus, RUMPH. | Stratiotes acoroides, LINN.

Grows in the Concans and Moluccas.

Ottelia alismoides, PERS.

Stratiotes alismoides, LINN.
Hymenotheca laxifolia, SALIS.
Damasonium Indicum, WILLDE.
„ alismoides, R. BR.

The Panee-kula of Bengal, grows in most parts of India.

HYDROCHELIDON INDICA or 'Sterna leucoparica, the 'Whiskred Tern, occurs in Europe, Asia, Africa, Malay countries; and very common in India.

HYDROCHLORATE D'AMMONIAC. FR. Hydrochlorate of Ammonia.

HYDROCOTYLE ROTUNDIFOLIA. WALL. Syn. of Hydrocotile Asiatica.—*Linn.*

HYDROCOTYLE ASIATICA. *Linn.*

Hydrocotyle rotundifolia, *Wall.*

		Elika chavi kura,	„

A small herbaceous creeping plant with little purplish red flowers, a native of Africa and America, and grows all over southern Asia, in moist shady places. It has long been employed in medicine, and its virtue in leprosy has been latterly again much lauded. An infusion of the toasted leaves in conjunction with vendeum is given to children in fever.—*R. Brown. Ainslie's Mat. Med.* p. 126.

HYDROCOTYLE ROTUNDIFOLIA, *Wall*, Syn. of H. Asiatica.

HYDROCHLORIC-ACID. Nimak ka tezab. Is made similarly to nitric acid, substituting common salt for the nitre.

HYDROCYANIC ACID. Prussic acid.

HYDROLEA ZEYLANICA. *Vahl.*

Nam zeylanica, LINN. | Steris aquatica BURM.

A herbaceous plant, grows in water and marshy ground in the East Indies. The leaves beaten into a pulp and applied as a poultice are deemed useful in cleaning and healing ill conditioned ulcers in which maggots have formed.—*Lind. Fl. Med.*, *p.* 401, in *O'Shaughnessy*, *p.* 507.

HYDROPHASIANUS, a genus of the Sub-family Parrinæ, viz.,

Sub-fam. Parrinæ, 2 gen. 2 sp. viz., Metopodius; 1 Hydrophasianus.

Fam. Gruidæ, 1 gen. 1 sub-gen. 3 sp. viz., 2 Grus. 1 Anthropoides.

HYDROPHIDÆ, a family of serpents, viz. :

Enhydrina Bengalensis, *Gray*. Sandheads.
Hydrophis gracilis, *Shaw*. Sandheads.
„ jerdonii, *Gray*. (Hydrus, Cant). Mergui.
„ nigrocincta, *Daud.*
„ curta, *Shaw.*
„ cydnocincta, *Daud.* (Hydrus, Cant). China Hidgilli.
„ robusta, *Fischer*. Hidgilli.
„ coronata, *Gunth.* Hidgilli.
„ stricticolles, *Gunth.* Hidgilli.
„ chloris, *Daud.* Sandheads.
„ guntheri, *Theob.*
„ trachyceps, *Theob.* Mergui.
„ viperina, *Schmidt.* Rangoon.
Pelamis bicolor, *Schneid.* Nicobar.
Platurus scutatus, *Lour.* Ramree, Penang.
„ Fischeri, *Jan.* Bay of Bengal.

HYDROPHYLAX MARITIMA, *Linn.* A creeping plant with lilac coloured flowers, grows on sand hills on the Coromandel and Malabar Coast.

HYDROSAURUS SALTATOR.—*Lour.* A genus of reptiles, of the

Sec. B. Squamata, Scaled reptiles.
Order Sauria.
Fam. VARANIDÆ.
Psammosaurus scincus, *Merr.* Nubia, Salt Range.
Varanus flavescens, *Gray*. Bengal.
„ dracæna, *Linn* Bengal, Agra.
„ nebulosus, *Dum and Bib.* Bengal, Agra
Hydrosaurus salvator, *Laur.* Bengal, Assam, Armus Malacca, Rungpur.

HYDROPHIS, a genus of the Hydridæ or Sea Snakes found on all the coasts of India. Sir J. E. Tennent has sailed through large shoals of them in the Gulf of Manaar, close to the pearl banks of Aripo. The fishermen of Calpentyn on the west of Ceylon live in perpetual dread of them, and believe their bite to be fatal. In the course of an attempt which was recently made to place a light-house on the great rocks of the south-east coast, known by seamen as the Basses, or Baxos, the workmen who first landed found that portion of their surface liable to be covered by the tides, honey-combed and hollowed into deep holes filled with water, in which

were abundance of fishes and some molluscs. Some of these cavities also contained sea-snakes from four to five feet long, which were described as having the head "hooded like the cobra de capello, and of a light grey colour, slightly speckled. They coiled themselves like serpents on land, and darted at poles thrust in among them. The Singalese who accompanied the party, said that they not only bit venomously, but crushed in their coils the limb of any intruder." The principal habitat of sea-snakes is the ocean between the southern shores of China and the northern coast of New Holland, and their western limit appears to be about the longitude of Cape Comorin. It has long since been ascertained that they frequent the seas that separate the island of the Pacific; but they have never yet been found in the Atlantic. *Tennent's Sketches of the Natural History of Ceylon*, p. 309.

HYDROPHOBIA. Dr. A Gibson says the Notonia corymbosa, native name "Wandur Rotee," is useful as a prophylactic in Hydrophobia. It grows rather plentifully on the stony parts of the high hills near Jooner, and also in some parts of the Northern Deccan, Khandeish, &c. About four ounces of the stem and bark of the plant are steeped in cold water for a night, when it has become softened, the material is then kneaded with the hand, so as to extract the thick greenish juice which mixes with the water, and in this state it is drunk in the morning, the quantity of water being about a pint. On the same evening two pills, or boluses, composed of the flour of black gram, made up with the thick juice of the plant, are given, and the dose of the watery infusion next morning, to be repeated as before, and the same pills again in the evening. The like process to be gone through on the third day, after that nothing. The giving of the medicine should not commence until nine days after the bite of the animal. The plant is one readily propagated by cuttings, but it will only grow in rocky places and corners of old fort walls, &c. In appearance the plant resembles the euphorbium, or milk bush, except that it is destitute of the thorns. The leaves have a thick cabbage-like appearance, only they are much smaller.—*Times of India, Jan.* 2.

HYDROPHYLAX MARITIMA.—*Linn.* The Seaside Hydrophylax is a straggling herbaceous plant, native of the shores of Coromandel, where it shows its pale lilac blossoms great part of the year. The branches run over the sand, sometimes under the surface, and strike root at the joints. It answers well as a sand binding plant where the sand is moist.

HYDROSAURI, or water lizards, live on the margins of springs and on low river banks.

HYDROSAURUS SALVATOR.—*Lour.* Tail compressed, fingers long, nostrils near the extremity of the snout. A black band on each temple, round yellow spots disposed in transverse series on the back. Teeth with the crown compressed and notched.—*Tennent's Sketches of the Natural History of Ceylon*, p. 272.

HYDRUS. See Hydridæ.

HYDUR WULLEE, a mahomedan saint.

HYEE-BIN. Burm. Rhamnus jujuba.

HYENA. See Hyæna.

HYETE. Sw. Wheat.

HYI-BIN. Burm. Zizyphus jujuba.

HYLOBATES, the 'wa-wa' or long-armed ape, is the most beautiful of all the monkey tribe. The fur of this gentle little animal is grey, its face, hands, and feet, are jet black, in features it more resembles those of the human race than the oran utang.—*Low's Sarawak*, p. 80.

HYLOBATES HOOLOOK, the Holock. It is the Simia Hoolock, *Harlan;* H. seyrites and H. coromandus, *Ogilby;* H. Houloch, *Lesson*, a nature of Assam ?

HYLOBATES LAR, the Gibbon; Homo lar, *Linnæus;* Simia longimana, *Schreber;* S. albimana *Vigors* and *Horsfield*; Le Grand Gibbon of *Buffon;* a native of Malacca where it is known as the white handed Gibbon. The contrast which this animal offers with H. hoolock, is very remarkable. The body is proportionally much shorter; and it is quite incapable of walking in the erect attitude commonly assumed by H. hoolock, always creeping forward when on the ground in a crouching position.

HYLOBATES LEUCISCUS, the silvery Gibbon, or Wow-Wow, Simia leucisca, *Schreber*, Moloch, *Audeb.* native of Malacca. See Simiadæ.

HYLÆDACTYLIDÆ, a family embracing Hylædactylus vittatus, *Cantor*, Pegu.

H. bivittatus, *Cantor.* See Engystoma interlineatum.

HYLINA this section of the Reptilia, comprehends
